PUBLICATIONS OF INTEREST TO USERS OF EMPLOYMENT AND EARNINGS STATISTICS

EMPLOYMENT AND EARNINGS AND MONTHLY REPORT ON THE LABOR FORCE

issued each month, providing...

. . . . current industry data for keeping each series listed in this volume up to date

. . . . timely analysis of current developments in employment, unemployment, hours and earnings for the Nation

. . . . current statistics for States and more than 182 metropolitan areas on employment in nonagricultural establishments by major industry division, earnings and hours of factory workers, and labor turnover rates in manufacturing

. . . . detailed statistics on the labor force. . . .characteristics of the employed and unemployed, such as age, marital status, color, industry, and occupational attachment

Annual subscription: $7 ($1.25 additional for foreign mailing)
Single copy 65 cents

EMPLOYMENT AND EARNINGS STATISTICS FOR STATES AND AREAS, 1939-65 BLS BULLETIN 1370-3

. . .1966 edition. . .contains all industry detail currently published by each State agency cooperating with the BLS. . .annual averages shown from earliest date available through 1965 for over 7,000 employment series and more than 3,000 hours and earnings series. . .represents the leading industries in 50 States and 179 major areas. . .bulletin periodically revised

Price per copy $4.25

HOW TO ORDER:

The monthly report **Employment and Earnings and Monthly Report on the Labor Force** and the historical volume **Employment and Earnings Statistics for States and Areas, 1939-65** (BLS Bulletin 1370-3), may be ordered through the Superintendent of Documents, U.S. Government Printing Office, Washington, D. C., 20402, or any of the BLS regional offices listed on the inside back cover of this book.

INTRODUCTION

The 1966 edition in this series marks the fifth comprehensive data book on national statistics to be released by the Bureau of Labor Statistics since 1961 and replaces *Employment and Earnings Statistics for the United States, 1909-65* (BLS Bulletin 1312-3, issued in 1965).

Bulletin 1312-4, as did its four predecessor volumes, presents detailed industry statistics on the Nation's nonfarm work force. Included are monthly and annual averages on employment covering all employees, women, production workers in manufacturing and mining, construction workers in contract construction, and nonsupervisory workers in most of the remaining nonmanufacturing industries. Also shown are average weekly and hourly earnings, average weekly and overtime hours, and labor turnover rates. Seasonally adjusted data are presented for a number of these series as well as indexes of aggregate weekly hours and payrolls. Tables on spendable average weekly earnings and average hourly earnings, excluding overtime, are also featured.

The current volume introduces historical estimates of total employment of women on nonagricultural payrolls. Previously, estimates of women were available for selected industries only. The major technical characteristics of the payroll employment statistics program, such as scope, concepts, survey methods, estimating techniques, and limitations highlighted in the next few paragraphs, are described fully in the technical note following the main body of statistical tables.

Benchmark Adjustments

Periodically, the BLS adjusts its industry employment series to more recent benchmarks (comprehensive counts of employment) in order to correct for sampling variability and for changes in industrial activity of establishments. In this volume, data adjusted to March 1965 levels are shown for the first time. Consequently, many series, commencing with April 1964, have been revised and supersede those previously published in *Employment and Earnings and Monthly Report on the Labor Force, the Monthly Labor Review,* and in BLS Bulletin 1312-3. In the services division, data prior to March 1964 have been revised due to the recent availability of improved benchmark information of earlier periods on religious organizations and hospitals.

A special article, "BLS Establishment Employment Estimates Revised to March 1965 Benchmark Levels," featured in the September 1966 issue of *Employment and Earnings and Monthly Report on the Labor Force,* discusses in detail the effect of the latest benchmark adjustments. Reprints of the article are available upon request (as long as the supply lasts) to the BLS in Washington or to any of its regional offices, which are listed on the inside back cover of this bulletin.

Levels of employment for March 1959, 1961, 1962, 1963, 1964, and 1965, for industry categories not regularly published are shown in the back of the book. The data represent the actual count (benchmark) for these industries. For comparative purposes the published industry division totals are also provided in the same table.

