OVERVIEW

Lending by Production Credit Associations picked up sharply in June and July after an unusually slow spring season (Table 212.1). At the end of July, outstanding PCA loans were still only 4 per cent above a year earlier (Table 211.1) but if the accelerated pace of loan demand continues, year-over-year comparisons could rise significantly over the next few months.

Outstanding loans at Federal Land Banks are holding at about 15 per cent above a year earlier (Table 221.1); but lending activity has increased only nominally from the level reached last year (Table 223.3) and refinancing volume has also leveled off (Table 224.3). Thus a significant part of the growth in outstandings has resulted from the fact that repayments have recently dropped below last year's pace (Tables 224.1 and 224.3).

We (the authors) estimate that outstanding farm non-real-estate loans at commercial banks on June 30 totaled \$27.0 billion, or 5.5 per cent above a year earlier (Table 301.1). (We have changed our estimating procedure to eliminate the possibility of the kind of error that we had in the estimate we attempted three months ago, and have considerable confidence in the revised procedure.) This compares with a year-over-year increase of 4.1 per cent at PCA's on the same data.

Member bank borrowing at the Federal Reserve discount window under the seasonal borrowing privilege that was instituted in 1973 rose to \$200 million in August (Table 302.1). Most of the borrowing banks were relatively small institutions, as this privilege is designed to assist banks that have relatively large seasonality in their deposits and loans (as is common at banks in agricultural areas), but that are too small to be able to raise funds in national money markets on a reliable basis.

Most rural banks remain in tight liquidity positions. Average loan/deposit ratios at agricultural banks in the areas covered by Tables 311.3 and 312.3 now equal or exceed the unusually high ratios of last summer.
