the BUSINESS SITUATION

THE unemployment rate held in July at the 5.5 percent figure to which it had fallen in June. Before that decline, the rate had been stable at just about 6 percent for more than a year, as labor force growth kept pace with the brisk expansion of employment.

As was pointed out in last month's SURVEY, the June decline in the unemployment rate reflected developments in the labor force group aged 16 through 24. That group's unemployment rate dropped sharply, as employment rose in line with seasonal expectations but the number of unemployed rose less than seasonally, so that the group's labor force participation declined (seasonally adjusted). For people aged 25 and over, the unemployment rate was unchanged in June as both employment and the labor force expanded. The large June decline in the unemployment rate for those aged 16-24 was probably related to problems in calculating seasonal adjustment factors for the month in which academic vacations begin. This made it seem likely that the group's unemployment rate would move up again in July, as indeed it did. However, the rate for workers aged 25 and over—whose labor force participation shows much less seasonal volatility—declined in July. This left the overall rate unchanged.

In the age group under 25, both the number of labor force participants and the number employed dropped in July (seasonally adjusted), but for persons aged 25 and over there were increases in both the labor force and the number employed. Overall, the civilian labor force expanded only very slightly and civilian employment was unchanged—

in contrast to the sizable gains registered in most months of the past year.

The number of workers on nonfarm payrolls has also been increasing briskly over the past year, more or less paralleling the increase in the separately estimated total number of employed civilians. In the 12 months ending with May, the increase was about 1½ million. This was almost wholly in the service-producing industries, as employment in goods production (manufacturing, mining, construction) was barely changed—though manhours in manufacturing increased appreciably because of a lengthening of the workweek. In June and July, however, nonfarm employment was sluggish. It increased about 90,000 in June, a modest gain, and fell about 80,000 in July.

Employment in service-producing industries continued to expand in both June and July, but employment in goods-producing industries was unchanged in June and declined in July. Strikes were an important factor cutting into the July figures on construction employment, and July activity in the construction industry was also reportedly hampered by the aftereffects of the June flooding in the East. There was a total July decline in construction industry employment of 90,000, somewhat more than the net drop in the nonfarm payroll total. The aftereffects of the flooding are reported to have held down July employment in other industries as well, though there were probably also some employment gains stimulated by the floods. One industry that seems to have been affected is apparel manufacturing, where employment declined. In

the aggregate, manufacturing employment dropped 100,000 in July, while aggregate employment in service-producing industries increased about the same amount.

72-8-1

Consumer demand

The advance estimate of July retail sales shows an increase of about 2 percent that well outweighs the decline recorded in June. The sales estimates for both May and June were revised up, so that altogether the sales picture for recent months now looks even stronger than it did a month or so ago. On the basis of the revised information, BEA has increased the estimates of second quarter personal consumption expenditures on goods, especially nondurables. (The GNP revisions are summarized at the end of this article.)

The indicated July increase in retail sales includes a very sharp advance in sales by dealers in the auto group. Indeed, their dollar volume evidently reached a figure measurably larger than the previous record set last September. Aggregate sales by other durable goods stores were evidently little changed, but sales by nondurables retailers increased 1½ percent to more than recoup the 1 percent decline in June.

In unit terms, sales of new domestic model cars in July were at a seasonally adjusted annual rate of about 9¼ million units. This is an extraordinary figure, the highest since last September and October when sales averaged 10¼ million units in the first flush of the sales boom during the wage-price freeze. Stated in terms of quarterly averages, which are less volatile, the sales rate for new domestic models averaged just over 9 million units in last year's third and fourth quarters and this year's second quarter, and about 8¼ million in this year's first.

Foreign car sales thus far in 1972 have been quite stable at annual rates between 1.5 and 1.6 million. These figures are below the very high rates attained in the spring and summer of 1971, when sales ran above 1.6 million, but nevertheless represent a sharp recovery from the closing months of 1971. The foreign car sales rate averaged only 1.4 million units in the 4 months September–December—a period affected not only by the wage-price freeze (which ended in mid-November) but also by the temporary import surcharge and some shortages of foreign cars due to strikes at U.S. ports.

The evidence on consumer buying through July certainly indicates good demand strength. Also, the continued very rapid expansion of consumer installment debt indicates a strong willingness to spend and suggests optimistic income expectations. However, recent evidence bearing on the outlook for consumer demand has a more conservative tone.

The University of Michigan index of consumer sentiment increased in the second quarter but the gain was less than in the first and was concentrated in respondents' sharply improved expectations about their personal financial situations; this improvement outweighed pessimism about broader economic and financial conditions. The latest Census Bureau survey, taken in July, found that consumers' expectations of income improvement over the next 12 months had strengthened since April. However, the survey found no significant change from April in spending plans except for a drop in plans to spend on household furnishings. In line with these findings are the latest findings reported from the Conference Board's bimonthly survey. Overall, these survey results suggest that consumers continue to feel decidedly cautious—even as actual spending and incomes are rising quite strongly.

Personal Income

Personal income increased \$11¼ billion in July to a seasonally adjusted annual rate of \$934 billion (chart 1). This was an unusually large increase. Its exceptional size reflected the fact that losses caused by the flooding in the East were written off in June, an action that cut sharply into June income. According to the revised estimate, personal income declined \$1 billion in June.

The floods of course had some net adverse effect on employment and thus on wage and salary income, but this effect was not large—viewed in the context of the entire economy—and it did not have a very heavy impact on personal income. The floods' major impact on personal income occurred because

of the losses to houses and to plant and equipment and inventories owned by proprietors.

The write-offs of these losses in the month of June are currently estimated by BEA at about \$550 million, or about \$6½ billion at an annual rate. The estimated amount cut from proprietors' income was \$2½ billion (annual rate) and from rental income \$4¼ billion. Thus, if there had not been large losses to be written off in June, personal income in that month would have risen (all other things being equal) by \$5½ billion rather than declining \$1 billion; and the July increase would have been \$4½ billion rather than \$11 billion.

The \$4½ billion "underlying" July increase is on the small side, relative to figures for the past 6 months or so. The advance in wages and salaries was quite modest, only \$2½ billion, as earnings in commodity-producing industries fell about \$¼ billion as a result of the decline in employment.

Income expansion in the recovery

The expansion of economic activity over the past year has been mirrored in a strong expansion of personal income, especially wages and salaries. The existence of the various control programs of "Phase 2," instituted late in 1971, is consistent with the strong income expansion this year; the programs are aimed at moderating increases in wage rates and unit prices, and not at total amounts of income. (Similarly, the constraints put on profits by the Price Commission are in terms of profit margin per dollar of sales, not aggregate profits.)

Over the 8-month period from December 1970 to August 1971, the month when the freeze was imposed, personal income increased 8 percent at a seasonally adjusted annual rate (table 1). In the preceding 12 months, encompassing the 1969–70 recession, personal income increased 5½ percent.¹

Wage and salary income increased only 4 percent from December 1969 to

1. The recession trough has been tentatively dated at November 1970, but calculations using that month are severely affected by the loss of wages caused by the auto strike; in December 1970, the affected payrolls were back almost to the pre-strike level and the distortion problem is much less severe if December is used.

Table 1.—Change in Personal Income and Major Components

(Percent change, seasonally adjusted at annual rates)

	Dec. 1969 to Dec. 1970	Dec. 1970 to Aug. 1971	Aug. 1971 to Nov. 1971	Nov. 1971 to July 1972

Transfers.....	23.9	16.8	9.2	8.8

*Figures shown are calculated excluding a \$2 billion lump sum bonus wage payment to postal workers in August. This large income bulge in that 1 month distorts the picture of income developments. With the lump sum included—i.e., using the figures as published—the three-starred entries in the column for change from December to August, reading down, are 8.2, 7.2, and 10.3 percent, and the three-starred entries in the column for change from August to November are 4.8, 4.4, and -1.9 percent.

December 1970. In the first 8 months of 1971, it increased at a rate of 6¼ percent even though earnings in manufacturing increased very little. The expansion slowed during the freeze period, although increases in employment and the workweek kept earnings moving up at a good rate. The expansion since last November has been strong, in line with the growth of manhours.

The recovery of manufacturing manhours, and thus of earnings, did not get underway until late in 1971. Since November, manufacturing wages and salaries have increased at a very substantial annual rate of 12½ percent.

The figures in table 1 for private non-manufacturing wages and salaries are somewhat distorted by developments in the construction industry, which boost the rate of income change shown from August to November 1971 and hold down the rate of change from November to this July. Earnings in construction, seasonally adjusted, were unusually strong last November, evidently because of some change in seasonal patterns plus exceptionally good weather; earnings were unusually weak in July, because of strikes and the aftermath of the flooding.