Collection of Data

Each month a representative panel of industrial, commercial, and government establishments, employing collectively about 25 million workers, voluntarily submits information from payroll records to the State agencies participating in the Current Employment Statistics Program.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

After extracting data necessary for the preparation of State and area estimates on employment, hours, and earnings, these agencies forward the reports to the BLS (Washington Office) for use in the development of national estimates. This program is conducted jointly by State employment security agencies, the Bureau of Labor Statistics, and the Bureau of Employment Security (BES) in 44 States and the District of Columbia; in the remaining States, the program is a cooperative endeavor by State Departments of Labor and the BLS.

Labor turnover statistics, showing the rate of accessions and separations, by industry, are also based on data voluntarily supplied by employers. The State agencies in the Labor Turnover Statistics Program have the same responsibilities as in the Current Employment Statistics Program. In all States and the District of Columbia, the program is operated by the State employment security agencies in cooperation with BLS and BES.

Standard Industrial Classification

Each industry title in the bulletin is also identified by the appropriate SIC code. The industry conforms to the definition for that code which is described in the *1957 Standard Industrial Classification Manual* as amended by the *1963 Supplement* and published by the Office of Statistical Standards of the Bureau of the Budget.

Related State and Area Statistics

Although only national data are presented in this volume, a companion bulletin, *Employment and Earnings Statistics for States and Areas, 1939-65* (BLS Bulletin 1370-3, issued in 1966), provides similar information for all States, the District of Columbia, and 179 areas. That bulletin contains annual averages for total employment, and weekly earnings, weekly hours, and hourly earnings on the same basis as the National data from the beginning date of each series through 1965. Data for all the industry detail currently published by each cooperating State agency are presented in the bulletin.

Publication of Current Data

Current statistics continuous with the May 1966 figures shown in this book are provided each month in *Employment and Earnings and Monthly Report on the Labor Force,* beginning with the September 1966 issue. (For details on ordering see the inside front cover of this bulletin.)

* * * * *

This bulletin was prepared by the Division of Industry Employment Statistics, Robert O. Dorman, Chief, and the Data Systems Research and Development Staff, Rudolph C. Mendelssohn, Chief, under the general direction of Harold Goldstein, Assistant Commissioner for Manpower and Employment Statistics, and Dudley E. Young, Deputy Assistant Commissioner for Manpower and Employment Statistics.

CAUTION

Periodically, the Bureau adjusts the industry employment series to a recent benchmark to improve its accuracy. These adjustments may also affect the hours and earnings and labor turnover series because employment levels are used as weights. All the industry statistics in this book for periods after March 1965, the present benchmark date, are therefore subject to revision. Future editions of the present volume are planned for issue when the series are adjusted to new benchmark levels.

(1)QUITS INCLUDE MISCELLANEOUS SEPARATIONS PRIOR TO 1940.
(2)BEGINNING JANUARY 1943 LABOR TURNOVER RATES REFER TO ALL EMPLOYEES; PREVIOUSLY TO PRODUCTION WORKERS ONLY.
(3)BEGINNING WITH JANUARY 1959, TRANSFERS BETWEEN ESTABLISHMENTS OF THE SAME FIRM ARE INCLUDED IN TOTAL ACCESSIONS AND TOTAL SEPARATIONS, THEREFORE RATES FOR THESE ITEMS ARE NOT STRICTLY COMPARABLE WITH PRIOR DATA. TRANSFERS COMPRISE PART OF OTHER ACCESSIONS AND OTHER SEPARATIONS, THE RATES FOR WHICH ARE NOT SHOWN SEPARATELY.
NOTE: DATA INCLUDE ALASKA AND HAWAII BEGINNING 1959. THIS INCLUSION HAS NOT SIGNIFICANTLY AFFECTED THE LABOR TURNOVER SERIES.

EMPLOYMENT

HOURS AND EARNINGS

LABOR TURNOVER

BY INDUSTRY

NOTE: All data include Alaska and Hawaii beginning 1959.

For labor turnover rates, beginning with January 1959, transfers between establishments of the same firm are included in total accessions and total separations, therefore rates for these items are not strictly comparable with prior data. Transfers comprise part of other accessions and other separations, the rates for which are not shown separately.

