Producer Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered for 1 or 2 years from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

Annual subscription price:
\$21 a year domestic (includes
supplement)
\$5.25 additional foreign

Single copy \$8.50; foreign \$10.63
Supplement \$13; foreign \$16.25

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission. Second-class postage paid at Washington, DC and at additional mailing offices.

Price Movements

April 1987

The Producer Price Index for Finished Goods moved up 0.7 percent from March to April after seasonal adjustment. The index climbed 0.4 percent in January, slowed to a 0.1-percent advance in February, and then increased 0.4 percent again in March. Prices for intermediate goods rose 0.3 percent in April, the same as in March but less than in either of the first 2 months of the year. Crude material prices advanced 2.8 percent, the third substantial rise in the last 4 months. (See table A.)

Most of the April increase in the Finished Goods Price Index was caused by higher prices for meats, energy, and motor vehicles. After falling from late 1986 through early 1987, consumer food prices turned up in March and then rose even more in April. The increase in the index for finished energy goods followed a small drop in March and sharp advances in both January and February. The consumer durable goods index climbed considerably over the month, largely because of new cars and light trucks. In contrast, the index for consumer nondurables other than foods and energy declined after rising substantially in March, and capital equipment prices continued to move up modestly.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.9 percent in April to 295.0 (1967=100).

From April 1986 to April 1987, the Producer Price Index for Finished Goods moved up 2.7 percent. During the same 12-month period, consumer food prices climbed 4.2 percent, the energy goods index decreased 1.1 percent, consumer goods other than foods and energy increased 2.6 percent, and capital equipment prices were up 2.0 percent. Prices received by producers of intermediate goods moved up 1.2 percent during the 12 months ended in April 1987, while the crude goods index was 8.0 percent higher than a year earlier.

Finished goods

Finished consumer goods. The seasonally adjusted increase in the Producer Price Index for finished consumer goods went from 0.5 percent in March to 0.9 percent in April. The consumer foods index advanced 1.5 percent, in the wake of a 0.5-percent rise the month earlier; sharply higher meat prices accounted for most of this acceleration. Pork prices jumped 13.1 percent, the beef and veal index climbed 8.3 percent, and processed poultry prices increased 3.1 percent. Meat prices had been declining in most other recent months. Soft drinks, confectionery end products, and eggs recorded modestly higher prices in April. However, fresh fruit prices

reason, some of the figures shown above and elsewhere in this report may differ from those previously reported.

declined 11.1 percent, in contrast to a 7.7-percent advance in March, while the fish index was down 6.7 percent following a 4.6-percent drop the month earlier. In addition, the fresh and dried vegetables index moved down moderately after an upward surge of more than 20 percent in March. Prices for shortening and cooking oils and roasted coffee continued to fall.

After easing down slightly in March, the index for finished energy goods increased 2.1 percent over the month; the April rise was considerably smaller than the advances recorded in either January or February. The natural gas index turned up following a drop during the previous month, while gasoline and home heating oil prices both moved up around 2 percent, much more than in March.

The index for consumer durable goods increased 1.0 percent over the month after showing no change in March and falling in the month before that. Most of the April climb was due to a 2.4-percent advance in passenger car prices, which had decreased substantially in February and March. Prices for light trucks also turned up after several recent declines, and precious metal jewelry prices increased more than in March. However, indexes for home electronic equipment and household furniture showed little or no change in April following sizable increases in the preceding month.

Following an unusually large March rise of 1.2 percent, the index for consumer nondurables other than foods and energy declined 0.3 percent. A downturn in the cosmetics index accounted for much of this reversal. Prices for textile housefurnishings and over-the-counter drugs fell modestly after sharp increases in March. In addition, indexes for women's apparel and prescription drugs moved up much less than they had in the preceding month. Prices for alcoholic beverages, however, rose far more than in other recent months.

