OCTOBER 1995

National Economic Trends

THE FEDERAL RESERVE BANK of ST. LOUIS

Introducing Chain-Weight GDP Data in *National Economic Trends*

At the end of this year, the Department of Commerce will change the way it calculates real gross domestic product (GDP). For nearly 50 years, real GDP has been calculated using a fixed-weight index. This method of calculation will be replaced with a chain-weight index. Starting with this issue of *National Economic Trends,* we have added the chain-weight series to the charts on pages 4 and 5.

This change will more accurately measure the level of output and economic growth. To measure output in any year, the Department of Commerce first establishes a base year. In the base year, currently 1987, real GDP is set equal to nominal GDP. Under a fixed-weight index, the prices in the base year are used to determine real GDP in every year. Thus, real GDP of $5,344 billion in 1994 indicates how much the economy produced if goods and services cost the same as they did in 1987.

There are, however, problems with this method of calculation. As prices change, people and businesses alter their purchases, substituting away from goods whose prices are rising relative to others and toward goods whose relative prices are declining. Thus, output increases most for those goods whose relative prices are falling. Evaluating these goods at their previous higher prices overstates output growth. By contrast, growth may be understated in years before the base year. To lessen the bias in measuring current economic growth, the base year is regularly updated. Although such a revision presents a more accurate picture of the current economy, it further distorts the history of the series.

The chain-weight index will minimize the bias inherent in a fixed-weight index and eliminate the changes in historical growth rates that occur when a new base year is established. Under this method, real GDP is calculated using prices in years close to the year in question. For example, the calculation of 1991 real GDP uses the prices in 1990 and 1991 as weights. Real GDP for 1992 uses the prices in 1991 and 1992 as weights. Moving through time forms a chain of weights that gives the index its name.

The table below illustrates the difference in measured growth under the two indexes. In years close to the base year (1987), there is little substitution bias, so growth is the same using either index. As expected, however, the chain-weight index indicates higher growth in years prior to the base year and slower growth in years beyond the base year. Furthermore, as one moves further from the base, the substitution bias inherent in the fixed-weight index accumulates, resulting in an increasing divergence between the two indexes.

– Patricia S. Pollard

AVERAGE ANNUAL REAL GDP GROWTH

Period	Chain-Weight	Fixed-Weight (1987 $)	Difference
1961-1975	3.75%	3.38%	0.37 % points
1975-1986	3.18	2.88	0.30
1986-1991	2.02	2.02	0
1991-1994	2.72	3.16	-0.44

National Economic Trends is published monthly by the Research Division of the Federal Reserve Bank of St. Louis. For more information on data, please call (314) 444-8573. How to Use the Triangles in this Publication

This publication makes extensive use of "triangles" to present compound annual rates of change over various periods. Consider the simple, abbreviated triangle below for quarterly Real Gross Domestic Product from the first quarter of 1990 to the fourth quarter of 1991. From this triangle, the reader can obtain rates of change from any date on the top row to any date along the left column; actual dollar figures for the periods in the left-most column are shown in the right-most column. In our example, the compound annual rate of growth from II/1990 to III/1991 can be found at the intersection of the II/1990 column and the III/1991 row, a -0.6 percent rate; similarly, the annual rate of change from I/1990 to IV/1991 is -0.2 percent. Reading down the diagonal gives the growth rate from one quarter to the next.

Real Gross Domestic Product
(Compound Annual Rates of Change)

Terminal Quarter	Initial Quarter 1-90	2-90	3-90	4-90	1-91	2-91	3-91	Billions of Dollars Annual Rates

Dollars are measured using 1987 prices.
Second quarter data are final estimates.

