Preface

This bulletin presents an analysis of the trend of retail prices for the 6-year period 1953-58, tables of indexes and related data for these and earlier years, and a description of the 1952 revision of the Consumer Price Index. Bulletin 1165 covered the years 1949-52. In 1953, the Consumer Price Index was rebased from 1935-39=100 to 1947-49=100, and indexes for earlier years were converted to the new base to provide historically comparable data. This bulletin presents tables of indexes on the new base not only for the years under study (1953-58), but also for previous years.

A number of new index groupings were established at the time of the 1952 revision and subsequently. Data for these newly constructed groups are summarized in the tabular summary.

The bulletin was prepared by members of the staff of the Bureau's Division of Prices and Cost of Living, under the general direction of Allan D. Searle, Acting Chief, Index Methodology and Reporting Branch. Preparation of the bulletin was the responsibility of Joseph H. Freeman, assisted by Carlyle P. Stallings, Elizabeth P. Deutermann, and Charles H. Lewis.

CONSUMER PRICES IN THE UNITED STATES, 1953-58

Price Trends

Background 1/

In the 12 years preceding 1953, the United States was engaged in World War II and the Korean conflict and, as a result, experienced several periods of severe price inflation. Between 1940 and 1952, annual average consumer prices rose nearly 90 percent (chart 1).

As the United States increased its armed strength and later became involved in World War II, consumer prices climbed rapidly upward. From spring (March) 1941 through May 1943, the Consumer Price Index advanced 24 percent. However, toward the latter part of this period, the Government's economic stabilization program began to take effect and the rate of advance was retarded. Because of the success of the stabilization program, the period from May 1943 to June 1946 was one of relatively moderate price advance. After July 1946, however, controls were removed and prices soared, rising at the sharpest rate ever measured by the CPI. Largely responsible for this rise was the pent-up demand for consumer goods growing out of wartime shortages, supported by the increase in incomes and purchasing power generated by Government war expenditures. This postwar price advance lifted the CPI level more than 30 percent in a little over 2 years (June 1946-August 1948).

The inflation was temporarily halted by the recession of late 1948-49. More plentiful supplies and more cautious consumer buying helped check the price rise. As in the previous recession (1937-38) 2/, however, the CPI declined only moderately. Between the September 1948 index peak and February 1950, the subsequent low for this period, consumer prices in general fell 4 percent, primarily because of price decreases of 9 and 8 percent for food and apparel, respectively. Price movements were mixed, however; partially offsetting these declines was a steady increase in the costs of the services, including rent, which responded promptly to the relaxation of wartime rent controls.

With the outbreak of the Korean conflict in June 1950, prices moved quickly upward with all groups of goods and services joining in the rise. Between June 1950 and February 1951, the CPI advanced 8 percent or at a rate of 1 percent per month. After February 1951, the effects of the General Ceiling Price Regulation (GCPR) of January 25, 1951, placing controls over most prices, began to be felt and, from February through December 1951, the rate of advance was slowed, prices rising about 3 percent or 0.3 percent per month.

The year 1952 was one of comparative price stability. With the immediate crisis past by early 1952, it was possible to relax price controls gradually. Despite the loosening of controls, the index rose less than 1 percent over the year, December 1951-December 1952.

The Economy and Prices: 1953-58

During the years 1953 through 1958, America experienced a peacetime economic expansion, twice interrupted by recessions--once in 1953-54 and again in 1957-58. Over the entire 6-year period (December 1952-December 1958), the CPI rose 8.4 percent. During the first 3 years, there was almost complete price stability, but during the last 3-year period there was a renewed price rise. Between December 1952 and December 1955, the index advanced only 0.5 percent. From December 1955 to December 1958, however, it rose 7.8 percent.

Federal Reserve Bank of St. Louis

In July 1953, the Korean truce was signed and with it came a sharp reduction in defense expenditures. July 1953 marked the peak of the Korean period business cycle 3/ and immediately thereafter the "adjustment" or "recession" of 1953-54 ensued.

As in the short recessions of 1937-38 and 1948-49, during the 1953-54 economic downturn, industrial production declined sharply (about 10 percent) but no such sharp decline was evident in the general level of consumer prices. 4/ Food prices weakened noticeably in late 1954 and during 1955, but the rest of the index was quite firm throughout the whole period. One of the principal factors responsible for the seeming insensitivity of the overall index to the 1953-54 downturn was the uninterrupted rise in the prices of services.

During 1955, consumer prices demonstrated their insensitivity and tendency to lag on the "upturn" just as on the "downturn," during sudden changes in economic cycles. The Federal Reserve Board index of industrial production climbed steadily in the fall of 1954, reaching its former (July 1953) peak by the spring of 1955, and then continued upward to establish further highs in the fall of 1955. The CPI, however, rose only 0.3 percent from December 1954-December 1955. In the face of steady increases in the price of services (up 2 percent over the year), it was primarily the drop in food prices that held the total index virtually stable. Price declines for durables, e.g., automobiles, appliances—which were becoming increasingly subject to discounting—also contributed toward this stability.

The year 1956 saw the end of the relatively long period of price stability that began in 1952. The Consumer Price Index declined 0.1 percent in January of 1956 and held even in February, but during the last 10 months of the year it rose 3 percent. Only in August of that year when food prices dropped sharply from their seasonal peak, was the rise interrupted. The 0.2-percent drop in August was to be the last decline in the CPI for the next 2 years.

The renewed vigor of the climb in consumer prices in 1956 was, to a large extent, based upon two price developments: First, food prices, which in February 1956 had reached their lowest point since December 1950, moved rapidly upward; and second, the prices of durable commodities, which had been declining since 1952, held relatively firm during most of 1956 and then registered their usual fall spurt with the introduction of higher priced, new-model cars in October. The relative firmness in durables in 1956, before the seasonal spurt, was in part due to a steadying in appliance prices. These factors added to the continuing increases in the cost of services, upset the balance that had been responsible for the stability in the CPI over the preceding years, and initiated a rise that continued through July 1958 despite the occurrence of the recession of 1957-58. Services and food played a dominant role in the continuing climb of the CPI through 1957 and the spring of 1958.

August 1957 marked the peak of another business cycle. The economy then turned downward and the recession of 1957-58 followed. In the 6 months from October 1957 to April 1958, unemployment nearly doubled, and the Federal Reserve Board index of industrial production fell more than 10 percent. In April, the seasonally adjusted rate of unemployment stood at 7.5 percent of the civilian labor force, the highest rate in the postwar period. Yet in these 6 months, the CPI rose 2 percent. 5/ Although as already mentioned in the discussion of prior recessions, consumer prices normally lag and are little affected by short-run cyclical changes, regardless of intensity, there was a significant difference this time. During the previous periods of economic decline, any weakness in prices tended to be most evident in the food category. During the 1957-58 downturn, the food component played a major role in forcing the index upward in the face of the business decline. This reversal of the usual pattern was due primarily to two distinct causes: First, the effects

of abnormally bad weather during the winter of 1957-58, which destroyed much of the fresh fruit and vegetable crops and hence forced prices of these items upward; and second, longer range factors which encouraged withholding of cattle and hogs from market and thus pushed up meat prices. 6/ Contributing to the rise in the index was the upward pressure of these food prices during this period coupled with the continued climb of the services group.

The CPI reached an all-time high (123.9) in July of 1958. Then in August as the result of a sharp drop in food prices, the index registered its first decrease since August 1956, dropping 0.2 percent. For the next 2 months (September and October), prices on the average remained unchanged due to the effect of further declines in the foods group offsetting increases in other components. In November, prices rose 0.2 percent to equal the July high, because of the seasonal effect of the introduction of higher priced, new-model automobiles. But at the year's end, December 1958, the CPI dropped back 0.2 percent as the result of a further decline in food and minor decreases in several other groups.

Over the second half of 1958 (since June), consumer prices registered no net change; temporarily, a new price stability had been established.

Special Groups: 1953-58

The "all items" CPI is subdivided according to two systems: (1) commodities versus services, i.e., the so-called "special groups," and (2) specific end use, i.e., the so-called "major groups" (food, housing, apparel, etc.). In the special groups, the two broad categories, commodities and services, are further divided into such subcategories as nondurable commodities, nondurable commodities less food, durable commodities, etc.; services are divided into household operation services, transportation services, medical care services, etc. 7/

The special groups originated out of the need for groupings of CPI items that could be more readily related to trends of other economic indicators, e.g., wholesale or primary-market prices, the Department of Commerce's general business indicators, the Federal Reserve Board index of industrial production, etc. Price movements among the principal special groups are shown in chart 1, which plots the movement of selected special group indexes from the year 1935 (the first year for which such indexes are available) forward.

The most significant movements among the special groups over the years 1953-58 were the strong, steady rise of prices in the services category and the weakness of durable commodities. During the previously described periods of wartime and immediate postwar inflation, services, though moving upward, did not register increases of the amplitude recorded for commodities--between 1940 and 1952, services rose 48 percent as against an increase of 114 percent for commodities. However, in the 6 years, December 1952 through December 1958, while commodities were rising only 4 percent, the cost of consumer services rose 18 percent. In this same 6-year period, prices of durable commodities fell 1 percent.

