Price Movements December 1985

The Producer Price Index for Finished Goods moved up 0.4 percent from November to December after seasonal adjustment, considerably less than in either October or November. The slowdown was largely due to smaller increases in food and energy items. The Intermediate Goods Price Index rose 0.4 percent, about the same as in November; the November and December increases, however, were in contrast to the behavior of the index in most earlier months of 1985. After climbing sharply in each of the preceding 2 months, the index for crude goods edged down 0.2 percent in December. (See table A.)

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.2 percent in December to 297.2 (1967 = 100). From December 1984 to December 1985, the Finished Goods Price Index increased 1.8 percent, about the same as the 1.7-percent rise registered in 1984. However, the major categories of finished goods behaved somewhat differently in 1985 than in the year before.

Consumer food prices, which had climbed 3.5 percent in 1984, fell during most of 1985 before turning up in the fourth quarter to close the year 0.3 percent higher than at the end of 1984. After decreasing 4.1 percent in 1984, the index for consumer energy goods was at virtually the same level in December 1985 as 12 months

earlier. This index was quite volatile during 1985, however. The rise in the index for finished goods other than foods and energy accelerated modestly to 2.7 percent, following a 2.1-percent increase in 1984.

The index for intermediate materials, supplies, and components slipped 0.3 percent in 1985, after moving up 1.3 percent from December 1983 to December 1984. Following a 1.6-percent drop in 1984, the crude goods index fell 5.5 percent over the year, the largest annual decline since 1952.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods increased 0.5 percent in December after seasonal adjustment, following an advance of 1.0 percent in November. (See table B.) The index for consumer foods rose 0.8 percent, compared with an increase of 1.6 percent in the previous month. Prices for beef and veal, pork, and processed poultry turned down after rising considerably in both preceding months. Fish prices rose more slowly, following a 12.6-percent upward jump in November. Price increases also slowed for fresh fruits. On the other hand, prices for fresh and dried vegetables soared 19.3 percent after 4 consecutive monthly decreases. Prices for roasted coffee,

bakery products, and soft drinks also advanced.

The index for finished energy goods rose 1.8 percent, after climbing 3.1 percent in November. Prices for home heating oil and gasoline rose less than in November. In addition, the natural gas index moved down substantially more than in either October or November.

The index for finished consumer goods other than foods and energy was unchanged in December, after rising 0.1 percent in November. Declines for passenger cars and prescription drugs offset increases for apparel, tobacco products, cosmetics, costume jewelry, and light trucks.

Capital equipment. The Producer Price Index for capital equipment moved down 0.1 percent, after inching up 0.1 percent in November. Increases were registered for trucks, commercial furniture, plastics industry machinery, textile machinery, and metal forming machine tools. Prices for passenger cars, printing trades machinery, and photographic equipment declined.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components rose 0.4 percent, seasonally adjusted, in December. Most of this increase was due to the 2.0-percent climb in the intermediate energy index, the second consecutive large advance. Prices for both residual fuel and liquefied petroleum gas surged more than 9 percent, and gasoline and diesel fuel each moved up nearly 3 percent.

The index for nondurable manufacturing materials edged up 0.1 percent, following several months of small decreases. Increases for paper, paperboard, gray fabrics, synthetic fibers, and leather were nearly offset by declines in prices for plastic resins, processed yarns, and synthetic rubber. The durable manufacturing materials index rose 0.3 percent, led by higher prices for

copper and Portland cement. Prices for tin, silver, and gold fell.

No change was observed in the materials and components for construction index, which has been fairly stable in recent months. Advances for gypsum products and plastic construction products were balanced by falling prices for millwork, softwood lumber, and plywood.

Among miscellaneous intermediate goods categories, higher prices were noted for metal containers and nonferrous foundry shop products, while rubber hose prices moved down. In the intermediate foods and feeds grouping, prices rose for prepared animal feeds and crude vegetable oils.

Crude goods

The Producer Price Index for Crude Materials for Further Processing inched down 0.2 percent on a seasonally adjusted basis, after advancing about 3 percent in both October and November. Prices for many foodstuffs either turned down or rose moderately following surges in the preceding 2 months. The crude foodstuffs and feedstuffs index rose 0.2 percent, after jumping 5.8 percent in November. Following sizable advances of more than 10 percent in the previous month, prices turned down for cattle, chickens, and soybeans. Fluid milk prices also declined. Prices advanced less rapidly for unprocessed fish, wheat, corn, and fresh fruits. Prices turned up following November declines for hogs, turkeys, fresh vegetables, and raw cane sugar.