(1) DERIVED BY ASSUMING THAT OVERTIME HOURS ARE PAID AT THE RATE OF TIME AND ONE-HALF.
(2) 11-MONTH AVERAGE.
(3) AUGUST 1945 EXCLUDED BECAUSE OF VJ-DAY HOLIDAY PERIOD.
(4) PRIOR TO JANUARY 1956, DATA WERE BASED ON THE APPLICATION OF ADJUSTMENT FACTORS TO GROSS AVERAGE HOURLY EARNINGS (AS DESCRIBED IN THE MONTHLY LABOR REVIEW, MAY 1950, PP. 537-540; REPRINT AVAILABLE, SER. NO. R 2020).

(1) DATA ARE NOT AVAILABLE FOR THE PRINTING, PUBLISHING, AND ALLIED INDUSTRIES GROUP, AS AVERAGE OVERTIME RATES ARE SIGNIFICANTLY ABOVE TIME AND ONE-HALF. INCLUSION OF DATA FOR THE GROUP IN THE NONDURABLE GOODS TOTAL HAS LITTLE EFFECT.
(2) 11-MONTH AVERAGE.
(3) AUGUST 1945 EXCLUDED BECAUSE OF VJ-DAY HOLIDAY PERIOD.
(4) PRIOR TO JANUARY 1956, DATA WERE BASED ON THE APPLICATION OF ADJUSTMENT FACTORS TO GROSS AVERAGE HOURLY EARNINGS (AS DESCRIBED IN THE MONTHLY LABOR REVIEW, MAY 1950, PP. 537-540; REPRINT AVAILABLE, SER. NO. R 2020).

Technical Note

INTRODUCTION

This technical note describes the concepts, scope, and survey methods used in the preparation of the employment, hours, earnings, and labor turnover series shown in this volume.

COLLECTION

Payroll reports provide current information on wage and salary employment, hours, earnings, and labor turnover in nonfarm establishments, by industry and geographic location.

Federal-State Cooperation

Under cooperative arrangements with State agencies, the respondent fills out only one employment or labor turnover schedule, which is then used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. The States use the information to prepare State and area series and then send the establishment data to the BLS for use in preparing the national series.

Shuttle Schedules

Two types of data collection schedules are used: Form BLS 790--Monthly Report on Employment, Payrolls, and Hours; and Form DL 1219--Monthly Report on Labor Turnover. These schedules are of the "shuttle" type, with space for each month of the calendar year. The schedule is returned to the respondent each month by the collecting agency so that the next month's data can be entered. This procedure assures maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

The BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of nonagricultural establishments and, for most industries, payroll and manhours of production and related workers or nonsupervisory workers for the pay period which most nearly coincides with the *standard survey reference week* (the calendar week, Sunday through Saturday, which includes the 12th of the month). The labor turnover schedule provides for the collection of information on the total number of accessions and separations, by type, during the calendar month.

CONCEPTS

Industrial Classification

Establishments are classified into industries on the basis of their principal product or activity determined from information on annual sales volume. This information is collected each year on a supplement to the monthly 790 or 1219 report. For an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

All national, State, and area employment, hours, earnings, and labor turnover series are classified in accordance with the *Standard Industrial Classification Manual,* Bureau of the Budget, 1957, as amended by the *1963 Supplement.*

Industry Employment

Employment data for all except employees of the Federal Government refer to persons on establishment payrolls who received pay for any part of the pay period which includes the 12th of the month. For Federal Government establishments, employment figures represent the number of persons who occupied positions on the last day of the calendar month. Intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; Federal military personnel are excluded from total nonagricultural employment.

Persons on an establishment payroll who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during a part of the pay period and are unemployed or on strike during the rest of the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but do not report to work during the period.

Industry Hours and Earnings

Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers in manufacturing and mining, construction workers in contract construction, and nonsupervisory employees in the remaining nonfarm components. These terms are defined below. When the pay period reported is longer than 1 week, the figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

Construction workers include the following employees in the contract construction division: Working foremen, journeymen, mechanics, apprentices, laborers, etc., whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, attendants, service employees, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period which includes the 12th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firm. Bonuses (unless earned and paid regularly each pay period), other pay not earned in pay period reported (e.g., retroactive pay), and the value of free rent, fuel, meals, or other payment in kind are excluded.