Capital equipment. Prices received by producers of capital equipment rose 0.3 percent following a 0.1-percent increase in March. Higher prices for cars, light trucks, X-ray equipment, and commercial furniture more than offset declines in the indexes for heavy trucks, oil field and gas field machinery, and transformers.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components moved up 0.3 percent seasonally adjusted in April, the same as in March. Large increases for a variety of petroleum-related products were partly offset by falling prices for construction materials and electric power.

The intermediate energy index advanced 0.8 percent. Considerable increases occurred for gasoline, diesel fuel, residual fuel, and jet fuel. However, prices continued to decline for electric power, and liquefied petroleum gas prices turned down following sharp increases during the first quarter of 1987.

For the second time this year, the index for materials for nondurable manufacturing rose an unusually sharp 0.9 percent. Price increases accelerated for such petroleum-derived products as plastic resins and materials, synthetic rubber, and paint materials; furthermore, industrial chemicals prices continued to rise substantially. Increases also occurred for gray fabrics, paperboard, and nitrogenates, while prices fell for synthetic fibers and inedible fats and oils.

The durable manufacturing materials category was up 0.3 percent, largely because of a sudden sharp climb in precious metals prices, led by silver's 27.9-percent surge. Moderate increases occurred for aluminum and lead, while copper turned down. Among components for manufacturing, prices

declined for internal combustion engine parts and turbine parts.

The 0.3-percent decrease in the index for construction materials and components was the third downward movement in the last 5 months. Prices declined for plastic plumbing products, plywood, nonferrous wire and cable, metal valves, and asphalt felts and coatings. In contrast, millwork prices continued to advance.

The intermediate foods and feeds index moved up 1.8 percent, led by increases for meats, animal feeds, and refined sugar. However, crude vegetable oil prices turned down. Among miscellaneous intermediate goods, prices for photographic supplies rose sharply.

Crude goods

After inching up 0.1 percent in March, the Producer Price Index for Crude Materials for Further Processing rose 2.8 percent in April seasonally adjusted. Many foodstuff indexes increased faster than in March, while nonfood prices turned up following declines in the previous month.

The crude foodstuffs and feedstuffs index advanced 4.3 percent, much more than the 0.4-percent increase registered in March. Livestock prices rose substantially following smaller increases in both February and March. Prices for chickens and corn turned up following March declines. In contrast, prices fell after rising in the previous month for fresh fruits and vegetables, wheat, and turkeys. Unprocessed fish prices dropped even more rapidly than in March. Fluid milk prices also continued to decrease, although not as much as in the previous month.

The crude nonfood materials index increased 1.7 percent

following a 0.1-percent decline in March. Indexes for natural gas, crude petroleum, and raw cotton turned up after falling in the previous month. Prices turned up for nonferrous metal ores, and indexes for wool and construction sand and gravel increased more than in March. In contrast, coal prices registered the largest monthly decrease since March 1975. Prices for aluminum base scrap fell after rising in March. The iron and steel scrap index moved down for the fourth consecutive month, and iron ore prices also decreased. Price advances for wastepaper and cattle hides slowed.

Net output price indexes for major industry groups

The Producer Price Index for the net output of the domestic manufacturing sector moved up 0.7 percent from March to April; this index had advanced rapidly in January before slowing down in February and inching up very little in March. The index for the petroleum refining industry group jumped 4.3 percent in April, in contrast to its March drop of 1.2 percent; however, January and February advances in this index were even larger than April's. After showing little or no change in February and March, the food products group index increased 1.0 percent. The price index for the net output of the transportation equipment group turned up strongly following decreases in each of the 2 preceding months. Most other major manufacturing industry group indexes increased moderately in April.

After falling in March, the Producer Price Index for the net output of the domestic mining sector advanced 1.3 percent. April increases for oil and gas extraction and metal mining outweighed declines for other mining industries.

