Producer Price Indexes is a monthly report on producer price movement, including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered from the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402.

Subscription price:

- \$29 a year domestic (includes supplement)
- \$7.25 additional foreign

Single copy \$4.25
Supplement \$4.75

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through July 31, 1987. Second-class postage paid at Washington, D.C. and at additional mailing offices. Price Movements

March 1986

The Producer Price Index for Finished Goods fell 1.1 percent seasonally adjusted from February to March. The index had fallen a record 1.6 percent in February. In the first 3 months of 1986, the Finished Goods Price Index dropped at a seasonally adjusted annual rate of 12.4 percent, the largest decline for any 3-month period since this index was first calculated in 1947. Prices received by producers of intermediate goods declined 1.2 percent in March, almost as much as the 1.4-percent decrease in the preceding month. Crude material prices moved down 2.8 percent, following decreases of 1.4 and 5.0 percent in January and February. Price indexes for intermediate and crude goods also dropped at double-digit annual rates during the first quarter of 1986. (See table A.)

Sharply lower energy prices continued, as in February, to be the dominant and pervasive influence in March. Price indexes for finished, intermediate, and crude energy goods each dropped more than they had a month earlier. After falling broadly in February, however, food prices rose at the finished goods level and declined considerably less than in the previous month at the other stages of processing. Prices for some finished goods other than foods and energy increased moderately.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved down 1.4 percent in March

to 288.1 (1967 = 100). Over the year from March 1985 to March 1986, the Finished Goods Price Index declined 1.4 percent. During the same period, finished energy goods dropped 20.5 percent, consumer food prices edged down 0.5 percent, the index for consumer goods other than foods and energy rose 2.2 percent, and capital equipment prices advanced 1.7 percent. The index for intermediate goods dropped 2.9 percent during the 12 months ended in March 1986, and crude material prices were 10.1 percent lower than they had been a year earlier.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods fell 1.5 percent in March on a seasonally adjusted basis, following a decline of 2.0 percent in February. The index for finished energy goods plummeted 13.4 percent, after falling 9.4 percent in the previous month. Gasoline prices decreased a record 21.9 percent, compared with a decline of 11.1 percent in February. Home heating oil prices dropped 6.0 percent, substantially less than the record 26.2-percent decrease a month earlier. Natural gas prices moved down modestly.

After falling in both January and February, the index for consumer foods moved up 0.3 percent. Prices turned up after falling in the preceding month for fresh fruits and vegetables, pork, processed poultry, and eggs. Price

decreases slowed markedly for beef and veal. Fish prices turned down after rising the month earlier, and price increases for roasted coffee and confectionery end products slowed substantially. Shortening and cooking oils continued to move down.

The index for finished consumer goods other than foods and energy rose 0.8 percent after seasonal adjustment, following a 0.1-percent decrease in February. Increases were registered for light motor trucks, household furniture, drugs, alcoholic beverages, textile housefurnishings, and floor coverings. In contrast, prices declined for cosmetics and toys.

Capital equipment. The Producer Price Index for capital equipment advanced 0.3 percent, after inching up 0.1 percent in the previous month. Price movements were mixed and small throughout this category. Among the few notable movements were increases for light motor trucks and printing trades machinery and lower prices for office and store machines.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components fell 1.2 percent seasonally adjusted in March. From December 1985 to March 1986, this index fell at an annual rate of 11.6 percent after seasonal adjustment, surpassing the previous record established in the early 1950's. As in February, nearly all of the March decrease was caused by the intermediate energy index (down 9.4 percent). Prices fell more than 20 percent for gasoline, diesel fuel, and liquefied petroleum gas. Declines were also recorded for most other fuels and electric power.

Prices for intermediate goods other than energy moved up 0.2 percent over the month, following a 0.4-percent decline in February. The index for materials for non-durable manufacturing moved down 0.6 percent, more

than in any other recent month. Prices for industrial chemicals fell 1.4 percent, mainly reflecting the impact of recent drops in petroleum prices on petrochemicals. Substantial declines also occurred for inedible fats and oils, synthetic rubber, and medicinal and botanical chemicals. Prices advanced for synthetic fibers, wood-pulp, and paperboard. In the durable manufacturing materials category, increases for copper, gold, and platinum outweighed a decline in silver prices.

After moving down 0.3 percent the month before, the construction materials and components index edged up 0.1 percent. Prices rose substantially for softwood lumber, plywood, and plumbing fixtures and brass fittings. Offsetting decreases were noted for plastic plumbing products and gypsum products.

A number of sizable advances took place in the category of components for manufacturing, such as motor vehicle parts, hardware, and plastic parts and components. In other categories, prices rose for paper bags and shipping sacks and for manifold business forms. Declines occurred for paper boxes and containers, commercial printing, and carbon and graphite products. Among intermediate foods and feeds, prices rose for animal feeds and corn sweeteners, but crude vegetable oils fell.