All major components of the services group contributed to its sustained upward movement. Over the period December 1952 through December 1958, rents, which had already been partially freed from controls prior to 1953 and which were almost completely decontrolled after the summer of 1953, rose 15 percent. Transportation services advanced 23 percent, led by a 32-percent increase in public transportation (mostly local transit fares). Medical care services increased 25 percent with all its component elements contributing, i.e., professional services (doctor, dentist, optometrist, etc.), hospital rates, and group hospitalization insurance. These individual items along with others are discussed in more detail in the following sections of the bulletin.

6/ For more detail see section on Foods, p. 5.
7/ Indexes for "special groups" from 1935 to 1958 are shown in the tabular summary, tables B-4 and B-5.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

The almost uninterrupted rise in the services group (it advanced every month during the 6-year period except for March 1956 when it dropped 0.1 percent, and June and September 1958 when it held even) was in large part responsible for the insensitivity of the CPI to the two economic recessions that took place during the 6 years. Because many services are strongly influenced by custom (e.g., various professional and personal care services) and a number of others are specifically regulated by public authority (e.g., gas and electricity, public transportation, telephone, postage, etc.), they are not readily affected by short-run changes in the economy.

Durable commodity prices declined about 1 percent over the 6 years, December 1952-December 1958. During the first 3 years, December 1952-December 1955, they fell almost 8 percent and were one of the factors which helped offset the increase in service prices, thus contributing to the stability of the overall index during those years. The story of the decline in durables prices centers primarily around the drop in automobile prices during the years 1953 through 1955, and the decrease in appliance prices during most of the 6-year period ending December 1958. This story--involving consideration of the application of discounting techniques in the sale of new automobiles and the emergence of the so-called "discount house" in appliance merchandising--is discussed in later sections dealing with these specific items.

The nondurables less food group encompassed such a diversity of price movements among its various items during the years 1953-58 that their story is best told in the discussion of individual "items" in the sections that follow. Food is in itself a major group and is analyzed separately in detail.

Major Groups of Goods and Services: 1953-58

Retail Prices of Food. Retail prices of food moved upward between December 1952 and December 1958 but exhibited marked seasonal price fluctuations. In December 1958, they averaged 4.3 percent higher than in December 1952, and 1.8 percent above the post-Korean peak reached in August 1952. By July 1958, they had reached a new peak 4.4 percent above August 1952. However, between July and December 1958, food prices fell 2.5 percent. The trend of food prices was slightly downward during 1953, 1954, and 1955, and along with the decline in the prices of durable commodities, helped partially to offset the upward pressure of rising service costs on the overall index during these 3 years. During 1956, 1957, and 1958, however, the trend was upward. Prices of food as a whole reached their lowest point for this period in February 1956 (6.7 percent below August 1952) and then began a fairly steady rise.

The following tabulation gives percent changes for food and its major components for selected periods:

Group	Aug. 1952 to Dec. 1958	Aug. 1952 to Feb. 1956	Feb. 1956 to July 1958	Dec. 1952 to Dec. 1958
Total food	+ 1.8	- 6.7	+ 11.9	+ 4.3
Food at home	+ 0.2	- 8.1	+ 12.5	+ 2.6
Cereals and bakery products	+ 14.0	+ 5.8	+ 6.9	+ 13.8
Meats, poultry, and fish	- 5.4	- 21.6	+ 27.4	0
Dairy products	+ 3.0	- 3.3	+ 4.8	+ 1.4
Fruits and vegetables	+ 1.2	- 4.5	+ 16.4	+ 3.7
Other foods at home	- 2.1	- 3.1	+ 2.0	+ 0.1

Meats, Poultry, and Fish. Average prices of meats, poultry, and fish declined sharply from their August 1952 peak (19.4 percent above the 1947-49 average) to a level 22 percent lower by March 1956, and then rose markedly during 1956, 1957, and the first 7 months of 1958. By July 1958, they were back up to 19.2 percent above the 1947-49 average

and only 0.2 percent below the August 1952 peak. From July to December 1958, however, they dropped 5.2 percent and thus, at the year's end, the meat, poultry, and fish index was 5.4 percent below the August 1952 peak and at exactly the same level (113.0) as it was in December 1952.

The behavior of prices was different for beef and veal, pork, and poultry. Beef and veal had quite sharp and contrasting upward and downward movements, while poultry moved rather steadily downward. At the beginning of 1953, beef and veal prices were declining rapidly from 1951 levels, which were more than 30 percent above the 1947-49 average. Record production caused prices to continue steadily downward through March 1956, but, as farmers cut down on their herds in response to the low prices, the number of cattle available for market decreased. Because of the resultant short supplies, prices turned up sharply, rising more than 36 percent from March 1956 to June 1958. From the June 1958 peak, beef and veal prices fell for 3 months and then rose during the last 3 months of the year; at the end of 1958, they were 1.3 percent below the June level.

Pork prices, in contrast, began a substantial rise in 1953 in response to decreased production, reaching a peak in May 1954 of 22 percent above the 1947-49 average, at a time when beef and veal prices were below the 1947-49 base. As production increased under the encouragement of large supplies and low prices of corn for feed, pork prices dropped sharply. By December 1955, they were 29 percent below the May 1954 peak. They turned up in 1956 and 1957 and rose sharply in 1958 through July. However, during the last 5 months of 1958, pork prices dropped 9.4 percent.

Poultry prices responded to record supplies resulting from the rapid growth of the commercial broiler industry, declining more than 30 percent from December 1952 to December 1957. In the first half of 1958, poultry prices turned up despite record supplies because of demand for poultry as a substitute for high priced red meats. In the last half of the year, however, these record supplies made themselves felt and poultry prices declined in every month except one.

Fruits and Vegetables. Fruits and vegetables, as usual, exhibited sharp upward and downward price fluctuations depending upon the availability of supplies. During 1953, 1954, and 1955, price changes were generally seasonal in character, but unfavorable weather caused shortages in 1956 and again in 1958 and unusually sharp price rises occurred. Average prices were up 3.7 percent from December 1952 to December 1958.

Prices of fresh fruits and vegetables during 1953-55 averaged somewhat below 1952, reaching summer peaks each year about 20 percent above the 1947-49 base. In July 1956 and July 1957, they reached peaks considerably higher, while freezing weather in Florida in December 1957 brought especially sharp price rises and seasonal peaks occurred several months early in 1958.

The precipitate drop in the price of potatoes from $1.31 for 15 pounds in July 1952 to 64½ cents in March 1954 was one of the major influences in the 1953 decline. With adverse weather in growing areas, potatoes jumped to a level in May 1955 almost as high as in July 1952, and to $1.74 for 15 pounds in July 1956, the highest price on record.

Prices of other fresh fruits and vegetables responded to varying supplies. Tomato prices jumped 29 percent in the month of March 1956 to an average of 42 cents a pound, dropped to less than 17 cents in September 1956, and reached 46 cents a pound in April 1958. Green beans were very high priced and unavailable in many stores in early 1958 as a result of damage to the Florida crop.

Apples rose to a peak level of 23 cents a pound in 1957. Oranges were unusually high priced in 1958 because of the serious damage to the Florida crop. In July 1958, they sold at 80 cents a dozen and reached 87 cents a dozen in September and October before dropping off. Peaches were scarce in 1955 because of virtual destruction of that year's southeastern crop. In July 1955, they averaged 31 cents a pound compared to only 17 cents

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

in July 1958, due to a good crop in the latter year.

Processed fruits and vegetables exhibit less marked price fluctuations than the fresh items. They decreased slightly during 1953-54 in response to large packs, began a steady rise in early 1955 which lasted well into 1956, and then turned down until mid-1957. In 1958, prices of frozen orange juice rose markedly as a result of persistently strong demand in the face of shortages of fresh oranges, reaching 29 cents for a 6-ounce can. Canned orange juice also increased in price but by a smaller amount. In December 1958, frozen fruits and vegetables averaged 22 percent above December 1952, and canned fruits and vegetables, 10 percent.

Dairy Products. Dairy products dropped 8.7 percent in price from December 1952 to June 1954, with a sharp drop in early April 1954 as a result of the reduction in support prices from 90 to 75 percent of parity, and the increase in production. Prices rose in subsequent years, partly as a result of Government efforts. In December 1958, prices averaged 11.1 percent above June 1954.

Cereals and Bakery Products. Unlike other food groups, cereals and bakery products moved upward in price by small amounts but rather steadily, from December 1952 to December 1958. The total increase over the period was 13.8 percent. The steady rise was largely the result of higher manufacturing and operating costs.

Other Foods at Home. The other foods at home group, which includes coffee and other beverages, fats and oils, sugar and sweets, eggs, and other miscellaneous foods, showed fairly sharp price fluctuations over the period due to changes in the prices of eggs, but relatively little distinct trend. From December 1952 to December 1958, average prices rose only 0.1 percent.

