Price Movements

January 1979

The Producer Price Index for Finished Goods moved up 1.3 percent from December to January on a seasonally adjusted basis. The increase was considerably more than the average monthly increase of 0.8 percent during the last 4 months of 1978 and was the largest monthly advance since November 1974. Prices for intermediate (semi-finished) and crude goods also rose sharply in January. The acceleration in all three stages of processing occurred primarily in beef and cattle prices and in a broad range of nonfood commodities (table A).

For the first time in more than 4 years, all major components of the Finished Goods Price Index rose 1 percent or more. Prices for finished consumer foods were up 1.8 percent, a continuation of the sharp advances recorded during most of 1978. Prices for consumer nondurable goods other than foods rose sharply for the fourth consecutive month, and increases for consumer durable prices accelerated following relatively small changes in the closing months of 1978. Capital equipment prices rose somewhat more than

in any month last year (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 1.4 percent to 205.3 (1967=100). Over the year, the Finished Goods Price Index increased 9.8 percent. The finished consumer foods index was up 12.9 percent from January 1978 to January 1979, the index for finished consumer goods excluding foods rose 9.0 percent, and capital equipment prices were 8.4 percent higher than a year ago. The Producer Price Index for intermediate goods increased 8.9 percent over the year, and prices for crude materials advanced 18.5 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) rose 1.4 percent after seasonal adjustment, compared with increases of 0.9 percent in December and 0.7 percent in November.

¹ Seasonal adjustment factors have been recalculated to reflect developments during 1978. The new factors, to be used through December 1979, are published in table 17. In addition, data for September 1978 have been revised to reflect the availability of late reports and corrections by respondents. For these reasons, some

figures shown above and elsewhere in this report may differ from those previously reported.

¹ Seasonal adjustment factors have been recalculated to reflect developments during 1978. The new factors, to be used through December 1979, are published in table 17. In addition, data for September 1978 have been revised to reflect the availability of late

reports and corrections by respondents. For these reasons, some figures shown above and elsewhere in this report may differ from those previously reported.

The finished consumer foods index advanced 1.8 percent over the month, much more than in December (1.0 percent) and November (0.7 percent), and about as much as in October (1.9 percent). The January acceleration was caused by prices for beef and veal, which moved up over 13 percent. This was half as much as the increase in beef and veal prices during all of 1978. Milled rice prices turned up after falling most of last year. Higher prices were also recorded for fresh and dried vegetables, vegetable oil end products, processed poultry, pork, and whole black pepper. Prices for dairy products and processed fruits and vegetables also moved up but considerably less than in most recent months. Prices for fresh fruits, roasted coffee, and fish declined sharply.

The index for consumer durables advanced 1.2 percent in January, after rising 0.5 percent and 0.4 percent in December and November, respectively. Prices for passenger cars were up considerably more than in recent months. Prices were also higher for household flatware, jewelry made of platinum and karat gold, luggage and small leather goods, household furniture, household appliances, and lawnmowers. On the other hand, prices for household glassware moved down.

Prices for consumer nondurable goods other than foods moved up 1.2 percent over the month, somewhat more than the 1.0 percent average increase in each of the last 3 months of 1978. Some of the largest advances in January occurred for tobacco products, gasoline, tires and tubes, and cosmetics. Increases were also registered for home heating oil, pharmaceutical preparations, razor blades, sporting and athletic goods, nonalcoholic beverages, sani-

tary papers and health products, apparel, and footwear. Prices for textile housefurnishings decreased over the month.

Capital equipment. The Producer Price Index for capital equipment rose 1.0 percent over the month, following increases of 0.7 and 0.9 percent in December and November, respectively. Some of the largest advances in January occurred for motor trucks, commercial furniture, oilfield machinery and tools, and hand tools. Prices for machine tools, however, rose considerably less than in most recent months.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components advanced 1.2 percent in January after seasonal adjustment, more than in any month since November 1974. The acceleration in the index was the result of sharply higher prices for a broad range of manufacturing and construction materials.

The index for intermediate materials less foods and feeds also rose 1.2 percent from December to January. The largest upward price movements were in the durable manufacturing materials category. Almost half of this increase was caused by a 3.6 percent increase in prices for finished steel products. Prices also rose for copper and copper products, precious metals, hardwood lumber, pig iron and ferroalloys, flat glass, and jewelers' materials and findings.

Among nondurable manufacturing materials, the price indexes for industrial chemicals and plastic resins and

materials both advanced more over the month than in all of 1978. Prices were also higher for woodpulp, inedible fats and oils, leather, and paint materials.

The index for materials and components for construction moved up in January at about the same rate as it had during most of 1978. Prices for plywood, millwork, Portland cement, concrete products, gypsum products, asphalt roofing, and fabricated structural metal products registered some of the largest advances over the month. On the other hand, the indexes for softwood lumber and building paper and board declined for the second consecutive month.

Among processed fuels and lubricants, price increases were recorded for residual fuel, diesel fuel, commercial jet fuel, and lubricating oil materials. In contrast, liquefied petroleum gas prices declined, as they had during most of last year.

Among other intermediate nonfood goods, some of the largest increases occurred for metal containers, mining machinery parts, valves and fittings, notions, photographic supplies, abrasive products, and fluid power equipment.