Crude goods

The Producer Price Index for Crude Materials for Further Processing dropped 2.8 percent in March seasonally adjusted, chiefly because of the continued sharp decline in petroleum prices. Changes for other crude materials items were mixed. During the first quarter, the crude goods index plunged at a seasonally adjusted annual rate of 31.3 percent, the steepest drop since the mid-1970's.

The index for crude energy materials moved down 8.9 percent in March, after dropping 8.2 percent in

February. Crude petroleum prices fell 24.8 percent, an even sharper drop than the previous record decline of 20.3 percent in February. Crude oil prices now match their mid-1979 levels. The natural gas index declined moderately in March, and coal prices turned up slightly after falling the month earlier.

Following a drop of 3.6 percent in February, the crude foodstuffs and feedstuffs index decreased 1.0 percent. Prices for livestock and unprocessed fish fell less than in the preceding month. In addition, prices turned up for chickens, fresh fruits and vegetables, and wheat after February decreases. Raw cane sugar increased more than in the preceding month. Corn prices fell even more than in January or February, and fluid milk prices turned down. Prices for turkeys and soybeans rose but considerably less than in February.

The index for crude nonfood materials other than energy increased 2.6 percent, in the wake of a 3.0-percent drop in February. Copper base scrap prices turned up, after falling in the previous month. Prices for raw cotton, construction sand and gravel, and cattle hides rose more than in February. Aluminum base scrap and wastepaper prices also continued to increase. Price decreases were noted, however, for ferrous scrap and leaf tobacco.

Net output price indexes for major industry groups

From February to March, the Producer Price Index for the net output of total manufacturing industries fell 1.5 percent, nearly the same as the 1.4-percent drop in this index the month before. The net output price index for total mining industries declined 7.4 percent, even more than the 6.1-percent decrease registered in February. (See table 4.) Substantially reduced prices for the energy industries were once again the major influences in both mining and manufacturing. The index for the petroleum refining industry group dropped 15.9 percent, following a 12.1-percent decrease in the previous month. Similarly, the 9.3-percent decline in the oil and gas extraction industry index surpassed its 7.4-percent fall in February. The metal mining industry index declined 2.2 percent, after moving down 0.7 percent in February; lower prices for silver and uranium ores caused most of the March decrease. The only sizable industry group increases registered in March were a 0.9-percent climb for lumber and wood products, a 0.8-percent advance for nonmetallic mineral mining, and a 0.5-percent rise for textile mill products. No other industry groups changed by more than 0.3 percent over the month.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 75,000 quotations per month.

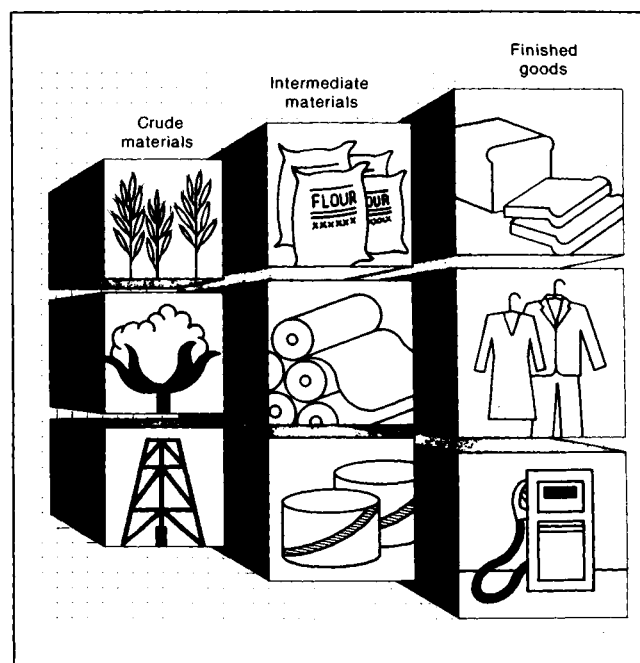

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by

establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently cor-

rect this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most producer price indexes currently reflect values of shipments reported in the 1972 Census of Manufactures; these weights will be updated for 1982 Census of Manufactures data in 1987.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request (202 523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

| <i>Index Point Change</i> | |
|-----------------------------|-------------|
| Finished Goods Price Index | 288.5 |
| Less previous index | 285.0 |
| Equals index point change | 3.5 |
| <i>Index Percent Change</i> | |
| Index point change | 3.5 |
| Divided by previous index | 285.0 |
| Equals | 0.012 |
| Result multiplied by 100 | 0.012 x 100 |
| Equals index percent change | 1.2 |

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later period). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1967 to \$288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data usually are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. Seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchase agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived by the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1981 through December 1985 were replaced at the beginning of 1986. Indexes for most broad commodity groupings

and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregative method, which combines seasonal movements from the basic stage-of-processing categories and from a wide variety of food subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

For more information, see "Appendix A: Seasonal Adjustment Methodology at BLS" in the *BLS Handbook of Methods*, (1982), Bulletin 2134-1.