The rate of increase in government wages and salaries was boosted by increases in Federal pay scales in early 1971 and again in early 1972, plus

military pay raises in late 1971. Of course, other wage components were also affected by pay raises in the past 2 years, but the Federal raises are generally quite noticeable in the data because they affect a very large number of workers at one time. Employment at the Federal level has been stable to declining throughout the period since late 1969 (and had indeed been stable for more than 2 years before that). State-local government employment continued in 1970 to rise more or less in line with its strong trend, but stabilized in 1971; it is now growing again.

"Other labor income"—mainly employer payments to private pension and health and welfare funds—is a very rapidly growing element of labor compensation, as table 1 shows. Nonwage income components have generally increased less rapidly since last August than in the early months of the recovery. The one exception, among major components, is personal interest income (which is combined with rental income in the table). Expansion of both farm and nonfarm proprietors' income was very fast early in the recovery, slower in the freeze period, and even slower in the period November–July.

The level of transfer payments was boosted during the course of both 1970 and 1971 by increases in social security benefit rates. With the mid-1971 benefit increase excluded, the rise in total transfer income from December 1970 to August 1971 is about 10½ percent, more in line with the experience since last August than is the 16¼ percent rate of increase from December 1970 to August 1971 shown in table 1. Another, very large benefit increase goes into effect shortly. Unemployment compensation is a small part of total transfer income—less than \$6 billion last year out of a total of nearly \$100 billion. Income from this source more than doubled between late 1969 and late 1970, during the recession, and continued to increase at a very substantial rate during much of 1971. Since late last year, however, it has declined as economic conditions have strengthened, and this has somewhat slowed the expansion of total transfer income.

Corporate Profits

The strong expansion of national output this year has stimulated a strong expansion of profits. The preliminary estimate of second quarter profits as measured in national income shows an increase of nearly \$6 billion to a seasonally adjusted annual rate of \$87½ billion. That figure is a record; it modestly surpasses the old peak of \$85½ billion reached in the middle two quarters of 1968. Profit expansion in the second quarter was centered in durable goods manufacturing, public utilities, and financial institutions.

The national income measure of profits excludes gains or losses arising from differences between the replacement cost of goods taken out of inventory and the cost at which they are charged to production. These inventory profits or losses are excluded because national income is intended to measure only the factor incomes arising from production. The amount of inventory profit was somewhat smaller in the second quarter than in the first, and thus book profits—profits as stated before the inventory valuation adjustment (IVA)—increased \$5 billion, somewhat less than the increase in national income profits. Profit tax liability increased \$2 billion and after-tax book profits \$3 billion.

In June, business suffered a considerable loss of plant and equipment and inventory because of the floods. On the basis of available information, BEA tentatively estimates the amount of the losses to corporations at \$450 million, or about \$1¼ billion (annual rate) for the quarter. Thus, in the absence of the flood losses, but with all other things being equal, the increase in pretax profits from the first to the second quarter would have been about \$1¼ billion larger than it was. BEA estimates that capital consumption allowances (which include allowances for accidental damage to fixed capital) were swelled by about \$1¼ billion in the quarter and that the losses of inventory that affected second quarter profits were about \$½ billion.

Nonfinancial corporations

Nonfinancial corporations' profits (including IVA) from domestic ac-

CHART 2

Nonfinancial Corporations: Output, Costs, and Profits

NOTE.—Output is constant dollar gross corporate product (GCP). Price per unit is calculated by dividing current dollar GCP by constant dollar GCP. Unit costs and unit profits are calculated by dividing the several components of current dollar GCP by constant dollar GCP. Nonlabor cost consists of capital consumption allowances, net interest, and indirect business taxes plus business transfers less subsidies received.

tivities rose \$4¼ billion in the second quarter to a seasonally adjusted annual rate of \$64¼ billion (chart 2).² This increase put profits about \$18 billion above the figure for the fourth quarter of 1970, which was both the general cyclical trough and the quarter in which output and profits were cut by the auto strike. Nevertheless, nonfinancial corporations' profits are still considerably below the peak of about \$70 billion that was attained during 1966 and touched again in 1968. (Total corporate profits reached a record in the second quarter because of the strong growth trend of financial institutions' profits, which only paused, did not decline, in the 1967 and 1969-70 economic slowdowns.)

The recovery of nonfinancial corporations' profits since the fourth quarter of 1970 reflects both fairly strong expansion of nonfinancial corporations' real output (i.e., their gross product, or value added, in constant dollars), especially in the past 3 quarters, and recovery in the margin of profit per unit of real output (chart 2). Despite this recovery, the margin remains far below the levels prevailing before the recent economic slowdown.

Chart 2 shows the real output (constant dollar gross product, or value added) of nonfinancial corporations; price, costs, and profit per unit of output; and the total dollar amount of profit. Gross product, or value added, is the sum of factor incomes originating in corporations plus other charges against production; it is the sum of employee compensation, net interest payments, pretax profits (with IVA), capital consumption allowances, indirect taxes (net of subsidies received), and transfer payments made by corporations. The profit margin plotted on chart 2, profit per unit of constant dollar output, or value added, is thus not the same as profit per dollar

2. Net profits remitted from abroad are included in the total corporate profits figure that is a component of national income. These profits represent a net export of capital services by U.S. owners of property, and are counted in net exports on the "product" side of the national income and product accounts. However, profits from abroad are not included in this review of nonfinancial corporations' profits, cost, and output because there is no available information about the amount of output (value added) with which these profits are associated.

of sales. For one thing, sales are stated in current prices for profit margin calculations; moreover, a company's sales are equal to the sum of its value added plus its expenditure for purchased materials.

Unit price and unit costs

The increase in the unit price of nonfinancial corporations' output has been quite slow in the past year—only 1 percent at an annual rate from the second quarter of 1971 to the fourth quarter and only 2 percent (annual rate) from the fourth quarter to this year's second quarter. From the fourth quarter of 1969 to the second quarter of 1971, unit price increased at an annual rate of 4¼ percent.

The rate of increase in unit costs has also slowed. The rebound of output after the cyclical trough has allowed fixed costs to be spread over a growing volume of production. As a result, unit nonlabor costs have been more or less stable during the past year after having risen very rapidly in 1969 and 1970, when output was not growing (chart 2).

The rate of increase of unit labor cost—employee compensation per unit of real output—has also been much slower in the past year than it had been in the late 1960's. This is the result mainly of a speedup in the growth of output per man-hour, for there has been fairly little slowdown in the growth of compensation per man-hour. The Bureau of Labor Statistics has recently begun to publish quarterly estimates of man-hours in nonfinancial corporations (calculated on the basis of hours paid for, not hours worked), and these estimates make it possible to assess the relative importance of output per man-hour and compensation per man-hour as factors influencing change in unit labor cost.

Table 2 summarizes developments since the end of 1966, showing changes in output, man-hours, output and compensation per man-hour, and the various per unit measures plotted on chart 2.

The first time period in table 2 is from the end of 1966 to mid-1968, covering the mini-recession of 1967 and a subsequent period in which man-hours

Table 2.—Change in Nonfinancial Corporations' Output, Price, and Costs

[Percent change, seasonally adjusted at annual rate]

	1966-IV to 1968-II	1968-II to 1969-IV	1969-IV to 1970-IV	1970-IV to 1972-II	1971-II to 1972-II
Output (constant dollar gross product).....	3.8	3.5	-3.7	8.4	8.2
Man-hours.....	.7	2.1	-5.0	2.4	2.7
Output per man-hour.....	3.1	1.4	1.4	5.8	5.6
Compensation per man-hour.....	6.2	7.3	7.4	6.5	6.5

Unit nonlabor cost.....	6.4	6.6	9.9	1.8	2.1
Unit price.....	2.7	2.8	4.5	2.3	1.5
Unit profit.....	-3.7	-15.1	-15.4	15.2	3.8

continued to increase very slowly. In the period from mid-1968 to end-1969, man-hour growth was faster, productivity very weak, and profit margins plummeted. Margins continued to decline in the recession year from end-1969 to end-1970.

The table takes the fourth quarter of 1970 as another point for calculations, because it was a cyclical turning point for the general economy. However, the auto strike put an extra damper on that quarter. To put a clearer light on developments since the post-strike rebound, the table also shows change from the second quarter of last year to the second quarter of this year.

The table covers the period since the time at which significant inflationary problems began to develop. Before that, in the first half of the 1960's output per man-hour increased strongly and offset the increase in compensation per man-hour. As chart 2 shows, unit labor cost was steady in those years and unit profit increased very substantially. Beginning in the mid-1960's, the situation turned much less favorable for profit margins and has brightened only in the very recent past.

Federal Fiscal Position

The Federal Government's deficit as measured in the national income accounts amounted to about \$21 billion (seasonally adjusted annual rate) in the second quarter. This was more than \$6 billion above the deficit recorded in the first quarter. The increase reflected a sharp boost in Federal spending, particularly for grants-in-aid and purchases of goods and services.