Egg prices dropped sharply during 1954 as a result of abundant supplies. Egg production in 1954 was nearly double that of 1935-39, reflecting developments in nutrition and methods of raising poultry, and rose to even higher levels in following years. In January 1955, prices averaged only 52 cents a dozen, and in June 1957, 48 cents a dozen. By June 1958, the low point for the year, prices had increased somewhat to 55 cents a dozen.

From an average price of 87 cents a pound for bag and can coffee combined in December 1952, prices rose sharply to an all-time high of $1.23 a pound in August 1954 because of frosts and drought in Brazil. As a result, consumers shifted to instant coffee, tea, and other substitutes, and prices declined, by June 1955, to an average of 89 cents or a little less than $1 a pound for vacuum pack coffee. Greatly increased planting of trees was reflected in price decreases beginning in the second half of 1957 and by December 1958, coffee prices had declined below the December 1952 level.

Housing. The CPI housing group includes residential rents and all items of expense connected with the acquisition and operation of a home. Subgroups of this index are rent, other shelter costs, gas and electricity, solid fuels and fuel oils, housefurnishings, and household operation. Due to the comprehensive nature of the housing group, which encompasses a variety of durable and nondurable commodities and services, there are often important differences in price movements within the group.

Two-thirds of the items included in housing costs in the CPI are consumer services, such as rent, charges involved in purchasing a home, and home maintenance and repair items. Their steady upward trend was largely responsible for the 10-percent increase in total housing costs during the 6 years, December 1952 through December 1958. Housing costs to the consumer rose 2.1 percent in 1953 (December to December) but increased less than 1 percent per year in 1954 and 1955. The climb accelerated in 1956, and the following year, and leveled again through 1958.

Underlying the sharp increase in housing costs in the beginning of the 6-year period was the rise in residential rents, as Federal wartime controls were completely lifted in July 1953 and rapid local decontrol followed. The increase in rents between December

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

1952 and December 1953 was equal to more than one-third (38 percent) of the 14.9-percent increase which occurred over the entire 6-year period. The 5.7-percent advance in rents between December 1952 and December 1953 was followed by an average annual (December to December) increase of 1.7 percent in the next 5 years.

On a national average, the cost of buying a home rose moderately during the 1953-58 period, although about a third of the index cities reported lower costs. For the Nation as a whole, the 6-year (December 1952-December 1958) increase in mortgage interest rates was about 14 percent, and a very large part of this occurred between mid-1956 and mid-1957, in response to a tighter Government credit policy.

Homeowners' maintenance and repair expenses climbed a total of 17 percent over the 6 years, December 1952 to December 1958. The services associated with maintenance and repair, such as repainting, refinishing floors, and reshingling roofs, advanced more than twice as much as did the prices of commodities used in maintaining and repairing a house (house paint, porch flooring, water heaters, kitchen sinks, and faucets).

From December 1952 to December 1958, the family bill for gas and electricity rose 11.9 percent. The gas increase, however, was five times larger than that of electricity, 20 percent and 4 percent, respectively. Although prices of home fuels naturally vary with the seasons, the trend has been upward. Coal prices were higher, with bituminous rising considerably more than anthracite. The fuel oil price increase, a total 13.5 percent over the period, was precipitated by the Suez crisis in the summer of 1956.

In contrast to most housing expenses, prices of housefurnishings were lower in December 1958 than in December 1952, by 4.3 percent. They were relatively stable during 1953 but declined steadily in the next 2 years with intensified competition and price cutting in the retail appliance market. Prices steadied in 1956 and 1957 and again drifted lower in 1958.

The price fluctuations of individual housefurnishings items were varied. The major cause of the general decline was the drop in appliance prices (15 percent) over the 6-year period, December 1952 through December 1958. This trend was due primarily to the radical change in retail merchandising of appliances. Discount houses made inroads into the market and competition for customers became severe. Regular outlets that did not give reductions from list prices were caught, at first, between the discount houses and the need to maintain their prices under so-called "fair trade" statutes. From 1955 to 1957, manufacturers gradually dropped fair trade pricing and discount competition intensified. Appliance prices steadied somewhat during the latter part of 1956 and in 1957, but fell again during the first half of 1958.

The furniture and bedding index decreased 0.3 percent from December 1952 to December 1958. Prices for these items declined 3 percent from December 1952 to June 1955 and showed a subsequent increase of 4.3 percent from March 1956 to June 1957, partially in response to higher labor and material costs (especially steel), and freight rates. The pressures of consumer demand arising during the general boom in the sales of household durables also were partly responsible for the price increases during this period.

Until 1955, textile housefurnishing prices fell from peaks reached during the Korean conflict, led by a 19-percent drop in sheet prices between the end of 1952 and September 1955. Textile items strengthened slightly the next year and remained fairly steady through 1958. Floor coverings rose in price through 1957 as material and other costs increased, though prices in 1958 were reduced.

Apparel. By December 1952, apparel prices had declined 3.8 percent from the high point in the fall of 1951 during the Korean conflict. Only relatively small changes in prices occurred during the following 6 years. There was a downward drift in prices for about 2½ years, except for the usual fall increases. This slow downtrend was reversed in the fall of 1955 and by October 1956, apparel prices were 2.1 percent higher than in

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

October of the preceding year. Some lesser increases occurred during 1957 but in 1958 apparel prices were almost stable (except for seasonal influences), primarily due to an adequate supply of clothing and limited increases in manufacturing costs. Over the 6-year period from December 1952 to December 1958, the average increase for apparel was 2.3 percent, the smallest increase shown for any of the major groups.

Among the apparel subgroups, the only significant departures from this general trend were for prices of footwear and of apparel made of rayon or other manmade fibers.

Footwear prices, after declining 4.6 percent from a high point in October of 1951 to a low in January 1953, edged up slowly until the fall of 1955. From September 1955 to December 1956, prices rose 7.0 percent, reflecting higher wholesale prices for leather and higher operating costs. During the next 2 years, the rate of increase was considerably slower. In December 1958, footwear prices were 3.2 percent higher than in December 1956, for a total increase over 6 years (December to December) of 14 percent.

In contrast to footwear, prices for apparel made of rayon and other manmade fibers declined slowly but almost continuously over the 6 years from December 1952 to December 1958, aside from some fluctuation due to seasonal factors. Although most of these commodities participated in the decline for a large part of the time and were lower in December 1958 than in December 1952, the major factor was the persistently lower prices for nylon hosiery. By the end of 1958, nylon hose prices were 15 percent lower than 6 years earlier. In addition, rayon and nylon slips and nightgowns had only small price increases during the upturn in 1955 and then remained stable or were further reduced. Since women's and girls' apparel of manmade fibers are more important in the index than similar apparel for men and boys, the lowered prices for these articles was the main reason for a small decrease for women's and girls' apparel for the 6-year period. All men's and boys' apparel increased 0.9 percent, and all women's and girls' decreased 0.2 percent from December 1952 to December 1958.

Prices of wool and cotton apparel went down slowly during 1953 and 1954. Both classes then showed general increases of moderate amounts until 1958, when some decreases were reported. From December 1952 to December 1958, the increase for wool garments amounted to 2.6 percent and for cotton apparel, 3.9 percent.

Transportation. The transportation group includes both public and private transportation. Public transportation is comprised of city bus, streetcar, and subway fares, and railroad coach fares. Private transportation includes prices paid for new and used cars, gasoline and motor oil, tires, automobile repairs, insurance, and registration fees.

The overall transportation index remained relatively stable from 1952 to mid-1956 and then moved firmly upward to the end of 1958. Over the 6 years from December 1952 to December 1958, the cost of public transportation increased about 32 percent, while the price of private transportation rose a little more than 9 percent.

The advances in local transit and railroad fares resulted from a combination of increased operating costs and a decline in patronage. Nationwide population movements to suburbs and a concomitant preference for private transportation caused a decline in the use of existing methods of service so that companies were unable to sustain profitable operations without substantial fare increases.

Within the private transportation subgroup, dealers' selling prices of new cars averaged 13.5 percent higher in December 1958 than in December 1952. (See chart 3.) This price increase did not reflect higher prices resulting from voluntary quality upgrading by consumers, such as the increasing preference for 8-cylinder cars, automatic transmissions, etc. It did, though, reflect price increases attributable to the introduction of certain design and styling features, such as wider windshields, increased use of chrome, etc.

Federal Reserve Bank of St. Louis

Each fall, as new model cars were brought on to the market, the new car index registered a seasonal increase. Then as the model year progressed, dealers tended to grant price concessions. Reported prices after June 1954 reflected the growing practice of larger price concessions as the model year progressed.

In the 6-year period (December 1952-December 1958), the volume of new car purchases moved inversely to price. Sales of new automobiles rose steadily to a record high in 1955, a year in which production reached a peak of 8 million cars. However, prices of new automobiles declined 2.8 percent between December 1952 and December 1955. In 1956, though, purchases were not quite as great as in the year before. Demand also dropped sharply in the winter of 1957-58. As of December 1958, however, prices of new cars were 16.7 percent higher than in December of 1955.