After easing down 0.1 percent in November, the crude energy materials index fell 0.5 percent. Natural gas prices declined for the sixth time in the last 7 months. Coal prices also moved down, although considerably less than in either October or November, while crude petroleum continued to advance moderately.

The index for crude nonfood materials other than

energy dropped 1.0 percent, following a 0.2-percent decrease in November. Lower prices for leaf tobacco, brass scrap, raw cotton, iron ore, and crude natural rubber more than offset continued sharp advances for cattle hides.

Changes in the Producer Price Index for January 1986

Several significant changes in the substance and presentation of monthly producer price indexes in the PPI news release and in the detailed report, *Producer Price Indexes*, will become effective with the release of January 1986 PPI data in February. Highlights include the following:

- The PPI program will expand to encompass the net output of virtually all remaining industries in the mining and manufacturing sectors that had not been covered

before. This expansion will complete the transition to the methodology of the Producer Price Index Revision, a process that began in the late 1970's.

- All remaining indexes for imports such as crude natural rubber, cocoa beans, and bananas will be eliminated. The PPI will thus be consistent as a measure of changes in prices received by domestic producers. BLS has a separate survey which provides price indexes covering all imported goods.

- Publication of the few remaining unit dollar prices will be discontinued. The PPI program will be strictly a system of price indexes.

- A new table will be added to the PPI news release to show indexes for the net output of major mining and manufacturing industry groups at the 2-digit Standard Industrial Classification (SIC) level.

- Several tables in *Producer Price Indexes* will be re-arranged and renumbered. Tables 9 and 10 will be dropped; all industry-related data will appear in the tables presenting net output indexes.

Price Highlights, 1985

By Roger Burns, Andrew Clem,
Craig Howell, and William Thomas

Prices received by producers of finished goods moved up 1.8 percent from December 1984 to December 1985. This marked the third consecutive year that the Finished Goods Price Index index rose less than 2 percent. Producer prices for intermediate and crude goods decreased in 1985. The intermediate materials, supplies, and components index fell 0.3 percent, the first calendar-year drop in this series since 1962. This index, like finished goods, had moved up less than 2 percent in both 1983 and 1984. The index for crude materials for further processing fell rapidly through the first 9 months of 1985 before recovering somewhat in the fourth quarter to finish the year 5.5 percent below its December 1984 level. This was not only more than the 1.6-percent decrease recorded in the preceding 12 months, it was also the largest annual decline in crude material prices in a third of a century.

Many of the economic forces that helped to restrain inflation in 1983 and 1984 continued to operate with similar effect in 1985. The enormous volume of imported goods was once again a pervasive influence, even though the trade-weighted value of the American dollar in international currency markets retreated modestly after it had peaked early in the year. Intensified efforts to restrict imports of certain goods from selected countries did not lead to major price boosts for most domestically produced items. Continued heavy domestic and foreign production of a variety of basic agricultural, energy, and industrial materials kept many of these prices falling.

Having slowed sharply in mid-1984, the general expansion of the American economy regained some vigor after mid-1985, aided by looser monetary policies and a considerable drop in interest rates. Consumer spending continued to climb, undeterred by mounting debts and low personal saving rates. Investment spending, however, increased more slowly, after several years of unusually strong growth. Uncertainties generated by possible changes in tax laws affecting capital expenditures contributed to business caution on long-range commitments. The residential housing market was also not much stronger than in 1984, in spite of declining interest rates. Tighter credit eligibility restrictions by mortgage lenders effectively limited demand by disqualifying many potential homebuyers without sufficient resources for a substantial down payment. At year's end, there were few labor or material shortages or capacity constraints threatening to reignite inflation.

Finished goods

Although prices for finished goods rose 1.8 percent, about the same as in 1984, price movements of the individual components were somewhat different. Consumer food prices rose much less than they had a year earlier; energy prices showed no net change after falling 3 years in a row; and the index for finished goods other than foods and energy moved up somewhat more than in the previous year.¹

The index for finished consumer foods inched up 0.3 percent in 1985, following a 3.5-percent rise in the preceding year. Prices for pork, beef and veal, processed poultry, and fish all fell significantly for much of the year, largely because of plentiful supplies, but turned up by year-end; only beef and veal ended the year below the level of December 1984. Consumer demand continued to drift away from red meats toward poultry and fish. Egg prices rose nearly 7 percent in 1985, after falling the previous year when egg producers overexpanded flocks. In contrast, shortening and cooking oils were 15 percent lower than a year earlier, as both animal and vegetable based products showed declines. Prices also fell over the year for dairy products and soft drinks.

