Price Movements

December 1978

The Producer Price Index for Finished Goods moved up 0.8 percent from November to December on a seasonally adjusted basis. This was about the same as in each of the last 3 months. Prices for intermediate (semifinished) goods rose nearly as much as in November, while prices for crude goods rose considerably less than in any of the previous 3 months (table A).

Among finished goods, prices for consumer foods rose more than in November but considerably less than in the 2 months before that. Prices for consumer nondurable goods other than foods rose about as much as in November and October but much more than in most other months of the year. The index for consumer durables rose moderately (0.5 percent) for the second consecutive month after showing virtually no change in October and September; this index had registered an average monthly rise of 1.1 percent during the first 8 months of the year. Although capital equipment prices increased somewhat less than in the previous month, the December advance was larger than

in most other months in 1978 (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods increased 0.9 percent to 202.4 (1967=100). Over the year, the Finished Goods Price Index rose 9.1 percent—the largest advance for any calendar year since 1974, when this index moved up 18.3 percent. The finished consumer foods index was up 11.9 percent from December 1977 to December 1978, the index for finished consumer goods excluding foods rose 8.3 percent, and the capital equipment index was 8.0 percent higher than a year ago. The Producer Price Index for intermediate goods increased 8.5 percent over the year, and prices for crude materials advanced 17.1 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) advanced 0.9 percent in December after seasonal adjust-

ment, compared with increases of 0.7 percent in November and 1.0 percent in October.

The finished consumer foods index rose 0.9 percent in December after rising 0.6 percent in November and 1.7 percent in both October and September. Price changes for meats in December were mixed: Beef and veal prices turned up after declining in the previous month, while pork prices moved down after a November advance. Prices were higher for processed poultry, fresh and dried fruits and vegetables, processed fruits and vegetables, vegetable oil end products, dairy products, and confectionery end products. Prices were lower for eggs and refined sugar in consumer size packages.

The index for consumer nondurable goods other than foods increased 1.0 percent in December, about the same as in November and October. Substantial increases were registered over the month for gasoline and home heating oil. Prices were also higher for textile housefurnishings, leather footwear, prescription drugs, and tires and tubes. Prices for tobacco products declined for the third consecutive month.

Prices for consumer durables moved up 0.5 percent in December, following an increase of the same amount in November and after showing no change in October. Some of the largest advances in December occurred for household glassware, mirrors, jewelry, household flatware, electronic hearing aids, home electronic equipment, and floor coverings.

Capital equipment. The Producer Price Index for capital equipment moved up 0.8 percent over the month. Although

this was somewhat less than the 1.0 percent advance registered in November, it was larger than the average monthly increase of 0.6 percent recorded during the first 10 months of the year. In December, prices for machine tools continued to rise sharply, motor trucks and commercial furniture rose substantially after several months of relatively small changes, and prices for several kinds of general purpose machinery increased more than in most recent months. On the other hand, prices for fixed wing utility aircraft and for transformers and power regulators turned down after rising rapidly in November, and prices for special industry machinery, oilfield machinery, and railroad equipment rose less than in most recent months.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components moved up 0.6 percent from November to December on a seasonally adjusted basis. This was slightly less than the 0.7-percent average monthly increase for all of 1978.

Excluding foods and feeds, the intermediate materials index rose 0.5 percent, the smallest increase since July. The slowdown was most pronounced within the index of materials and components for construction (up 0.3 percent in December vs. 1.2 percent in November). Prices declined after rising in November for plywood, lumber, building paper and board, and plastic construction products. Prices advanced less than in the previous month for gypsum products, asphalt roofing, millwork, and cement.

Among durable manufacturing materials, prices for nonferrous mill shapes, wire and cable, and flat glass rose sharply. Higher prices for domestic copper and precious metals led to an upturn in the index for nonferrous refinery shapes, which had declined in November. Among materials for nondurable manufacturing, prices advanced for unsupported plastic film, synthetic rubber, industrial chemicals, plastic resins and materials, finished fabrics, and leather. On the other hand, prices fell after rising in November for inedible fats and oils, processed yarns and threads, and gray fabrics. Fertilizer material prices moved down for the eighth consecutive month.

The processed fuels and lubricants index increased more in December than in the previous month. Prices for liquefied petroleum gas, electric power, commercial jet fuel, and diesel fuel registered large advances. In contrast, the residual fuel index declined following a sharp November increase. Among other intermediate nonfood materials, prices for paper boxes and containers recorded a sharp decrease.

The intermediate foods and feeds index advanced 1.2 percent in December, after a small decline in the previous month. Prices for crude vegetable oils and refined sugar

for use in food manufacturing turned up after falling in November. Flour prices also rose but much less than in November.

Crude materials

The Producer Price Index for crude materials for further processing moved up 0.4 percent in December, seasonally adjusted, following 3 months of much larger increases. Much of this deceleration was due to the 0.2 percent decrease in prices for crude foodstuffs and feedstuffs, which had risen rapidly in the preceding 3 months. Prices fell after rising in November for grains and green coffee, and hog prices declined for the second consecutive month following 3 months of substantial increases. On the other hand, higher prices were recorded for live poultry, cattle, oilseeds, raw cane sugar, and fluid milk.

The crude nonfood materials index rose 1.3 percent, less than the increases in the 2 previous months. Crude natural rubber prices declined for the first time since April, and coal prices continued to fall. Prices for both ferrous and nonferrous scrap, as well as for crude petroleum, rose less than in November. On the other hand, price increases accelerated for natural gas and wastepaper.

¹ Commodities at the subproduct class (8-digit) level are assigned to stage-of-processing (SOP) indexes according to the amount of processing, manufacturing, or assembling to which those commodities are subjected before they enter the market. The weight of each subproduct class is allocated among the various SOP indexes in accordance with the relative proportion of output consumed at each level of processing. SOP allocations are placed within parentheses for those commodity groupings whose subproduct classes are not

uniformly divided among different stage-of-processing categories. Such figures indicate the weighted average allocated to a particular stage-of-processing category as of December 1977.

¹ Data for August 1976 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices since February 1973 have a 1-month lag.

² Caution should be used in interpreting month-to-month changes, because of low response

rates from the sample of reporters which ranged from 30 to 80 percent for these particular indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in

the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of

this value; the pilot survey covers about 2 percent of it.

- (3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

- (4) Estimates of sampling error will be published.

Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished

goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Wholesale Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities WPI uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration on page 85).

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Re-

spondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	<u>184.5</u>
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
