Price Movements

July 1978

Summary

The Producer Price Index for Finished Goods moved up 0.5 percent from June to July on a seasonally adjusted basis. This was somewhat less than the 0.8 percent average monthly increase in the first 6 months of the year (table A). Prices of commodities at the intermediate (semifinished) stage of processing moved up slightly more than in June but about the same as in both May and April. A downturn in crude foodstuffs prices led to a decrease in the index for crude materials, which had registered large advances during most of the previous 9 months.

In July, finished consumer food prices moved down 0.3 percent, the first decline since last summer. The index for finished consumer goods other than foods advanced 1.0 percent in July, after an increase of 0.4 percent in June and a 0.8 percent rise in May (table B). The acceleration in July was caused by sharper price increases for consumer durables. Capital equipment prices moved up 0.5 percent, less than in June and May but about as much as in each of

the first 4 months of the year. (The Finished Goods Price Index reflects only changes in prices received by producers for goods that are in the form in which they eventually are sold to final users. See "Brief Explanation of Producer Price Indexes," page 91.)

Before seasonal adjustment, the Producer Price Index for Finished Goods increased 0.8 percent to 195.9 (1967=100). Over the year, the Finished Goods Price Index was up 8.1 percent. The finished consumer foods index was up 9.7 percent from July 1977 to July 1978, the index for finished consumer goods excluding foods rose 7.0 percent, and the capital equipment index was 8.3 percent higher than a year earlier. The Producer Price Index for intermediate goods increased 6.5 percent over the year, and crude materials prices rose 15.3 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) rose 0.5 percent in July, seasonally adjusted, somewhat

less than in June and May (0.7 and 0.6 percent, respectively). The slowdown in July was primarily due to the first decline in the finished consumer foods index since September 1977. Between September and June, this index recorded monthly advances averaging about 1.1 percent. Among finished consumer goods other than foods, prices for consumer durables registered the third large increase in the past 4 months. Consumer nondurables other than foods increased about as much as in the 2 preceding months.

The decrease for finished consumer foods in July largely reflected sharply lower prices for meats. Prices also declined for milled rice and vegetable oil end products following advances in June. Roasted coffee prices fell after showing no change in the preceding month. Prices for processed poultry rose less than in June. On the other hand, price increases accelerated for fresh and dried fruits and vegetables, fish, bread, flour base mixes and doughs, and processed fruits and vegetables. Prices turned up for eggs, refined vegetable oils, and miscellaneous processed foods after declining a month earlier.

The consumer durables index increased 1.8 percent from June to July, after increases of 0.2 percent in June and 1.2 percent in May. Jewelry prices turned up sharply. Prices for home electronic equipment and dinnerware also advanced following no change in June. Prices rose more than in June for household flatware, household furniture, household appliances, and passenger cars.

The index for consumer nondurables goods other than foods moved up 0.6 percent in July, about the same as in both June and May but slightly more than earlier in the year. Prices rose in July for tobacco products, sanitary

papers and health products, finished lubricants, apparel, pharmaceutical preparations, and rubber footwear. Gasoline prices declined.

Capital equipment. The Producer Price Index for capital equipment advanced 0.5 percent in July, after increasing 0.8 percent in June and 0.9 percent in May. Price increases in July slowed markedly for motor trucks, photographic equipment, transformers and power regulators, special purpose machinery, and pumps and compressors. Increases for construction machinery, agricultural machinery, industrial process furnaces and ovens, machine tools, and integrating and measuring instruments were roughly the same as in June. On the other hand, prices turned up for commercial furniture following a small decline in June, and railroad equipment advanced after showing no change in the previous month.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 0.5 percent in July, seasonally adjusted, following increases of 0.3 percent in June and 0.6 percent in May. After declining 2.7 percent during the preceding month, the index for intermediate foods and feeds advanced 1.5 percent from June to July. This pattern largely reflected prices for manufactured animal feeds, which turned up sharply in July following a June decrease. On the other hand, flour and animal fats and oils moved down in July after rising in the previous month, and prices for crude vegetable oils and refined sugar for food manufacturing fell more than in June.

The index for intermediate materials excluding foods and feeds moved up 0.4 percent over the month, following 4 consecutive monthly increases of 0.5 percent. Prices for plywood, electric power, residual fuel, and plastic construction products turned down after rising in June. Liquefied petroleum gas prices dropped for the fourth consecutive month. Glass containers, paper, industrial chemicals, and millwork moved up considerably less than in the preceding month. On the other hand, prices turned up following June declines for inedible fats and oils, paper boxes and containers, and coke. Prices increased more than in June for aluminum castings, gypsum products, refractories, bituminous paving materials, leather, fabricated metal products, lumber, and motor vehicle parts. (Intermediate materials are semifinished commodities which have been processed but which require further processing before they become finished goods.)

Crude materials

The Producer Price Index for crude materials for

further processing declined 0.6 percent from June to July after seasonal adjustment, following advances of 1.8 and 0.3 percent in June and May, respectively. The July downturn was caused entirely by crude foodstuffs and feedstuffs. Prices for hogs, cattle, and green coffee fell after rising in June, grain prices dropped more in July than in the prior month, and live poultry increased much less than in June. On the other hand, prices for oilseeds and cocoa beans turned up following June decreases.

The index for crude nonfood materials moved up 2.3 percent over the month, after a 1.7 percent rise in June and a 0.4 percent increase in May. The largest increases in July occurred for leaf tobacco, crude natural rubber, natural gas, iron and steel scrap, and crude petroleum. Prices for plant and animal fibers, hides and skins, and nonferrous scrap declined. (Crude materials are products entering the market for the first time which have not been manufactured or fabricated but which will be processed further before becoming intermediate or finished goods.)

Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index revision have been developed for the period beginning January 1978 and will be published each month in table 14, "Producer price indexes for the net output of selected industries and products." The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing.

The present PPI's cover only about 50 percent of this value; the pilot survey covers about 2 percent of it.

- (3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.
- (4) Estimates of *sampling error* will be published.

Test price indexes for the four pilot program industries for the period from January through July 1978 are shown in table C. No data from the pilot program are available prior to December 1977, which is used as the base period for all published indexes. New data are available by telephone from BLS as of the day of each monthly news release: Area code 202—523-1715 or 523-1204.

Sample Changes in the July 1978 Producer Price Indexes

The data contained in this report reflect the semi-annual changes in the sample of commodities used in calculating Producer Price Indexes. Changes in the commodity sample are made each year with the release of the January index in February and again in August when the July index is released. Sample revisions are designed, within the fixed-weight concept, to improve primary market coverage and to account for changes in production and marketing patterns.

Specifications for new commodities are listed in table 16. The number of changes by major commodity group is shown in the following tabulation:

<i>Major commodity group</i>	<i>Commodity code</i>	<i>Items added</i>	<i>Items dropped</i>
Total		55	63
Farm products	01	0	0
Processed foods and feeds	02	0	0
Textile products and apparel	03	8	0

Furniture and household durables	12	0	1
Nonmetallic mineral products	13	0	0
Transportation equipment	14	2	20
Miscellaneous products	15	24	0

In July, 55 products were added to the list of commodities included in the Producer Price Index sample, while 63 items were dropped. As a result, the sample in July 1978 included 2,765 items, compared with 2,773 in January 1978. The number of Industry-Sector Price Indexes was increased by these sample changes, which provided more representative pricing of the industry output. Three additional 4-digit industries and 13 additional 5-digit product classes were published for the first time in July. The Standard Industrial Classification (SIC) codes and titles are as follows:

<i>SIC Code</i>	<i>Title</i>
2331	Women's and misses' blouses and waists
2361	Children's dresses and blouses
3079	Miscellaneous plastic products

22531	Sweaters, knit jackets, and jerseys
23292	Men's and boys' outerwear, not elsewhere classified
23612	Children's and infants' knit sport shirts
30790	Consumer and commercial plastic products
30792	Foamed plastic products
30794	Packaging and shipping containers
30795	Industrial plastic products, except belting
30797	Plastic dinnerware, tableware, and kitchenware
30798	Regenerated cellulosic products
30799	Custom compounding of purchased resins
38423	Personal industrial safety devices
38424	Electronic hearing aids

Major areas of change

In the stage of processing (SOP) category for intermediate materials, supplies, and components, a major reclassification and expansion was made for plastic products. Probability sampling techniques were used to select the sample of company reporters and products. The range of commodities in the new indexes is very broad and thus the range of prices is wide; consequently, average prices will not be published. The new sample more accurately reflects the state of today's plastic industry. As a result of these sample changes, the comprehensive index for plastic products (commodity code 07-2) was published for the first time in July. The following new commodity groupings are allocated to the SOP category for intermediate goods: Plastic packaging and shipping products; foamed plastic products; and plastic parts and components for manufacturing. The expansion of the plastics sample also resulted in the addition of two new commodity groupings to the SOP grouping for finished consumer goods: Disposable plastic dinnerware and tableware; and consumer and commercial plastics, not elsewhere classified.

A new product class for industrial safety equipment was also introduced in July. Most of the commodity groupings included in this product class—such as respiratory protective equipment, eye and face protective equipment, and protective clothing—are allocated to the SOP grouping for intermediate supplies. However, the commodity grouping for mechanical power press guards is allocated to the capital equipment component of finished goods. Also within the capital equipment component, all motor trucks were classified into one of two categories: motor trucks, 10,000 lbs. GVW and under; and motor trucks, 10,001 lbs. GVW and over. Indexes for both categories were published for the first time in July.

The consumer durables component of finished goods was strengthened by the introduction of a new commodity grouping for electronic hearing aids. Seven items of apparel

were added to improve the category for consumer non-durable goods other than foods.

1 Commodities at the subproduct class (6-digit) level are assigned to stage-of-processing (SOP) indexes according to the amount of processing, manufacturing, or assembling to which those commodities are subjected before they enter the market. The weight of each subproduct class is allocated among the various SOP indexes in accordance with the relative proportion of output consumed at each level of processing. SOP allocations are placed within parentheses for those commodity groupings whose subproduct classes are not uniformly divided among different

stage of processing categories. Such figures indicate the weighted average allocated to a particular stage of processing category as of December 1977.

¹ Data for March 1978 have been revised to reflect the availability of late reports and corrections by respondents. All prices have been lagged one month since February 1973.
² Caution should be used in interpreting month-to-month changes, because of low response

rates from the sample of reporters which ranged from 30 to 60 percent for these particular indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

³ June 1978 index corrected to reflect proper application of rates.

⁴ Revised. On June 28, 1978, the Interstate Commerce Commission ordered a rollback, retroactive to November 30, 1977, of the rate increases authorized under Ex. Parte No. 343 from 5 percent to 3 percent for newsprint, paper, sulphuric acid, rubber (natural or synthetic), manufactured iron or steel, and recyclables. The rate increases for sodium alkalis and industrial

gases were lowered from 5 percent to 2 percent. In view of this decision, the indexes for STCC groups 28 and 33 and total freight have been revised from December 1977 through June 1978.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables,

as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Wholesale Price Index and the Industrial Commodities Price Index

would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities WPI uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from pro-

ducing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays.

For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