Man-hours cover man-hours worked or paid for, during the pay period which includes the 12th of the month, for production, construction, or nonsupervisory workers. The man-hours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Overtime hours cover premium overtime hours of production and related workers during the pay period which includes the 12th of the month. Overtime hours are those for which premiums were paid because the hours were in excess of the number of hours of either the straight-time workday or workweek. Weekend and holiday hours are included only if premium wage rates were paid. Hours for which only shift differential, hazard, incentive, or other similar types of premiums were paid are excluded.

Gross Average Hourly and Weekly Earnings

Average hourly earnings are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late-shift work, and changes in output of workers paid on an incentive plan. Shifts in the volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time, while rates are the amounts stipulated for a given unit of work or time. The earnings series, however, does not measure the level of total labor costs on the part of the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings for those employees not covered under the production-worker, construction-worker, or nonsupervisory-employee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings, but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

Average Weekly Hours

The workweek information relates to the average hours for which pay was received, and is different from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect changes in the workweek of component industries.

Average Overtime Hours

The overtime hours represent that portion of the gross average weekly hours which were in excess of regular hours and for which premium payments were made. If an employee worked on a paid holiday at regular rates, receiving as total compensation his holiday pay plus straight-time pay for hours worked that day, no overtime hours would be reported.

Since overtime hours are premium hours by definition, gross weekly hours and overtime hours do not necessarily move in the same direction from month-to-month; for example, premiums may be paid for hours in excess of the straight-time workday although less than a full week is worked. Diverse trends at the industry-group level may also be caused by a marked change in gross hours for a component industry where little or no overtime was worked in both the previous and current months. In addition, such factors as stoppages, absenteeism, and labor turnover may not have the same influence on overtime hours as on gross hours.

Railroad Hours and Earnings

The figures for class I railroads (excluding switching and terminal companies) are based on monthly data summarized in the M-300 report of the Interstate Commerce Commission and relate to all employees who received pay during the month, except executives, officials, and staff assistants (ICC group I). Gross average hourly earnings are computed by dividing total compensation by total hours paid for. Average weekly hours are obtained by dividing the total number of hours paid for, reduced to

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

a weekly basis, by the number of employees, as defined above. Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings.

Spendable Average Weekly Earnings

Spendable average weekly earnings in current dollars are obtained by deducting estimated Federal social security and income taxes from gross weekly earnings. The amount of income tax liability depends on the number of dependents supported by the worker and his marital status, as well as on the level of his gross income. To reflect these variables, spendable earnings are computed for a worker with no dependents, and a married worker with three dependents. The computations are based on the gross average weekly earnings for all production or nonsupervisory workers in the industry division without regard to total family income.

"Real" earnings are computed by dividing the current Consumer Price Index into the earnings averages for the current month. The resulting level of earnings expressed in 1957-59 dollars is thus adjusted for changes in purchasing power since the base period.

Average Hourly Earnings Excluding Overtime

Average hourly earnings excluding premium overtime pay are computed by dividing the total production-worker payroll for the industry group by the sum of total production-worker man-hours and one-half of total overtime man-hours. Prior to January 1956, these data were based on the application of adjustment factors to gross average hourly earnings (as described in the *Monthly Labor Review*, May 1950, pp. 537-540). Both methods eliminate only the earnings due to overtime paid for at $1\frac{1}{2}$ times the straight-time rates. No adjustment is made for other premium payment provisions, such as holiday work, late-shift work, and overtime rates other than time and one-half.

Indexes of Aggregate Weekly Payrolls and Man-Hours

The indexes of aggregate weekly payrolls and man-hours are prepared by dividing the current month's aggregate by the monthly average for the 1957-59 period. The man-hour aggregates are the product of average weekly hours and production-worker employment, and the payroll aggregates are the product of gross average weekly earnings and production-worker employment.

Labor Turnover

Labor turnover is the gross movement of wage and salary workers into and out of employed status with respect to individual establishments. This movement, which relates to a calendar month, is divided into two broad types: *Accessions* (new hires and rehires) and *separations* (terminations of employment initiated by either employer or employee). Each type of action is cumulated for a calendar month and expressed as a rate per 100 employees. The data relate to all employees, whether full- or part-time, permanent or temporary, including executive, office, sales, other salaried personnel, and production workers. Transfers to another establishment of the company are included, beginning with January 1959.

Accessions are the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.

