Producer Prices and Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights and changes in the sample. A subscription may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Subscription price:

\$20 a year domestic (includes
supplement)

\$5.00 additional foreign

Single copy \$3.25

Supplement \$3.50

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through March 1982. Second-class postage paid at Laurel, Md. Price Movements

May 1982

The Producer Price Index for Finished Goods showed no change on a seasonally adjusted basis from April to May. This marked the third consecutive month of little or no change in the index. Prices for intermediate goods edged up 0.1 percent, after falling 0.6 percent in April. Crude material prices climbed 2.2 percent, the second consecutive substantial monthly advance (table A).

Among finished goods, price indexes for consumer foods and for consumer goods other than foods and energy rose only about half as fast as in April. The energy goods index dropped sharply, although not so much as in the previous month. Capital equipment prices moved up 0.4 percent for the second consecutive month.

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.3 percent to 277.7 (1967 = 100). Over the year, the Finished Goods Price Index increased 3.0 percent. In contrast, the index had climbed 10.8 percent in the 12 months ended in May 1981. From May 1981 to May 1982, the index for finished consumer foods rose 3.8 percent, prices for finished energy goods declined 11.2 percent, the index for finished consumer goods other than foods and energy advanced 5.4 percent, and capital equipment

prices moved up 6.0 percent. The Producer Price Index for intermediate goods was 1.0 percent higher than a year earlier, while crude material prices were down 1.9 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods edged down 0.1 percent in May on a seasonally adjusted basis, after no change in April. Declines for energy goods more than offset increases for foods.

The finished energy goods index fell 3.1 percent, the fifth consecutive monthly decrease. In the first 5 months of this year, this index declined at an annual rate of 27.5 percent. The gasoline index fell almost as sharply as in April; the home heating oil index also dropped but far less than in either of the 2 previous months. (Because prices for refined petroleum products are routinely lagged one month, the May indexes for gasoline and home heating oil reflected April prices.) Natural gas rose 1.8 percent, the fourth consecutive increase of about 2 percent.

The index for finished consumer foods rose 0.7 per-

cent, following a 1.6 percent advance in April. Price increases slowed markedly for pork (4.4 vs. 13.5 percent) and beef and veal (0.9 vs. 3.7 percent). Price increases also slowed for fish. Prices for eggs and fresh fruits turned down after rising in April. Roasted coffee prices fell more than in the preceding month, and prices for whole black pepper fell sharply after no change in April. On the other hand, prices climbed rapidly after declining in April for fresh and dried vegetables and milled rice; prices rose faster than a month earlier for processed poultry, shortening and cooking oils, and flour base mixes. Refined sugar rose 3.9 percent, following no change in April.

The rise in the index for finished consumer goods other than foods and energy slowed to 0.3 percent, after increasing 0.6 percent in April. Much of the deceleration was due to a downturn in prices for gold jewelry, tobacco products, leather footwear, luggage and small leather goods, and household flatware. Price increases slowed somewhat for several other goods, including household furniture and pharmaceutical preparations. On the other hand, prices turned up after declining in April for passenger cars, apparel, silver jewelry, and costume jewelry. Prices for light motor trucks rose 4.0 percent after edging up 0.1 percent in April. Price increases also accelerated for cosmetics and household appliances. Prices for periodicals and electric lamps continued to rise rapidly.

Capital equipment. The Producer Price Index for capital equipment increased 0.4 percent, about the same as in each of the previous 2 months. The May advance was chiefly due to increases for motor vehicles, integrating and measuring instruments, rubber working machinery, industrial process furnaces and ovens, min-

ing machinery, and woodworking machinery. In contrast, photographic equipment prices declined.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components edged up 0.1 percent in May on a seasonally adjusted basis, following 3 consecutive declines. The 1.0 percent increase in this index from May 1981 to May 1982 was the smallest 12-month change since December 1967.

The index for intermediate materials excluding foods and energy rose 0.4 percent, after showing very little change over the past several months. The May increase was led by a 0.9 percent advance in the durable manufacturing materials index, which in turn largely resulted from a seasonally adjusted rise in the steel mill products index. (Steel prices remained unchanged in May before seasonal adjustment.) Prices for copper mill shapes moved up, while decreases were registered for silver, gold, titanium, and lead.