Federal receipts increased \$4 billion in the second quarter to \$225.4 billion (seasonally adjusted annual rate). Corporate tax accruals rose \$1.7 billion. Personal taxes increased only \$1.5 billion; personal income taxes increased \$4.4 billion but there was a \$2.9 billion decline in estate and gift taxes, which had been temporarily boosted in the fourth and first quarters by a speedup in the payment schedule. Social insurance contributions rose \$0.9 billion. Indirect business taxes fell \$0.2 billion, largely because of a decline in customs duties.

Federal expenditures increased \$10.2 billion in the second quarter to \$246.5 billion. This large advance centered in grants-in-aid, which rose \$5.7 billion, including a \$4 billion (annual rate) advance payment for public assistance. Other public assistance grants also increased sharply. Defense purchases rose \$1.9 billion—the third consecutive

quarterly increase in this category. Transfer payments advanced \$1 billion and net interest increased \$0.7 billion.

For fiscal year 1972, preliminary data show a deficit of about \$22 billion on the NIA basis. The deficit on the NIA basis estimated from the January budget was \$35 billion. (The NIA deficit for the full fiscal year 1972 exceeds the average of the four seasonally adjusted quarterly deficits because the January 1972 increase in the social security tax base to \$9,000 resulted in an increase in seasonally adjusted social insurance contributions in the first half of 1972 but had little effect on unadjusted contributions.)

As shown in table 3, fiscal 1972 NIA receipts were \$8.2 billion higher and expenditures \$4.7 billion lower than estimated in January.

Personal taxes, mainly because of unexpected overwithholding, exceeded the January estimate by nearly \$8 billion; corporate and indirect business tax liabilities were only modestly above the budget estimates. On the other hand, social insurance contributions fell about $\frac{1}{2}$ billion short, partly because the additional increase in the social security tax base to \$10,200 proposed in the budget to be effective retroactive to January 1972 was not approved by Congress.

On the expenditure side, grants-in-aid were \$3.4 billion below budget esti-

mates, largely because budget assumptions about revenue sharing did not materialize. Transfer payments were also well below the budget, primarily because of lower-than-expected unemployment benefits. Total purchases of goods and services closely matched the January budget estimate although defense purchases were higher and non-defense purchases lower than assumed in the budget.

Increase in social security benefits

Last month's Congressional approval of a 20 percent across-the-board increase in social security benefits, new social security taxes, and a new method for determining future benefit and tax increases has important implications for the budget outlook in fiscal 1973 and beyond.

The new across-the-board benefit increase will raise transfer payments \$8.2 billion (annual rate) in October. This represents an expenditure increase of about \$6 billion for the full fiscal year 1973 as compared to about \$4 billion of social security benefit increases included in the 1973 budget presented last January (and in the mid-year Budget review). The budget assumed a 5 percent across-the-board benefit increase payable in July 1972 plus liberalized benefits in certain other categories.

Under the new law, social insurance contributions will increase \$6.5 billion (annual rate) in January 1973 as a result of increasing the combined employee-employer tax rate from 10.4 percent to 11 percent, and increasing the maximum earnings subject to tax from \$9,000 to \$10,800. The January budget called for a rate increase to 10.8 percent in January 1973 and for an increase in the tax base to \$10,200 effective January 1972. As compared to the budget, the impact of the new law is to reduce the estimate of Federal receipts in fiscal 1973 by roughly \$1½ billion.

In addition to raising benefits and taxes, the new legislation introduces an escalator clause tying future benefit increases to the increase in the consumer price index. Barring additional legislative action, the earliest date at

which an "automatic" benefit increase could occur would be January 1975. An increase at that time would be triggered if the CPI in the second quarter of 1974 is at least 3 percent higher than in the third quarter of 1972.

After 1974, when the tax base will rise to \$12,000 under the new law, increases in the tax base will automatically go into effect when benefits increase. The amount of the increase will be determined by the percentage increase in average wages subject to the social security tax.

The new method of determining social security benefits and their financing substantially reduces (or eliminates) the budget surpluses of the social security system. In the past, these surpluses have provided a source of financing general fund deficits. Table 4 shows the estimated budget position of the social security system, fiscal years 1973-1978, under the present law and under the old law. The projections under the present law assume "automatic" increases in benefits and in the maximum earnings subject to tax in January 1975 and January 1977.

Second Quarter GNP Revised

On the basis of additional source data, BEA has made various revisions in the income and product accounts for the second quarter. Aggregate GNP is essentially unaltered, with downward revisions in business fixed investment, net exports, and State and local government purchases just about offsetting upward revisions in consumption, inventory accumulation, and residential construction.

From the first quarter to the second, total GNP increased slightly more than \$30 billion at a seasonally adjusted annual rate, or close to 11½ percent. In deflated terms, the advance was nearly 9½ percent.

The downward revision of about \$1 billion in business fixed investment reflects the availability of more complete information on second quarter spending. This information indicates that investment in producers' durable equipment did not increase nearly as strongly in the second quarter as preliminary evidence had suggested. However, the estimate of investment in nonresidential structures has been revised up.

The estimated rate of inventory accumulation was revised up and now stands at \$5 billion (annual rate). This accumulation figure is low in absolute terms, given the growth rate of economic activity, but it is far stronger than the accumulation rate in recent quarters. The estimate of accumulation in May (in terms of book values, which are reported monthly) was revised up, and all major business sectors show sizable gains in that month. Estimated June accumulation by manufacturers was very substantial, though trade firms showed a decline. An upswing in inventory accumulation has been conspicuous by its absence in the current economic recovery, and most analysts are expecting demand strength to develop in this area. The second quarter figures, though subject to error and hardly conclusive, suggest that a move in this direction may be underway.

The estimate of personal consumption expenditures was revised up about \$1 billion, mainly in spending for nondurables. The first half of 1972 saw a very strong advance in consumer spending—about 9½ percent at an annual rate in the first quarter and more than 10 percent in the second. These gains, coming in a period when after-tax income has been held down by the effects of overwithholding, have pushed the saving rate down to about 6½ percent. For nearly two years the rate had been running around 8 percent or higher.

- Revised figures show second quarter GNP up \$30 $\frac{1}{2}$ billion; real GNP up 9 $\frac{1}{2}$ percent
- In July: The jobless rate remained at 5.5 percent
- The wholesale price index rose 0.8 percent; prices of nonindustrial products were up 2.2 percent

The Development of Wage and Price Relationships for a Long-Term Econometric Model

IN September 1965, work was begun at Harvard University by Lester Thurow on the development of an econometric model designed to provide long-term projections of the U.S. economy and to aid in the formulation of fiscal policies. Financial support was provided by the Interagency Growth Project through a research contract with the Bureau of Economic Analysis (formerly the Office of Business Economics). A progress report on that work was published as "A Fiscal Policy Model of the United States," by Lester C. Thurow, in the June 1969 *SURVEY OF CURRENT BUSINESS*.

Since then, the model formulated by Thurow has been extensively tested and modified, but it retains its original features of relative simplicity and emphasis on Federal fiscal policies. The modified model (referred to in this article as the BEA long-term model) is currently being used to make long-term projections of GNP and its components.

Because of the emphasis on simplicity in the design of the original model, several important economic variables were treated at a highly aggregative level, compared to their treatment in other econometric models, and other variables that are usually treated as being simultaneously determined within the economic system represented by the econometric model were assumed to be exogenous.

Two key variables in an econometric model of the aggregate economy are the price level and the aggregate wage rate. In the original Thurow model, prices were exogenous and there was no equa-

tion for the wage rate. There was an equation explaining employee compensation that was not so much a behavioral relationship based on theoretical considerations as a correlation of the movements of broad aggregates, since employee compensation was determined by observing its relatively constant ratio over time to national income.¹

This treatment of employee compensation did not create a problem in the original version of the model since the only variable directly affected by employee compensation was social security contributions. Employee compensation did not interact at all with the supply side of the model. However, when the model was modified so that the income and supply sides interacted simultaneously, the reliability of the employee compensation equation became important.

Thus, a natural extension of the model is the development of a behavioral equation for compensation. Adopting the theory that prices and wages are simultaneously determined, an equation for the price level is also developed. This article reports on progress in the development of the compensation and price equations.

A three equation model is developed: an equation explaining the percent change in employee compensation per

man-hour, and two price relationships, the first explaining the level of the implicit deflator for gross private product and the second explaining the percent change in the implicit deflator for personal consumption expenditures.

The percent change in employee compensation per man-hour is explained primarily by two factors: demand pull, measured by the unemployment rate, and the expected rate of price change, measured by the percent change in the current period in the personal consumption expenditures deflator.

The percent change in the personal consumption deflator, needed for the compensation equation, is explained by a simple correlation with the percent change in the gross private product deflator, and that deflator is explained by making it a function of unit labor costs and a demand variable, the unemployment rate.

