Producer Price Indexes Data for January 1985

Name Change

Beginning with the release of the January 1985 producer price indexes, the name of this periodical was changed from *Producer Prices and Price Indexes* to *Producer Price Indexes*. This name change does not affect any of the data in the periodical.

Price Movements

January 1985

The Producer Price Index for Finished Goods showed no change on a seasonally adjusted basis from December to January. The index had risen modestly in both November and December. Intermediate material prices edged down 0.1 percent, the same as in December. Prices received by producers of crude goods dropped 2.2 percent, the largest monthly decrease in recent months. (See table A.)

Among finished goods, the index for energy goods fell considerably more than a month earlier, and food prices turned down following moderate advances in November and December. At the same time, however, the increase in the index for finished goods other than foods and energy accelerated to 0.6 percent; until now, this index had not climbed more than 0.3 percent in any month since last March. Substantial boosts in prices for motor vehicles and tobacco products accounted for much of the January advance in this index.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.1 percent to 292.7 (1967 = 100). From January 1984 to January 1985, the Finished Goods Price Index moved up 1.1 percent. During the same period, consumer food prices increased 0.7 percent, the index for energy goods fell 5.4 percent, prices received by producers of consumer goods other than

foods and energy advanced 2.5 percent, and capital equipment prices were up 2.2 percent. The index for intermediate goods was 1.0 percent higher than in January 1984, and crude material prices declined 4.2 percent over the year.

Finished goods

Finished consumer goods. After a rise of 0.2 percent in December, the Producer Price Index for finished consumer goods edged down 0.1 percent on a seasonally adjusted basis. The index for energy goods fell 2.4 percent, following a 0.6 percent decline a month earlier. Prices fell much more than in December for gasoline, home heating oil, and natural gas.

Prices moved down 0.6 percent for finished consumer foods in January, after rising as much in the previous month. Prices fell after increasing in December for eggs, beef and veal, fish, and confectionery end products; poultry prices moved down after showing no change a month earlier. Prices continued to fall for fresh vegetables and for shortening and cooking oils. Pork prices rose, but much less than in December. On the other hand, prices climbed more than in December for processed fruits and vegetables, fresh fruits, and milled rice. Prices continued to rise moderately for bakery pro-

ducts and breakfast cereals. Roasted coffee prices edged up after falling in earlier months.

Among finished consumer goods other than foods and energy, prices advanced 0.7 percent, after moving up 0.2 percent in December. Much of the acceleration in price increases was due to the indexes for passenger cars and light trucks, both of which rose 2.2 percent after edging up 0.2 percent in December, and tobacco products (up 4.0 percent vs. 1.0 percent a month earlier). Other consumer goods that rose much more rapidly than in the previous month included plastic products, household furniture, leather footwear, floor coverings, and periodicals. Prices turned up after falling in December for tires and tubes, newspapers, and prescription drugs. In contrast, prices fell more than a month earlier for cosmetics, home electronic equipment, and for small arms and ammunition. Prices turned down after rising in the previous month for rubber footwear, household appliances, and motor homes.

Capital equipment. The Producer Price Index for capital equipment advanced 0.4 percent, after showing no change in December. Price increases accelerated for motor vehicles, food products machinery, and for fans and blowers. Prices turned up after falling a month earlier for construction machinery, office and store machines, woodworking machinery, and photographic equipment.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components edged down slightly (0.1 percent) on a seasonally adjusted basis for the second consecutive month. As in December, the decline was largely due to the energy and the foods and feeds categories, while the index for intermediate goods excluding foods

and energy again showed no net change.

The intermediate energy index fell 0.6 percent, slightly more than in the month before. Substantial declines occurred for gasoline, liquefied petroleum gas, diesel fuel, and kerosene. These were partially offset by hikes for electric power and residual fuel.

As in most recent months, the intermediate foods and feeds index registered a decrease, moving down 1.4 percent between December and January. Prices for crude vegetable oils and animal fats and oils were sharply lower, while prepared feeds and refined sugar continued to decrease. Flour prices rose, however.

The index for materials for durable manufacturing declined 0.7 percent, continuing the prevailing downward pattern of the last several months. Substantial decreases continued for gold, silver, lead, and jewelers' materials, and prices turned down for steel mill products, tin, and Portland cement. In contrast, primary aluminum and flat glass prices advanced. For the fifth consecutive month, the nondurable manufacturing materials index remained at virtually the same level. Prices for industrial chemicals and processed yarns recorded increases. These were offset by declines for plastic resins, inedible fats and oils, woodpulp, paper, and paperboard.

