Producer Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered for 1 or 2 years from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

Annual subscription price:

\$29 a year domestic (includes
supplement)

\$5.25 additional foreign

Single copy \$10; foreign \$12.50

Supplement \$17; foreign \$21.25

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission. Second-class postage paid at Washington, DC and at additional mailing offices.

Price Movements

August 1989

The Producer Price Index for Finished Goods moved down 0.4 percent seasonally adjusted from July to August. This was the same as the decrease in July and was somewhat more than June's slight dip. The Intermediate Goods Price Index fell 0.3 percent, about as much as in each of the 2 preceding months. The Crude Goods Price Index dropped 1.9 percent after a small rise in July and a 2.0-percent decline in June. (See table A.)

A substantial and broad-based drop in the energy index was responsible for the August decrease in the Finished Goods Price Index. Food prices increased slightly for the second consecutive month. The index for finished goods other than foods and energy turned up 0.5 percent following a small decline of 0.2 percent in the previous month.

Before seasonal adjustment, the Producer Price Index for Finished Goods decreased 0.6 percent in August to 113.3 (1982=100).

From August 1988 to August 1989, the Finished Goods Price Index moved up 4.2 percent, the Intermediate Goods Price Index rose 3.4 percent, and the Crude Goods Price Index increased 4.2 percent. During this same period, consumer food prices were up 4.5 percent, while indexes for food materials fell about 1 percent at both the crude and the intermediate goods levels. The index for finished energy goods rose 4.1 percent over the 12 months ended in August

1989, somewhat less than the 5.2-percent advance in the intermediate energy goods index and considerably less than the 11.3-percent climb in the index for crude energy materials. The index for finished goods other than foods and energy moved up 4.2 percent from August 1988 to August 1989; its counterparts among intermediate and crude goods rose 3.4 and 1.9 percent over that span.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods declined 0.5 percent seasonally adjusted following drops of 0.6 and 0.4 percent in July and June. The index for finished energy goods fell 7.3 percent after falling about 3 percent in both previous months. Gasoline prices fell even more in August, 12.1 percent, than in July when they declined 7.2 percent. Price indexes for home heating oil and natural gas both turned down after rising in July.

The consumer foods index increased 0.3 percent after inching up 0.1 percent in July. Price increases accelerated for beef and veal, dairy products, and bakery products. Prices turned up after falling a month earlier for eggs and pork. Prices fell less than in the previous month for fresh and dried

vegetables and processed poultry. Fish and pasta prices continued to rise. In contrast, prices turned down after rising in July for soft drinks, fresh fruits, and roasted coffee.

After falling 0.3 percent in July, the index for consumer goods other than foods and energy turned up 0.5 percent; this upturn was led by the passenger car index. Prices also rose after falling a month earlier for women's and children's apparel, cosmetics, floor coverings, and lawn and garden equipment. Price increases accelerated for pharmaceutical preparations, men's and boys' apparel, footwear, periodicals, and gold jewelry. In contrast, prices for household glassware turned down after a substantial advance 1 month earlier. Price increases slowed for books and household flatware.

Capital equipment. The Producer Price Index for capital equipment increased 0.3 percent in August after showing no change in July. Prices for motor vehicles turned up after moving down in July. Price increases accelerated for commercial furniture, oil field and gas field machinery, metal forming machine tools, and textile machinery. Prices continued to rise modestly for agricultural machinery, communication equipment, pumps and compressors, and industrial material handling equipment. In contrast, prices turned down after rising a month earlier for ships, and price increases slowed for construction machinery, metal cutting machine tools, and transformers.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components declined 0.3 percent seasonally adjusted from July to August, the third consecutive downward movement. As in the previous month, lower prices for energy goods and manufacturing materials dominated. (See table B.)

Following smaller decreases in July and June, the in-

termediate energy index fell 2.1 percent. Gasoline prices dropped more sharply than in July. Residual fuel prices also moved down, although less than in the month before, while prices for jet fuels turned up.