Development of wage-price relationships for the BEA long-term model started with an examination of wage behavior with respect to the unemployment rate, as in "Phillips curve" analysis. George Perry's findings concerning the effects of changes in labor force composition² were incorporated and tested, and a test was also made of a form of the price expectations hypothesis used in several recent studies.³

1. The Thurow model related employee compensation to an income variable consisting of personal income less the sum of dividends, interest (government and consumer), and government transfers. In the BEA long-term model, the equation has been modified to take the following form (fitted to annual data in current dollars for 1948-1968):

$$C = 23.84 + .7519Y \quad R^2 = .999 \\ (9.55) \quad (127.2)$$

C = private employee compensation

Y = gross national product less the sum of capital consumption allowances and indirect business taxes; values in parentheses are t ratios.

2. George L. Perry, "Inflation and Unemployment," in *Savings and Residential Financing: 1970 Conference Proceedings*, sponsored by the United States Savings and Loan League, Chicago, Ill., May 7 and 8, 1970; reprinted by the Brookings Institution, Reprint No. 188, Dec. 1970; "Changing Labor Markets and Inflation," in Okun and Perry, eds., *Brookings Papers on Economic Activity*, 3:1970, pp. 411-441.

3. See, e.g., R. J. Gordon, "The Recent Acceleration of Inflation and Its Lessons for The Future," in Okun and Perry, eds., *Brookings Papers on Economic Activity*, 1:1970, pp. 8-41. Gordon reports tests of the "acceleration hypothesis" in which an attempt to hold unemployment below the "natural" rate is hypothesized to lead to an ever-accelerating inflation.

NOTE.—A version of this article was delivered at the American Statistical Association Annual Meetings, Montreal, Canada, August 1972.

Wage Relationships

The theory of wage determination used here as a basis for statistical estimation explains wage movements primarily by two forces: demand pull and the expected rate of price change. Additional explanatory variables, as explained below, are also hypothesized to affect wage determination.

Demand pull is measured by a form of the unemployment rate and the expected rate of price change is measured by the actual observed rate of change of a price index of consumer purchases.

A consideration in choosing the variables to be included in the wage equation was the desire to minimize the number of additional exogenous variables introduced into the model. The basic wage equation explains the percent change in employee compensation per man-hour by the reciprocal of the unemployment rate, the percent change in the deflator for personal consumption expenditures (PCE), the percent change in a corporate profit rate, the percent change in employee and employer social insurance contributions per man-hour, and the percent change in a variable representing industry mix. (The precise definitions of these variables are presented below, under the heading "Definition of variables.") The only variable exogenous to the model that is added in this formulation is the variable that measures change in the industrial composition of employment. Social insurance contributions and the corporate profit rate are endogenously determined in the original model, and the deflator for personal consumption expenditures is the dependent variable in one of the price equations developed in this study.

The unemployment rate is used as a measure of demand for labor. The reciprocal of the rate is specified to allow for the nonlinearity of the relationship between wage change and unemployment (a relationship that has generally been hypothesized to be convex to the origin when the rate of wage change is plotted against the unemployment rate).

The percent change in the PCE deflator is used as a measure of expect-

tations of future price changes. Use of only the current value of the variable (i.e., change from the previous to the current year) represents the assumption that price expectations are based only on current, not lagged, price movements.⁴ The consumer price index (CPI) is the variable most frequently used in measures of price expectations in wage equations. However, its use here would present a problem in integrating the wage-price sector into the BEA long-term model. The planned dependent variable in the main price equation is the private GNP deflator, and the PCE deflator is better correlated with it than is the CPI. This consideration, plus the need for the PCE deflator elsewhere in the model, makes it preferable to use the PCE deflator rather than the CPI in constructing the price expectations variable.

The percent change in the profit rate is used as a measure of change in employers' ability to pay wage increases; or alternatively, it can be viewed as a measure of productivity change.⁵

The percent change in social insurance contributions appears as an explanatory variable because such contributions are included in the compensation measure that is being explained, and have shown marked variations over time because of changes in social insurance tax rates.⁶

Since wage levels as well as rates of wage change vary among industries, the ideal approach would be to estimate separate industry wage equations and then aggregate. Instead, as a simpler procedure an industry shift variable has been included. Since compensation per man-hour is relatively low in the service industries and since there has

been continuing employment shift to these industries, the percent change in the ratio of employment in the service industries to total employment is used as the measure of changes in industry mix. Since the model is estimated on an annual basis, all data for estimation are on an annual basis. Percent changes are calculated from the previous year.

Several lag patterns on the explanatory variables were tested, especially in the construction of the price expectations variable, but none of the lagged variables had a significant coefficient and frequently the signs were wrong. These results contrast with most published quarterly results, where lags, especially in the price expectations variable, have significant coefficients and the expected sign. It is not unreasonable, however, for explanatory variable lags of a year or more to have no effect on the dependent variable in the annual equations estimated in this study.

Alternative specifications of labor demand

Perry's hypothesis, referred to previously, is that an unemployment rate weighted by composition of the labor force, and the dispersion of the unemployed, provide a better measure of labor demand conditions for explaining wage change than does the conventional unemployment rate.⁷ To test this, several regressions were run with these two variables substituted for the unemployment rate.

A weighted unemployment rate U^* was calculated for each year using Perry's definition, and the weights (I_i) calculated by him:⁸

7. For a theoretical basis for Perry's dispersion hypothesis see G. C. Archibald, "The Phillips Curve and The Distribution of Unemployment," *American Economic Review*, May 1969, pp. 124-134.

8. Perry, "Changing Labor Markets and Inflation," *op. cit.*, pp. 439-440. In principle, there is a different set of weights (I_i) for the various age-sex classes in each time period. However, Perry found that the weights vary insignificantly over time and so used averages, which are also used here. I_i is defined as $J_i K_i$, where J_i is the ratio of the average annual hours worked per employed person in the i th age-sex class to the average annual hours worked by employed males age 35-44, and K_i is the ratio of average hourly earnings of employed persons in the i th class to the average for males aged 35-44. The age breakdown is into four groups: 16-19, 20-24, 25-64, 65 and over. Each age group is broken down into male and female.

Data on unemployment (V_i) and labor force (L_i) used for the calculation were taken from the *Manpower Report of the President*, April 1971, p. 205.

4. This assumption is consistent with Gordon's finding based on quarterly data, that price expectations as measured by a distributed lag of changes in the CPI are not influenced by lagged price changes running back more than four quarters; Gordon, *op. cit.*, p. 37.

5. J. Vanderkamp, "Wage Adjustment, Productivity and Price Change Expectations," *Review of Economic Studies*, Vol. 39(1) No. 117 (January 1972), p. 62.

6. Alternatively, the dependent variable could have been calculated net of social insurance contributions, eliminating any need to include contributions as an explanatory variable. Preliminary results from this formulation are not encouraging but further testing is being carried out.

$$U^* = \frac{\sum I_i V_i}{\sum I_i L_i}$$

where:

I_i is the weight for the i^{th} age-sex class,

V_i is the number in the i^{th} age-sex class who are unemployed,

L_i is the number in the i^{th} age-sex class who are in the labor force, and the summations are over all age-sex classes.

A measure of unemployment dispersion DU^* was calculated for each year using Perry's definition and the same data used in calculating the weighted unemployment rate:⁹

$$DU^* = \sum \left| \frac{I_i V_i}{\sum I_i V_i} - \frac{I_i L_i}{\sum I_i L_i} \right|,$$

with the summations over all age-sex classes. This measure is the sum, over all age-sex classes, of the differences (without regard to sign) between the share of a class in total unemployment and its share in total labor force; all data are weighted by the weights (I_i) described above. Perry's results showed that the pressure on wages would be greater as the value of the dispersion measure increased.

9. Perry, *ibid.* p. 422.

Plan of work

The plan for determining the wage equation to incorporate into the BEA long-term model was first to test equations using single equation estimating techniques; then, having selected a preferred equation on the basis of those tests, to estimate the equation for inclusion into the model, using simultaneous equation techniques. The final step was to simulate the period 1948-1968 using the model including the new compensation equation, as well as the new price equations developed in this article, and to compare these simulation results with those obtained prior to the equation change. (The simulation results presented at the end of this article are for simulations including not only the compensation equation selected for the model but also the two price equations developed in this article.)

Definition of variables

C: Private employee compensation per man-hour.

U: Reciprocal of overall unemployment rate (percent).

U^* : Reciprocal of weighted unemployment rate; calculation of weighted rate is described in text.

DU^* : Measure of unemployment dispersion; calculation is described in text.

P_1 : Implicit price deflator for personal consumption expenditures (1958=100).

P_2 : Consumer price index (1958=100).

P_3 : Implicit price deflator for gross private product (1958=100).

Π : Ratio of after-tax corporate profits to previous year's gross stock of nonresidential fixed capital in 1958 dollars.

S: Ratio of employer, employee, and self-employed contributions for OASDHI per man-hour.

I: Ratio of the average number of employees (both full- and part-time) in service industries to the average number of full- and part-time employees in the total private economy. (Service industries are those defined as "Services" in *Standard Industrial Classification Manual*, 1972.)

D_k : Dummy variable for Korean War Period; equal to 1 for 1951-53.