Used car prices first appeared in the revised index in January 1953. They declined sharply until March 1956 when prices were a little more than 30 percent below the January 1953 level. This drop occurred as automobile ownership grew from an average of slightly less than one car per household in 1952 to 1.12 in 1957, 8/ and was indicative of a growing consumer preference for new rather than used cars. From the summer of 1956 to autumn 1957, prices strengthened, declined in the disappointing market of the following winter, and resumed their climb at a more rapid rate to the end of 1958. At this point, used car prices were still 10 percent below their level at the beginning of 1953.

Rising labor and other operating costs were mainly responsible for the 21.4-percent increase in automobile repair charges over the 6-year period (December 1952-December 1958). A small rise in prices of tires despite a much larger increase in wholesale prices was due to an extremely competitive market to which retailers responded with trade-in allowances, "sale" prices, and discounts from list prices. Auto insurance rates increased moderately until 1958, when the rising cost of claims precipitated a 10-percent rate increase in the first quarter (from December 1957 to March 1958). Registration fees averaged 18.9 percent higher in 1958 than in 1953, with States increasing their charges as new cars became heavier and more powerful.

Gasoline and motor oil, the most important of the automobile operating expenses, were both considerably higher in December 1958 than they were 6 years earlier. Oil prices were persistently strong but the gasoline prices moved erratically as a result of tax changes and political disturbances in the Middle East. The Federal gasoline tax of July 1, 1956, raised average prices more than 3 percent and State increases were comparable. When the Suez Canal closed in November of 1956, American producers geared production to satisfy probable European requirements. Then when the Canal opened sooner than expected, stocks were overexpanded. Also at that time, there occurred a reduction in the growth rate of U.S. consumption. As a result, price wars flared in many areas of the country as operators tried to move their stocks.

Medical Care. In the 6 years, December 1952 to December 1958, the medical care index increased 23.5 percent. During this period, all of the medical care items rose, although the degree of price movement varied widely. In December 1958, group hospitalization premiums, reflecting the advance in hospital rates, were higher by 49.1 percent than 6 years earlier; whereas the optometric examination and eyeglasses advanced only 5.2 percent. Hospital rates increased 40.2 percent during the same period, as labor and operating costs continued to mount. Physicians' and dentists' fees also increased 21.3 percent and 16.1 percent, respectively. Prices of prescriptions and drugs rose 11.9 percent as higher production and distribution costs were passed on by the manufacturers.

When price changes for the various physicians' services are compared, the

Federal Reserve Bank of St. Louis

differences are not quite as marked, ranging from a rise of 26.1 percent for an obstetrical case to 6.1 percent for an appendectomy. Physicians' office and house visits advanced 22.3 percent and 23.5 percent, respectively, and a tonsillectomy was higher by 14.9 percent.

In the 6-year period (December 1952-December 1958), the annual (December-to-December) increase for the medical care index averaged 3.9 percent. The smallest increase was 2.2 percent in 1954, due to the smaller-than-average increase for medical services other than hospital rates and group hospitalization premiums. The largest annual increase was reported in 1958 with group hospitalization higher by 10.8 percent and hospital rates by 3.9 percent, resulting in an overall annual increase of 4.6 percent for medical care.

Personal Care. Family expenses for personal care, which include such items as men's haircuts, beauty shop services, and toilet articles, advanced a total of 15 percent from December 1952 to the end of 1958. An important factor in the persistent price advance was the fact that half of the personal care items are services. The personal care price trend generally paralleled that of all services in the CPI for much of the 6-year period. A major cause of the price increase for personal care was the advance in men's haircuts, which were priced 24 percent higher in December 1958 than 6 years earlier. Beauty shop services rose about 19 percent during the same period, reflecting price increases for such items as shampoo and wave set. Toilet goods price movements were mixed but in general they were higher.

Reading and Recreation. The cost of reading and recreation to the urban family rose only 8.2 percent between December 1952 and the close of 1958, slightly less than the average of all consumer prices. Prices fell slightly from December 1952 to the summer of 1955 and remained fairly stable until the following summer, but in the next 2½ years (June 1956 to December 1958), they rose almost 9 percent. Within the group, there were divergent movements: Commodities declined while services increased. Prices of television sets, affected by competition between discount houses and regular outlets, dropped almost 7 percent between December 1952 and the end of 1958. In contrast, movie admissions rose 28.9 percent in the same period. To combat declining attendance, theaters introduced special features and improved screens and techniques. To offset the resultant increased costs, they raised prices. Newspaper prices increased sharply after remaining relatively stable for a number of years. By December 1958, newspaper prices had increased 19.7 percent over the December 1952 levels.

Other Goods and Services. During most of the 6-year interval, from December 1952 to December 1958, other goods and services, which consist primarily of tobacco and alcoholic beverages, moved similarly to the total CPI, increasing almost 10 percent. Prices of alcoholic beverages did not advance as rapidly as prices of tobacco products. Cigarette prices rose 16.3 percent, reflecting industrywide price increases in February 1953 and June 1957. Higher manufacturing costs and increased State taxes contributed to price increases for both alcoholic beverages and tobacco.

History, Scope, and Meaning of the Consumer Price Index

The Bureau of Labor Statistics' Consumer Price Index measures changes in retail prices of goods and services purchased by city wage-earner and clerical-worker families. It is an index of price change, and therefore does not indicate changes in the kinds and amounts of goods and services families buy or the total amounts families spend for living, or differences in price levels or living costs in different places.

The Consumer Price Index in roughly its present form was first published in 1921 with data back to 1913. The basic features of the early "cost-of-living" index, as the series was then known, included: (1) An index designed to measure changes in prices paid by a specific population group—urban wage-earner families; (2) a national "all items" index, published regularly, based on a city sample representative of all U.S. cities included in the scope of the measure (initially the index was limited to large cities); (3) a weighting structure which represented the relative importance of items in the typical wage-earner and clerical-worker family consumption pattern as derived from consumer expenditure surveys; and (4) systematic collection of prices from retail stores and service establishments typically patronized by the "index families".

The CPI, as published in 1921, was based on data developed from surveys of family expenditures during the years 1917 to 1919. Details of cost of goods in the family "market basket" were obtained from 12,100 wage-earner and clerical-worker families in 92 industrial centers. Price data were collected regularly for about 145 commodities, and services and indexes were constructed for 32 cities and for the U.S. as a whole. Two other cities were added later and the 34-city sample was maintained until the revision of the index in 1952. The base period of the early CPI was 1913=100, later changed to 1923-25=100.

Revision of 1934-36. In 1934 through 1936, the Bureau undertook a comprehensive family expenditure survey and instituted marked improvements in methods of collecting retail prices. The survey covered buying patterns of nearly 14,500 families in 42 cities, each with a population of 50,000 or more. The 1934-36 survey revealed that expenditures for food, housing, and clothing had all changed markedly in the kinds of goods purchased and in dollar volume as a percent of total family income and expenditure. The results of the survey were used to reweight the index. Simultaneously, new commodities were added and the base period shifted to 1935-39=100. A significant development was the initiation of pricing according to predetermined quality descriptions. The work of revision was completed in 1940.

World War II. During World War II, the Bureau attempted to take account of the effect of shortages, rationing and price control, and quality declines, on retail prices. Proper allowance for quality change could not be made, however. No satisfactory method existed for measuring "black market" prices, which apparently were frequent during that period. The Bureau was able to revise the list of articles priced, however, and take cognizance of the effect of rationing by shifting the importance of weights for certain foodstuffs (meat and sugar, for example). Wartime product specifications replaced those of peacetime, collection of rent information directly from tenants was instituted, and other changes were made to meet the wartime situation.

Postwar Revision. In 1949, the Bureau of Labor Statistics commenced a 3-year program to revise the index. Before this was completed, however, the Korean conflict occurred in 1950 and it was decided that immediate changes in the index were necessary, even though based on incomplete survey results. Consequently, an "interim adjustment" was made, using information then available and embracing (1) revision of city population weights using 1950 Census

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

data; (2) correction of the rent index for the "new unit bias," 9/ to take account of the rent differential between housing constructed prewar and postwar (World War II); (3) addition of some 25 new items; and (4) revision of weights for groups of items and for some commodities.

Meanwhile, the 3-year comprehensive revision program continued and was completed in December 1952. The index base was shifted to 1947-49=100. New weights representing 1951-52 spending patterns were derived from the 1950 consumer expenditure study. This revision of the market basket was the first basic step in revision of the CPI.

An integral part of this revision was a complete reexamination of the cities chosen for inclusion in the total CPI. The former index represented only large cities, but the revised index is based on a scientifically chosen sample of 46 urbanized areas, including large, medium-size, and small cities with more than 2,500 population. 10/

The following tabulation shows the expenditure bases for weights in the original index and in each major revision and the period during which these weights were used:

	Date of expenditure survey	Period used in index
Original index	1917-19	1913-39
1940 1/	1934-36	1935-52 2/
1951 3/	1947-49 4/	1950-52
1953	1950	1953 to date

1/ In the 1940 revision, all-items indexes for the years 1925-29 were revised retroactively by reweighting group indexes with weights calculated as averages of group expenditures derived from the surveys of 1917-19 and 1934-36; all-items indexes for the years 1930-34 were revised retroactively by reweighting group indexes with weights derived from the 1934-36 survey; for the years 1935-39, indexes for all items and major groups were completely recalculated with revised weights derived from the 1934-36 survey.