Declines for a wide variety of commodities prompted another slide (0.4 percent) in the index for nondurable manufacturing materials. Prices continued to fall for plastic resins and materials, paint materials, paper, fertilizer materials, medicinal and botanical chemicals, and inedible fats and oils. In contrast, industrial chemical prices edged up slightly after recent sharp drops, and gray fabric prices continued to advance. The index for materials for durable manufacturing dropped 0.6 percent, the fifth consecutive monthly decrease, as prices fell considerably for steel mill products, aluminum mill shapes, and ferrosilicon. Copper and brass mill shape prices turned up sharply, however.

The index for construction materials and components edged up 0.1 percent, the third consecutive month of negligible change. Notable increases were registered for nonferrous wire and cable and steel power boilers. Prices turned down after rising in July, however, for plywood, softwood lumber, metal work, gypsum products, and plastic construction products.

Among other categories of intermediate goods, advances were recorded for motor vehicle parts, foundry and forge shop products, aircraft engines and parts, internal combustion engines, and paper boxes and containers. The intermediate foods and feeds index moved down 0.2 percent, led by prepared animal feeds.

Crude goods

After edging up 0.2 percent in July, the Producer Price Index for Crude Materials for Further Processing dropped

1.9 percent in August, seasonally adjusted. The index for energy materials turned down strongly following a July advance, but foodstuffs and basic industrial materials increased following declines in the previous month. (See table B.)

The index for crude energy materials fell 6.7 percent after rising 2.1 percent in July. Crude petroleum prices plummeted 10.5 percent, the largest single monthly decline in more than 3 years. The natural gas index turned down after moving up in the preceding month. Coal prices rose but much less than in July.

The crude foodstuffs and feedstuffs index rose 1.7 percent after dropping 1.1 percent in July. Cattle prices rose much faster than in either July or June. Prices for fluid milk, wheat, and unprocessed fish also increased more than in the previous month. Price declines for live chickens and fresh vegetables slowed markedly. Hay and hog prices turned up following July decreases. In contrast, prices turned down for soybeans, fresh fruits, and lambs after rising in the preceding month. Price advances for corn and raw cane sugar slowed. Turkey prices fell substantially for the second consecutive month.

The index for crude nonfood materials other than energy rose 1.2 percent, following a decline of 1.5 percent in July. Prices advanced sharply for copper ores, copper base scrap, and lead and zinc ores following decreases in the preceding month. Wastepaper prices also turned up. Prices for raw cotton, logs and timber, and lead scrap rose faster than in July. Silver ore prices continued to rise substantially. Price declines slowed somewhat for iron and steel scrap. In

contrast, prices fell for cattle hides and leaf tobacco after moving up in July. Aluminum base scrap prices fell for the seventh consecutive month.

Net output price indexes for major industry groups

The Producer Price Index for the net output of the domestic manufacturing sector declined 0.4 percent in August after edging down 0.1 percent in both July and June. (Net output price indexes are not seasonally adjusted.) The August drop was dominated by a 5.9-percent slump in the index for the petroleum refining industry group, the third consecutive large monthly decrease. The index for the chemicals industry group fell more than in the preceding month. The largest August increases were the 0.8-percent advances recorded for both the tobacco manufactures and the leather products industry groups. Most other manufacturing industry group indexes changed less than 0.5 percent. From August 1988 to August 1989, the index for the net output of total manufacturing industries rose 4.2 percent.

After climbing 1.2 percent in July, the index for the net output of the domestic mining sector declined 5.1 percent in August. The oil and gas extraction industry group index fell 6.8 percent in the wake of a 1.6-percent advance the month before. In contrast, the metal mining industry group index followed its 4.2-percent decrease in July with a 4.7-percent increase in August. Over the 12 months ended in August 1989, the Producer Price Index for the net output of total mining industries advanced 7.9 percent.

Experimental Computer Price Indexes

Beginning this month, the Bureau of Labor Statistics is publishing new commodity-based computer price indexes in table 13 of this periodical on an experimental basis. These new indexes will be treated separately from the traditional Producer Price Index commodity grouping system and will not now be included in the stage-of-processing indexes or other PPI data.