Among finished energy goods, the index for natural gas moved down 6.2 percent, after rising 1.0 percent in 1984. This decline reflected lower prices for interstate gas after the lifting of controls in January 1985 on most U.S. wellhead natural gas under the 1978 Natural Gas Policy Act. Indexes for gasoline and home heating oil turned up after they had fallen the previous year. Gasoline prices were poised for sharp declines in 1985, amid strong expectations of falling crude oil prices because of disarray within the Organization of Petroleum Exporting Countries (OPEC). While gasoline prices did post a net decline for the second half of the year, this was not enough to offset the unusually strong advances that occurred in the spring when the glut of foreign gasoline on the market eased. After substantial declines in the first half, fuel oil prices rose sharply in the second half when inventories of heating oil were unusually low. Hoping that crude oil prices would fall, refiners sometimes preferred to buy from other refiners instead of buying crude oil on the spot market. The resulting surge of purchases of heating oil in some areas

¹ Effective with data for July 1985, the 1-month lag in indexes for major refined petroleum products was eliminated. At that same time, the sample of refined petroleum products was reweighted.

led to higher prices.

The index for consumer goods other than foods and energy advanced 2.7 percent in 1985, after rising 2.2 percent a year earlier. Increases were widespread and generally moderate. However, passenger cars rose 3.5 percent and light motor trucks increased 8.0 percent, the largest calendar-year advances in 3 years. Demand for cars and trucks was very high in 1985, peaking at periods when low-interest financing and other incentives were in effect, then slumping when they were discontinued. Light trucks became increasingly popular as the second family car; 1985 sales of light trucks exceeded the previous record of 4.3 million sold in 1978. Domestic manufacturers sold about 8.2 million passenger cars in 1985, compared to 7.9 million in 1984.

From December 1984 to December 1985, the capital equipment index advanced 2.7 percent while inflation for most domestically produced capital goods was restrained by continued fierce competition from imported machinery. Although capital spending rose in 1985, the rise was smaller than in other recent years. Unlike the year before when there was widespread optimism, several developments caused business to become more cautious about investment spending in 1985. For example, uncertainty over the possible cancellation of the investment tax credit increased, and speculation persisted on whether there would be a change in the period over which companies could recover investment in machinery through depreciation.

Intermediate goods

The Producer Price Index for Intermediate Goods edged down 0.3 percent from December 1984 to December 1985, following a 1.3-percent rise in 1984. Moderate declines were widespread among products within this category, while annual increases of more than 3 percent were rare. Despite the improvement in the economy after midyear, metal markets were generally sluggish in 1985. Demand for domestic steel, for example, was limited. Restrictions on steel imports cut the market share won by foreign steel producers only marginally. Some producers who were in financial straits lowered their prices to maintain or increase their market share and to generate needed cash. The continuing trend towards substitution of plastics and aluminum for steel in many major products also kept steel manufacturers from boosting output.

Prices for many nonferrous metals were considerably lower at the end of 1985 than they had been a year earlier. Tin, lead, and zinc all fell more than 20 percent. After fluctuating indecisively during most of 1985, tin prices plummeted nearly 30 percent in November and December. The financial collapse of the International Tin Council, which had been maintaining a massive buffer stock in order to support tin prices, precipitated the abrupt price drop. Lead and zinc prices fell because of a surplus in world markets that persisted in the face of pro-

duction cutbacks in North America. (Because these two "sister metals" are generally mined together, their production levels are interrelated.) Aluminum prices continued to fall moderately in 1985, as demand did not improve enough to pare worldwide inventory levels sufficiently. Copper prices rose 7.5 percent, the first yearly increase since 1979. Recent increases in copper prices have been attributed in part to the falling value of the American dollar. Gold prices were much less volatile than in other recent times, finishing the year 2.9 percent lower than in December 1984. Silver was down more sharply (14.6 percent), partly as a result of large sales of private holdings.

Prices were weak throughout the textile and fibers sector during 1985. In recent years (particularly since 1983), competition from foreign producers has intensified in textile material markets, above and beyond the long-standing foreign penetration of apparel markets. For example, domestic production of manmade fabrics was down nearly 10 percent during the first 3 quarters of 1985, compared to the same period in 1984. Decreased domestic production of these textile fabrics had a direct impact on American producers of synthetic fibers, the index for which fell 4.8 percent over the year. This was the fourth consecutive annual decrease and the largest such drop on record.

