# OF INTEREST TO USERS OF EMPLOYMENT AND EARNINGS STATISTICS

## State and Area News Releases

Cooperating State agencies publish monthly reports on current employment, hours, earnings, and in many instances labor turnover data, for the States and areas shown in this bulletin. These releases are available, without cost, upon request to the agencies listed on the inside back cover.

## Employment and Earnings

This monthly periodical presents detailed national statistics on employment, unemployment, labor force, weekly and overtime hours, hourly and weekly earnings, payroll and man-hour indexes, and labor turnover rates.

For States and the areas listed in this volume, available data are currently shown for--

- Employment - by major industry divisions
- Hours and Earnings - for manufacturing
- Labor Turnover - for manufacturing

Subscription to Employment and Earnings is \$3.50 per year. The report may be ordered through the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C. or any of the BLS Regional Offices listed on the inside back cover.

## Employment and Earnings Statistics for the United States, 1909-62 BLS Bulletin 1312-1

This volume, scheduled for release in the near future, will, like its predecessor, Employment and Earnings Statistics for the United States, 1909-60, BLS Bulletin 1312, present historical national statistics for nonagricultural industries. Monthly and annual data adjusted to March 1962 benchmarks (complete counts of employment), will be included for the following: All employees, production workers, weekly and overtime hours, hourly and weekly earnings, employment of women, and labor turnover rates from the beginning date of each series through the latest month available in 1963. The availability of this publication will be announced.

## PREFACE

This bulletin continues the Bureau of Labor Statistics (BLS) program of providing basic information on the Nation's nonfarm work force.

The data presented in the bulletin are based on information from payroll records submitted voluntarily to State agencies cooperating with the BLS by a representative panel of industrial, commercial, and government establishments, employing collectively about 25 million workers. The data provide detailed industry information for States and major areas on the employment, hours, and earnings of nonfarm workers. They show in what industries people have jobs, their average weekly hours, and how much they earn by the hour and by the week.

The State and area statistics are the product of cooperative programs in 44 States, participated in by the State employment security agencies, the BLS, and the Bureau of Employment Security (BES); in the remaining States, the program is participated in by State Departments of Labor and the BLS.

The cooperating State agencies collect and process the information provided by participating employers. The data are used by the State agencies to prepare statewide and area estimates, and are sent to the BLS for the preparation of national estimates. Contribution (tax) reports filed by employers subject to State unemployment insurance laws are the major source of benchmarks (complete counts of employment), on which these employment statistics are based. These reports, covering about three-fourths of the total number of nonfarm employees in the United States, are collected and tabulated by State employment security agencies under the direction of the BES. Benchmark data for the remaining portion are obtained by BLS from information collected under the programs of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies, both private and government.

This bulletin was prepared in the Division of Industry Employment Statistics, under the supervision of Robert O. Dorman, Chief, and the Division of Data Systems Research and Development, under the supervision of Rudolph C. Mendelsohn, Chief, under the general direction of Harold Goldstein, Assistant Commissioner for Manpower and Employment Statistics, and Dudley E. Young, Deputy Assistant Commissioner for Manpower and Employment Statistics.

## INTRODUCTION

In recognition of the growing need for State and area statistics, and as part of its continuing program to provide historical data of maximum geographic detail, the BLS has prepared this bulletin which provides annual average data on industry employment, hours, and earnings for States and major areas. These data are collected and prepared by cooperating State agencies under the technical direction of the BLS.

For each of the 50 States, the District of Columbia, and 146 areas, statistics are presented covering the entire available industry detail, based on the 1957 Standard Industrial Classification system, except for "residual" groups (e.g., "other durable goods"), which are not shown separately. The specific industries selected for publication are generally those which best reflect the currently significant economic activities in the State or area. As shifts in the economy occur, cooperating State agencies may introduce new series for specific industries, or change to industry combinations which reflect the changing situation.

This volume is primarily directed at grouping together all information available for a single State or area. However, summary tables, beginning on page xii, have been provided for ease in comparing employment data for all States for the total nonfarm sector and for each industry division, and hours and earnings levels for total manufacturing. The chart, immediately preceding the summary tables, indicates the percentage change that occurred in total nonfarm employment in each State during the period 1939-62.