The experimental price indexes are an outgrowth of a pilot project initiated in 1987 and completed in October 1988. The purpose of the pilot was to evaluate different quality adjustment procedures for quantifying technological change in the computer hardware industry. For these indexes, BLS has used a composite of the pilot quality adjustment methods which most closely approximates the traditional PPI producer-cost procedure. Although this approach seems most promising at this time, BLS will continue to evaluate the alternatives.

The price index series will be issued quarterly with a base of October 1988=100. Indexes are available for October

1988 and January, April, and July 1989. Subsequent indexes will appear on the same quarterly schedule. The new table 13 also shows year-to-year and quarter-to-quarter percent changes for these series. The indexes are not seasonally adjusted.

The publication structure of the new indexes reflects word-size and type of microprocessor for general purpose digital computers. The indexes are based on a judgmentally drawn sample of manufacturers and items which will be updated approximately every 2 years.

Further information on the pilot study and/or a copy of the BLS working paper on this subject may be obtained by contacting the U.S. Department of Labor, Bureau of Labor Statistics, Division of Industrial Prices and Price Indexes, Attention: Jim Sinclair, 600 E Street, N.W., Room 5115, Washington D.C. 20212, telephone Area Code 202-272-5052. An article on the experimental indexes will appear in a forthcoming issue of the *Monthly Labor Review*.

Milestones in Producer Price Index Methodology and Presentation

Andrew G. Clem

The decade of the 1980's has witnessed some of the most profound changes in the history of the Producer Price Index program. The completion of the PPI Revision program has not only greatly expanded the coverage of the index, but has also vastly improved sampling and calculation procedures. It has also made PPI data more compatible with other economic time series by making more extensive use of the Standard Industrial Classification (SIC).

Now that the transition has been completed, it is an appropriate time to review what specific changes have been made in the index itself, and in this periodical, *Producer Price Indexes*. The focus in this article will be on the changes in the more recent past. However, notable accomplishments of earlier decades will be outlined as well. At the end of this brief summary appears a chronology of significant events in the PPI program since World War II. (Note: Although the name "Wholesale Price Index" was officially used until 1978, the term "Producer Price Index" as used in this article refers, for the sake of clarity, to the industrial price program over the years.)

The first comprehensive overhaul of the PPI took place when the January 1952 index was published.¹ This overhaul involved a major expansion of the sample of commodities, a revision of the weight structure, and a retroactive recalculation of the indexes back to 1947. The size of the sample expansion is reflected by the large number of index series in the PPI historical files whose data begins in 1947, 1,811 individual items and commodity groupings. Only 81 series date back further than 1947.

The next watershed year in the PPI was 1967. The commodity code system was extended to provide for more "room" for expansion, adding a new level of aggregation known as the subproduct class. In addition, there was a revision of the weight structure, and a reclassification of several major groups. Finally, the first indexes classified by SIC were published, under the Industry-Sector Price Index (ISPI) program. This was a precursor to the PPI Revision.

The high rates of inflation during the 1970's gave rise to heightened public awareness of government price statistics. In the PPI program, special efforts were made to improve

the quality and sample breadth of energy price indexes. Seasonal adjustment methodology was improved, and was given greater public prominence. More importantly, research was begun on the comprehensive project to revise the methodology of the PPI.

The year 1978 was marked by several crucial events, both cosmetic and substantive. In March, the name of the program was officially changed from the "Wholesale Price Index" to the "Producer Price Index." For years, the term "wholesale" had been misleading many people into thinking that the index was based on quotes that wholesalers/distributors charged to retail outlets. The name change to "PPI" was intended to express more correctly the type of price data collected, which was always the price *received* by the *producer*. At the same time, the analytical focus of the program shifted from the major commodity groups to the stage-of-processing (SOP) categories. Thus, the index for All Commodities was replaced by the Finished Goods Price Index as the principal measure of industrial prices. The use of SOP indexes instead of major commodity groupings went a long way toward eliminating the double-counting problem that had been historically a major criticism of the PPI.