New Weight Structure for Producer Price Index

Andrew Clem and William D. Thomas

For the first time in over 10 years, the universe of weights used to construct the Producer Price Index (PPI) has been comprehensively updated. The dynamic nature of the American economy requires that periodic revisions be made to the PPI weight structure to ensure its relevance. The revision affects all PPI series derived from traditional commodity indexes, including stage-of-processing indexes, durability-of-product indexes, and special commodity groupings. Historical indexes are not affected, and there is no break in continuity of the PPI.

Weights are used to aggregate price changes for individual commodities to higher level groupings. They represent the total net selling value of commodities priced in the PPI, which comprises a wide range of crude and intermediate materials and finished goods, including both capital equipment and goods intended for household consumption.

Between January 1976 and December 1986, the data used to derive the weights were taken from the 1972 values of shipments. Since January 1987, 1982 values have been used for weighting purposes. This article describes the procedures for updating the weights, presents the revised and former relative importance values, and discusses some of the causes of major shifts in weights that resulted from the revision.

Derivation of indexes and weights

Most of the basic data on selling values of commodities in the PPI are taken from the economic censuses of the Bureau of the Census. The 1982 Census of Manufactures provided the data for about 84 percent of the total value; the 1982 Census of Mineral Industries (which includes oil and gas production) accounted for about 7 percent, and the 1982 Census of Wholesale Trade (covering scrap materials) for 0.6 percent. Other sources were the Department of Agriculture (5.1 percent), the Edison Electric Institute (3.4 percent), and the National Marine Fisheries Service (0.1 percent).

The formula by which the PPI is calculated is a modification of the Laspeyres fixed-base-weight formula. In the pure Laspeyres formula, the physical quantities of all individual items are held constant, regardless of price change.¹ Although

this assumption is suitable for medium-term time spans, structural shifts among industries necessitate occasional weight revisions. In practice, however, the PPI is computed using total values of shipments rather than physical (or unit) quantities, which are not available on a consistent and comprehensive basis, as are values of shipments. There is an implicit fixed quantity associated with each specific commodity (bushels, tons, gallons, etc.), but it is never computed.²

The alternative to the Laspeyres formula would be the Paasche formula, which uses current-quantity weights instead of base-quantity weights. However, this method has its own drawbacks and, in any case, is impractical for an index combining price movements for thousands of items every month.

The equations on page 5 describing the weight-update procedure are followed by an explanation of their use. (Because published index and relative importance values have a reference base of 100, each of the formulas is multiplied by 100.)

In the following equations:

- P = price (dollars per unit for commodities; can only be defined for groupings as the ratio of the total values between two time periods)
- Q = quantity (number of physical units)
- V = value (of shipments); or P times Q
- R = relative importance (the ratio of the aggregate value of an item or mid-level grouping to the total, e.g., all commodities, value)
- I = index
- 67 = total or average for the year 1967
- 72 = total or average for the year 1972
- 82 = total or average for the year 1982
- 86 = December 1986 (the weight-link month)
- b = base year (in general)
- t = current month (in general)
- i = individual commodity
- A = aggregate-level index (e.g., all commodities)
- N = number of commodities within the aggregate

¹ The assumption of fixed quantities imparts to the Laspeyres formula a tendency to overstate the importance of items whose prices have risen sharply since the weight base-period, and to understate the importance of items that have declined in price. See, for example, William Mendenhall and James E. Reinmuth, *Statistics for Management and Economics*, Duxbury Press 1974, p. 421.

² Base-year quantities could be computed if base-year prices were known. However, the Bureau of Labor Statistics does not maintain files of prices on a historical basis.