Prior to 1959, State and area industry series conformed to the 1945 *Standard Industrial Classification Manual* for manufacturing industries, and to the 1942 *Social Security Board Industrial Classification Code* for nonmanufacturing. Beginning with the publication of data for January 1959, all series were converted to the 1957 *Standard Industrial Classification Manual* coding, with comparable data provided for 1958.

For periods prior to 1958, State agencies have generally constructed "replacement" series, with special attention devoted to broad industrial categories. Two States, however, have not completed recasting historical industry statistics to the new classification structure and adjusting to later benchmark levels. For these States, employment series based on the previous classification structure are shown at the industry division level for the period 1939-57, and overlapping values for the year 1958 have been included in the footnotes at the end of the statistical tables.

Current State and area statistics are published monthly by State agencies and may be secured upon request to the appropriate agency listed on the inside back cover of this bulletin. Current statistics are also published by the BLS in the monthly report, *Employment and Earnings*, which provides employment data for the major nonfarm industry divisions, and hours and earnings in manufacturing for all States and selected areas.

The major technical characteristics of this cooperative employment statistics program, such as scope, concepts, survey methods, estimation methodology, and limitations are described in the Technical Note (page 629), following the statistical tables.

Comparable historical national industry statistics have been published in *Employment and Earnings Statistics for the United States, 1909-60*, BLS Bulletin 1312 issued in 1961. A revision of this bulletin including data through 1962 will be issued in 1963.

# Percent Increase in Nonagricultural Employment by State, 1939-62

## Footnotes

1/ Data not strictly comparable with subsequent years.

2/ Data not necessarily comparable with subsequent years for the following series due to change in area definitions (see Area Definitions pages 625-7).

<u>Area</u>	<u>Year</u>	<u>Employment</u>	<u>Hours and Earnings</u>
Atlanta, Georgia	1955	x	
Bridgeport, Connecticut	1958	x	x
Hartford, Connecticut	1958	x	x
Jackson, Mississippi	1960	x	
Minneapolis-St. Paul, Minnesota	1957	x	
Oklahoma City, Oklahoma	1957	x	
Providence-Pawtucket, Rhode Island	1958		x
Seattle, Washington	1958	x	x
Stamford, Connecticut	1958	x	
Tulsa, Oklahoma	1957	x	

3/ Federal employment in the Maryland and Virginia sectors of the District of Columbia metropolitan area is included in data for the District of Columbia.

4/ Series not necessarily comparable prior to 1958 due to adoption of the 1957 Standard Industrial Classification system and/or introduction of improved benchmark data. The following estimates for 1958 are comparable with data for prior years:

<u>Industry division</u>	<u>Employment (in thousands)</u>	
	<u>Michigan</u>	<u>Texas</u>
Total	2,119.7	2,457.3
Mining	14.1	125.0
Contract construction	89.6	160.1
Manufacturing	838.3	460.7
Transportation and public utilities	138.8	221.2
Wholesale and retail trade	438.5	684.4
Finance, insurance, and real estate	76.5	117.4
Service and miscellaneous	243.7	307.9
Government	280.1	380.6

Manufacturing	<u>Hours and Earnings</u>
	<u>Vermont</u>
Weekly earnings	\$68.17
Weekly hours	40.1
Hourly earnings	\$1.70

5/ Subarea of New York-Northeastern New Jersey.

NOTE: For all States and areas listed in this bulletin durable goods include SIC-19, 24, 25, 32-39; nondurable goods include SIC 20-23, 26-31. However, for Maine, Massachusetts, New York, Vermont, and Rhode Island and the areas within these States, except New York-Northeastern New Jersey, miscellaneous manufacturing (SIC-39) is included with nondurable goods.

SOURCE: Cooperating State agencies listed on inside back cover.

# Technical Note

## Measuring Employment, Hours, and Earnings in States and Areas

### INTRODUCTION

The current employment statistics program is an integrated Federal-State undertaking, sponsored by the Bureau of Labor Statistics in cooperation with the Bureau of Employment Security, U.S. Department of Labor. The program is designed to produce estimates of nonfarm employment, hours, and earnings at the national, State, and area levels. Under this program, the BLS has contracted with State agencies for collecting the data and preparing and publishing estimates each month for all States and major areas throughout the country. Reports collected from establishments provide current information on wage and salary employment, hours, and earnings in nonfarm establishments.