The construction materials and components index edged up 0.1 percent, continuing the recent pattern of small upward movements. Prices rose for asphalt paving mixtures, plumbing fixtures and brass fittings, and asbestos shingles. The indexes for softwood lumber, millwork, plywood, and nonferrous wire and cable, however, registered decreases.

In the components for manufacturing category, prices advanced sharply for electric motors and generators, as well as for mechanical power transmission equipment. In miscellaneous categories, increases

took place for commercial printing, pesticides, and manifold business forms, while prices for metal containers and machine tool parts declined.

Crude goods

The Producer Price Index for Crude Materials for Further Processing fell 2.2 percent on a seasonally adjusted basis, after inching down 0.1 percent in December. The crude foodstuffs and feedstuffs index dropped 2.4 percent in January, following an increase of 0.3 percent in the previous month. Prices turned down sharply for cattle, turkeys, and raw fish following December advances. Raw cane sugar and hog prices fell more than in the preceding month. Prices also dropped for cocoa beans and fresh vegetables. In contrast, the indexes for chickens and wheat turned up after decreasing in the previous month. Hay and fresh fruit prices also increased.

After declining 0.6 percent in the preceding month, the crude energy materials index dropped 2.2 percent. Crude petroleum prices fell 3.3 percent, the largest monthly decline in almost 2 years. Prices for natural gas also fell substantially, but coal prices continued to rise moderately.

The index for crude nonfood materials other than energy fell 1.4 percent, the sixth decline in the last 7 months. Prices fell more sharply than in the previous month for ferrous scrap, crude natural rubber, and wastepaper. Prices for cattle hides and copper scrap turned down after rising in December, and the leaf tobacco index also decreased. On the other hand, aluminum scrap prices surged 15 percent higher after edging up in the preceding month, and raw cotton rose as much as in December.

Introduction of Producer Price Indexes for Major Industry Groups and Subgroups

Effective this month, BLS is publishing producer price indexes for some 2-digit major industry groups and some 3-digit industry subgroups within the Standard Industrial Classification (SIC) system. These more aggregate industry-based indexes, referred to below as "higher level" indexes, join the indexes for more detailed industries and products already being published under the ongoing Producer Price Index Revision program. (See Technical Notes.)

The availability of PPI's for aggregated SIC industry groups greatly enhances comparisons with similarly organized economic time series published by the Bureau of Labor Statistics and other agencies. Examples of such series include employment, average hourly earnings, gross output (part of the National Income Accounts), and corporate earnings. Because the new indexes measure price changes for the net output of industries and industry groups, they are also useful for measuring intersectoral transmission of inflation. At present, there are no plans to calculate historical values for these higher level SIC indexes.

By January 1986, when the conversion to the PPI Revision program is scheduled to be completed, indexes should be published for all but a few mining and manufacturing industries, and for nearly all higher level aggregations as well. For the time being, gaps in coverage will preclude publication of some higher level SIC indexes. The primary criterion for determining publication is that at least 75 percent of the net output of their component industries be represented by published indexes. In addition, a higher level index will not be published if it has only one component industry.

The new higher level indexes are included in table 4, "Producer price indexes for the net output of industries and their products," of this report. Furthermore, the 2-digit SIC indexes (and eventually those for the total mining sector and the total manufacturing sector) appear in a new table, table 14, "Producer price indexes for the net output of major mining and manufacturing industry groups." This table summarizes the vast quantity of industrial price data now gathered under the revised PPI methodology.

The net output aggregation concept is a crucial feature of all industry indexes under the revised PPI methodology. Briefly, net output weighting excludes the values of commodities consumed within the same in-

dustry or industry groups in which they are produced. By using shipments data from a detailed input-output table, the net output ratios for each industry and higher level group may be developed. This ratio expresses the percentage of an industry's gross output shipped outside the industry. It is important to remember that the term "net" depends on the context, i.e., level of aggregation. In general, the net output of an industry group will be less than the sum of the net outputs of the component industries because there are usually significant shipments between industries in the same industry group. For example, the net output of SIC 3714 (the motor vehicle parts industry) includes sales to both original equipment manufacturers (OEM) and replacement buyers. Calculation of the net output price index for SIC 371 (the motor vehicles and equipment industry) would exclude the OEM shipments portion of SIC 3714. The same principle applies in the calculation of the 2-digit industry group indexes and those for all mining and all manufacturing.

