Price Movements

March 1979

The Producer Price Index for Finished Goods moved up 1.0 percent from February to March on a seasonally adjusted basis. Over the first 3 months of 1979, the Finished Goods Price Index increased at a seasonally adjusted annual rate of 14.1 percent, the largest quarterly advance since the fourth quarter of 1974. Prices for intermediate (semi-finished) goods also rose 1.0 percent over the month, almost as much as in both February and January. However, crude material prices, largely reflecting a slowdown in increases for foodstuffs, rose considerably less than in either of the first 2 months of the year (table A).

Among finished goods, prices for consumer nondurable goods other than foods rose 1.4 percent, the sixth consecutive large monthly increase. Consumer food prices rose more than 1 percent for the sixth time in the last 7 months, but the March advance was more moderate than in the first 2 months of 1979. Prices for capital equipment and con-

sumer durables both rose 0.6 percent, slightly less than in February and considerably less than in January (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.7 percent to 208.8 (1967=100). Over the year, the Finished Goods Price Index increased 10.4 percent. The finished consumer foods index was up 12.8 percent from March 1978 to March 1979, the index for finished consumer goods excluding foods rose 10.2 percent, and capital equipment prices were 8.6 percent higher than a year ago. The Producer Price Index for intermediate goods increased 9.7 percent over the year, and prices for crude materials advanced 20.0 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) rose 1.1 percent in March, following increases

of 1.2 percent in February and 1.4 percent in January.

The finished consumer foods index advanced 1.2 percent in March, following sharper rises in February and January. Although beef and veal prices moved up rapidly for the fourth consecutive month, prices declined for fresh vegetables and pork after rising rapidly a month earlier. Prices also were lower in March for vegetable oil end products, roasted coffee, and processed poultry. Prices for eggs, on the other hand, rose sharply after declining in each of the preceding 3 months. Prices were also higher for milled rice, confectionery end products, and whole black pepper.

The index for consumer nondurables other than foods increased 1.4 percent in March, following increases of 0.9 percent in February and 1.2 percent in January. In March, price increases accelerated for home heating oil and gasoline. Leather footwear prices rose sharply for the second consecutive month. However, prices declined for tires and tubes.

Prices for consumer durables rose 0.6 percent in March, compared with 0.7 percent in February and 1.2 percent in January. Prices were higher for mobile homes, jewelry, household flatware, luggage and small leather goods, and bicycles. Passenger car prices edged slightly higher for the second consecutive month following a large advance in January.

Capital equipment. The Producer Price Index for capital equipment moved up 0.6 percent after rising 0.8 percent in February and 1.0 percent in January. Motor truck prices, which had risen sharply in each of the 2 previous months, were unchanged in March. Prices for machine

tools and construction machinery moved up, but less than in most recent months. Price increases were also registered for most other capital goods, led by commercial furniture, hand tools, and fixed wing utility aircraft.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components advanced 1.0 percent, seasonally adjusted, from February to March. This rise was nearly as much as the increases in each of the first 2 months of 1979. The 13.7 percent annual rate of increase for the first quarter of this year was greater than for any 3-month period since the fourth quarter of 1974.

Excluding foods and feeds, the intermediate materials index rose 1.1 percent, following a 0.9 percent upward movement in February. The March acceleration was principally due to substantial advances for processed fuels and for materials used in nondurable manufacturing. Prices for most other major categories of the intermediate non-food materials index, however, rose less than in the preceding month.

The processed fuels and lubricants index rose sharply (1.9 percent), after a 0.2 percent drop in February. Prices for residual fuel, liquefied petroleum gas, coke, electric power, and commercial jet fuel all turned up after declining the month before. Diesel fuel prices rose considerably more than in February.

The nondurable manufacturing materials category registered a 1.4 percent advance, more than in any recent month. The industrial chemicals index recorded its third consecutive large increase, and leather prices were up

nearly 20 percent. Prices for inedible fats and oils, phosphates, nitrogenates, processed yarns and threads, wood-pulp, and rubber products also advanced. On the other hand, finished fabrics declined for the first time since last June.

Among durable manufacturing materials, nonferrous metals generally recorded smaller increases than in the previous month, and prices for precious metals turned down after 3 consecutive large advances. In contrast, the price increases for plastic resins and materials and foundry and forge shop products exceeded those for the prior month.

Within the construction materials and components category, prices advanced for softwood lumber, millwork, plastic construction products, heating equipment, concrete products, and structural clay products. On the other hand, lower prices were recorded for building paper and board and insulation materials.

Several other intermediate nonfood goods also registered large advances, including plastic parts and components, paper boxes and containers, ball and roller bearings, mining machinery parts, plastic packaging and shipping products, wiring devices, and metal containers.

The intermediate foods and feeds index rose only 0.3 percent in March, following 3 months of much larger

advances. Crude vegetable oil prices fell sharply after rising for 3 months. Prices for manufactured animal feeds also declined after a steep advance in the previous month, and the index for flour rose less than in February.

Crude materials

The Producer Price Index for crude materials for further processing rose 1.0 percent in March on a seasonally adjusted basis, following 2 months of much larger increases. Much of this deceleration was due to a smaller increase in prices of crude foodstuffs and feedstuffs, which had risen rapidly in both February and January. Prices turned down for hogs, raw cane sugar, and wheat after rising sharply in February. Cocoa beans fell for the third consecutive month. Cattle prices continued to rise substantially, but the rise was smaller than in either February or January. Green coffee prices turned up after declining for 3 consecutive months. Prices for fluid milk, barley, and oats also moved up.

The crude nonfood materials index rose 2.1 percent. Prices for nonferrous scrap, crude petroleum, and sand, gravel, and crushed stone moved up much less than in February. Increases accelerated, however, for hides and skins, natural rubber, iron and steel scrap, coal, and natural gas.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 90 percent of total intermediate materials, and about 97 percent of total crude materials. For each commodity component of the finished goods index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP

grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

¹ Data for November 1978 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices have been lagged 1-month since February 1973.
² Caution should be used in interpreting month-to-month changes, because of low response

rates from the sample of reporters which ranged from 30 to 60 percent for these particular indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in

the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of

this value; the pilot survey covers about 2 percent of it.

- (3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey itself.

- (4) Estimates of sampling error will be published.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished

goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration on page 85.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Re-

spondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	1.0
divided by the previous index	<u>184.5</u>
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays.

For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