### COLLECTION

Federal-State Cooperation. Under cooperative arrangements with State agencies, the respondent fills out only one schedule, which is used for national, State, and area estimates. This eliminates duplicate reporting on the part of respondents and, together with the use of identical techniques at the national and State levels, insures maximum geographic comparability of estimates.

State agencies mail the forms to the establishments and examine the returns for consistency, accuracy, and completeness. After the States use the information to prepare State and area series, the data are sent to the BLS for use in developing estimates at the national level.

Shuttle Schedules. Form BLS 790--Confidential report on Employment, Payrolls, and Hours--is used to collect employment, payroll, and man-hours data. These schedules are of the "shuttle" type, with space for each month of the calendar year. The schedule is returned to the respondent each month by the State agency so that the next month's data can be entered. This procedure promotes maximum comparability and accuracy of reporting, since the respondent can see the figures he has reported for previous months.

The BLS 790 provides for entry of data on the number of full- and part-time workers on the payrolls of nonagricultural establishments and, for most industries, payroll and man-hours of production and related workers or nonsupervisory workers for the pay period ending nearest the 15th of each month.

### CONCEPTS

Industrial Classification. Establishments are classified in accordance with the 1957 Standard Industrial Classification Manual into industries on the basis of their principal product or activity as determined from information on their annual sales volume. This information is collected each year on an industry class supplement to the monthly report. In the case of an establishment making more than one product or engaging in more than one activity, the entire employment of the establishment is included under the industry indicated by the most important product or activity.

Industry Employment. Employment data, except for the Department of Defense, refer to persons on establishment payrolls who received pay for any part of the pay period ending nearest the 15th of the month. For civilian employees of the Department of Defense establishments, the figures represent the number of persons who occupied positions on the last day of the calendar month; intermittent workers are counted if they performed any service during the month.

The data exclude proprietors, the self-employed, unpaid family workers, farm workers, and domestic workers in households. Salaried officers of corporations are included. Government employment covers only civilian employees; Federal military personnel are excluded from the estimates of total nonagricultural employment.

Persons on an establishment payroll who are on paid sick leave (when pay is received directly from the firm), on paid holiday or paid vacation, or who work during any part of the pay period and are unemployed or on strike during the rest of

the period, are counted as employed. Not counted as employed are persons who are laid off, on leave without pay, or on strike for the entire period, or who are hired but do not report to work during the period.

Industry Hours and Earnings. Hours and earnings data are derived from reports of payrolls and man-hours for production and related workers, construction workers, or nonsupervisory employees. These items are defined below. When the pay period reported is longer than 1 week, the figures are reduced to a weekly basis.

Production and related workers include working foremen and all nonsupervisory workers (including leadmen and trainees) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping, maintenance, repair, janitorial and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), and recordkeeping and other services closely associated with the above production operations.

Construction workers relate to the following employees in the contract construction division: Working foremen, journeymen, mechanics, apprentices, laborers, etc., whether working at the site of construction or in shops or yards, at jobs (such as precutting and preassembling) ordinarily performed by members of the construction trades.

Nonsupervisory employees include employees (not above the working supervisory level) such as office and clerical workers, repairmen, salespersons, operators, drivers, attendants, service employees, linemen, laborers, janitors, watchmen, and similar occupational levels, and other employees whose services are closely associated with those of the employees listed.

Payroll covers the payroll for full- and part-time production, construction, or nonsupervisory workers who received pay for any part of the pay period ending nearest the 15th of the month. The payroll is reported before deductions of any kind, e.g., for old-age and unemployment insurance, group insurance, withholding tax, bonds, or union dues; also included is pay for overtime, holidays, vacations, and sick leave paid directly by the firms. Bonuses (unless earned and paid regularly each pay

period), other pay not earned in pay period reported (e.g., retroactive pay), and the value of free rent, fuel, meals, or other payment in kind are excluded.