The distinction between SIC-defined indexes from the PPIR and traditional PPI commodity grouping indexes is important because they are constructed differently and are intended for different applications. Thus, two indexes with similar titles calculated under different methodologies are likely to move somewhat differently, even though they are derived from essentially the same detailed commodity price quotes. In the traditional PPI system, detailed commodity indexes are weighted together to form higher level indexes using 1972 values of shipments irrespective of which industry produced the commodity. Under the revised PPI methodology, however, detailed indexes are aggregated using 1977 values of shipments from the specified industry only. And, as emphasized earlier, the industry and industry group indexes (2-, 3- and 4-digit SIC codes) include weights only for commodities that are shipped to other sectors, i.e., net output weights.

Just as there are many SIC-defined industries with titles identical (or nearly so) to PPI commodity groupings, several higher-level SIC indexes may be confused with traditional PPI major commodity groups. For example, SIC industry group 23 (apparel and other fabricated textile products) is very similar to PPI subgroup 03-8, which bears the same title. To mitigate this problem, it will be standard practice to refer to SIC-

defined indexes from the PPIR in the following manner (using SIC 28 as an example): “The Producer Price Index for the chemicals and allied products industry.” This phrasing (using the key word “industry”) will differentiate SIC-defined indexes from PPI commodity

groups having the same titles, such as commodity code 06: “The Producer Price Index for chemicals and allied products.” Citing the appropriate PPI or SIC code numbers will help avoid confusion as well.

Future Changes in Producer Price Indexes for Refined Petroleum Products

In July 1985, the Bureau of Labor Statistics will discontinue publication of table 7, average prices and regional indexes for refined petroleum products. Most national indexes will continue to appear in table 6 of this report. National indexes for the petroleum refining industry (SIC 2911) and refined petroleum products will appear in table 4 of this report beginning in July.

These changes reflect a major methodological revision designed to improve the timeliness of Producer Price Index data for refined petroleum and to integrate refined petroleum more fully into the Bureau's system of industrial price measures. Currently, the refined petroleum indexes are published with a 1-month lag; for example, the Producer Price Index for January contains refined petroleum data for December. Such a lag is necessary to develop sufficient information to publish accurate regional indexes. However, the lag also causes problems in analyzing current economic movements, especially in view of the large importance of refined

petroleum in the major Producer Price Indexes, such as the Finished Goods Price Index.

In 1983, the Energy Information Administration (EIA) of the U.S. Department of Energy began publication of State-level average prices for most major petroleum products. This provided an opportunity for the BLS to improve its petroleum indexes, thereby satisfying users by incorporating more current data in its national indexes. At the same time, the geographic data no longer published by the BLS are available to users from EIA in *Petroleum Marketing Monthly* (EIA-0380) in substantially the same detail. This publication can be ordered through the National Energy Information Center, telephone (202) 252-8800, at \$6.50 for a single copy and \$65 annually. The center can also answer questions regarding Department of Energy surveys.

For more information on the Bureau's changes, contact Ken Lavish, Sarah Cohen, or Ralph Jacko at (202) 272-5210.

Further Expansion of the Producer Price Index

Beginning with data for January 1985, indexes for 36 additional industries are being calculated as part of the comprehensive program to revise the Producer Price Index. This expansion includes improvements in such areas as chemical and fertilizer minerals, children's outerwear, leather goods, fabricated metal products, industrial machinery, and electrical equipment. The PPI Revision program now covers 341 industries which account for 75.3 percent of the value of all domestic mining and manufacturing production. Effective with January 1986 data, the revision of the Producer Price Index for the mining and manufacturing sectors will be completed. The industries being calculated for the first time in this phase of the PPI Revision are the following:

<i>Standard Industrial Classification (SIC) Code</i>	<i>Industry</i>
1011	Iron ore
1453	Fire clay
1472	Barite
1474	Potash, soda and borate minerals
1476	Rock salt
1477	Sulfur
1492	Gypsum
2067	Chewing gum
2091	Canned and cured fish and seafood
2253	Knit outerwear mills
2361	Children's outerwear
2363	Children's coats and suits
2369	Children's outerwear, n.e.c.