The domestic electronics industry suffered an unusually sharp slump during the year because of a slowdown in personal computer sales and intensified competition from foreign (mainly Japanese) component suppliers. The PPI for electronic components and accessories edged up only 0.7 percent in 1985, the smallest rise in 10 years. Sharp price declines were particularly evident in the semiconductor industry, where prices for some advanced integrated circuits plunged more than 40 percent.

Construction material prices edged up 1.0 percent over the year. There was considerable variation in price behavior among the various kinds of construction materials. Several nonmetallic mineral products climbed moderately. Gypsum product prices turned up 8 percent, recovering from the drop that had occurred in the second half of 1984, while prices for plastic plumbing products dropped nearly 12 percent; lumber and plywood prices declined for the second consecutive year. Although the residential housing construction market remained fairly good in 1985, it did not expand in response to the general drop in interest rates; this had a restraining effect on prices of lumber and other wood products heavily used in building new homes. The commercial construction market, however, had a very strong year, helping to boost prices for those materials used in erecting office buildings.

The index for intermediate energy goods moved down 0.8 percent in 1985. Residual fuel prices fell 15.6 percent, principally because of reduced world demand following the settlement of the British coal strike. Prices

for jet fuels and coke also decreased. These declines were nearly balanced by increases for electric power, gasoline, and diesel fuel. The 4.7-percent fall in the index for intermediate foods and feeds was led by substantial decreases for crude vegetable oils and animal fats and oils. Price movements for other products in this category were moderate.

Among other kinds of intermediate goods, prices for woodpulp fell more than 15 percent, as a shift from seasonal to year-round production resulted in a sizable rise in supplies. Paperboard prices declined nearly 10 percent, reflecting an overexpansion of capacity in this country and Canada. Prices for paper and paper boxes and containers moved down modestly. Prices and production levels in the pulp and paper products industry had risen steadily during 1983 and most of 1984. Moderate decreases were registered for a number of other products, such as mixed fertilizers, plastic resins and materials, rubber and plastic products, and medicinal and botanical chemicals.

Crude goods

The Producer Price Index for Crude Materials for Further Processing dropped 5.5 percent, following a 1.6-percent decrease in 1984 and a 4.7-percent advance in 1983. The indexes for foodstuffs and other nonenergy materials both fell more than in the preceding year, following increases in 1983. The crude energy price decline in 1985, which had slowed in 1984, nearly matched the 1983 rate of decrease.

After moving down 1.2 percent in 1984, the crude foodstuffs and feedstuffs index fell 6.4 percent from December 1984 to December 1985. The index declined through the first 9 months of the year before recovering somewhat in the fourth quarter. Falling prices prevailed while livestock owners liquidated portions of their herds in order to meet the high debt service costs incurred in connection with previous loans for expanded production. Prices

then turned up at the close of 1985 as the liquidation of stocks left livestock inventories low. The decline in grain and feedstuff prices reflected continued bountiful harvests both here and in many other countries. However, inclement weather in some areas and higher export demand generally pulled fourth quarter prices up.

The crude energy materials index moved down 4.3 percent, considerably more than the 1.3-percent decline for the previous year. The bigger decrease was principally due to a 6.2-percent drop in the natural gas index, the largest yearly decline on record. Crude petroleum prices fell for the fourth consecutive year, moving down 4.0 percent. Most of the decline occurred in the first quarter as a response to the October 1984 cut in international light crude oil prices by North Sea producers; prices were relatively stable through the rest of the year. The coal index dropped 1.4 percent, the first annual decrease since 1975. Contract coal prices tied to declining indexes for fuel oil and natural gas turned down in 1985.

The index for crude nonfood materials other than energy dropped 4.5 percent, following a 3.3-percent decline in 1984. Lower prices for ferrous scrap and iron ore were prompted by slack demand from domestic steel manufacturers. Prices for aluminum base scrap fell due to an oversupply of primary aluminum, and brass scrap dropped as it followed the downward movement of primary zinc. Leaf tobacco was down a record 11.6 percent, reflecting reduced effective price supports and large supplies. Raw cotton prices were lower as a result of burdensome stocks and weak demand from domestic fabric manufacturers confronted with intense foreign competition. The 38.5-percent fall in wastepaper prices was chiefly a reaction to the sharp drop in prices for woodpulp, which competes with wastepaper as a basic material in the manufacture of certain paper products. In contrast, cattle hide prices increased in response to good demand from foreign apparel manufacturers, coupled with low supplies in the wake of a partial liquidation of cattle herds.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 85 percent of total finished goods, about 85 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods,

the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

³ Not seasonally adjusted.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes is undergoing extensive changes. It currently contains about 3,200 commodities and about 43,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by class of buyer and by degree of fabrication (i.e., finished goods, intermediate goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and that are ready for sale to the final demand user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