2/ Weights based on the 1934-36 expenditure survey were used in the "old series" index through June 1953.

3/ In the 1951 revision (interim adjustment), all-items and group indexes for January to December 1950 were revised retroactively; indexes for rent and all items were corrected for the new unit bias from 1940.

4/ 7 cities only.

Description of Old, Adjusted, and Revised Series. The "old series" index measured average price changes through June 1953 with weights based on 1934-36 spending patterns. The "adjusted series" index measured average price changes from 1950 through 1952 with weights based on estimated 1949 expenditures, with a retroactive correction for the new unit bias in the rent index back to 1940. Both the old and adjusted series were published for the period 1940-52. The "revised series," which is the index currently published, measures price changes from 1953 to date with weights based on 1950 expenditure patterns from the expendi-

---

9/ The rent component had understated the actual rise in rents after 1940 because the index techniques failed to reflect the significant difference between rents for new dwellings when they first came on the rental market and those of comparable dwellings already on the market. In a market free from controls there is no consistent differential between the "old" and "new" units, but under the provisions of rent control, rents for older units were controlled while most new units were exempt. See Interim Adjustment of CPI (BLS Bull. 1039).

10/ For a more detailed discussion, see Selection of Cities for Consumer Expenditures Survey, 1950 (in Monthly Labor Review, April 1951, pp. 430-436; also issued as Reprint R. 2060).

Federal Reserve Bank of St. Louis

ture survey, adjusted for income and price change to 1952. A continuous series extending back to 1913 was achieved by linking the revised series to the adjusted series at December 1952. The old series was discontinued in June 1953. Table 1 presents a comparison of the current index with earlier series.

The Current Index. The current index is based on prices of some 300 items which were selected to represent average price movements of all goods and services bought by the families of urban wage earners and clerical workers, as shown by the Survey of Consumer Expenditures in 1950. Prices are collected from a sample of retail stores and service establishments in the 46 urbanized areas and smaller cities. The establishments where prices are obtained are those most frequently patronized by wage-earner and clerical-worker families and represent the important types of merchandising operations, such as chain, independent, department, and specialty stores, and others. Rental data are obtained from tenants living in units representative of all rental dwellings in the urbanized areas.

The goods and services included are priced in accordance with detailed specifications which define quality. To the extent possible, prices are obtained for commodities of constant quality from month to month so that the index shows price change only and is not affected by quantity or quality differences. 11/ In addition to verifying the product description, the Bureau's agents check on discounts or trade-in allowances to obtain realistic net prices. These net prices paid by customers, including sales and excise taxes, are used to calculate the CPI.

The national index (U.S. city average) includes prices from the 20 large urbanized areas for which separate indexes are published and for 26 additional medium-size and small cities. 12/ For the 5 largest cities, indexes are published each month for all major groups and subgroups of items (see Tabular Summary tables C-2 and C-3). For the other 15 large cities, indexes are published monthly for food and its subgroups and quarterly for all items, including food. The publication schedule for the city all-items indexes is as follows:

Monthly	Jan., Apr., July, Oct.	Feb., May, Aug., Nov.	Mar., June, Sept., Dec.
Chicago	Boston	Cleveland	Atlanta
Detroit	Kansas City	Houston	Baltimore
Los Angeles	Minneapolis	Scranton	Cincinnati
New York	Pittsburgh	Seattle	St. Louis
Philadelphia	Portland	Washington, D. C.	San Francisco

Indexes for selected items and for special groupings of items are published for the months of March, June, September, and December based on data for cities priced in these months.

11/ See Average Retail Prices: Collection and Calculation Techniques and Problems (BLS Bull. 1182).

12/ See footnote 10.

Table 1. Comparison of Old, Adjusted, and Current Consumer Price Index Series

Item	Old Index	Adjusted Index	Current Index
Base period	1935-39=100	1935-39=100	1947-49=100
Basis of index weights: Expenditure weights	Average family expenditures derived from 1934-36 Survey of Money Disbursements of Wage Earners and Clerical Workers in 42 Large Cities.	Relative weights of Old Index adjusted to postwar pattern by estimates based on Surveys of Income and Expenditures in 7 Cities, 1947-49 and appropriate postwar data from other sources, such as recent food consumption surveys by U.S. Department of Agriculture, and from trade and official sources on production, marketing, sales, etc.	Average family expenditures derived from 1950 Consumer Expenditure Survey in 91 Cities, adjusted to reflect the 1952 expenditure pattern required to maintain the level of living characteristic of urban wage-earner and clerical-worker families.
Population weights	Estimated 1942 populations of large cities.	1950 populations of large cities.	1950 populations of all urban places.
Population Coverage of Expenditure Survey 1/			
Family size	2 or more persons	Same as old index	Same as old index.
Employment-occupation of chief earner or head of family.	Wage earner or salaried clerical worker	do	Do.
Length of employment.	1 member, at least 1,008 hours spread over 36 weeks.	Head of family, 26 weeks.	No specific requirement but major portion of income of family head must be from employment as wage earner or salaried clerical worker.
Income	Minimum family income of $500 in the survey year and earnings of chief earner at least $300. Chief earner, salaried clerical workers, earning less than $2,000 during the survey year or less than $200 during any 1 month. No upper limitation on wage earners or total earnings of all members of the family combined. No more than ¼ of income could be from interest, dividends, rents, gifts, income in kind, etc.	Family income under $10,000 after taxes in the survey year. No lower income limit, except that families which had no incomes from wages or salaries were excluded.	Same as adjusted index.
Economic level	No relief families either on direct or work relief.	No exclusion for receipt of relief, as such, but only families with wage or salary earnings included.	Do.

Federal Reserve Bank of St. Louis

Table 1. Comparison of Old, Adjusted, and Current Consumer Price Index Series - Continued

Item	Old Index	Adjusted Index	Current Index
City Coverage			
Sample	34 large cities--none less than 50,000 population; only 1 with 1950 population of less than 100,000. (56 cities for food).	Same as old index.	46 cities ranging in size from Madill, Okla. (about 2,500 population) to New York City.
Pricing cycle	Food and fuel priced monthly in all cities.	do	Food, fuel, and a few selected items priced monthly in all cities.
	Other commodities and services priced monthly in 10 cities, quarterly in 24.	do	Other commodities and services priced monthly in 5 largest cities, quarterly in 15 large cities and 26 medium-size and small cities.
Commodity Coverage			
Number of items priced	200	225	310
Food	51	60	87
Housing	46	52	66
Shelter	1	1	15
Rent	1	1	1
House purchase and upkeep	-	-	14
Gas and electricity	2	3	3
Solid fuels and fuel oil	8	8	7
Housefurnishings	25	29	30
Household operation	10	11	11
Apparel	62	66	73
Transportation	10	10	18
Medical care	15	16	18
Personal care	11	12	13
Reading and recreation	2	5	31
Other goods and services	3	4	4
Published group indexes	Food, rent, apparel, fuel, housefurnishings, and miscellaneous goods and services.	Same as old index.	Food, housing, apparel, transportation, medical care, personal care, reading and recreation, and other goods and services.
Important changes:			
Food away from home	Estimated to have same price movement as food consumed at home.	do	Restaurant meals priced.
Used cars	Estimated to have same price movement as new cars.	do	Used cars priced.
Housing:			
Rent	No adjustment for new unit bias.	Adjusted for new unit bias from 1940.	No adjustment needed.
Home-ownership costs	Home purchase not included in index. Maintenance costs estimated to have same price movement as rents.	Same as old index.	Home purchase included. Home maintenance items priced and purchase price of home represented by direct pricing.

1/ For the old index, expenditure surveys were limited to wage-earner and clerical-worker families. For the adjusted and current indexes the surveys included all urban consumers. The population coverage information presented here, however, refers only to the wage-earner and clerical-worker families of the surveys.

The Comprehensive Revision of 1952

Revision of Housing Concept. Although the current (revised) index is not fundamentally different from prior series, important changes in the pattern of living in the U.S. between 1939 and 1950 made certain conceptual revisions desirable. In that period, the expenditures of city-workers' families for housing changed radically, requiring revision of the housing concept. When the index was initiated, the identification and classification of expenditures for housing were relatively simple. Families either owned or rented their dwellings (shelter only) and paid for fuel and furnishings separately. But as the manner of living altered, housing became an ever-changing group of goods and services. According to early family living studies, most city workers rented their homes and the purchase price of homes and payments on mortgage principal were treated as savings. By 1950, the increased proportion of homeowners among wage-earner families required a revised measurement of homeowner shelter costs. In the light of the revised housing concept, the omission of home purchase from the index was no longer valid.

In the early versions of the index, prices of homeowner's maintenance items were assumed to move like rents, on the grounds that owner housing had been in competition with rental housing, and many factors which affected rents affected owner maintenance costs similarly. The assumption that rents and maintenance costs moved together became invalid during World War II as rents came under control but homeowners' costs in general did not. Therefore, in revising the index, the Bureau broadened the housing definition to include all items of expense connected with the acquisition and operation of a home. The purchase of a home was included in the weights and pricing of both home purchase and maintenance items was instituted.

