Price Movements

March 1983

The Producer Price Index for Finished Goods edged down 0.1 percent from February to March on a seasonally adjusted basis. This followed a 1.0 percent drop in January and a 0.1 percent rise in February. Prices for intermediate goods fell 0.7 percent, considerably more than in either of the 2 preceding months. Crude material prices moved up 0.6 percent, the same as in February. (See table A.)

Among finished goods, the index for energy goods decreased sharply for the third consecutive month. Prices for finished consumer goods other than foods and energy rose only slightly, following a much larger advance in the previous month. The increases in the price indexes for finished consumer foods and capital equipment were both about the same as in February.

Before seasonal adjustment, the Producer Price Index for Finished Goods declined 0.1 percent to 283.4 (1967=100). From March 1982 to March 1983, the Finished Goods Price Index rose 2.2 percent. Finished consumer food prices were up 1.4 percent over the year, the finished energy goods index was down 4.5 percent, the index for finished consumer goods other than foods and energy increased 3.7 percent, and capital equipment prices rose 3.9 percent. The index for intermediate goods

was 0.5 percent lower than in March 1982, and crude material prices were up 0.7 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods moved down 0.3 percent, after edging up 0.1 percent in February. The finished energy goods index fell 3.2 percent, the fourth consecutive monthly decline. Price indexes for gasoline and home heating oil decreased even more than in February, while the natural gas index increased substantially for the second consecutive month.

The index for finished consumer foods rose 0.5 percent, about as much as in February. Prices for fresh and dried vegetables soared 21.3 percent. Advances were also registered for beef and veal, pork, and fish. However, prices declined for fresh fruits, processed poultry, eggs, and for shortening and cooking oils.

The index for finished consumer goods other than foods and energy edged up 0.1 percent, after rising 0.7 percent a month earlier. Price indexes increased less than in the previous month for passenger cars, publications, prescription drugs, alcoholic beverages, and cos-

tume jewelry. Prices turned down after rising in February for gold jewelry, cosmetics, household flatware, and for luggage and small leather goods. On the other hand, prices advanced more than in February for apparel, household furniture, and for small arms and ammunition. Prices for mobile homes and cutlery moved up after showing little or no change a month earlier.

Capital equipment. The Producer Price Index for capital equipment rose 0.4 percent, almost as much as in February. Some of the larger increases were recorded for motor vehicles, commercial furniture, aircraft, agricultural machinery, and construction machinery.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components fell 0.7 percent in March on a seasonally adjusted basis, following smaller declines in each of the 2 preceding months; lower energy prices were again the major factor. The intermediate energy index dropped 3.0 percent, as price indexes for most refined petroleum products registered even larger decreases than in other recent months. The electric power index moved down for the second consecutive month.

The index for intermediate materials other than foods and energy edged down 0.1 percent, after rising 0.4 percent the month before. The reversal was due to the durable manufacturing materials index, which fell 1.1 percent following a 2.3 percent upward surge in February. Prices turned down in March for silver, gold, zinc, copper, steel mill products, and jewelers' materials.

The index for nondurable manufacturing materials decreased 0.3 percent, a continuation of its downward trend over the past year. Prices for industrial chemicals and plastic resins moved down after small increases in the previous month, and prices continued to fall for paint materials, woodpulp, paper, and processed yarns.

In contrast, higher prices were recorded for synthetic fibers and leather.

The construction materials and components index rose 0.3 percent for the second consecutive month. Softwood lumber prices continued to advance, although considerably less than in either January or February. Increases were also registered for millwork, softwood plywood, and building brick. However, prices moved down for plastic construction products, metal valves, hardwood plywood, and asphalt roofing.

Among other nonenergy intermediate goods, prices advanced for automotive castings and job stampings, internal combustion engines, and electric motors, while prices for ball and roller bearings declined. Prices for photographic supplies turned up substantially, after falling in most other recent months. The intermediate foods and feeds index rose 0.3 percent, as higher prices for animal feeds were partly offset by a sharp drop in corn syrup prices.

Crude materials

The Producer Price Index for Crude Materials for Further Processing rose 0.6 percent on a seasonally adjusted basis. Prices for foodstuffs and feedstuffs moved up 0.7 percent, considerably less than in either January or February. Substantial increases were recorded for cattle, grains, fresh vegetables, and hay. In contrast, prices for live poultry, hogs, and cocoa beans decreased sharply, and prices for oilseeds and raw cane sugar declined slightly following large February advances.

The crude nonfood materials index moved up 0.5 percent, following 3 consecutive monthly declines. Prices for iron and steel scrap, aluminum base scrap, raw cotton, crude natural rubber, cattle hides, and potash climbed rapidly. On the other hand, copper base scrap and wastepaper prices fell. Among crude energy materials, increases for natural gas and coal offset a drop in crude petroleum prices.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 87 percent of total intermediate materials, and about 87 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods,

the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for November 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Prices for all items in this grouping are lagged 1 month.

⁵ Regional refined petroleum product prices and price indexes are presented in table 7. ⁶ Prices for some items in this grouping are lagged 1 month.

⁷ This grouping excludes fabricated wire products, which had been included in the discontinued code 10-13 and which are now grouped in code 10-88.

n.s.c. = Not elsewhere classified.

Note: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

¹ The figure shown for each item is its value weight expressed as a proportion of the total value weight for the U.S. Postal Service Index.

² Data for November 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after

original publication. Data are not seasonally adjusted.

³ Postal service prices contained in the Consumer Price Index are from first class and fourth class mail.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 3,400 commodities and about 26,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton

yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price

changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. In these cases, movements in the commodity indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979.