New hires are temporary or permanent additions to the employment roll of persons who have never before been employed in the establishment (except employees transferring from another establishment of the same company) or of former employees not recalled by the employer.

Other accessions, which are not published separately but are included in total accessions, are all additions to the employment roll which are not classified as new hires, including transfers from another establishment of the company.

Separations are terminations of employment during the calendar month and are classified according to cause: Quits, layoffs, and other separations, as defined below.

Quits are terminations of employment initiated by employees, failure to report after being hired, and unauthorized absences, if on the last day of the month the person has been absent more than 7 consecutive calendar days.

Layoffs are suspensions without pay lasting or expected to last more than 7 consecutive calendar days, initiated by the employer without prejudice to the worker.

Other separations, which are not published separately but are included in total separations, are terminations of employment because of discharge, permanent disability, death, retirement, transfers to another establishment of the company, and entrance into the Armed Forces for a period expected to last more than 30 consecutive calendar days.

Comparability With Employment Series

Month-to-month changes in total employment in manufacturing industries reflected by labor turnover rates are not comparable with the changes shown in the Bureau's employment series for the following reasons: (1) Accessions and separations are computed for the entire calendar month; the employment reports refer to the pay period which includes the 12th of the month; and (2) employees on strike are not counted as turnover actions although such employees are excluded from the employment estimates if the work stoppage extends through the report period.

ESTIMATING METHODS

The principal features of the procedure used to estimate employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of ratio estimation, (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of size and regional stratification.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

The "Link Relative" Technique

From a sample composed of establishments reporting for both the previous and current months, the ratio of current month employment to that of the previous month is computed. This is called a "link relative." The estimates of employment (all employees, including production and nonproduction workers together) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives." Other features of the general procedures are described later in the table on summary of computational methods. Further details are given in the technical notes on *Measurement of Employment, Hours, and Earnings in Nonagricultural Industries* and on *Measurement of Labor Turnover,* which are available upon request.

Size and Regional Stratification

A number of industries are stratified by size of establishment and/or by region, and the stratified production or nonsupervisory-worker data are used to weight the hours and earnings into broader industry groupings. Accordingly, the basic estimating cell for an employment, hours, or earnings series, as the term is used in the summary of computational methods, may be a whole industry or a size stratum, a region stratum, or a size stratum of a region within an industry.

Benchmark Adjustments

Employment estimates are periodically compared with comprehensive counts of employment which provide "benchmarks" for the various nonagricultural industries, and appropriate adjustments are made as indicated. The industry estimates are currently projected from March 1965 levels. Normally, benchmark adjustments are made annually.

The primary source of benchmark information is the employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These tabulations, covering about three-fourths of the total nonfarm employment in the United States, are prepared under the direction of the Bureau of Employment Security. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with new benchmark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one, and the new benchmark for each industry is then carried forward progressively to the current month by use of the sample trends. Thus, under this procedure, the benchmark is used to establish the level of employment, while the sample is used to measure the month-to-month changes in the level.

Data for all months since the last benchmark to which the series has been adjusted are therefore subject to revision. To provide users of the data with a convenient reference source for the revised data, the BLS publishes as soon as possible after each benchmark revision a summary volume of employment, hours, earnings, and labor turnover statistics.

THE SAMPLE

Design

The sampling plan used in the current employment statistics program is an optimum allocation design known as sampling proportionate to average size of establishment. The universe of establishments is stratified first by industry and then within each industry by size of establishment in terms of employment. For each industry the total size of sample is distributed among the size class cells on the basis of average employment per establishment in each cell. In practice, this is equivalent to distributing the predetermined total number of establishments required in the sample among the cells on the basis of the ratio of employment in each cell to total employment in the industry. Within each stratum the sample members are selected at random.

Under this type of design, large establishments fall into the sample with certainty. The size of the samples for the various industries is determined empirically on the basis of experience and of cost considerations. In a manufacturing industry in which a high proportion of total employment is concentrated in a relatively few establishments, a large percentage of total employment is included in the sample. Consequently, the sample design for such industries provides for a complete census of the larger establishments with only a few chosen from among the smaller establishments or none at all if the concentration of employment is great enough. On the other hand, in an industry in which a large proportion of total employment is in small establishments, the sample design calls for inclusion of all large establishments, and also for a substantial number of the smaller ones. Many industries in the trade and service divisions fall into this category. In order to keep the sample to a size which can be handled by available resources, it is necessary to accept samples in these divisions with a smaller proportion of universe employment than is the case for most manufacturing industries. Since individual establishments in these nonmanufacturing divisions generally show less fluctuation from regular cyclical or seasonal patterns than establishments in manufacturing industries, these smaller samples (in terms of employment) generally produce reliable estimates.