NOTE.— $\bar{R}^2$ is the coefficient of determination corrected for degrees of freedom. Values in parentheses are t ratios, DW is the Durbin-Watson statistic, and SEE is the standard error of estimate corrected for degrees of freedom.

Dependent variable in each equation is C.

Equations (1)-(9) were estimated by ordinary least squares; equation (10) is equation (9) estimated by two-stage least squares.

Equations (1)-(6) were estimated for 1948-1970; (7)-(10) were estimated for 1948-1968. Forecast errors for 1969 and 1970 are labeled e_{69} and e_{70} respectively.

D_g : Dummy variable for period of wage-price "guideposts"; equal to 1 for 1962-66.

ULC: Unit labor cost (ratio of private employee compensation to private GNP in 1958 dollars).

Percent change from previous to current year is denoted by a dot over the variable.

Estimated equations

Table 1 shows results of fitting various specifications of the wage equations. The dependent variable in each case is the percent change in compensation per manhour. Equations (1) through (6) were estimated for the period 1948-70; those which seemed to give the best results were then estimated for the period 1948-68, which is the period currently used for all other equations in the BEA long-term model. The equations estimated for 1948-68, numbers (7) through (10), were then used to forecast values for 1969 and 1970. This forecast provided another criterion on which to select a final equation specification for two-stage least squares estimation. The specification finally selected is the one shown as (4) fitted to 1948-70, and as (9) fitted to 1948-68.

Equation (1) incorporates Perry's hypotheses. The fit is very good but the coefficient of the dispersion variable, DU^* , has the wrong sign and is not statistically significant. Neither of the dummy variables, one for the Korean War period in which there were wage-price controls, the other for the 1962-66 "guidepost" period, has a significant coefficient.

Equation (2) is the same as (1) but with the dummy variables omitted. The fit is good with all coefficients having the expected sign except that of DU^* , which is again negative and not significant.

In equations (3) and (4) the variables U^* and DU^* are replaced with the conventional unemployment rate. The coefficients of the dummy variables used in (3) are again not significant but the coefficients of all other variables in both

equations have the expected sign and are statistically significant.

In each of these equations the coefficient of the price expectations variable is above 0.8. This value is much higher than those reported by most other studies,¹⁰ although it does not support the accelerationist hypothesis since it is less than one. The high value is entirely due to the use of the PCE deflator rather than the CPI; this can be seen by comparing equations (2) and (4) with equations (5) and (6), where the only difference is the substitution of P_2 for P_1 .

Since equations (2) and (4) provide equally good explanations of the dependent variable, they were both re-estimated for the 1948-1968 period and appear as equations (7) and (9), respectively. Forecast errors for 1969 and 1970 are shown for these equations. The errors are calculated for both years using actual values of the independent variables. The equations over-predicted in both years; i.e., the actual change in compensation per manhour was smaller than predicted by the equations. Equation (8), which includes the weighted unemployment rate but excludes the dispersion index, was also estimated for the period 1948-68, and errors were calculated for 1969 and 1970.

Equation (9) is marginally better than (7) or (8) in terms of fit and forecast, and it also avoids the introduction of additional exogenous variables, compared to (7) and (8); thus, (9) was selected for estimation by the two-stage least squares method. The result is shown as equation (10).

The two-stage least squares procedure is used to circumvent simultaneous equation bias.¹¹ Two of the right-hand-side variables in the equation, $\dot{U}$ and $\dot{S}$, are determined simultaneously in the model with the percent change in employee compensation, the dependent variable. In two-stage least squares estimation, the actual

values of $\dot{U}$ and $\dot{S}$ are replaced by values computed for them from ordinary least squares regressions applied to the reduced form of the complete BEA long-term model. Comparison of equations (9) and (10) shows that coefficients estimated by the two-stage procedure are very close to those estimated by ordinary least squares.

Since none of the equations presented here shows the weighted unemployment rate together with the dispersion measure to be superior to the conventional unemployment rate in the explanation of wage change, a further direct comparison was made, consistent with Perry's reported equations.¹² Two equations were estimated, identical except for the unemployment concept. The profit rate is omitted from the explanatory variables because it is not included in Perry's regressions. The interindustry shift variable is included, however, since Perry adjusted his dependent variable to take account of employment shifts among industries. Using symbols already defined, the regression results for 1948-70 are:

$$(a) \dot{C} = 2.17 + .546 \dot{P}_2 + 12.42 U^* \\ (1.94) \quad (5.63) \quad (3.08) \\ - .0287 DU^* + .0439 \dot{S} \\ (1.13) \quad (2.94) \\ - .459 \dot{I} \\ (3.42)$$

$$\bar{R}^2 = .88, DW = 2.46, \overline{SEE} = .764$$

$$(b) \dot{C} = 1.40 + .522 \dot{P}_2 + 14.87 U + \\ (1.19) \quad (6.10) \quad (3.36) \\ .0462 \dot{S} - .452 \dot{I} \\ (3.23) \quad (3.54)$$

$$\bar{R}^2 = .89, DW = 2.47, \overline{SEE} = .750$$

By the usual measures equation (a) would not be considered superior in any respect to equation (b). This finding differs substantially from Perry's finding that U^* provides more explanatory power than U . Perry's study used quarterly data; however, since changes in labor force composition occur only gradually over time, this factor, if relevant, should retain its explanatory power in an annual compensation equation.

Price Relationships

To close the wage-price sector it is necessary to develop an equation explaining the implicit deflator for personal consumption expenditures. The price deflators for all major final demand components as well as the deflator for private GNP are required by the BEA long-term model. Two methods of making these prices endogenous are available: (1) the component deflators can be estimated and then aggregated to derive the overall deflator; (2) the overall deflator can be estimated first and the component deflators can be based on it by means of simple regressions. Method (2) will produce one more equation than the number of deflators to be determined, since the overall deflator is a weighted average of the components; this problem of over-determination can be solved by replacing the initial value of the private GNP deflator, as calculated from its equation, by the weighted average of the component deflators. Because method (2) is considerably easier from the point of view of statistical estimation, it was selected.

The relationship hypothesized to explain the private GNP deflator is that it is a mark-up over unit labor cost, with the mark-up varying as aggregate demand fluctuates.¹³

In the equation used, unit labor costs have a delayed effect on prices, reflecting transmission lags, while fluctuations in aggregate demand, as measured by the unemployment rate, are assumed to affect the price level concurrently. Since the model is estimated with annual data, a lag of one period means a lag of one year. The equation, fitted to annual data for 1948-68, is:

$$(11) \quad P_3(t) = 16.4 + \frac{172.5}{(34.5)} ULC(t-1) - \frac{1.256}{(4.4)} U(t)$$

$\bar{R}^2 = .98$, $DW = 1.84$, $\overline{SEE} = 1.33$, numbers in parentheses are t ratios.

13. This hypothesis can be shown to be consistent with the form of the production function specified elsewhere in the BEA long-term model.

The coefficients of both explanatory variables have the expected sign and are significant. The elasticity of the private GNP deflator with respect to unit labor costs, calculated at the variable means, is 0.90. This seems to be in line with previously reported elasticities,¹⁴ but the fact that it is less than unity implies a slight increase in labor share over time. Forecast values of the private GNP deflator for 1969 and 1970 are 123.6 and 129.9, respectively, an underprediction in both years. The 1969 forecast error is 0.7 index point and the 1970 error is 0.4 point.

The estimated equation tying the deflator for personal consumption expenditures (P_1) to the private GNP deflator (P_3), expressed in terms of percentage changes and fitted to annual data for 1948-68, is:

$$(12) \quad \dot{P}_1 = .124 + .857 \dot{P}_3$$

(1.49) (22.7)

$\bar{R}^2 = .97$, $DW = 1.80$, $\overline{SEE} = .31$; numbers in parentheses are t ratios.

The variables have been defined previously. The equation was corrected for serial correlation by the Cochrane-Orcutt procedure.¹⁵

Forecast values for the PCE deflator were calculated for 1969 and 1970,

using the actual value of the independent variable in both years and applying the predicted percent change to the actual value of the PCE deflator in 1968 and 1969, respectively. The 1969 forecast implied a PCE deflator of 123.4 in that year, compared to an actual value of 123.5. The 1970 forecast implied a PCE deflator of 129.1, compared to 129.3 actual.

Simulation Results

Equation (10), the two-stage estimation of the preferred compensation equation, and the equations for the PCE and private GNP deflators, were used with the full BEA long-term model to simulate the complete set of endogenous variables for the period 1948-68 and to forecast these variables for 1969. Annual absolute errors between estimated and actual values of some of the endogenous variables were then calculated and compared with errors calculated from a model simulation for the same time period before equation (10) was substituted for the compensation equation previously used and before the addition of the two deflator equations. Average annual absolute errors, calculated as percentages of actual values, are shown in table 2 for simulation before and after the inclusion of equations (10) through (12).