Andrew Clem and William D. Thomas are economists in the Office of Prices and Living Conditions, Bureau of Labor Statistics.

$$(1) \quad I_{A,t} = \frac{\sum_{i=1}^N P_{i,t} Q_{i,b}}{\sum_{i=1}^N P_{i,b} Q_{i,b}}$$

$$(2) \quad I_{A,t} = \frac{\sum_{i=1}^N (P_{i,t} / P_{i,67}) (P_{i,67} Q_{i,82})}{\sum_{i=1}^N P_{i,67} Q_{i,82}}$$

$$(3) \quad R_{i,86(72)} = \frac{V_{i,72} (P_{i,86} / P_{i,72})}{V_{A,72} (P_{A,86} / P_{A,72})}$$

$$= \frac{P_{i,72} Q_{i,72} (P_{i,86} / P_{i,72})}{\sum_{i=1}^N P_{i,72} Q_{i,72} \left(\sum_{i=1}^N P_{i,86} Q_{i,72} / \sum_{i=1}^N P_{i,72} Q_{i,72} \right)}$$

$$= \frac{P_{i,86} Q_{i,72}}{\sum_{i=1}^N P_{i,86} Q_{i,72}}$$

$$(4) \quad R_{i,86(82)} = \frac{V_{i,82} (P_{i,86} / P_{i,82})}{V_{A,82} (P_{A,86} / P_{A,82})}$$

$$= \frac{P_{i,82} Q_{i,82} (P_{i,86} / P_{i,82})}{\sum_{i=1}^N P_{i,82} Q_{i,82} \left(\sum_{i=1}^N P_{i,86} Q_{i,82} / \sum_{i=1}^N P_{i,82} Q_{i,82} \right)}$$

$$= \frac{P_{i,86} Q_{i,82}}{\sum_{i=1}^N P_{i,86} Q_{i,82}}$$

A number of complicating factors necessitate modifications of the pure fixed-base-weight Laspeyres formula shown in equation (1). First, the arithmetic reference base year has generally differed from the weight base period in the PPI. Also, as noted above, it is the aggregate values of commodities, rather than their physical quantities, that are used to calculate commodity grouping indexes. Aggregate (i.e., the absolute weights) values are the prices multiplied by quantities summed for each commodity in the grouping, and updated for price change from the weight base year to the index calculation month. The modified Laspeyres formula which approximates the calculation of the PPI is shown in equation (2).

More significantly, for the last several years there have been a number of sample expansions as well as semiannual reclassifications which have required minor adjustments to the weight structure. Relatively minor changes will continue as industry samples are "recycled" to account for structural changes in the U.S. economy. However, to facilitate the explanation of the weight revision procedures, it is assumed that the PPI base-year price measurements coincide perfectly with the real market, and that no sample changes have occurred.

Equations (3) and (4) show how the relative importance of each individual item is derived, taking base-year quantities and adjusting them by PPI price movements between the weight base year (1972 or 1982) and December 1986.³ The relative importance of an item will be higher (or lower) than its share of the actual census total value of shipments if its price rose more (or less) during that time interval than did the price level of the aggregate category to which it is being compared. For example, petroleum products have a much lower weight than they would have if their prices had not fallen between 1982 and 1986.

Since both the old and revised weights have been adjusted for price change through December 1986, any shifts observed must derive from changes in quantities.

Causes of shifts in weights

Table C shows the relative importance of commodity groupings in each stage-of-processing (SOP) category in December 1986 (the month in which the new and old weights were linked) under the 1982 and 1972 weight structures. The difference between the two columns reflects primarily the shift in value weights. To a small extent, it also reflects the routine sample changes that went into effect in January 1987.

One cause of the shifts in weights was a change in the definition of the PPI universe; the PPI now includes military sales and also shipments between establishments of the same company (interplant transfers). Interplant transfers are now included because, under the industry-oriented concept of the PPI revision, the universe of transactions includes all shipments outside the industry where a product originates,

³ The weight of an item or grouping is the absolute dollar value adjusted for price change. The relative importance is that weight divided by the total index weight and multiplied by 100.

1/ Relative importance data for commodity groupings include only those subproduct classes allocated to the respective stage-of-processing (SOP) grouping. The revised weight structure (based on 1982 shipment values) includes the effects of sample changes in January 1987, while the old weight structure does not include these sample changes. Because these figures are based on unrevised December 1986 index levels, they are subject to revision; final relative importance data will be published in the annual supplement to Producer Price Indexes later this year.