Regular publication of indexes under the revised methodology began in January 1980, and coverage expanded almost as scheduled during the first half of the decade, in spite of tight budget constraints.² Many industrial sectors were introduced into the PPI for the first time, such as printing and publishing, logging, ship and boat building, nonferrous ores, specialized textiles, communications equipment, and various engineering and scientific instruments. In addition, coverage was expanded considerably for aircraft and parts, chemicals, plastics, and special industry machinery. However, as a consequence of the scientific sampling procedures used in the PPI Revision process, many detailed indexes ceased being published.

As the PPI Revision neared completion, several major changes were made in the presentation of the data. A number of three-digit industry group and several two-digit major industry group indexes were first published between 1985 and 1986, thus affording even better compatibility between the PPI and other economic time series. Until then, the highest-level indexes that had been published were four-digit industry indexes. The weighting structure of the PPI commodity grouping indexes was revised at the beginning of 1987, and

¹ All dates cited in this article and in the accompanying chronology refer to the month to which the indexes pertain, usually 1 month before the indexes were published.

in January 1988,³ the reference base was changed from 1967=100 to 1982=100. Indexes for several new "service-sector" industries were first published during 1988; these represent the first major step in the planned expansion of the PPI into service industries, which are increasingly important in the American economy.

Chronology, 1952-89

January 1952: First comprehensive revision of index methodology, and expansion of sample. Indexes were recalculated retroactively to 1947. In addition, the reference base was changed to 1947-49=100 from 1926=100. The universe was redefined as the "total net selling value of commodities produced or processed in the U.S. (or imported for consumption) flowing into primary markets"; Census values of shipments were used as weights, for the first time (1947 values). Previously, items had been weighted "only by their own market value (quantity marketed times price)." Indexes for "economic sectors" (later called "stages of processing") were first calculated.

January 1955: Weight revision: average shipment values from 1952-53 were introduced.

January 1958: Weight revision: 1954 Census values were introduced. Also, indexes for "economic sector by durability of product" were first published, and calculated retroactively to 1947. The previously existing indexes for economic sectors were renamed "economic sector by stage of processing."

January 1961: Weight revision: 1958 Census values were introduced.

January 1962: The standard reference base year was changed to 1957-59=100 from 1947-49=100.

January 1967: Major revision of commodity classification system: detailed items were given 8-digit codes (rather than 6). Also, former major group 11 (machinery and motive products) was divided into present-day groups 11 and 14, and former major group 14 (tobacco and bottled beverages) was distributed among the present major groups 02 and 15. There was also a revision of the weighting structure, as 1963 Census values were introduced. Industry-Sector Price Indexes were published for the first time, and included 51 industries. This made the PPI more compatible with other economic statistics using the Standard Industrial Classification (SIC). Sample changes were henceforth geared toward improving coverage of SIC groupings.

³ An article describing the weight change and analyzing its effects on the index appeared in the April 1987 issue of this periodical, and also in the August 1987 issue of the *Monthly Labor Review*.

January 1971: Change in reference base to 1967=100 from 1957-59=100. The January 1971 detailed report showed annual averages for 1967, 1969, and 1970, plus all rebasing factors and relative importance data.

May 1974: Indexes for refined petroleum were revised for March 1973 forward; for the first time, quotes from producing companies were used instead of spot market quotes from trade journals. Because average month pricing was used (instead of using quotes from the Tuesday of the week in which the 13th falls), a 1-month lag was introduced for refined petroleum products.

June 1975: First publication of railroad freight price indexes. This was the first industry outside of the goods-producing sectors included in the PPI. A probability sample permitted calculation of standard errors of the monthly percent changes, which were published in the 1976 edition of the annual supplement to the monthly detailed report.

July 1975: Summary text for the press release and detailed report placed primary focus on seasonally adjusted percent changes for the first time.

August 1975: First publication of regional refined petroleum indexes, based on an expanded sample.

January 1976: Revision of weight structure; 1972 Census values were substituted for 1963 values, and 1967 input-output ratios were used for stage-of-processing allocations instead of 1958 ratios.