The revised housing concept led to some changes in classification of items in the index. Prior to the revision, the individual items of housing expense, instead of comprising a separate housing index, appeared in four of the six major components of the CPI: rent; fuel, light, and refrigeration; housefurnishings; and miscellaneous goods and services. The rent component included expenditures by renters for shelter and other items in the rental price, combined with expenses of owners for mortgage interest, taxes, insurance, repairs, ground rent, and financing charges in connection with sale or purchase. With the 1953 revision, the calculation of a housing index was started. Subgroups of this index now include shelter, gas and electricity, solid fuels and fuel oils, housefurnishings, and household operation. The weights for the new shelter component include residential rents, home purchase and upkeep, and housing away from home.

The rent segment measures the effect of price change on the cost of renting dwelling units in proportion to the number of tenants among city-workers' families in 1952. It reflects changes in contract rents charged for dwellings which represent all types of family rental units. Rent information is obtained directly from the tenant by personal interview.

The homeowner segment measures the effect of price change on the costs of acquiring and operating homes in current markets at the ownership level in 1952. These costs consist of such items as financing services required to buy similar qualities of housing under the same mortgage risk conditions as existed in the reference year; the same level of protection against fire and other hazards as existed in 1952 for a similar quality of house and type of risk; property tax payments levied on the same quality of homes owned in 1952; and maintenance and repairs at the same rate as observed in 1952.

Revising the Index. One of the first steps in the revision program was collection of information on rent and housing characteristics for a large sample of dwelling units. These dwelling unit surveys served two purposes: (1) They provided addresses from which a representative sample of households could be selected for a detailed study of family expenditures,

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

and (2) they provided the basic data needed to calculate and make the necessary correction for the understatement in the rent index. 13/

The family expenditure data for the 1952 index revision were obtained during the early months of 1951. Bureau field interviewers obtained from each family in the sample a comprehensive accounting of its income, savings, and expenditures during the calendar year 1950. The data obtained included the kinds and amounts of goods and services bought, the amounts spent for each item, and where purchases were made. 14/ Price information was also obtained for an expanded list of goods and services in additional types of stores, to provide data on comparative price movements required for selection of item and store samples.

Revision of City Sample. By the addition of small and medium-size cities, the city sample was made representative of all urban places. Selection of the cities to be included in the expenditure survey was based on two major considerations: (1) To provide a good sample of the total urban population on which estimates of the U.S. urban spending pattern could be based, and (2) to make possible reasonably reliable estimates of expenditure weights for any city in the U.S.

Thirteen large urbanized areas 15/ having a total population of 35.5 million were included because of their extreme importance from any point of view. The remainder of the 46 cities were chosen by scientific sampling methods from among 2,785 cities with a total population of 55.2 million. In selecting the sample, consideration was given to temperature, population density, community income level, and (in the case of the smallest cities) distance to a market center.

To expand the sample for expenditure data, 50 additional cities were selected. Of the total of 96 cities in the sample, 6 had been surveyed during the previous 3 years and were not included in the 1950 program. Only the national sample of 46 cities is included in the revised Consumer Price Index. 16/

Converting Expenditure Data to Index Weights. The consumer expenditure surveys yielded expenditure data which could serve adequately as a firm basis for weights for the national "all items" CPI and for the various groupings within the U.S. index. The same reliability attached to the weights for the large cities.

General Description. As usual with samples, however, the finer the detail required, the more sampling error, other things being equal. Thus, the expenditure data for a group of items for any one small city would have more sampling error than for the U.S. as a whole. This error was reduced by pooling the data for a number of related cities and using the average expenditures for the city-groups to develop weights which were then used for each city in the group.

Under this general procedure, the first step in the adjustment of the survey data was the classification of items into three broad categories of consumption which previous studies had indicated were related to level of income. These groupings were: (1) food and alcoholic beverages, (2) housing, and (3) all other goods and services. Within each of these categories, items were further classified into subcategories, groups, subgroups and item classes.

Federal Reserve Bank of St. Louis

Beginning with the smallest classification:

1. The relative importance of each item in total expenditure for small groups of related items was calculated for each city.
2. Distributions of cities by these relative importance figures were examined for similarities or differences in expenditure patterns.
3. Expenditure data for cities having similar family expenditure distributions were averaged for each city grouping separately and the resulting average relative importance was used for each city in the group. The average was assumed to give a more representative pattern and minor intercity differences were regarded as sampling errors. Where the range was extremely large, several city groupings were made. The objective was to minimize the adjustments due to sampling and reporting errors, but to preserve city differences which were felt to represent real differences in consumption patterns by city.

This same procedure was used at successively higher levels, subgroups, groups, etc., up to but not including the three major categories of consumption--food, housing, and all other goods and services, which were derived by procedures to be discussed later.

1952 Weights. The Consumer Expenditure Survey data relate to the year 1950, but the new weights were not introduced into the CPI until 1952. Accordingly, two broad types of adjustment were needed: (1) to take account of changes in basic spending patterns between 1950 and 1952, and (2) to take account of price changes between 1950 and 1952.

The first step in estimating 1952 expenditures was derivation of estimated family income for each city. Family income for 1952 was estimated from a straight-line regression of 1950 income of wage-earner and clerical-worker families and gross weekly earnings of production workers in manufacturing industries. Two sets of regression coefficients were calculated, one for use with cities having populations of 240,000 and over and another for cities of under 240,000 population. The equations thus developed were then applied to 1952 earnings data to obtain estimated family income by city in 1952.

A number of aspects of the method of converting statistics from the expenditure survey to weights in the Consumer Price Index have been described in various articles in the Monthly Labor Review and in BLS Bulletin 1165, Consumer Prices in the U.S., 1949-52. The following discussion, therefore, deals with certain aspects of the weight revision which are of general interest and have not been treated elsewhere. The method of deriving the weights for housing are covered in considerable detail in two issues of the Monthly Labor Review. 17/

Food and Alcoholic Beverages. Expenditures for total food and alcoholic beverages were derived from the 1950 expenditure survey, adjusted for changes in consumption between 1950 and 1952 on the basis of observed relationships between food expenditures and net money income. More specifically, the 1952 estimated expenditures for food were computed by region and city-size class from regression equations of food expenditures and net money income in 1950. From these equations and 1952 estimated income, derived as described above, 1952 estimated food expenditures were obtained. In addition, a variety of data were used to correct for the under-reporting of expenditures for alcoholic beverages.

Automobiles. Automobile purchases data reported in the expenditure survey indicated abnormally high rates of acquisition, probably resulting from advanced buying because of the Korean conflict and delayed buying caused by World War II shortages. It was decided, therefore, to adjust the reported data on purchases to eliminate the effect of unusually high purchase rates. For new and used cars separately, a normal purchase rate was calcu-

Federal Reserve Bank of St. Louis

lated from the change in percentage of families owning cars between 1935 and 1950. Annual rates of increase in ownership were calculated separately for each region (South, North Central-Northeast, and West). The number of initial buyers was calculated as the difference between the number of owners at the beginning and the end of the year. Replacement rates derived from the expenditure data were applied to the ownership figures to obtain an estimate of replacement buyers. 18/ The average number of cars bought per family was multiplied by the average price to obtain the expenditure weight.

Television. Expenditures for television sets in 1952 were estimated by differing techniques, depending upon the availability of data. For cities in which television transmitters were located, data on the number of sets in use were available from industry sources in addition to the data on ownership and purchases from the BLS expenditure survey of 1950. From the data on sets in use for various dates, rates of sales and ownership in 1950 were derived. Examination of both sets of data disclosed consistent relationships between sales (or purchases) during the year and ownership at the end and the beginning of the year. Where available, the more comprehensive industry figures were used as a basis for adjusting the BLS survey data. The corrected 1950 purchase rates were projected to 1952 by the ratio of sales in 1952 to sales in 1950, derived from the industry data on the number of sets in use.

Other Goods and Services. For this category, estimates of 1952 expenditures were made on the basis of 1950 expenditure-income ratios for six regional groupings and three metropolitan areas. The ratios were applied to the estimates of 1952 income minus expenditures for food, housing, automobiles, and television sets. Weights in finer detail--subcategories and items--were developed from the relative importance of the subcategory or item, using expenditure data from the survey.

Item Sample. The expanded sample of goods and services includes approximately 300 items, most of which represent a group of items which are considered to be in the same "price family." The classification by price family is based on similarity in physical characteristic, function, and other factors affecting price movements. Appendix table A-3 shows the items currently priced for the index and the items represented by each priced item. The appropriateness of these groupings was checked by comparing the prices of the several items over a considerable period of time to make sure that their movements conformed generally to the trend in prices of the sample commodity.

Outlet Sample. Prices are collected periodically from a sample of stores and other establishments where urban wage-earner and clerical-worker families buy goods and services. These include chain and independent groceries, department stores, drug stores, and other specialty stores. Prices obtained from these sources are averaged for each city.