2452	Prefabricated wood buildings
2531	Public building and related furniture
2642	Envelopes
2645	Die-cut paper and paperboard
2753	Engraving and plate printing
2999	Petroleum and coal products, n.e.c.
3131	Boot and shoe cut stock and findings
3161	Luggage
3449	Miscellaneous metalwork
3471	Plating and polishing
3479	Metal coating and allied services
3497	Metal foil and leaf
3536	Cranes and monorails
3565	Industrial patterns

3623	Welding apparatus, electric
3652	Records and tapes
3691	Storage batteries
3751	Motorcycles, bicycles and parts
3995	Burial caskets

A total of 87 new items has been added to the list of commodities included in the Producer Price Index. The number of commodity indexes whose movements are based on data from the PPI Revision now comes to about 2,600.

See tables 15 through 19 in this issue for listings of all additions, deletions, and recodes of indexes affected by this latest expansion of the PPI Revision program. Introduction of the next set of indexes for industries based on the PPI Revision program is planned for July 1985, with the final set of indexes coming into publication in January 1986.

Recalculation of Seasonal Adjustment Factors

Effective with data for January 1985, seasonal adjustment factors have been recalculated to reflect 1984 price movement patterns for stage-of-processing (SOP) and commodity groupings. This routine annual recalculation may affect seasonally adjusted indexes and percent changes from January 1980 to the present. Revised seasonally adjusted data for this period, as well as

seasonal factors to be used through December 1985, are available on request from BLS. Table C shows 1984 monthly seasonally adjusted percent changes for the three major SOP categories calculated with the old seasonal factors, compared with the percent changes for recalculated indexes which incorporate the new seasonal factors.

¹ Comprehensive relative importance figures are computed once each year in December.

² Data for September 1984 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

⁴ Includes crude petroleum.

⁵ Excludes crude petroleum.

⁶ Percent of total finished goods.

⁷ Percent of total intermediate materials.

⁸ Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

⁹ Percent of total crude materials.

NOTE: Seasonally adjusted data shown may differ from those previously reported. See footnote 1 on table A.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 85 percent of total finished goods, about 85 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP

grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

⁴ Not available.

NOTE: Seasonally adjusted data shown above may differ from those previously reported. See footnote 1 on table A.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for September 1984 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Prices for all items in this grouping are lagged 1 month.

⁵ Regional refined petroleum product prices and price indexes are presented in table 7.

⁶ Prices for some items in this grouping are lagged 1 month.

⁷ This grouping excludes fabricated wire products, which had been included in the discontinued code 10-13 and which are now grouped in code 10-88.

n.e.c. = Not elsewhere classified.

Note: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

¹ Data for September 1984 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes

because of low response rates, which ranged from 30 to 60 percent for these indexes.

¹ Standard Transportation Commodity Code.

² The figure shown for each item is its percent of total railroad freight.

³ Data for September 1984 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

⁴ The price index for total railroad freight also includes STCC groups not shown separately.

⁵ Dec. 1978 = 100.

⁶ This index contains shipments from a number of STCC groups.

¹ Indexes in this table are derived from the net-output-weighted industry price indexes shown in table 4. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly-titled indexes which are derived from traditional commodity groupings shown in table 6.

² All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes is undergoing extensive changes. It currently contains about 3,200 commodities and about 43,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by class of buyer and by degree of fabrication (i.e., finished goods, intermediate goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and that are ready for sale to the final demand user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components include commodities that have been processed but that require further processing. Examples of such semifinished goods include flour, cotton yarns, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that

are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated and which are not sold directly to consumers. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude non-food materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than broad commodity grouping indexes. Broad commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the broad commodity grouping indexes uses the total shipment values for commodities at all stages of processing. Within the stage-of-processing structure, on the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade

publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In aggregating producer price indexes, price changes for various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars as follows: "The price of a representative sample of finished goods produced in the United States has risen from \$100 in 1967 to \$225."

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equal index percent change	0.5

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy,

seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index Revision (PPIR) in table 4, "Producer price indexes for the net output of selected industries and their products." Table 4 includes data for Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1986, table 4 will cover nearly all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within the industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in one industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products. Because of the distinction between primary and secondary products, an index for a product

made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some PPIR indexes published in table 4 correspond to 8-digit commodities published in table 6. In these cases, movements in the commodity indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect,

but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the PPIR program, item weights are based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes. In addition, some

traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.