The index for nondurable manufacturing materials edged down 0.1 percent, much less than the 1.5 percent drop in April. Prices for finished fabrics, industrial chemicals, and plastic resins showed smaller declines compared to the prior month. In addition, prices for woodpulp, synthetic fibers, gray fabrics, phosphates, and inedible fats and oils turned up after falling in April.

The construction materials index moved up 0.2 percent; this index was at virtually the same level in May as it was 6 months earlier. Higher prices were recorded for plywood, asphalt roofing, and building paper and board. In contrast, prices for asphalt paving mixtures, plastic construction products, and clay sewer pipes declined.

In the manufacturing components category, price advances occurred for nonautomotive metal stampings, motor vehicle parts, and internal combustion engines. In other categories, prices increased for foamed rubber, metal containers, photographic supplies, and unsupported plastic film and sheeting, but fell for glass containers and pesticides.

The index for intermediate energy goods declined 2.2 percent, about the same as in April. Continued substantial decreases were registered for gasoline, diesel fuel, commercial jet fuel, liquefied petroleum gas, and kerosene. Electric power prices turned down, while residual fuel prices rose.

The intermediate foods and feeds index move up 1.7 percent, somewhat less than in the previous month. Higher prices for refined sugar used in food manufacturing, animal feeds, crude vegetable oils, and animal fats and oils were partly offset by lower flour prices.

Crude materials

The Producer Price Index for Crude Materials for Further Processing rose 2.2 percent on a seasonally adjusted basis, slightly more than the 1.8 percent increase in April. The index for crude foodstuffs and feedstuffs moved up 2.7 percent, after rising 3.5 percent in the preceding month. Advances for cattle, hogs, oilseeds,

and hay were substantial, although not as large as in the previous month. On the other hand, the increase for sugar accelerated to 10.9 percent. Corn prices also moved up more than in April. Prices for live poultry and wheat, which had fallen in the previous month, turned up in May.

The index for crude nonfood materials other than energy advanced 3.9 percent, after rising 1.9 percent in April and falling in each of the 8 months before that. Prices for copper base scrap, which had decreased for 8 consecutive months, turned up dramatically. Prices for sand and gravel rose considerably more than in other recent months. Raw cotton climbed more than 3 percent for the third consecutive month, and iron ore prices jumped more than in any month since February 1981. Prices for crude natural rubber and potash continued to rise. On the other hand, prices for iron and steel scrap and wastepaper continued to fall sharply, and prices for logs and timber declined after rising in each of the 3 previous months. Aluminum base scrap and cattle hide prices also dropped, but much less than in April.

The crude energy materials index moved up 0.7 percent following 3 months of decreases. Prices for natural gas continued to climb at about the same pace as in other recent months. Crude petroleum prices were unchanged after decreasing for 3 months.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed.

For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

⁴ Not available.

NOTE: Relative importance figures have been revised to reflect revisions in December 1981.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for January 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Prices for all items in this grouping are lagged 1 month.

⁵ Regional refined petroleum product prices and price indexes are presented in table 7.

⁶ Prices for some items in this grouping are lagged 1 month.

n.e.c. = Not elsewhere classified.

Note: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

¹ Data for January 1982 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

³ The figure shown for each item is its percent of total railroad freight.

⁴ Dec. 1978=100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

¹ The figure shown for each item is its value weight expressed as a proportion of the total value weight for the U.S. Postal Service Index.

² Data have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Postal service prices contained in the Consumer Price Index are from first class and fourth class mail.

NOTE: Revised historical price indexes for the U.S. Postal Service, January 1972 through May 1982, are published in Table 14.

NOTE: U.S. Postal Service price indexes are introduced here for the first time for January 1972 through December 1976. Quantity weights from calendar 1972 were used in calculating these additional historical indexes. The index base remains 1977=100 for USPS indexes, 1972 through present.

Minor corrections have been included for four of the above historical series for 1977 through present. These are International air mail, 4311-511; International surface mail, 4311-512; International mail, 4311-5; and United States Postal Service, 4311.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton

yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	184.5
equals index point change	1.0
Index Percent Change	
Index point change	1.0
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by

establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979.