March 1976: New seasonal adjustment procedures were put into effect; many higher-level seasonally adjusted indexes were computed *aggregatively* for the first time. Rather than computing seasonal factors directly for the broad grouping, the seasonally adjusted numbers were derived indirectly from its seasonally adjusted component indexes.

July 1976: First publication of regional bituminous coal indexes.

July 1977: An expanded sample for natural gas permitted the first publication of import, interstate, and intrastate components, and the 2-month lag was reduced to 1-month.

A new focus

March 1978: The official name of the program was changed to "Producer Price Index," replacing the less accurate and misleading name, "Wholesale Price Index." The old tables 1, 2, 3, and 5 were eliminated, new tables 2 and 3 were added, and others were renumbered. For the first time, the primary focus was placed on the stage-of-processing indexes.

May 1978: Implementation of the regular “N-4” revision cycle, whereby indexes are finalized on the fourth month after original publication. Revisions to previously published data had been made on an ad hoc basis.

July 1978: First publication of PPI Revision “pilot survey” indexes (4 industries) in table 14. This pilot program for the PPIR continued until December 1979, and was subsequently integrated into the PPI Revision.

June 1979: A new sample was put into place for railroad freight indexes; an article in this periodical showed the derivation of statistical variances.

October 1979: First publication of seven “special” stage-of-processing indexes related to energy (table 1). This was in response to numerous questions from the press over the effect of the energy crisis on the PPI.

January 1980: Commencement of regular publication of PPIR indexes (16 industries). Former table 14 was renumbered table 4. Affected commodity indexes in table 6 were “interfaced” with corresponding PPIR product indexes (indicated by a “.99” code).

May 1980: First publication of the five remaining “special” energy-related stage-of-processing indexes in table 1.

September 1980: First publication of telecommunication services; data calculated retroactively and shown for 1972 through August 1980.

January 1981: Revisions of stage-of-processing indexes for 1976-80, based on updated input-output ratios (1972 instead of 1967).

October 1981: Additional telecommunication indexes first published; data shown from 1972 through October 1981.

December 1981: First publication of postal service indexes; data shown from 1977 through 1981.

January 1982: Changes in table numbers and formats: table 3 began to show seasonally adjusted indexes for 10 major stage-of-processing groups back several years; regional indexes for bituminous coal were moved to table 4; percent changes for 4-digit SIC groups were no longer published; and tables 8, 10, and 12 were deleted.

April 1982: Revision of railroad freight indexes; data shown for 1979 through April 1982. Revision of telephone indexes, based on corrected data; data shown for 1972 through 1981.

May 1982: Revision of postal service indexes; data shown for 1972 through May 1982.

July 1982: Incorporation of the steel industry in the PPIR; many changes were made in sample of products; former code 1013 was changed to 1017. New policy on detailed product indexes called for putting new detailed indexes in table 4 only, while table 6 would generally consist of broader groupings.

January 1983: Commencement of the phase-out of the Industry-Sector Price Index; industries with indexes already included in the PPIR (table 4) were henceforth to be removed from tables 9 and 10. (See January 1986.)

January 1985: Change in name of periodical to “Producer Price Indexes” (deleting “...Prices and...”). The title change foreshadowed the planned discontinuation of dollar prices from table 6. First publication of higher-level SIC indexes (table 14).

March 1985: Incorporation of railroad freight under the PPIR methodology, and deletion of the separate table for railroad freight (former table 11).

July 1985: Incorporation of petroleum refining under the PPIR methodology; elimination of the 1-month lag; revision of June (N-1) indexes and all aggregate indexes affected by petroleum (including Finished Goods); announcement that table 7 would no longer be published because of the elimination of regional petroleum indexes.

Completion of the PPI revision

January 1986: Coverage under the PPI Revision program achieved for all but 4 mining and manufacturing industries; first publication of 74 new PPIR industries. Last remaining imported items were eliminated from PPI universe. In addition, the last remaining Industry-Sector Price Indexes were discontinued, as tables 9 and 10 were deleted. (See January 1983.) These events were reflected in a comprehensive change in sequence and format of detailed report tables; former table 14 became table 4, and was also shown in PPI news release for the first time.