2/ A ratio above 1.0 indicates an increase in relative importance; for example, a ratio of 1.25000 indicates a 25-percent increase, a ratio of 3.10000 indicates a 210-percent increase, and a ratio of 0.67000 indicates a 33-percent decrease.

regardless of ownership of the producing establishment.⁴ The inclusion of military sales has had a minimal impact on stage-of-processing relative importance values because such sales do not fit into any of the SOP categories.

Interplant transfers were previously excluded because the traditional PPI was a measure of price change in primary markets, i.e., at the first commercial transaction for each commodity. For example, a steel manufacturer might own a coal mine supplying a blast furnace it operates at a different location. The shipment of coal from the mine to the blast furnace would not be a market transaction because the respective establishments are part of the same corporate enterprise. Under the industry-oriented concept of the revised PPI methodology, all shipments outside the industry where a product originates are included. In this example, the coal mine and the blast furnace are classified as being in different industries even though they are owned by the same enterprise. Thus, transactions between such commonly-owned establishments are included in the new PPI.

Of greater significance than changes in the definition of the universe were changes reflecting cyclical and long-term trends in the economy. The economy of 1972 was strongly bolstered by stimulative monetary policies, while prices for most goods were frozen by Administration order. However, the Arab oil embargo of 1973 caused an outbreak of inflation that did not abate until after economic stabilization measures were taken that brought on a period of severe recession during the early 1980's.

As a result, the economy displayed unusual weakness in many sectors during 1982, when most recent economic censuses were taken, particularly in such industries as housing and motor vehicles. Because of the sharp business cycle contrast between 1972 and 1982, a number of categories in the PPI related to these sectors showed substantial declines in relative importance, unrelated to any long-term structural change in the economy.

The more significant weighting shifts that occurred are discussed in the following paragraphs and shown in table C, which presents the relative importance values of commodity groupings for each respective stage-of-processing category before and after the weight revision.⁵ Commodity groupings are listed in code-number sequence within each SOP group, similar to table 2 of the monthly report, *Producer Price Indexes*.

Crude materials

The change in the scope of transactions included in the PPI universe was most pronounced within the crude materials category. All three types of crude energy materials—coal, natural gas, and crude petroleum—rose sharply because of

the inclusion of interplant transfers. The largest gain was for crude petroleum, which rose 151 percent. This increase represented the inclusion of the output of oil wells owned by vertically integrated petroleum refining companies. The relative importance of coal climbed by 78 percent while natural gas rose about 24 percent. As a result, the total weight of energy in the crude materials category nearly doubled, from 23 percent on the 1972 basis to 41 percent on the 1982 basis.

This unusually sharp increase for energy commodities resulted in a displacement of the importance of most other goods; nonenergy crude goods overall showed a 23.2-percent drop in relative importance. Thus, many items showed large apparent decreases in market size when in fact there were no major corresponding structural changes in the market. At the same time, this displacement phenomenon enhances the significance of the few increases which did occur for nonenergy items within the crude materials category, for example, wastepaper, logs, and metal ores.

Among crude agricultural products, the largest decline in weight was for manufacturing grade raw milk (in the fluid milk group), which fell 59 percent. Raw cane sugar declined 45 percent in relative importance. The worldwide shortage of cane sugar that led to an explosion in prices during 1980 prompted many confectionery and beverage producers to seek alternative ingredients such as artificial sweeteners. The increased popularity of diet beverages cut further into sugar's traditional markets.

Wheat registered a 37-percent drop in relative importance, due mostly to the large decrease in export demand in the wake of the strengthening U.S. dollar during the early 1980's. Corn and soybeans showed much smaller declines, as these crops are less dependent on export markets. The weights of both cattle and hogs fell 32 percent, reflecting decreased consumer preference for red meats in favor of poultry and fish; these latter categories showed moderate increases.