Man-hours cover man-hours worked or paid for, during the pay period ending nearest the 15th of the month, for production, construction, and nonsupervisory workers. The man-hours include hours paid for holidays and vacations, and for sick leave when pay is received directly from the firm.

Gross Average Hourly and Weekly Earnings. Average hourly earnings for manufacturing and nonmanufacturing industries are on a "gross" basis, reflecting not only changes in basic hourly and incentive wage rates, but also such variable factors as premium pay for overtime and late-shift work, and changes in output of workers paid on an incentive plan. Shifts in total volume of employment between relatively high-paid and low-paid work and changes in workers' earnings in individual establishments also affect the general earnings averages. Averages for groups and divisions further reflect changes in average hourly earnings for individual industries.

Averages of hourly earnings differ from wage rates. Earnings are the actual return to the worker for a stated period of time, while rates are the amounts stipulated for a given unit of work or time. The earnings series, however, does not measure the level of total labor costs to the employer since the following are excluded: Irregular bonuses, retroactive items, payments of various welfare benefits, payroll taxes paid by employers, and earnings by employees not covered under the production-worker or nonsupervisory-employee definitions.

Gross average weekly earnings are derived by multiplying average weekly hours by average hourly earnings. Therefore, weekly earnings are affected not only by changes in gross average hourly earnings, but also by changes in the length of the workweek, part-time work, stoppages for varying causes, labor turnover, and absenteeism.

Average Weekly Hours. The workweek information relates to the average hours for which pay was received, and differs from standard or scheduled hours. Such factors as absenteeism, labor turnover, part-time

work, and stoppages cause average weekly hours to be lower than scheduled hours of work for an establishment. Group averages further reflect differences in the workweek of component industries.

#### ESTIMATING METHODS

**EMPLOYMENT.** The principal features of the estimating procedure used to prepare estimates of employment for the industry statistics are (1) the use of the "link relative" technique, which is a form of ratio estimation, (2) periodic adjustment of employment levels to new benchmarks, and (3) the use of a modified cutoff type of sample.

**The "Link Relative" Technique.** From a sample of establishments, which reported for both the previous and current months, the ratio of current month employment to that of the previous month is computed. The estimates of employment (all employees, including both production and nonproduction workers) for the current month are obtained by multiplying the estimates for the previous month by these "link relatives."

At the aggregate industry level, i.e., divisions and groups, employment is the sum of the employment estimates for component industries. Annual average employment is the sum of the monthly estimates divided by 12.

**Benchmark Adjustment.** Each year employment estimates are compared with comprehensive counts of employment, which provide "benchmarks" for the various industries defined as nonagricultural, and appropriate adjustments are made as indicated. Normally, benchmark adjustments are made annually.

The primary source of benchmark information is the employment data, by industry, compiled quarterly by State agencies from reports of establishments covered under State unemployment insurance laws. These reports, covering about three-fourths of the total nonfarm employment in the United States, are collected and tabulated by State employment security agencies under the direction of the Bureau of Employment Security. Benchmark data for the residual are obtained from the records of the Social Security Administration, the Interstate Commerce Commission, and a number of other agencies in private industry or government.

The estimates relating to the benchmark month are compared with the new bench-

mark levels, industry by industry. If revisions are necessary, the monthly series of estimates are adjusted between the new benchmark and the preceding one and the new benchmark for each industry is then carried forward progressively to the current month on the basis of trends shown in the sample. Thus, under this procedure, the benchmark is used to establish the level of employment, while the sample is used to measure the month-to-month changes in the level.

Data for the periods subsequent to the last benchmark are subject to revision.

**HOURS AND EARNINGS.** These estimates are based on the same sample that reported on employment. Estimates of average weekly hours and average hourly and weekly earnings apply only to production or nonsupervisory workers as distinguished from all employees.

For individual industries, monthly estimates of average weekly hours are obtained by dividing man-hours by production workers (or nonsupervisory workers), and average hourly earnings are compiled by dividing payrolls by man-hours. Industry group and division averages are obtained by weighting the averages for individual industries by production-worker employment or production-worker man-hour aggregates in the particular groups or divisions.