The increased error in simulating nonresidential fixed investment can be traced to a poor corporate profits equation. Simulations of both private GNP and personal consumption expenditures show improved results, the latter resulting from a significantly

Table 2.—Simulation Errors

Variable	Average annual percent error without regard to sign, 1948-1968	
	Without equations (10) through (12)	Equations (10) through (12) included
Gross private product (1958\$).....	1.7	1.6
Nonresidential fixed investment (1958\$).....	3.8	5.8
Personal consumption expenditures (1958\$).....	1.25	1.0
Disposable personal income (1958\$).....	1.4	0.6
Private employee compensation.....	1.9	1.7
PCE deflator.....	(*)	1.6
Private GNP deflator.....	(*)	1.1

*Exogenous.

smaller error in disposable personal income. All three new equations perform well. However, the 1969 forecast error for the PCE deflator is larger in the full model simulation than when the forecast is made by single equation. The PCE deflator forecast by the full model for 1969 is 124.7 compared to 123.5 actual. Using the full model, the forecast of the private GNP deflator is 124.8 in 1969, compared to an actual value for that year of 124.3.

Summary

A three-equation model of the wage-price sector has been developed and integrated into the BEA long-term

model. Changes in the unemployment rate and in the price expectations variable were found to have the largest impact on changes in compensation per manhour. Although the value of the coefficient of the price expectations variable in the compensation equation is high, there does not seem to be support for the accelerationist hypothesis. Neither labor force composition change nor dispersion of the unemployed over age-sex classes provides additional explanatory power for change in compensation, contrary to recent empirical work. The coefficients of lagged unit labor cost and the current unemployment rate in the

equation for the gross private product deflator were significant, and this formulation of the markup hypothesis produced a good fit over the sample period.

The wage and price equations were integrated into the BEA long-term model and the model was simulated for the sample period, to make error comparisons of that simulation with a simulation made without the new equations. The results are encouraging, but work on evaluating forecast errors beyond the sample period must be carried out to evaluate fully the contribution to the model of the new relationships.

State and Regional Personal Income, 1971

TOTAL personal income in the United States rose nearly 7 percent from 1970 to 1971, with gains of 5½ percent or more in each of the eight regions and 4½ percent or more in each of the States. Nationally, consumer prices (as measured by the implicit price deflator for personal consumption expenditures) rose 3¼ percent. The personal income gain in every region and State and the District of Columbia exceeded the increase in consumer prices, at least moderately, so that real purchasing power of consumers increased in all areas.

On a per capita basis, the national increase in total personal income was 5¾ percent in 1971. The gain in per capita income in every region and in all but three of the States exceeded the rise in consumer prices. The exceptions were Iowa, Connecticut, and Washington, where the gains were between 3½ and 3¾ percent. The largest per capita increases, ranging from 8 to 15¼ percent, were in West Virginia, Arizona, Colorado, South Dakota, and North Dakota.

Industrial causes for differential rates of area income change

Most differentials between area (regional and State) and national change in total personal income were traceable primarily to developments in manufac-

turing and secondarily to those in farming. Developments in construction also influenced the geographic pattern of income change, but to a lesser degree.

The key role played by manufacturing payrolls and farm income in explaining regional and State income growth differentials in 1971 is highlighted in Table A. Changes in total income, non-manufacturing income, nonfarm income, and nonmanufacturing-nonfarm income are shown. Data in the right-hand section of Table A show percentage changes in each aggregate as an index of the relevant U.S. percent change.

Comparison of these aggregates reveals the combined effect of the percent change in a component and its importance in an area's income structure. It will be noted that the deviations of regional and State changes from the national pace are smaller when manufacturing and farming are omitted than they are in the case of total personal income. In many regions and States, when one of these income components is omitted, the area-Nation differential is cut by 40 percent or more. Thus, it can be seen that these industries directly played key roles in explaining area growth differentials last year. In still other areas, the differentials are reduced by 20 to 40 percent.

Area variations in rates of change were as large for construction payrolls as for manufacturing payrolls, but the latter comprise nearly 19 percent of total personal income whereas construction payrolls comprise only 4 percent of total income. As a result, differential changes in manufacturing have a much larger effect on area-Nation income differentials than do differential changes in construction.

Regional changes in manufacturing payrolls ranged from a gain of 7 percent in the Rocky Mountain region to a decline of 3 percent in New England. There were large gains in manufacturing payrolls in the Rocky Mountain and Southeast, regions in which the total income advance was substantially better than average, and small losses in manufacturing payrolls in each of the three regions where income rose least (Mideast, Far West, and New England). Thus, the regional variation in income change excluding manufacturing (columns 2 and 6 in the table) was much smaller than the variation in total income change (columns 1 and 5). Construction payrolls also were up substantially in each of the fast-growing regions and up only moderately in two of the three slowly expanding regions.

Close association between differential area changes in farm income and in total income is more apparent on a State than on a regional basis. There were, as usual, large regional variations around the national average gain in farm income, but in three of the four regions where agriculture is especially important—Plains, Rocky Mountain, and Southeast—the advance in farm income was fairly close to average. This comparative regional uniformity in rates of change represents an averaging of much larger variations among the States of the regions. In the fourth region where agriculture is important—the Southwest—there was a large drop in farm income, but other income components in the region advanced so vigorously that the gain in total personal income in the region approximated the national average.

NOTE.—The State income estimates were prepared in the Economic Measurement Branch, Regional Economics Division by Wallace Bailey, Jr., Kenneth Berkman, Michael Carroll, Vivian Conklin, Francis Dallavalle, Virginia Davis, Linnea Hazen, Kenneth Horowitz, Gordon Lester, Jr., Allan Millican, Elizabeth Queen, William Reid, Jr., Victor Sahadachny, Maurice Schlak, and Mary Schneider under the direction of Edwin J. Coleman. Special programming for this article was prepared by Francis Dallavalle, David Cartwright, and Yvonne Collins.

SURVEY OF CURRENT BUSINESS

Regional detail

Above-national-average advances in manufacturing payrolls, both durable and nondurable, directly accounted for roughly half of the area-U.S. differential gains in personal income in the Rocky Mountain and Southeast regions. This strength in the manufacturing industries led to advances above the national average in income from wholesale and retail trade, construction, the transportation, communications and

public utilities group, the finance, insurance, and real estate group, and services.

The personal income increase last year was just below the U.S. average in the Southwest, Great Lakes, and Plains. In these regions, gains in most major income components were close to the corresponding national average advance. In the Great Lakes the near average gain in manufacturing payrolls primarily reflected a combination of

good gains in the auto industry stemming from recovery from the strike of late 1970 and the strong cyclical recovery in the industry, and a small gain in nondurable manufacturing. In the Southwest large gains in income from construction and nondurable goods manufacturing offset a large decline in that region's agricultural sector and a smaller decline in durable goods manufacturing payrolls.

Footnotes to table 63:

1. Consists of net income of farm proprietors', farm wages, and farm other labor income less personal contributions under the OASDHI program.
2. Consists of income disbursed directly to persons by the Federal and State and local governments. Comprises wages and salaries (net of employee contributions for social insurance), other labor income, interest and transfer payments.
3. Equals total personal income less farm income and government income disbursements.

NOTE.—Detail may not add to total because of rounding.

Footnotes to table 70:

1. Consists of wage and salary disbursements, other labor income, and proprietors' income.
2. Does not include earnings of military personnel.
3. Less than \$500,000.

NOTE.—Details may not add to total because of rounding.

Source: U.S. Department of Commerce, Bureau of Economic Analysis.

(Continued from page 23)

Total personal income increases last year were below the U.S. average in the Mideast (6½ percent), Far West (6 percent), and New England (5¾ percent) regions. Manufacturing payrolls were off at least moderately in each of these regions, with the weakness concentrated in durable goods. In two of them (New England and Mideast), nonmanufacturing income went up about as rapidly as it did in the Nation. In contrast, in the Far West, the income weakness was not industrially concentrated. In this region the gain in most income components was not as strong as the respective gain nationwide.

Reflecting the weakness in manufacturing, income increases in most service-type industries in each of the three regions were below the national average. In New England, an especially large increase in transfer payments helped to offset the sharp drop in manufacturing payrolls.

State detail

At the State level, too, there was a clear tendency for big percentage gains in manufacturing payrolls to be associated with big gains in total income and for declines (or very small advances) to be associated with small gains in total income (table A). Large changes in farm income in States where agriculture is important were significant in explaining the size of the overall income change in those States.

Among the 24 States with the largest (8¾ to 17 percent) and smallest (4½ to 6 percent) gains in personal income, there were unusually large percentage gains or losses in manufacturing payrolls in all but one. These changes played a key role (explaining two-fifths or more of the State-Nation personal

income change differential) in 13 of these States and were of significance in 9 of the remaining 11. Changes in farm income were the overriding reason for the unusually large or small gains in total personal income in five of the 24 States.