Among crude materials other than energy and agricultural products, the weak construction market in 1982 resulted in sizable drops for construction sand, gravel, and crushed stone and for miscellaneous nonmetallic minerals such as clay and mica. However, logs and timber showed a 20-percent increase because of the inclusion of the values of shipments of timber to sawmills owned by the same company; this was paradoxical because, as noted below, 1982 was a bad year for construction-related industries such as logging and sawmills. The relative importance of wastepaper more than doubled as environmental and economic considerations encouraged paperboard manufacturers to make greater use of recycling as an alternative to reliance on woodpulp.

Metal ores rose very sharply, largely reflecting the inclusion of interplant transfers in the PPI weight universe. A majority of metal mines in the U.S. are owned by the firms

⁴ The PPI Revision (PPIR) program began in 1978 and was completed in 1986. Virtually all 493 mining and manufacturing industries are now covered. However, the PPIR industry-classified indexes were not affected by the weight revision; they continue to be calculated using 1977 net output weights.

⁵ Most of the data used in the analysis of long-term trends was taken from the 1984 *U.S. Industrial Outlook*, published by the U.S. Department of Commerce. This issue contained output data for many industries for both 1972 and 1982.

which smelt or refine the ores themselves. Consequently, the weight of nonferrous ores nearly tripled, and the weight of iron ore more than quadrupled.

Intermediate goods

The weight shifts within the intermediate goods category appear consistent with the widespread perception that American industry has expanded in the high-technology and chemical-related sectors and declined in basic heavy industries. However, the significant declines which occurred in the relative importance of construction materials, such as lumber and nonmetallic minerals, were not due to such a fundamental structural change in the economy, but rather to the cyclical weakness of the construction sector in 1982. Neither the energy nor the food materials categories within the intermediate goods index showed much change in the weight revision.

The outstanding increase in relative importance among intermediate goods was for electronic components and accessories, which more than doubled, from 1.3 percent to 2.8 percent. The biggest gains were for integrated circuits, of which some types increased tenfold or twentyfold in relative importance between 1972 and 1982. Demand for some of these semiconductor chips was boosted enormously by the microcomputer boom that began in the late 1970's; the increase in household sound and video equipment and commercial communication equipment sectors also stimulated rapid growth in semiconductors.

Growth in the aerospace industry also was reflected in the PPI weight revision, although part of the increase stemmed from the inclusion of military sales in the weight universe. The relative importance of aircraft engines and engine parts nearly tripled, while aircraft parts and auxiliary equipment rose 44 percent.

Medical and surgical instruments and appliances also showed substantial increases in their weights, as shipments grew in tandem with the increased proportion of medical expenses in household and public budgets. Growth was also evident among pharmaceuticals. Biological products more than doubled their relative importance, and medicinal and botanical chemicals (from which drugs are derived) showed an 83-percent advance in importance.

The chemical industry was given a tremendous stimulus by growth in plastic product markets. During the 1970's and 1980's, new types of plastic materials came to be used more and more frequently in durable goods. Plastic products used by businesses recorded a 37-percent increase in relative importance, while plastic resins and materials rose 34 percent. Because of demand derived from the plastics sector and the rapid rate of price increase since 1972, the relative importance of industrial chemicals moved up from 3.3 percent to 4.1 percent of the total intermediate goods index, a 25-percent increase.

Another area of notable increases was the pulp and paper industry. The relative importance of paper rose 41 percent,

while that of paperboard moved up 28 percent. Although faced with competition from plastics and other packaging materials, the paper industry managed to develop new types of containers made from corrugated paper.

An interesting substitution effect occurred in the processed foods and feeds category. Confectionery materials gained 49 percent in weight, reflecting increased use of corn sweeteners such as high-fructose corn syrup in candy and soft drinks. Corn sweeteners displaced refined sugar, which fell 50 percent and paralleled the drop in the relative importance of raw cane sugar within the crude materials index. In addition, crude vegetable oils rose 36 percent, while prepared animal feeds showed a more modest increase, 15 percent.