To obtain annual averages of average weekly hours, the 12-month total of aggregate man-hours (average weekly hours multiplied by production-worker employment) is divided by the 12-month total of employment. The 12-month total of aggregate payrolls (weekly earnings multiplied by employment weights or hourly earnings multiplied by aggregate man-hours) is divided by the 12-month total of aggregate man-hours to yield average hourly earnings.

Average weekly earnings, except for industries where man-hours data are not collected, are the product of average weekly hours and average hourly earnings.

#### THE SAMPLE

**Design.** The sample design used in the current employment statistics program is that of a modified cutoff sample. In a cutoff design, all establishments in a category are listed in descending sequence by number of employees. A cutoff point is selected in terms of the number of employees in an establishment, and only estab-

lishments above the cutoff point are included in the design. Sample selection is made by the cooperating State agencies at the area level with supplementation for establishments in sections of the State lying outside of the defined areas. The national sample is then the sum of all the State samples.

In cutoff sampling, the general objective is to obtain a sample comprising a large enough proportion of universe employment so that satisfactory estimates can be prepared. Since employer participation in the BLS 790 program is voluntary, some establishments above the cutoff may have declined to report. To replace these in the design, reports are solicited from the next largest establishments below the cutoff until the desired employment coverage is attained.

As a result of these procedures, the sample consists of heavy representations of the largest establishments in each industry with a considerable representation of smaller establishments as well. In the context of the employment and payroll statistics program, with its emphasis on producing timely data at minimum cost, a sample must be obtained which will provide coverage of a sufficiently large segment of the universe to provide reasonably reliable estimates that can be published promptly and regularly. The present sample meets these specifications for most industries. With its use, State agencies are able to produce preliminary estimates each month for many industries and for many geographic levels within a few weeks after reports are mailed by respondents.

Reliability of the Employment Estimates. One measure of the reliability of an employment estimate projected from a benchmark is the amount by which it differs from the new benchmark at the next adjustment period. The BLS uses this criterion instead of the standard error of the estimates, since it is not possible to compute a mathematically precise statement of error unless the estimates are based on a probability sample.

A consistently high degree of reliability of estimates prepared by State agencies is maintained by the relatively large percentage of the employment universe covered by the sample, and the annual adjustment of employment estimates to benchmark levels.

Differences between the benchmarks and the estimates, result from not only sampling and response errors but also from changes in the industrial classification of individual establishments (resulting from changes in their product), which are not reflected in the estimate levels until the data are adjusted to new benchmarks. At the more detailed industry levels, particularly within manufacturing, changes in classification are the major cause of benchmark adjustments; however, they become of less importance at broader aggregations of industries. Another cause of differences, generally minor, between the estimates and the benchmark arises from improvements in the quality of benchmark data.

For employment, the sum of the State figures may differ slightly from the equivalent official U.S. totals on a national basis, because some States have more recent benchmarks than others and because of the effects of differing industrial and geographic stratification.

#### COMPARABILITY WITH OTHER SERIES

County Business Patterns. Data in County Business Patterns, published jointly by the U.S. Departments of Commerce and Health, Education, and Welfare, differ from BLS establishment statistics in the treatment of central administrative offices and auxiliary units, in industrial classification, and reporting differences. In addition, CBP coverage is incomplete for some nonprofit activities, and interstate railroads and government are excluded.

Employment covered by State Unemployment Insurance programs. Not all nonfarm wage and salary workers are covered by the unemployment insurance programs. All workers in certain activities, such as interstate railroads, are excluded. In addition, small firms in covered industries are also excluded in 32 States. In general, these are establishments with fewer than four employees.

Statistics on manufactures and business, Bureau of the Census. BLS establishment statistics on employment differ from employment counts derived by the Bureau of the Census from its censuses or annual sample surveys of manufacturing establishments and the censuses of business establishments. The major reasons for some noncomparability are different treatment of

---

business units considered parts of an establishment, such as central administrative offices and auxiliary units, the industrial classification of establishments, and different reporting patterns of multiunit companies. There are also differences in the

scope of the industries covered, e.g., the Census of Business excludes contract construction, professional services, public utilities, and financial establishments, whereas these are included in BLS statistics.