Prepared by Federal Reserve Bank of St. Louis
October 2, 1995

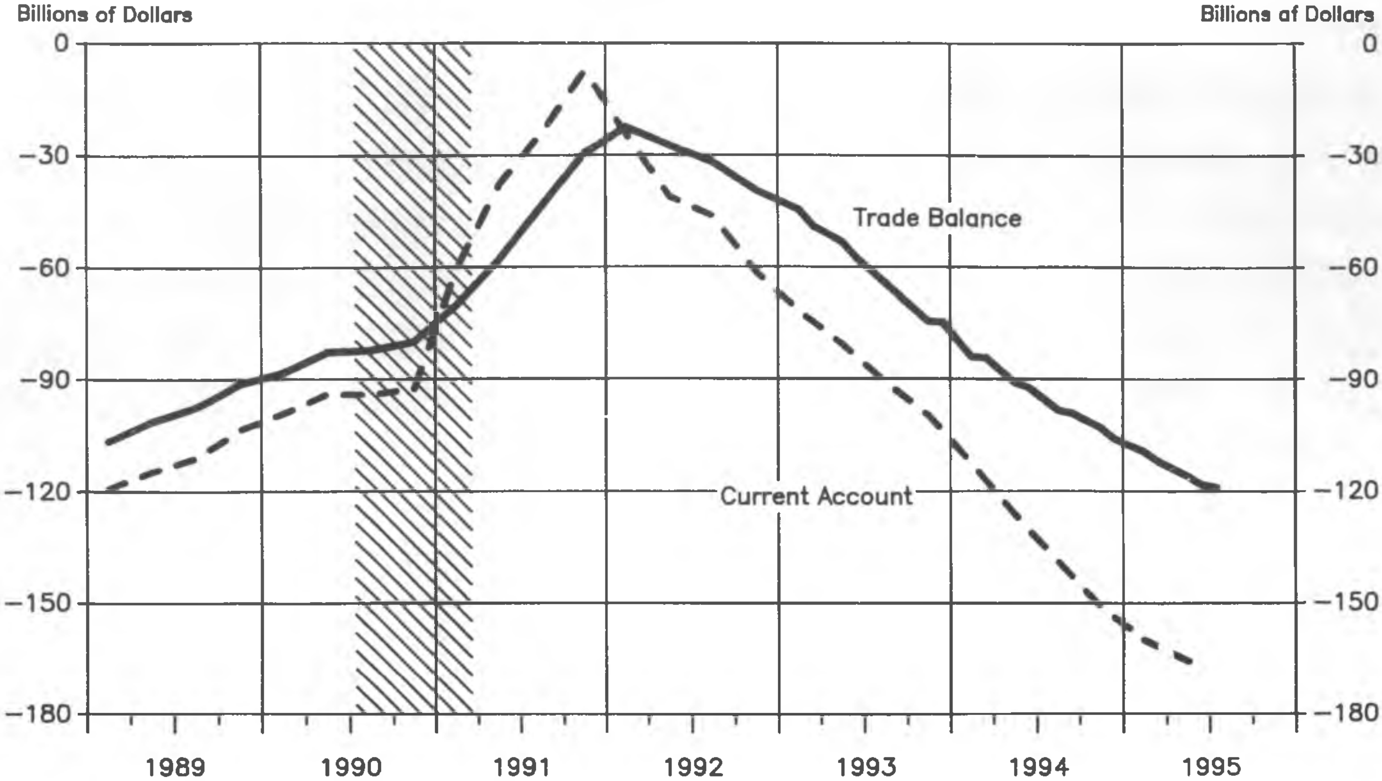
Trade and Current Account Balances

Current Prices



The goods and services trade balance and the current account are for the current plus 3 previous quarters until 1993. Since 1993, the goods and services trade balance uses the current plus previous 11 months.

Shaded area represents a period of business recession.

Prepared by Federal Reserve Bank of St. Louis

2	581.1	360.6	219.9	454.7	-28.2	35.2	623.7

(1) Profits data includes the Inventory Valuation Adjustment and Capital Consumption Adjustment.
The latter is the excess of depreciation allowances over Capital Consumption.
Net Cash Flow equals After-Tax Corporate Profits less Dividends, less the Inventory Valuation Adjustment, plus Capital Consumption.