Among industrial goods exhibiting major declines in relative importance were asbestos products, which fell 61 percent. Health concerns during the 1970's resulted in sharp restrictions on use of asbestos as an insulation material. Knit finished fabrics declined 53 percent, and narrow-woven fabrics moved down 44 percent.

Real total expenditures on residential construction in 1982 fell to their lowest level since the early 1960's. Consequently, the weights assigned to most construction materials within the intermediate goods category dropped substantially; for example, softwood lumber moved down from 1.1 percent to 0.6 percent. In addition, the weight of plywood fell nearly 30 percent, and millwork registered a decrease of about 14 percent. Clay bricks and tiles were down nearly 50 percent, and concrete products declined about 30 percent.

Basic metal industries also showed significant weight declines as domestic output of raw steel in 1982 dropped to the lowest level since 1958. Besides the reduced demand for steel resulting from the downsizing of automobiles and fewer purchases of heavy machinery by American industries, as much as 20 percent of the diminished steel market was taken by imported steel. Thus, the relative importance of both steel mill products and foundry and forge shop products fell roughly one-third following the weight revision.

There was no clear trend among nonferrous metals, which showed virtually no net change overall. Aluminum gained substantially in importance because of increased use in beverage containers and aerospace equipment. However, zinc fell by about two-thirds, and precious metals declined 18 percent.

Contrary to the pattern of petroleum-derived and pharmaceutical chemicals, certain chemical products moved down in importance. Inedible fats and oils, mixed fertilizers, and miscellaneous paint products all fell at least 30 percent. Various electrical equipment categories also fell (between 10 and 25 percent), including electric lamps and bulbs, air-conditioning and refrigeration equipment, motors and generators, and wiring devices.

The relative weight of the glass containers category decreased by about 20 percent as the increased popularity of aluminum, plastic, and paper containers (and stricter legislation on deposits for beverage containers in some States) displaced much of the market once held by the glass container industry.

Finished goods

Some of the sharpest changes in weights among finished goods took place in capital equipment. The weight of communication and related equipment nearly quintupled, reflecting the growing importance and increased applications of this technology. Among the most prominent examples of these are the entry into the market of new telephone service companies and new television enterprises, particularly cable TV. Oilfield and gasfield machinery almost tripled in importance, as deregulation of domestic oil and the partial decontrol of gas prices precipitated a high level of exploration and drilling activity and in turn sharp increases in demand for such machinery. Significant increases also occurred in the weights for photographic equipment, ships, and aircraft.

On the other hand, the relative importance of heavy trucks in the finished goods category dropped from 1.2 percent to only 0.3 percent, reflecting the poor state of demand for automotive products during the recession of 1981-82. In addition, the following types of capital goods declined in importance: Locomotive parts (79 percent); textile machinery and equipment (42 percent); and railroad cars and parts (40 percent). Because the Bureau now assigns the weight of the computer industry to the broad category of machinery and equipment, rather than to the more specific category of office and store machinery, the weight of the latter dropped substantially, 52 percent. In addition, the weights of metal-forming machine tools, truck trailers, plastics machinery, and automotive maintenance equipment also moved down.

Among consumer finished goods, one of the largest shifts was the 27-percent decline in relative importance for passenger cars, which now represent 6.4 percent of the finished goods index, compared to 8.8 percent under the previous weight structure. Sales of domestic cars fell to under 6 million in 1982, compared to over 9 million in 1972. During the same period, sales of imported cars climbed steadily. The growing consumer preference for light-duty pickup trucks was reflected in the 6-percent increase for light trucks. Given the nearly disastrous conditions in the motor vehicle market in 1982, the fact that the relative importance for light trucks increased at all is significant.

Several other durable consumer goods declined in importance from 1972 to 1982. The largest decline was for travel trailers and campers, which fell 65 percent, mostly in response to curtailed vacation driving following the gasoline price increases of the 1970's. Household furniture fell 22 percent, jewelry and jewelry products declined 52 percent, and mobile homes decreased 50 percent over the same period.