States with large income gains

There were five States with very large personal income gains last year. These States, with gains ranging from 10 percent to 17 percent, were North Dakota, Arizona, Colorado, Florida, and South Dakota. Another 10 States had gains which were well above the national average. These States, where gains ranged from 9½ to 8¾ percent, were Nevada, Utah, West Virginia, Alaska, Mississippi, Tennessee, Delaware, Arkansas, Georgia, and South Carolina.

Manufacturing payrolls in each of these 15 States rose at a rate well above the national average, and gains in this component played the key role in the rapid rate of overall income expansion in eight of the 15. These States were Arkansas, Mississippi, Alaska, Nevada, South Dakota, Delaware, Utah, and Colorado. In the remaining seven States of the fast-growing group, manufacturing also played a significant although smaller role in income growth.

Farm income rose more rapidly than in the Nation in 10 of the 15 States. However, in only two—North Dakota and South Dakota—was a big increase in farm income the key factor in the rapid rate of overall income expansion.

In 13 of these States, construction rose more rapidly than in the Nation as a whole. In seven of them—Arizona, Colorado, South Dakota, Tennessee, Georgia, Utah, and West Virginia—the gains were particularly large. In

Arizona and Utah the gains in construction combined with unusually large gains in Federal Government payrolls to account for the fast rate of total personal income growth. In West Virginia, in addition to the increases in manufacturing and construction, there was a gain of more than 5 percent in that State's large mining industry.

Reflecting the strength in these basic industries, income in most service-type industries tended to rise at a much more rapid rate in the 15 fast-growing States than in the Nation as a whole.

States with small income gains

The income gain in three States—Iowa, Washington, and Connecticut—was between 4½ and 4¾ percent, well below the national average of 7 percent. In an additional six States—Ohio, Minnesota, Maine, Pennsylvania, Texas, and California—the gains were from 5½ to 6 percent.

Manufacturing payrolls either declined or rose by much less than the national average in eight of these nine States. The weakness centered in durable goods production, where payrolls declined in seven of these States. In Washington and Connecticut the large declines in manufacturing payrolls centered in the continued cutback in the aerospace industry.

A large drop in farm income explains the weakness of income expansion in Iowa, and declines in farming also held back the increase in personal income in Texas and Minnesota. In all three States, the gain in income excluding farming was close to that recorded in the Nation.

The industrial pervasiveness of the income weakness in California and Washington reflected the cumulative direct and indirect effects of the cutbacks in the aerospace industry.

Alternative Measures of Price Change for GNP, 1969-72

THE implicit price deflator for GNP, a byproduct of the calculation of constant-dollar, or "real", GNP, has been used increasingly over the past several years as a comprehensive composite index of the prices of all the goods and services that make up the GNP. Unlike most price indexes, which are constructed with fixed weights, the GNP deflator is based on shifting weights that reflect the shifting composition of GNP. This was explained in an article in the March 1969 SURVEY,¹ which carried a table for the period 1965-68 comparing the quarter-to-quarter behavior of the implicit deflator with that of alternative indexes of GNP prices using fixed weights.

The fixed weighted price indexes published in 1969 were based on 1958 weights and fourth quarter 1965 weights. New fixed weighted indexes based on 1967 weights were published in the August 1971 SURVEY, which carried a table for the period 1965-71 showing quarter-to-quarter percentage changes in the implicit deflator, the fixed weighted index using 1967 weights, and the chain price index. In the chain index calculation, quarter-to-quarter percentage changes are weighted by expenditures in the first of the two quarters involved.

The tables presented here take account of the revisions of 1969-72 income and product data published in July 1972. The data for 1965-68 published in the August 1971 SURVEY have not been revised. The quarter-to-quarter percentage changes in the implicit deflators and chain indexes for total GNP and for gross private product are updated on an ongoing basis in table 19 of the national income and product

tables published every month in the SURVEY.

Table 1 shows quarter-to-quarter percentage changes in the various price measures. Table 2 shows quarterly values of the fixed weighted price indexes calculated with 1967 weights. The indexes are shown on the base 1958=100, the same base used for the implicit deflators.

The fixed weighted index based on 1967 weights and the chain index increased at about the same rate as the implicit deflator for total GNP in the period 1965-70, although there were occasional short-run divergences because of changes in the composition of constant-dollar GNP, which affect the implicit GNP deflator but not the fixed weighted index or the chain index. However, there has been a persistent divergence during the past six quarters: in every quarter from 1971-I through 1972-II, both the fixed weighted index and the chain index increased at a faster rate than the implicit deflator. The quarterly increase in the fixed weighted index averaged 0.9 percentage point greater (at an annual rate) than the increase in the deflator for total GNP over this period; the quarterly increase in the chain index averaged 0.6 percentage point greater than the increase in the deflator. This persistent di-

vergence was due largely to a steady decline in the weight of Federal general government employee compensation in total real GNP, resulting from a declining level of Federal employment, particularly in the military. Because the level of the deflator for Federal general government employee compensation is high relative to the average deflator for total GNP, a decrease in the weight of this item tends to hold down the level of the implicit deflator for GNP, which has the effect of holding down the rate of increase in the implicit deflator.

The declining weight of Federal general government employee compensation was not the only factor in the divergence observed during the past six quarters. A similar, though less sharp, pattern of divergence can be seen in the measures of price change for gross private product (GNP less output of general government, represented by compensation of general government employees). In this case, the fixed weighted index increased faster than the implicit deflator in each of the six quarters, with the excess averaging 0.6 percentage point (at an annual rate), and the chain index increased faster than the deflator in each of the quarters, with the excess averaging 0.4 percentage point. This divergence resulted from a decline in weights of components of gross private product that have relatively high deflators. Declining weights for output of highways and streets and nonresidential buildings purchased by State and local governments and for output of private industrial buildings have had the largest effects on the private GNP deflator over this period. The weights (i.e., shares of constant-dollar GNP) of these items and of Federal general employee compensation are shown here for the year 1967, the fourth quarter of 1970, and the second quarter of 1972.

Sources and Uses of Funds of Nonfarm Nonfinancial Corporations; Size and Composition of Personal Saving

REVISED estimates of the sources and uses of funds of nonfarm nonfinancial corporations are shown in table A below, and revised data on the volume and composition of personal saving in table B. The source of these statistics is the Flow of Funds accounts prepared by the Board of Governors of the Federal Reserve System. The tables here show the data only from 1967 onward. While revisions have been made by the Federal Reserve for years prior to 1967, space considerations pre-

clude their publication at this time. Tables are available upon request from the Flow of Funds Section of the Board of Governors of the Federal Reserve System, Washington, D.C. 20551.

Tables A and B bring the estimates of internal sources, personal saving, and of physical asset purchases into line with the revised 1969-71 national income and product data published by BEA in the July SURVEY.

Data in the format of table B were

formerly prepared by the Securities and Exchange Commission, and BEA used to publish those data in table 5.7 of the national income and product accounts in the July SURVEY each year. The preparation of such data is now done by the Federal Reserve in conjunction with the Flow of Funds accounts. BEA intends to publish each year in the August or September SURVEY an updating of the data in table B to incorporate the annual revisions of the income and product accounts.

Table A.—Sources and Uses of Funds, Nonfarm Nonfinancial Corporate Business, 1967-71

(Billion of dollars)

1. The figures shown here for "internal sources," "undistributed profits," and "capital consumption allowances" differ from those shown for "cash flow, net of dividends," "undistributed profits," and "capital consumption allowances" in the gross corporate product table (p. 13 of this issue of the SURVEY) for the following reasons: (1) these figures include, and the statistics in the gross corporate product table exclude, branch profits remitted from foreigners, net of corresponding U.S. remittances to foreigners; (2) these figures include and cash flow in the gross corporate product table excludes the corporate inventory valuation adjust-

ment; and (3) these figures exclude and the gross corporate product figures include, the internal funds of corporations whose major activity is farming.

2. Foreign investment excludes amounts financed by bond issues abroad, and bond issues outside the U.S. are excluded from financial sources of funds above.

National Income and Product Accounts

HISTORICAL data are presented here for certain detailed data series first published in the data tables for 1968-71 in

the July 1972 issue of the SURVEY. Table A shows annual and quarterly data, 1947-71, on the breakdown of Federal and State-local government purchases into major components. Quarterly data for 1968-71 are in table 3.14 in the July SURVEY. Table B shows

annual data, 1946-71, on the surplus or deficit of State and local governments allocated between the surplus of social insurance funds and the surplus or deficit of all other funds. Annual data for 1968-71 are in table 3.3 in the July SURVEY.

Table A.—Government Purchases of Goods

Professional Positions at BEA

On the basis of Congressional action to date on the fiscal 1973 budget, BEA expects to undertake a significant expansion of its program. The major elements of the program expansion will be: (1) a strengthening of the estimation and analysis of the quarterly GNP accounts; (2) additional work on input-output tables, including the preparation of annual tables and testing and improvement of input-output analysis; (3) development of information needed to analyze the economic impact of changes in the environment; (4) development and analysis of information on the activities and economic impact of U.S. multinational corporations; (5) expanded analysis and research on the system of leading, coincident, and lagging business indicators.