In the context of the BLS employment and labor turnover statistics programs, with their emphasis on producing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, the BLS is able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are mailed by respondents, and at a somewhat later date, statistics in considerably greater industrial detail. The tendency of such a sample to produce biased estimates of the level of earnings for certain industries is counteracted by the stratified estimating procedure described under "Estimating Methods."

Coverage

The BLS sample of establishment employment and payrolls is the largest monthly sampling operation in the field of social statistics. The table that follows shows the approximate proportion of total employment in each industry division covered by the group of establishments furnishing monthly employment data. The coverage for individual industries within the division may vary from the proportions shown.

Approximate size and coverage of BLS employment and payrolls sample, March 1965 [1]

Industry division	Employees	
	Number reported	Percent of total
Mining	287,000	46
Contract construction	620,000	22
Manufacturing	11,338,000	64
Transportation and public utilities:		
Railroad transportation (ICC)	697,000	96
Other transportation and public utilities	1,740,000	54
Wholesale and retail trade	2,403,000	20
Finance, insurance, and real estate	1,030,100	35
Service and miscellaneous	1,682,000	19
Government:		
Federal (Civil Service Commission) [2]	2,326,000	100
State and local	3,980,000	52

[1] Since a few establishments do not report payroll and man-hour information, hours and earnings estimates may be based on a slightly smaller sample than employment estimates.

[2] State and area estimates of Federal employment are based on reports from a sample of Federal establishments, collected through the BLS-State cooperative program.

The table that follows shows the approximate coverage, in terms of employment, of the labor turnover sample.

Approximate size and coverage of BLS labor turnover sample, March 1965

Industry	Employees	
	Number reported	Percent of total
Manufacturing	10,809,200	61
Metal mining	65,800	80
Coal mining	61,600	43
Communication:		
Telephone	579,200	80
Telegraph	21,600	68

Reliability of the Employment Estimates

The estimates derived from the establishment survey may differ from the figures that would have been obtained if it were possible to take a complete census using the same schedules and procedures. The relatively large size of the BLS establishment sample assures a very high degree of accuracy. Therefore, sampling variability as expressed in standard errors of the estimate is of little consequence particularly with respect to month-to-month changes. However, since the use of the link relative technique requires the use of the previous month's estimate as the base in computing the current month's estimate, small sampling and response errors may cumulate over several months. To remove this accumulated error, the estimates are adjusted to new benchmarks annually. In addition to the sampling and response errors, the benchmark revision adjusts the estimates for changes in the industrial classification of individual establishments (resulting from changes in their product which are not reflected in the levels of estimates until the data are adjusted to new benchmarks). In fact, at the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments. Another cause of differences, generally minor, arises from improvements in the quality of the benchmark data. (See section on benchmark data.)

The entire difference between the estimate and benchmarks is assumed to have accumulated at a regular rate. Accordingly, the all employee series, for months between the current and the last preceding benchmark, are adjusted by wedging or tapering out the difference back from the current benchmark to the last previous benchmark. The series for months subsequent to the benchmark month are revised by projecting the level of the new benchmark by the trend of the unadjusted series.

An approximation of the average standard deviation (based on the experience of the last several years) of differences between benchmarks and estimates, is presented in the following table. The chances are about 2 out of 3 that the revisions will be less than the amount indicated for each size of estimate. The chances are about 19 out of 20 that the revisions will be less than twice the amount indicated.

Federal Reserve Bank of St. Louis

Average Standard Deviation of Differences between Benchmarks and Estimates

Size of employment estimate:	Standard deviation[1]
50,000	2,000
100,000	2,500
200,000	4,000
500,000	7,500
1,000,000	12,000

[1]Assuming 12-month intervals between benchmark revisions.

Since these differences are established at the end of 12 monthly estimates it follows that the deviation between successive months during the year is much smaller or approximately 1/12 of the amount indicated. The importance of the current adherence to annual benchmark adjustments thus becomes evident - if a longer period between benchmarks were tolerated the error could be expected to become larger.