For cities added to the CPI in 1952, samples of independent food stores were selected from listings of all outlets in which wage earners reported food purchases in each city, stratified by type of store in terms of foods sold, importance of store in wage-earner purchases, and geographic location within the city. All important chain store systems are included in the sample for each city. Prices obtained from chain and independent stores are averaged separately and combined with weights based on sales volume data.

Samples of rental units were selected by probability sampling procedures, from block listings of the rental dwelling units in each city, stratified according to block density and location within the area.

For goods and services other than foods and rents, outlets are selected to include the establishments more frequently patronized by wage-earner and clerical-worker families,

---

18/ Adjustments were also made to account for sales without repurchase.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

and which represent all important types of merchandising operations. In the newly added cities, the importance of individual stores in family buying was established by asking families where they bought the goods and services reported as expenditures in 1950. Stores of different types mentioned most frequently were selected after checking with local business associations.

In small cities, where mail-order buying is important, prices obtained from catalogs are included in the calculation of price change for the city. Also, for small cities, an appropriate part of price changes for commodities bought "out of town," such as furniture, is represented by the price change in large cities. Thus, the movements of prices in small cities included in the national average are based on prices from outlets in the sample cities, from mail-order catalogs, and from outlets in large marketing centers, weighted in accordance with the importance of such buying as reported in the 1950 survey.

Population Weights. City indexes are combined into the U.S. index by use of weights proportionate to the population of wage-earner and clerical-worker families in cities represented in the index. Each of the 12 largest urbanized areas has a weight proportionate to its own population. These 12 cities combined have about two-fifths of the total weight. The other nine large cities combined represent a class of cities having about one-fifth of the urban population and were, therefore, assigned about one-fifth of the weight. In addition to its own population, each city's weight represents all other cities with similar classification characteristics. Similarly, the 9 medium-size cities have about one-fifth and the 16 small cities about one-fifth of the weight. The importance of cities in the index is based on the 1950 Census of Population.

Some Limitations.

Limitations on Use. The CPI is designed to reflect price movement of a fixed quantity and quality of goods and services relating to a well-defined class of consumers. The index therefore cannot be used to measure changes in living standards or cost of living, since both are responsive to many factors other than changes in prices. Living costs may vary with changes in family size, income, tastes, and for numerous other reasons not directly related to price fluctuation.

As a measure of average price change, the CPI does not necessarily correspond with the price experience of any one family or small group of families. Strictly speaking, the index is not applicable to families with very low or very high incomes, elderly couples, single workers, rural families, or other groups whose level or manner of living and spending differ from the average of all city-worker families. These groups may spend their incomes differently and are therefore affected differently by price changes. On the other hand, when the index is used to estimate price change for all city families, the limitations are not considered to be serious, since the wage-earner and clerical-family group represents such a large proportion (nearly two-thirds) of total urban population. The CPI measures only price change over time and does not measure differences in price levels between the various cities for which indexes are computed. A higher index for one city means that prices have advanced more since the base period in this city than in others, not that prices are higher than in cities with lower indexes.

Limitations of Measurement. The Consumer Price Index is subject to the usual limitations of statistical calculations. Certain limitations or errors are inherent in sampling procedures. Expenditures for goods and services which form the basis for index weights were obtained from interviews with about 8,000 families; price changes are based on prices of about 300 items, collected in about 1600 food stores and 4,500 other retail stores and establishments; rents are obtained from approximately 30,000 tenants. Prices are collected in a sample of 46 cities. There is also a sample of time, since information is collected only at certain periods. Because sampling is done at various levels--cities, items, outlets--it is not possible to determine such measures of statistical reliability as the standard error of estimate for the CPI as a whole.

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

To gain about the same degree of accuracy throughout the index, the number of price observations obtained for any item is determined by its price variability and its importance in the total index. For example, prices of fresh vegetables, which are important in the family food budget, change frequently and have different seasonal patterns in different cities; they differ from item to item and from store to store. To measure the average change in prices of all vegetables satisfactorily, a large number of them must be priced in a fairly large number of stores each month in every city. On the other hand, men's nationally advertised brand shirts can be priced less frequently and in fewer stores. Shirt prices do not change often, and shirts of comparable quality sell for about the same price in almost all stores.

The Bureau employs carefully trained interviewers in order to keep reporting errors to a minimum. It also takes precautions to prevent month-to-month pricing errors which might seriously affect the index. Selling prices are recorded as marked or as reported by the merchant, including sale prices, discounts, trade-in allowances, premium prices, and special charges. Sale prices for merchandise usually priced for the index are used if the sale is of sufficient duration to allow most consumers to take advantage of the reductions. Discounted prices are used if they apply generally to all or a majority of customers; they are not used if offered to special types of buyers only, or if affected primarily by the bargaining skills of the buyer.

The agent is instructed to report prices for the same specified item as that for which prices were reported in the preceding period. When this is not possible, a substitution is made of another article that falls within the quality limits defined by the specifications.

One of the more difficult problems in the index calculation is the measurement of quality changes. In order to eliminate the effect of major changes in quality of the products, detailed specifications are drawn up and used by the Bureau's field agents in comparing prices of 1 month with those of the next. The specifications provide a detailed description of the article, including quality factors associated with price as well as other physical characteristics that are essential to the identification of the priced item from store to store and time to time. If a new-model automobile, for example, includes additional equipment, the price is adjusted so that the cost of the extra equipment is not reflected as a price change. However, there are other types of change which are not easily discernible, which cannot be evaluated, and for which no adjustment in price is possible. For short periods the effect of this type of change is probably negligible. For longer periods there is undoubtedly a significant effect on the indexes for certain items, although there is no way of determining their effect on the total index.

The revision of the CPI was designed to reduce the effects of these errors. Among the improvements introduced was direct measurement of changes in prices of houses and their upkeep, restaurant meals, and used cars, which were formerly estimated by other items or excluded from the index.

Relative Importance of Consumer Price Index Components.

The Consumer Price Index is a weighted average of changes in prices of goods and services purchased by city wage-earner and clerical-worker families. The weight of each item in the index represents the annual expenditure by the average family for the commodities of which that item is a sample in the year when the weighting structure was established.

These basic value weights represent the quantity of each commodity or service multiplied by the unit price in effect at the time the weight was established. Thus, if dry cleaning services accounted for $50 in the annual average family expenditure, that total represented some quantity of service units times a price per unit. The implicit

Digitized for FRASER
http://fraser.stlouisfed.org/
Federal Reserve Bank of St. Louis

quantity weight involved in this aggregate remains constant during the periods between weight revisions. 19/

The percentage relationship of the current value weight (implicit quantity times price) for each item to the total of all items is referred to as its relative importance. At the time of the introduction of new weights, the relative importance of each item is equivalent to its importance in the average family expenditures. With subsequent changes in prices, however, the importance of the various commodities and services may change in relationship to one another. Thus, if food prices rise and clothing prices fall, food will increase in relative importance to clothing.

A comparison of data in columns 4, 5, and 10 of table 2 illustrates the difference between changes in relative importance and changes in expenditures. Expenditures for food actually accounted for a little more than 35 percent of the family budget in 1935-39. By 1950, prices for food had increased relative to other commodities and services, and the relative importance of food rose to nearly 42 percent of the index. That is, the 1935-39 quantities of food, in 1950, would have cost 42 percent of the market basket valued at 1950 prices. But the 1950 consumer expenditure survey revealed (column 10) that food expenditures took only about 30 percent of the budget. The explanation is, of course, that family incomes had risen more than prices and, therefore, families had more to spend on nonfood items. As a result, the relative expenditures for food were lower, not higher, in 1950 than in the 1930's. Thus, changes in the relative importance of a component result from (a) major weight revisions based on comprehensive consumer expenditure surveys, such as that completed in December 1952; (b) minor weight adjustments to take account of changes in the list of items priced, such as the discontinuance of several items in 1955; and (c) different rates of price change among the various items. In the absence of a weight revision in the index, if prices of all items changed at the same rate, their importance in the index would not change.

It follows then that, except for an interval following a weight change, current relative importance figures do not necessarily represent a distribution of current family expenditures. Family spending patterns are affected by many factors other than price change, such as income, family size, and relative availability of goods of different kinds and qualities, etc. The relative importance figures indicate how urban families of wage earners and clerical workers would distribute their expenditures if they continued to buy the same kinds and amounts of goods and services that they purchased when the preceding expenditure study was made (e.g. 1950 as adjusted to 1952). The relative importance figures should not be used as estimates of current spending patterns or as indicators of changing consumer expenditures. These data simply represent the old market basket repriced, not a new market basket.

Table 2 shows distributions of family expenditures and index value weights in the original index and at the revision dates. The 1917-19 distribution of expenditures is shown in column 1. Comparison of column 2 with column 3, column 5 with column 6, and column 7 with column 8 shows the effect of the various weight revisions as consumer spending habits changed. On the other hand, comparison of column 1 with column 2, or column 4 with column 5, or column 6 with column 7, or column 8 with column 9 shows the effect of price change only.