Because of staff reassignments, as well as existing vacancies, BEA expects to fill positions not only in the expanding program areas but also in its other program areas—the preparation, analysis, and projection of the U.S. balance of payments accounts and of the State and regional economic accounts, work on short-term and long-term econometric models, and the analysis of economic conditions in the SURVEY OF CURRENT BUSINESS.

BEA invites inquiries from interested economists about positions in the range from GS-7 to GS-15 (\$9,000 to \$33,000). Inquiries should be accompanied, if possible, by Form 171, the Civil Service Commission "Personal Qualifications Statement." Those inquiring should indicate whether they have a current Civil Service eligibility rating. Address inquiries to William N. Turanin, Personnel Representative, Bureau of Economic Analysis, Room 6096, U.S. Department of Commerce, Washington, D.C. 20230.

CURRENT BUSINESS STATISTICS

THE STATISTICS here update series published in the 1971 edition of BUSINESS STATISTICS, biennial statistical supplement to the SURVEY OF CURRENT BUSINESS. That volume (available from the Superintendent of Documents for \$3.00) provides a description of each series, references to sources of earlier figures, and historical data as follows: For all series, monthly or quarterly, 1967 through 1970 (1960-70 for major quarterly series), annually, 1947-70; for selected series, monthly or quarterly, 1947-70 (where available). Series added or significantly revised after the 1971 BUSINESS STATISTICS went to press are indicated by an asterisk (*) and a dagger (†), respectively; certain revisions for 1970 issued too late for inclusion in the 1971 volume appear in the monthly SURVEY beginning with the September 1971 issue. Also, unless otherwise noted, revised monthly data for periods not shown herein corresponding to revised annual data are available upon request.

The sources of the data are given in the 1971 edition of BUSINESS STATISTICS; they appear in the main descriptive note for each series, and are also listed alphabetically on pages 189-90. Statistics originating in Government agencies are not copyrighted and may be reprinted freely. Data from private sources are provided through the courtesy of the compilers, and are subject to their copyrights.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1969	1970	1971	1969			1970				1971				1972

¹ Revised. ² Preliminary. ³ Number of carriers filing complete reports for the year.

⁴ For month shown. ⁵ See note "8". ⁶ Annual total reflects revisions not distributed to the monthly or quarterly data. ⁷ Based on six months ending in month shown. ⁸ Before extraordinary and prior period items. ⁹ Reporting roads only; excludes AMTRAK operations. ¹⁰ For six months ending in month shown.

¹¹ Indexes are directly comparable for the identical quarter of each year (and from year to year). ¹² Natl. Railroad Passenger Corp. (AMTRAK) operations for 1971 (mil. \$): Operat-

ing revenues, \$6; expenses, 179; net income, -55 (Interstate Commerce Comm.). ¹³ Includes data not shown separately. ¹⁴ Revised monthly data back to 1969 will be shown later.

¹⁵ Not comparable with data in 1971 BUSINESS STATISTICS.

¹⁶ Effective Jan. 1972, data reflect an expanded sample that includes many motor-hotels; comparable June 1971 figures are as follows: Average sale per room \$19.26; occupancy, 63%.

¹⁷ Data include visits, effective Jan. and July 1971, to Guadalupe Mts. and Redwood National Parks, and effective Jan. 1972, to Arches and Capitol Reef National Parks.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971								1972

* Revised. † Preliminary.

1 Reported annual total reflecting revisions not distributed to the monthly data. ‡ Series discontinued. § Less than 500 short tons. ¶ Annual total reflects sulfur content, whereas monthly data are gross weight. * Gross weight. † Beginning Jan. 1972, data exclude polyvinyl acetate, polyvinyl alcohol, and other vinyl resins; comparable Dec. 1971 figure, 820.1 mil. lb.

♂ Scattered revisions have been made in the annual data back to 1967; monthly revisions are not available.

♂ Data are reported on the basis of 100 percent content of the specified material unless otherwise indicated. ♀ Includes data not shown separately.

§ Data exclude black blasting powder.

† Revised monthly data for 1970 will be shown later.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS

¹ Revised. ² Preliminary. ³ Less than 50 thousand pounds. ⁴ Crop estimate for the year.
⁵ Previous years' crop; new crop not reported until beginning of new crop year (July for barley, oats, rye, and wheat; Oct. for corn). ⁶ Effective May 1971, weighted average, 4 markets, all grades. ⁷ Average for Jan., April-Sept., and Dec. ⁸ Average for Jan.-April, June-Oct., and Dec. ⁹ Annual total reflects revisions not distributed to the months.

¹⁰ Monthly revisions for Jan. 1970-Apr. 1971 will be shown later. ¹¹ Aug. 1 estimate of 1972 crop.

¹² Condensed milk included with evaporated to avoid disclosing operations of individual firms. ¹³ Excludes pearl barley. ¹⁴ Bags of 100 lbs.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971							1972

* Revised. * Preliminary. * Annual data; monthly or quarterly revisions are not available. * Excludes figures for rubber-tired dozers (included for other periods). * For month shown. * Data cover 5 weeks; other periods, 4 weeks.

† Effective with the Apr. 1972 SURVEY, index reflects new seasonal factors. Revisions for 1969-71 appear at bottom of p. S-34 of the Apr. 1972 SURVEY.

* New series. Industrial supplies (marketed through distributors)—orders index (American

Supply & Machinery Mfrs. Assn.), based on 2-month moving average of selected members, new orders, is also adjusted for number of working days. Sales index (National and Southern Industrial Distributors Assns.) is based on selected panel of members' operations which cover national sales for maintenance, repair, and operations for all types of industries. Dishwashers and disposers (Assn. of Home Appliance Mfrs.) and gas equipment (Gas Appliance Mfrs. Assn.) reflect total industry sales. Monthly data prior to 1971 are available upon request.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS	1970	1971	1971							1972

* Revised. 1 Reported annual total; revisions not allocated to the months or quarter.

2 Data cover 5 weeks; other months, 4 weeks. 3 Ginnings to Dec. 13. 4 Ginnings to Jan. 16. 5 Crop for the year 1971. 6 Aug. 1 estimate of 1972 crop. 7 Revisions for 1st qtr. 1971: Total, 101,573; plate and other, 68,627. 8 Data for total board products are available back to 1947; however, no comparable data prior to 1971 are available for the components. 9 Includes data not shown separately.

△ Stocks (owned by weaving mills and billed and held for others) exclude bedsheeting, toweling, and blanketing, and billed and held stocks of denims.

¶ Unfilled orders cover wool apparel (including polyester-wool) finished fabrics; production and stocks exclude figures for such finished fabrics. Orders also exclude bedsheeting, toweling, and blanketing.

△ Total ginnings to end of month indicated, except as noted.

Unless otherwise stated in footnotes below, data through 1970 and descriptive notes are as shown in the 1971 edition of BUSINESS STATISTICS

INDEX TO CURRENT BUSINESS STATISTICS, Pages S1-S40

SECTIONS

General:

Business indicators	1-7
Commodity prices	7-9
Construction and real estate	9, 10
Domestic trade	11, 12
Labor force, employment, and earnings	13-16
Finance	16-21
Foreign trade of the United States	21-23
Transportation and communications	23, 24

Industry:

Chemicals and allied products	24, 25
Electric power and gas	25, 26
Food and kindred products; tobacco	26-30
Leather and products	30
Lumber and products	31
Metals and manufactures	31-34
Petroleum, coal, and products	34-36
Pulp, paper, and paper products	36, 37
Rubber and rubber products	37
Stone, clay, and glass products	38
Textile products	38-40
Transportation equipment	40

INDIVIDUAL SERIES

Advertising	11, 16
Aerospace vehicles	4, 40
Agricultural loans	16
Air carrier operations	23
Air conditioners (room)	34
Aircraft and parts	6, 7, 40

Fixed Nonresidential Business Capital in the United States, 1925-1970

A volume presenting annual estimates of the stock of fixed nonresidential business capital in the United States for the years 1925-70 has been published by the Bureau of Economic Analysis (formerly the Office of Business Economics).

The publication, titled "Fixed Nonresidential Business Capital in the United States, 1925-70," gives tabulations of gross and net capital stocks, depreciation, discards, and average ages of gross and net stocks, using alternative assumptions as to service lives, depreciation rates, and valuation of capital goods. Estimates are presented for

major industries (farm, manufacturing, nonfarm non-manufacturing) and for detailed types of equipment and structures. The investment data used to derive the capital stock estimates are also presented, as well as a detailed statement of the sources and methods used.

Copies of "Fixed Nonresidential Business Capital in the United States, 1925-70" can be purchased from the National Technical Information Service, U.S. Department of Commerce, Springfield, Virginia 22151. The prices of the 544-page volume is \$7.75 per paper copy and \$0.95 in microfiche.

Please mention accession number COM-71-01111 when ordering.