A comparison of the actual amounts of revisions made in the last three benchmark years follows:

Nonagricultural payroll employment estimates, by industry division, as a percentage of the benchmark for recent years

Industry division	1963	1964	1965
Total	101.0	100.0	99.5
Mining	100.3	100.0	99.5
Contract construction	101.5	101.5	100.9
Manufacturing	100.1	100.2	99.8
Transportation and public utilities	100.0	100.4	100.1
Wholesale and retail trade	100.6	100.4	99.4
Finance, insurance, and real estate	99.8	99.4	100.7
Service and miscellaneous	100.8	99.7	97.9
Government	103.8	99.0	99.8

SEASONAL ADJUSTMENT

Many economic statistics reflect a regularly recurring seasonal movement which can be estimated on the basis of past experience. By eliminating that part of the change which can be ascribed to usual seasonal variation, it is possible to observe the cyclical and other nonseasonal movements in the series. However, in evaluating deviations from the seasonal pattern--that is, changes in a seasonally adjusted series--it is important to note that seasonal adjustment is merely an approximation based on past experience. Seasonally adjusted estimates have a broader margin of possible error than the original data on which they are based, since they are subject not only to sampling and other errors but, in addition, are affected by the uncertainties of the seasonal adjustment process itself. Seasonally adjusted series for establishment data are published regularly in *Employment and Earnings and Monthly Report on the Labor Force.*

The seasonal adjustment method used for these series is an adaptation of the standard ratio-to-moving average method, with a provision for "moving" adjustment factors to take account of changing seasonal patterns. A detailed description of the method is given in the booklet, *The BLS Seasonal Factor Method* (1966), which may be obtained from the Bureau on request. An earlier version of the method is described in appendix G of the 1962 Report of the President's Committee to Appraise Employment and Unemployment Statistics, *Measuring Employment and Unemployment.*

For establishment data, the seasonally adjusted series on weekly hours and labor turnover rates for industry groupings are computed by applying factors directly to the corresponding unadjusted series, but seasonally adjusted employment totals for all employees and production workers by industry divisions are obtained by summing the seasonally adjusted data which are published for component industries. The factors currently in use are available upon request.

The seasonally adjusted data for Federal Government are based on a series which excludes the Christmas temporary help employed by the Post Office Department in December. The employment of these workers constitutes the only significant seasonal change in Federal Government employment during the winter months and the precise number of such workers employed in any year is shown in this bulletin. Furthermore, the volume of such employment may change substantially from year to year because of administrative decisions by the Post Office Department. Hence, it was considered desirable to exclude this group from the data upon which the seasonally adjusted series is based.

COMPARABILITY OF DATA WITH OTHER SERIES

Current Population Survey

Data based on household interviews are obtained from a sample survey of the population. The survey is conducted each month by the Bureau of the Census for the Bureau of Labor Statistics and provides a comprehensive measure of the labor force, i.e., the total number of persons 14 years of age and over who are employed or unemployed. It also provides data on their personal and economic characteristics such as age, sex, color, marital status, occupations, hours of work, and duration of unemployment. The information is collected by trained interviewers from a sample of about 35,000 households throughout the country and is based on the activity or status reported for the calendar week including the 12th of the month. These data are published monthly in *Employment and Earnings and Monthly Report on the Labor Force.*

Data from payroll reports and household interviews

Federal Reserve Bank of St. Louis

differ from each other because of differences in definition and coverage, sources of information, methods of collection, and estimating procedures. Sampling variability and response errors are additional reasons for discrepancies. The factors which have a differential effect on levels and trends of the two series are described as follows:

Employment

Coverage. The household survey definition of employment comprises wage and salary workers (including domestics and other private household workers), self-employed persons, and unpaid workers who worked 15 hours or more during the survey week in family-operated enterprises. Employment in both farm and nonfarm industries is included. The payroll survey covers only wage and salary employees on the payrolls of nonfarm establishments.

Multiple jobholding. The household approach provides information on the work status of the population without duplication since each person is classified as employed, unemployed, or not in the labor force. Employed persons holding more than one job are counted only once, and are classified according to the job at which they worked the greatest number of hours during the survey week. In the figures based on establishment records, persons who worked in more than one establishment during the reporting period are counted each time their names appear on payrolls.