One of the largest gains among consumer goods was for home electronic equipment, where an increase of 93 percent was noted for high-fidelity components and speakers. Sharp increases were also registered for phonograph records and prerecorded tapes (62 percent) and television sets (46 percent).

Changing consumer tastes led to a sharp change in the consumer foods category. Consumption of beef and pork declined because of consumer reaction to the sharp price increases during the 1970's, and because of health concerns. Consequently, the relative importance of both the beef and veal and the pork categories fell by 10 percent; beef and veal together now account for under 2.2 percent of the weight of the total finished goods index, while pork accounts for about 1.5 percent.

Many Americans substituted poultry and fish for other meats in their diets. The increased consumption of poultry was partly due to its relatively low price compared to other meats. The poultry industry gained a greater share of the market by reducing costs through improved efficiency in production. Poultry presently accounts for 1.2 percent of the finished goods index, an increase of over 61 percent compared to the 1972 weight structure. The relative importance of fish showed only a small increase.

Weights for confectionery end products rose 27 percent, compared to the 1972 structure, partly as a result of increased costs for ingredients, particularly sugar, while soft drinks advanced 11 percent. Among other foods, the proportion accounted for by salad dressings rose significantly. Increases also occurred for spices, frozen packaged sandwiches, and snack foods, while bakery products were 17 percent below the 1972 weight.

Because prices for finished energy goods more than quadrupled from 1972 to 1982, declines were experienced in per capita consumption. The net effect was little change in energy's relative share of consumer expenditures. The growing prevalence of new cars with greater fuel efficiency, coupled with the implementation of a nationwide 55-mile-per-hour speed limit, reduced demand for motor vehicle fuels compared with the long-term growth trend. Gasoline still accounts for about 3.6 percent of the weight of the finished goods index, the same as under the previous weight structure. A substantial increase in home insulation efforts, and some switching to alternative sources of energy, likewise reduced demand for home heating oil, which now represents 0.9 percent of the finished goods index, about the same as before. However, the relative importance of natural gas rose to 3.3 percent of the finished goods category, compared to 2.1 percent previously; this partly reflected the inclusion of interplant transfers in the PPI universe.

Among other consumer nondurables, athletic footwear rose 33 percent in importance, as more costly shoes were marketed to both fashion- and fitness-conscious consumers; alcoholic beverages increased 29 percent. Increases for plastic dinnerware and tableware reflected the growing importance and acceptance of these alternatives to chinaware and metal dining utensils. Women's and children's apparel also gained in importance, while men's apparel declined. Cosmetics and soaps both moved up about 9 percent in importance.

1/ Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

2/ All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or a business firm. Consumer foods include unprocessed foods, such as eggs and fresh vegetables, as well as processed foods, such as bakery products and meats. Other finished consumer goods include durable goods, such as automobiles, household furniture, and appliances, and nondurable goods, such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extensions of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Industries may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by

establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements in the latter indexes are calculated on the basis of the movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported monthly by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are always provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently cor-

rect this weakness at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1982 values of shipments as reported in the Census of Manufactures and other sources. From January 1976 through December , PPI weights were derived from 1972 shipment . Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	288.5
Less previous index	285.0
Equals index point change	3.5
<i>Index Percent Change</i>	
Index point change	3.5
Divided by previous index	285.0
Equals	0.012
Result multiplied by 100	0.012 x 100
Equals index percent change	1.2

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1967 or some later period). An increase of 188.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 288.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1967 to \$288.50 today." Likewise, a current index of 300.0 would indicate that prices received by producers of finished goods today are triple what they were in 1967.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data usually are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. Seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchase agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived by the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1981 through December 1985 were replaced at the beginning of 1986. Indexes for most broad commodity groupings

and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregative method, which combines seasonal movements from the basic stage-of-processing categories and from a wide variety of food subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
