Price Movements

February 1979

Summary

The Producer Price Index for Finished Goods moved up 1.0 percent from January to February on a seasonally adjusted basis. This compares with a 1.3 percent rise in January and an average monthly increase of 0.8 percent during the last quarter of 1978. Prices for intermediate (semifinished) goods rose more than 1 percent for the second consecutive month, and crude material prices increased over 3 percent, considerably more than in most recent months (table A).

Prices for most major components of the Finished Goods Price Index rose sharply, although not as much as in January. Prices for finished consumer foods were up 1.6 percent, slightly less than in the previous month but much more than in December or November. Prices for consumer nondurable goods other than foods rose substantially for the fifth consecutive month. Consumer durable prices rose 0.7 percent over the month, considerably less than the January advance. The rise in capital

equipment prices slowed slightly (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 1.0 percent to 207.4 (1967=100). Over the year, the Finished Goods Price Index increased 10.0 percent. The finished consumer foods index was up 12.5 percent from February 1978 to February 1979, the index for finished consumer goods excluding foods rose 9.6 percent, and capital equipment prices were 8.7 percent higher than a year ago. The Producer Price Index for intermediate goods increased 9.3 percent over the year, and prices for crude materials advanced 20.2 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) rose 1.2 percent after seasonal adjustment, compared with increases of 1.4 percent in January and 0.9 percent in both December and November.

The finished consumer foods index rose 1.6 percent from January to February, following a 1.8 percent advance in the preceding month. Prices for beef and veal rose much less than in January (4.7 vs. 13.3 percent). Prices for some foods, however, rose at a faster rate than in January—fresh and dried vegetables, pork, vegetable oil end products, refined sugar in consumer-size packages, and confectionery end products. Fresh fruits and fish turned up after falling in January. Prices for roasted coffee and processed poultry declined.

Prices for consumer nondurable goods other than foods advanced 0.9 percent in February after rising 1.2 percent in January. The largest increases occurred for leather footwear, tires and tubes, gasoline, and textile housefurnishings. Prices also rose for disposable plastic dinnerware and tableware, alcoholic beverages, and most other nondurables.

The index for consumer durables rose 0.7 percent over the month after an increase of 1.2 percent in January. Most of the slowdown in February was caused by a smaller rise (0.7 percent) in the passenger car index, which had advanced 2.1 percent in January. Prices for household furniture also rose much less than in the previous month. Luggage and small leather goods turned down after a substantial rise in January.

Capital equipment. The Producer Price Index for capital equipment rose 0.8 percent after increasing 1.0 percent in January. Motor truck prices advanced more than 2 percent for the second consecutive month. Commercial furniture prices rose sharply for the third consecutive month, but not as much as in January (1.5 vs. 3.6 percent). Prices for

special industry machinery and equipment and for oilfield machinery and tools also rose considerably less than in the preceding month. After rising rapidly in most recent months, prices fell for pumps and compressors, hand tools, and mining machinery and equipment.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 1.1 percent in February, seasonally adjusted, nearly as much as in the previous month. Higher prices for nonferrous metals and chemicals accounted for much of the February increase.

The index for intermediate materials less foods and feeds moved up 0.9 percent from January to February after rising 1.2 percent from December to January. The index for durable manufacturing materials advanced 1.6 percent, somewhat less than the 2.2 percent rise in January. Steep increases for copper and copper products and for precious metals accounted for much of the February advance. Prices were also higher for plastic resins and materials, laminated plastic sheets, foamed plastic products, flat glass, and jewelers' materials and findings. Steel mill prices, which had risen sharply in the preceding month, were virtually unchanged in February.

Among nondurable manufacturing materials, industrial chemical prices rose sharply for the second consecutive month; this index increased as much during the first 2 months of 1979 as it had from December 1976 to December 1978 (3.3 percent). Price increases were also registered for paper, paperboard, leather, and inedible fats

and oils. In contrast, prices for gray fabrics declined for the third consecutive month after rising substantially during most of 1978.

Prices for construction materials were generally higher. Some of the largest advances were registered for plastic construction products, asphalt roofing, bituminous paving materials, gypsum products, prepared paint, and fabricated structural metal products. On the other hand, prices for both softwood lumber and building paper and board declined for the third consecutive month, and plywood turned down after rising in January.

The processed fuels index edged down as prices fell for commercial jet fuel, residual fuel, liquefied petroleum gas, electric power, and coke. Diesel fuel prices rose, but less than in any month since last September.

Prices rose for a broad range of other intermediate non-food goods, including motor vehicle parts, rubber products, mechanical power transmission equipment, mixed fertilizers, bearings, and fluid power equipment. On the other hand, prices for pesticides declined.

The index for intermediate foods and feeds advanced 1.8 percent in February after rising 1.0 percent the month before. Prices for manufactured animal feeds and flour rose after decreasing in January, and crude and refined vegetable oil prices continued to rise. In contrast, prices for confectionery materials and for refined sugar used in food manufacturing turned down after increasing in January.

Crude materials

The Producer Price Index for crude materials for further processing rose 3.3 percent in February on a seasonally adjusted basis, the largest monthly advance since May 1975. Prices for crude foodstuffs and feedstuffs moved up 3.8 percent following a 2.8 percent rise in the preceding month. The acceleration in February was partly due to an upturn in prices for grains and raw cane sugar, both of which had declined in January. Prices for hogs, soybeans, and fluid milk rose more than in the previous month. Cattle prices rose sharply for the second consecutive month, although not as steeply as in January. In contrast, prices for live poultry turned down after rising substantially in each of the previous 3 months. Prices for green coffee and cocoa beans both decreased much more than in January.

The crude nonfood materials index advanced 2.8 percent over the month, after a 1.7 percent rise from December to January. Much of the February increase was caused by substantially higher prices for both ferrous and nonferrous scrap, especially copper base scrap. Prices for hides and skins moved up 12.6 percent, more than twice as much as in January. Prices also rose for natural gas, crude petroleum, and crude natural rubber. On the other hand, raw cotton prices turned down for the first time since last July.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 90 percent of total intermediate materials, and about 97 percent of total crude materials. For each commodity component of the finished goods index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to

the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

¹ Data for October 1978 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

² Seasonal commodity—no prices available this month.

³ Some of the titles of the individual commodity price indexes included in this grouping are not shown.

⁴ Not available.

⁵ Prices for some items in this grouping are lagged 1 month.

⁶ Regional price indexes for bituminous coal, industrial sizes, contract are presented in table B of

this report.

⁷ Prices for natural gas (08-31) are lagged 1 month.

⁸ Includes only domestic production.

⁹ Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

¹⁰ Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

¹¹ Some prices for industrial chemicals (06-1) are lagged 1 month.

¹ Data for October 1978 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices have been lagged 1 month since February 1973.

² Caution should be used in interpreting month-to-month changes, because of low response

rates from the sample of reporters which ranged from 30 to 60 percent for these particular indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in

the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of

this value; the pilot survey covers about 2 percent of it.

- (3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

- (4) Estimates of sampling error will be published.

For further information on the underlying concepts and methodology of the Producer Price Index revision, see "Improving the Measurement of Producer Price Change," by John F. Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished

goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Re-

spondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	1.0
divided by the previous index	<u>184.5</u>
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