Unpaid absences from jobs. The household survey includes among the employed all persons who had jobs but were not at work during the survey week--that is, were not working or looking for work but had jobs from which they were temporarily absent because of illness, bad weather, vacation, labor-management dispute, or because they were taking time off for various other reasons, even if they were not paid by their employers for the time off. In the figures based on payroll reports, persons on leave, paid for by the company are included, but not those on leave without pay for the entire payroll period.

Hours of Work

The household survey measures hours actually worked, whereas the payroll survey measures hours paid for by employers. In the household survey data, all persons with a job but not at work are excluded from the hours distributions and the computations of average hours. In the payroll survey, employees on paid vacation, paid holiday, or paid sick leave are included and assigned the number of hours for which they were paid during the reporting period.

County Business Patterns

Data in *County Business Patterns,* published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units. Differences may also arise because of industrial classification and reporting practices. In addition, CBP excludes interstate railroads and government, and coverage is incomplete for some of the nonprofit activities.

Employment Covered by State Unemployment Insurance Programs

Not all nonfarm wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 32 States. In general, these are establishments with less than four employees.

Statistics on Manufactures and Business, Bureau of the Census

BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different treatment of business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns by multiunit companies. There are also differences in the scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in BLS statistics.

Summary of Methods for Computing Industry Statistics

on Employment, Hours, Earnings, and Labor Turnover

Item	Basic estimating cells (industry, region, size, or region/size cell)	Aggregate industry levels (divisions, groups and, where stratified, individual cells)
	Monthly Data	
All employees	All-employee estimate for previous month multiplied by ratio of all employees in current month to all employees in previous month, for sample establishments which reported for both months.	Sum of all-employee estimates for component cells.
Production or nonsupervisory workers; women employees.	All-employee estimate for current month multiplied by (1) ratio of production or nonsupervisory workers to all employees in sample establishments for current month, (2) ratio of women to all employees.	Sum of production- or nonsupervisory-worker estimates, or estimates of women employees, for component cells.
Gross average weekly hours	Production- or nonsupervisory-worker man-hours divided by number of production or nonsupervisory workers.	Average, weighted by production- or nonsupervisory-worker employment, of the average weekly hours for component cells.
Average weekly overtime hours	Production-worker overtime man-hours divided by number of production workers.	Average, weighted by production-worker employment, of the average weekly overtime hours for component cells.
Gross average hourly earnings	Total production- or nonsupervisory-worker payroll divided by total production- or nonsupervisory-worker man-hours.	Average, weighted by aggregate man-hours, of the average hourly earnings for component cells.
Gross average weekly earnings	Product of gross average weekly hours and average hourly earnings.	Product of gross average weekly hours and average hourly earnings.
Labor turnover rates (total, men, and women).	The number of particular actions (e.g., quits) in reporting firms divided by total employment in those firms. The result is multiplied by 100. For men (or women), the number of men (women) who quit is divided by the total number of men (women) employed.	Average, weighted by employment, of the rates for component cells.
	Annual Average Data	
All employees and production or nonsupervisory workers.	Sum of monthly estimates divided by 12.	Sum of monthly estimates divided by 12.
Gross average weekly hours	Annual total of aggregate man-hours (production- or nonsupervisory-worker employment multiplied by average weekly hours) divided by annual sum of employment.	Annual total of aggregate man-hours for production or nonsupervisory workers divided by annual sum of employment for these workers.
Average weekly overtime hours	Annual total of aggregate overtime man-hours (production-worker employment multiplied by average weekly overtime hours) divided by annual sum of employment.	Annual total of aggregate overtime man-hours for production workers divided by annual sum of employment for these workers.
Gross average hourly earnings	Annual total of aggregate payrolls (production- or nonsupervisory-worker employment multiplied by weekly earnings) divided by annual aggregate man-hours.	Annual total of aggregate payrolls divided by annual aggregate man-hours.
Gross average weekly earnings	Product of gross average weekly hours and average hourly earnings.	Product of gross average weekly hours and average hourly earnings.
Labor turnover rates	Sum of monthly rates divided by 12.	Sum of monthly rates divided by 12.