February 1986: The price and unit columns of table 6 were eliminated, and new columns were added showing 1-month and 12-month percent changes. Furthermore, point codes for detailed commodity indexes were eliminated (since the PPIR interface had been completed, all point codes would have been “.99”).

March 1986: Table 2 was changed to show revised (N-4) indexes instead of relative importance data.

July 1986: First publication of indexes for material inputs to construction, table 11. Also, indexes for the petroleum pipeline industry (SIC 46) were first published. The process for revising the samples of industries previously included

in the PPI Revision was implemented, as the first batch of 25 “cycle 2” resampled industries was published.

January 1987: Implementation of new weighting structure, using 1982 Census values instead of 1972 values. An article explaining and analyzing the weight base change appeared in the April 1987 issue of the detailed report. Scrap and waste materials (SIC 5093) were included in the PPIR.

January 1988: The standard index reference base in the PPI was changed to 1982=100 from 1967=100, to coincide with the weight base year. A special historical table

(number 21) showed rebased data for the period 1967 through 1987 for 33 stage-of-processing series and 24 commodity grouping series. In addition, indexes for the air transportation industry were first published, and a revised (4-way) system of industry-based stage-of-processing indexes was introduced.

June 1988: First publication of indexes for foreign and domestic deep sea transportation, as well as for radio broadcasting.

August 1989: First publication of experimental indexes for the computer industry.

¹ Comprehensive relative importance figures are computed once each year in December.

² Data for April 1989 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

⁴ Includes crude petroleum.

⁵ Excludes crude petroleum.

⁶ Percent of total finished goods.

⁷ Percent of total intermediate materials.

⁸ Formerly titled "Crude materials for further processing, excluding crude foodstuffs and feedstuffs, plant and animal fibers, oilseeds, and leaf tobacco."

⁹ Percent of total crude materials.

¹ Indexes in this table are derived from the net-output-weighted industry price indexes shown in table 5. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly-titled indexes which are derived from traditional commodity groupings shown in table 6.

² Data for April 1989 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

1/ Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

1/ Indexes in this table are derived from the product indexes in table 5. These indexes are composed of the goods used by the industries in each of the industry stage of process output indexes as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

2/ All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

3/ Not available.

4/ Percent of final input to consumers.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

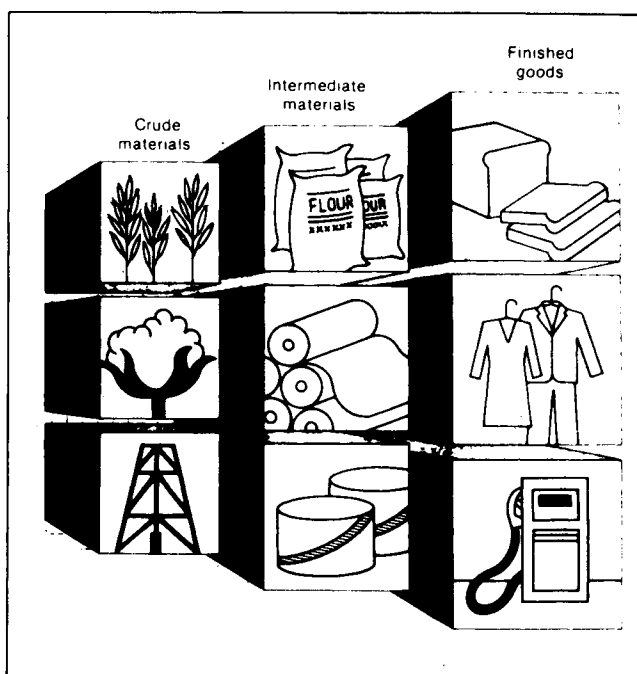

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classi-

fied in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on a base period of 1982=100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing

indexes) calculated from traditional commodity groupings, currently reflect 1982 values of shipments as reported in the Census of Manufactures and other sources. From January 1976 through December 1986, PPI weights were derived from 1972 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index Percent change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished

Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment

Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1983 through December 1987 were replaced at the beginning of 1988. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories with those of a wide variety of food and certain other subproduct class (6-digit level) series.