19/ See p. 15 for dates when weights were revised.

Relative importance data have two principal uses. They show the importance within the CPI of the various items and hence provide an indication of the significance which should be attached to price change for any specific item. Secondly, the relative importance figures can be used to recombine the data of the CPI to form special index groupings. That is, the relative importance figures for the appropriate periods can, with care, be used as weights to approximate combined price movements for any two or more component series. 20/

Correction Procedure for Published Price Indexes and Prices.

The Bureau's retail prices and indexes normally are considered final when issued. Necessary estimates for missing data are made at the time of release. Subsequent corrections of estimates are reflected in the next month's index. Every effort is made to eliminate errors in the computation of the Consumer Price Index. However, as errors do arise, the Bureau has set up the following correction procedure:

Prices or Indexes for Individual Items. A correction of less than 1.0 percent in an average price or in an item index will not be made for publication unless the entire index is recalculated.

A correction in an average price and/or in an item index of 1.0 percent or more will be published in the next subsequent release which normally carries the series affected, and normally for as far back as the month in which the incorrect data entered into the index calculation.

Subgroup, Group, or All Items Indexes. A correction which would cause a change of not more one-tenth (0.1) of an index point at any level will not be published although adjustments for the error will be made in current index calculations.

A correction which would cause a change of six-tenths (0.6) or more of an index point at a U.S. subgroup or a city subgroup or group level will be made in published subgroup and group indexes.

A correction which would cause a change of two-tenths (0.2) or more of an index point in a U.S. major group or all items index or in all items indexes for the 20 cities for which indexes are published will be made in the index at the group and subgroup levels regardless of the amplitude at the lower levels. A correction of this magnitude, which is extremely rare, would require the consideration by the Bureau of the statistical, economic, and other factors involved, to determine whether the previously published city or U.S. all items index is to be corrected or an adjustment made in calculating the current index number.

20/ A detailed description of the method for doing this was published in the article Relative Importance of Items in the CPI(in Monthly Labor Review, August 1954, pp. 891-896).

Table A-3. Allocation of family expenditures in the Consumer Price Index

Family expenditures for--	Represented in the index by--
FOOD	
Cereals and Bakery products	
Cereals	
Flour, white and cake	Flour
Macaroni, spaghetti, etc.	Flour
Flour mixes	Biscuit mix
Corn flakes	Corn flakes
Rolled oats	Rolled oats
Wheat cereal (uncooked)	Rolled oats
Other uncooked cereals	Rolled oats
Corn meal, grits, etc.	Corn meal
Rice	Rice
Baby food cereals	Flour, corn flakes, and rice
Other cereals	Flour, corn flakes, and rice
Bakery products	
Bread	Bread, white
Rolls	Bread, white
Soda crackers, other	Soda crackers
Cookies	Vanilla cookies
Cake	Vanilla cookies
Doughnuts, pies, pastry	All priced bakery products
Other bakery products	All priced bakery products
Meats, poultry, and fish	
Beef and Veal	
All beef steak	Round steak
Rib roast	Rib roast
Chuck roast	Chuck roast
Stewing, boiling, soup beef	Chuck roast
Other roast	Round steak, rib roast, and chuck roast
Hamburger	Hamburger
Liver and other beef	All priced beef
All veal	Veal cutlets
Pork	
Chops	Pork chops
Loin roast	Pork chops
Fresh ham	Smoked ham
Smoked ham	Smoked ham
Picnics	Smoked ham
Other fresh pork	Pork chops and smoked ham
Bacon and fresh sausage	Bacon
Salt pork	Bacon
Other smoked pork	Bacon and smoked ham
Lamb	
All lamb	Lamb, leg
Other meats	
Frankfurters, smoked sausage	Frankfurters
Canned luncheon meat	Canned luncheon meat
Cold cuts	Frankfurters and canned luncheon meat
Baby food meats, strained or chopped	Frankfurters and canned luncheon meat
Other canned meat	Frankfurters and canned luncheon meat
FOOD--Continued	
Other meats--Continued	
Tongue, heart, kidney, etc.	All priced meats
Frozen unprepared meat, and other meat	All priced meats
Poultry	
All poultry	Frying chickens
Fish and other seafood	
All fresh or frozen fish	Fresh and frozen fin fish
Canned salmon	Canned salmon
Canned tuna fish, sardines, etc.	Canned tuna fish
Cured, smoked, other fish	Canned salmon and tuna fish
Dairy products	
Fresh milk	Fresh milk, sold in stores and delivered
Buttermilk, chocolate milk, cream, etc.	Fresh milk, sold in stores and delivered
Butter	Butter
Canned milk, powdered milk	Milk, evaporated
Baby food, dried milk	Milk, evaporated
Formula ingredients	Milk, evaporated
Ice cream	Ice cream
Cheese	American cheese
Cheese spreads, etc.	American cheese
Fruits and vegetables	
Fresh fruits	
Oranges and fresh orange juice	Oranges
Lemons and limes	Lemons
Grapefruit	Grapefruit
Apples	Apples
Bananas	Bananas
Peaches	Peaches
Grapes	Grapes

Table C-2. Consumer Price Index--20 large cities: Indexes of all items and major groups of goods and services, by year and month, 1947-58--Continued

(1947-49=100)

Year and month	All items	Food	Housing	Apparel	Transportation	Medical care	Personal care	Reading and recreation	Other goods and services
	Kansas City, Missouri								
1947: Average	95.2	96.8	94.7	95.7	91.3	94.3	92.8	96.0	99.0
January	91.9	91.7	93.1	90.9	88.7	92.1	92.0	95.5	100.3
February	92.5	92.3	(1/)	93.3	88.8	93.0	92.7	95.4	100.3
March	93.9	95.3	(1/)	94.3	88.8	93.7	92.7	95.4	100.3
April	94.0	95.5	(1/)	93.9	90.0	93.8	93.4	95.4	96.8
May	93.7	94.5	(1/)	93.9	90.0	93.8	92.7	95.4	96.8
June	93.1	94.1	(1/)	93.3	90.2	94.1	92.6	95.4	99.4
July	93.7	94.8	93.6	93.0	90.5	93.8	92.1	95.4	99.4
October	98.3	101.2	97.0	100.1	93.5	95.2	92.4	95.5	99.1
1948: Average	102.9	104.4	101.5	103.8	101.2	101.6	103.7	101.9	98.9
January	101.2	104.2	99.4	102.3	97.6	99.3	95.4	101.6	98.5
April	101.7	103.5	100.1	103.7	98.1	101.4	105.5	103.1	97.2
July	103.7	106.8	101.8	102.9	100.4	101.8	105.1	101.6	97.9
October	104.5	105.1	103.1	106.0	105.9	103.3	105.5	101.6	101.0
1949: Average	101.8	98.7	103.9	100.5	107.5	104.0	103.6	102.1	102.0
January	103.1	101.7	103.9	103.5	105.9	103.3	104.9	101.5	101.8
April	102.2	99.2	103.5	102.0	107.9	103.5	104.3	102.2	102.1
July	101.6	98.5	103.7	99.8	106.9	104.3	103.5	102.2	102.1
October	101.1	97.2	104.0	98.3	108.3	104.6	102.6	102.2	102.1
1950: Average	103.4	99.9	107.0	100.6	110.0	106.2	103.9	101.6	103.2
January	100.9	96.0	104.9	98.4	108.6	104.5	101.8	102.2	102.1
April	101.4	96.5	105.8	98.5	108.6	105.1	101.3	102.0	102.1
July	103.7	101.9	106.9	98.8	111.6	105.3	102.0	99.5	102.6
October	105.0	102.6	108.4	103.7	109.7	108.4	105.6	100.8	104.6
1951: Average	111.2	111.3	112.8	109.3	115.9	111.0	116.8	108.7	107.4
January	109.1	109.0	110.7	107.1	112.5	109.2	116.6	107.9	106.6
April	110.9	111.0	112.3	109.8	114.7	110.1	117.0	108.4	107.3
July	111.6	111.7	113.3	109.7	115.7	110.8	117.0	109.6	107.7
October	112.0	111.8	113.6	110.3	118.2	112.3	116.7	107.3	106.8
1952: Average	114.5	113.2	115.2	107.5	127.2	116.7	115.7	109.4	113.4
January	113.2	113.9	114.1	108.3	119.6	113.5	116.3	112.8	110.5
April	113.9	112.1	115.0	108.4	127.0	114.3	116.3	107.9	113.4
July	115.3	115.1	115.5	107.6	128.4	118.5	115.5	108.5	114.0
October	115.2	114.4	115.5	106.3	130.2	118.6	115.3	109.7	114.0
1953: Average	115.0	110.5	117.6	105.4	130.0	119.4	115.5	112.1	117.9
January	114.3	110.2	116.4	106.1	130.6	119.1	114.9	109.4	115.5
April	114.3	109.3	117.0	105.1	130.0	119.3	114.7	110.0	119.3
July	115.3	111.9	117.7	105.6	130.5	119.4	116.0	109.5	118.0
October	115.7	111.1	118.5	105.3	130.6	119.6	115.9	116.9	118.2