The intermediate foods and feeds index moved up 1.0 percent from December to January. (This index is no longer

seasonally adjusted.) Prices for animal fats and oils and crude vegetable oils were up sharply; refined sugar for use in food manufacturing also rose. On the other hand, prices for flour and manufactured animal feeds declined.

Crude materials

The Producer Price Index for crude materials for further processing rose 2.4 percent in January on a seasonally adjusted basis, after a much smaller increase in December. Prices for crude foodstuffs and feedstuffs moved up 2.8 percent, after a 0.1 percent rise in the previous month. This acceleration was mainly due to a rise of about 11 percent for cattle prices. Prices for live poultry, hay, oilseeds, and fluid milk also moved up. In contrast, prices for wheat and raw cane sugar were lower.

The crude nonfood materials index advanced 1.7 percent in January. Prices increased for natural gas, crude petroleum, hides and skins, nonferrous scrap, and wastepaper. On the other hand, prices declined after rising in most recent months for iron and steel scrap and crude natural rubber.

Note on Seasonal Adjustment Procedures

Effective with this report, seasonal adjustment factors have been recalculated to reflect 1978 experience for stage-of-processing (SOP) groupings, commodity groupings, and durability groupings. The new factors, to be used through December 1979, appear in table 17. This routine annual recalculation may affect seasonally adjusted data from

January 1974 to the present. Table C compares percent changes for seasonally adjusted indexes calculated with the old seasonal factors and seasonally adjusted indexes recalculated with the new factors for the three major SOP categories.

Sample Changes in the January 1979 Producer Price Indexes

Data in this report reflect semiannual changes in the sample of commodities used to calculate Producer Price Indexes. Each year changes in the commodity sample are made in the January and July indexes. Sample revisions are designed, within the fixed-weight concept, to improve primary market coverage and to account for changes in production and marketing patterns.

Inasmuch as 20 products were added and 20 items were dropped in the list of commodities used for calculating Producer Price Indexes in January 1979, the sample now includes 2,765 items, the same as in July 1978. The number of changes by major commodity group is shown in the following tabulation:

Major commodity group	Com- mod- ity code	Items add- ed	Items drop- ped
Total		20	20
Farm products.	01	0	0
Processed foods and feeds	02	0	0

Miscellaneous products	15	19	6

In the Industry-Sector Price Index (ISPI), indexes for four 4-digit industries and six 5-digit product classes were published for the first time in January. These Standard Industrial Classification (SIC) codes and titles are as follows:

SIC code	Title
3911	Jewelry, precious metal
3915	Jewelers' findings and materials
3931	Musical instruments
3961	Costume jewelry and costume novelties

39112	Jewelry, made of precious metals
39151	Jewelers' findings and materials
39152	Lapidary work and diamond cuttings
39311	Pianos
39314	Other musical instruments and parts
39610	Costume jewelry and costume novelties

Major areas of change

The 20 products that were added to the index helped to improve the coverage in the stage-of-processing (SOP) grouping for finished consumer goods, particularly durables. The jewelry sample was revised extensively with the introduction of 15 new items that represent a broad range of costume and precious jewelry. The revision in the jewelry sample also improved the SOP category for intermediate materials for durable manufacturing, which now includes jewelers' materials and findings. Indexes for jewelry and jewelry products will now be published on a base of December 1978=100; indexes before that month are not available. A microwave oven and four musical instruments were also added to the sample of consumer durables.

Table 16 lists detailed specifications for new commodities. Detailed data on relative importance of all items in the index as of December 1978 will be published later this year in the annual supplement.

¹ Data for September 1978 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision four months after original publication.

² Comprehensive relative importance figures are computed once each year in December.

³ Not seasonally adjusted.

⁴ Percent of total finished goods.

⁵ Percent of total intermediate materials.

⁶ Percent of total crude materials.

¹ Commodities at the subproduct class (8-digit) level are assigned to stage-of-processing (SOP) indexes according to the amount of processing, manufacturing, or assembling to which those commodities are subjected before they enter the market. The weight of each subproduct class is allocated among the various SOP indexes in accordance with the relative proportion of output consumed at each level of processing. SOP allocations are placed within parentheses for those commodity groupings whose subproduct classes are not

uniformly divided among different stage-of-processing categories. Such figures indicate the weighted average allocated to a particular stage-of-processing category as of December 1977.

¹ Data for September 1978 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices since February 1973 have a 1-month lag.

² Caution should be used in interpreting month-to-month changes, because of low response

rates from the sample of reporters which ranged from 30 to 80 percent for these particular indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in

the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

¹ The seasonal factors for this series are implicitly derived and are not available in advance. They are derived by dividing the unadjusted aggregate by the adjusted aggregate. The seasonally adjusted index is computed by dividing the adjusted aggregate at each level of detail by the appropriate weight factor. Therefore, the application of an implicit factor to the unadjusted

index may not yield the seasonally adjusted index.

² Seasonally adjusted indexes are implicitly derived and, therefore, seasonal factors are not available in advance.

³ Series is not seasonally adjusted.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of

this value; the pilot survey covers about 2 percent of it.

- (3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

- (4) Estimates of sampling error will be published.

Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished

goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration on page 92.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Re-

spondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