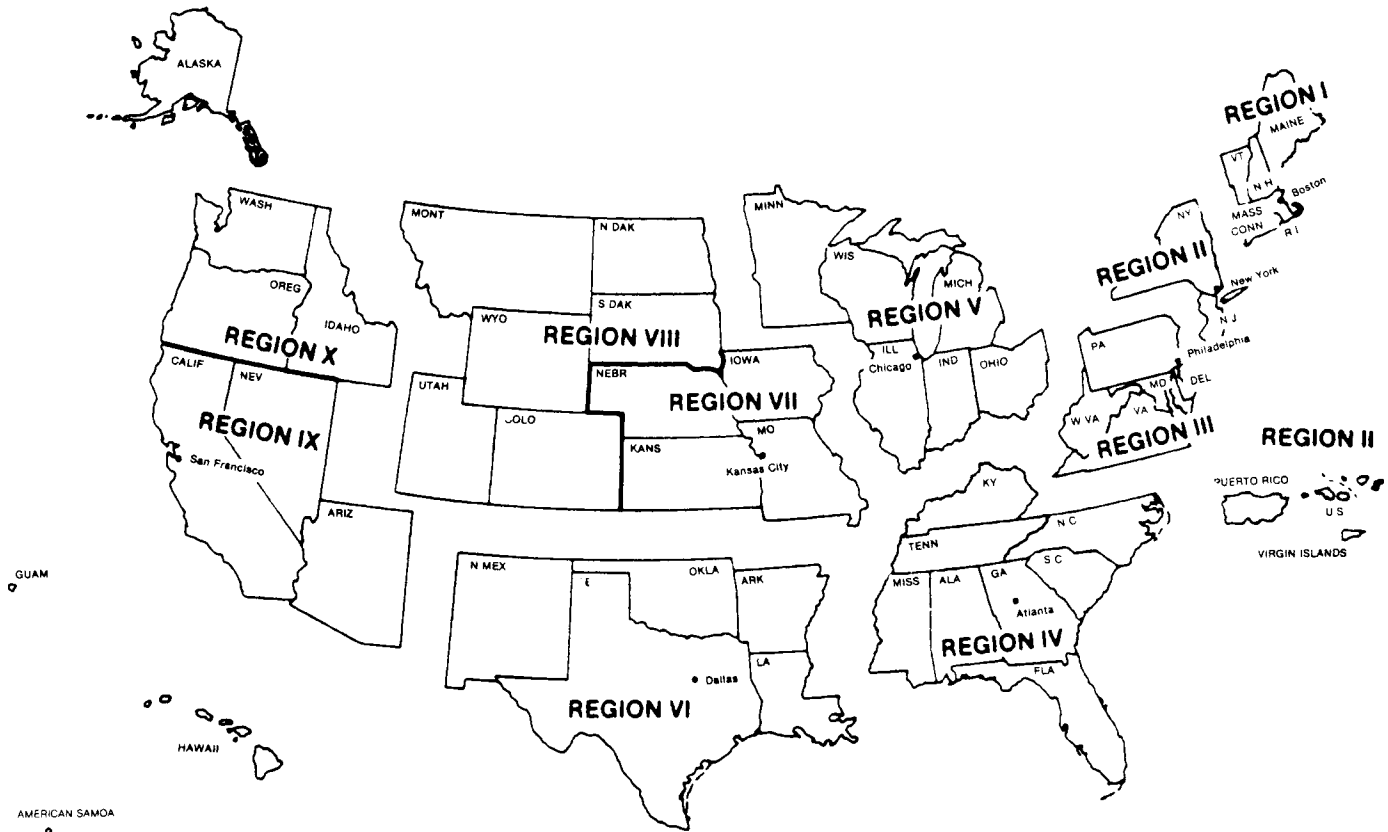

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