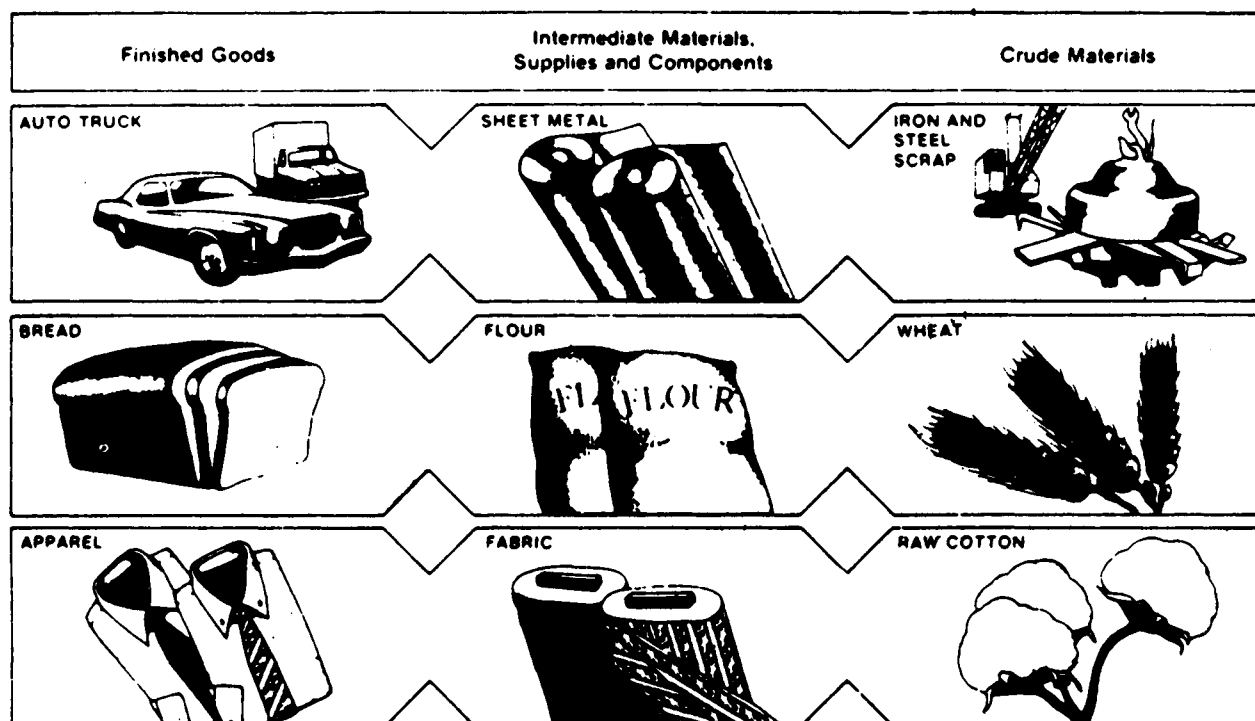

Intermediate materials, supplies, and components include commodities that have been processed but that require further processing. Examples of such semifinished goods include flour, cotton yarns, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that

are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated and which are not sold directly to consumers. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude non-food materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than broad commodity grouping indexes. Broad commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the broad commodity grouping indexes uses the total shipment values for commodities at all stages of processing. Within the stage-of-processing structure, on the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade

publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In aggregating producer price indexes, price changes for various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars as follows: "The price of a representative sample of finished goods produced in the United States has risen from \$100 in 1967 to \$225."

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equal index percent change	0.5

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy,

seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index Revision (PPIR) in table 4, "Producer price indexes for the net output of selected industries and their products." Table 4 includes data for Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1986, table 4 will cover nearly all 493 SIC mining and manufacturing industries.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within the industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in one industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry that are not derived from the sales of their products. Because of the distinction between primary and secondary products, an index for a product

made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some PPIR indexes published in table 4 correspond to 8-digit commodities published in table 6. In these cases, movements in the commodity indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in table 6 on their original base period of 1967 = 100 or some later base, corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect,

but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the PPIR program, item weights are based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes. In addition, some

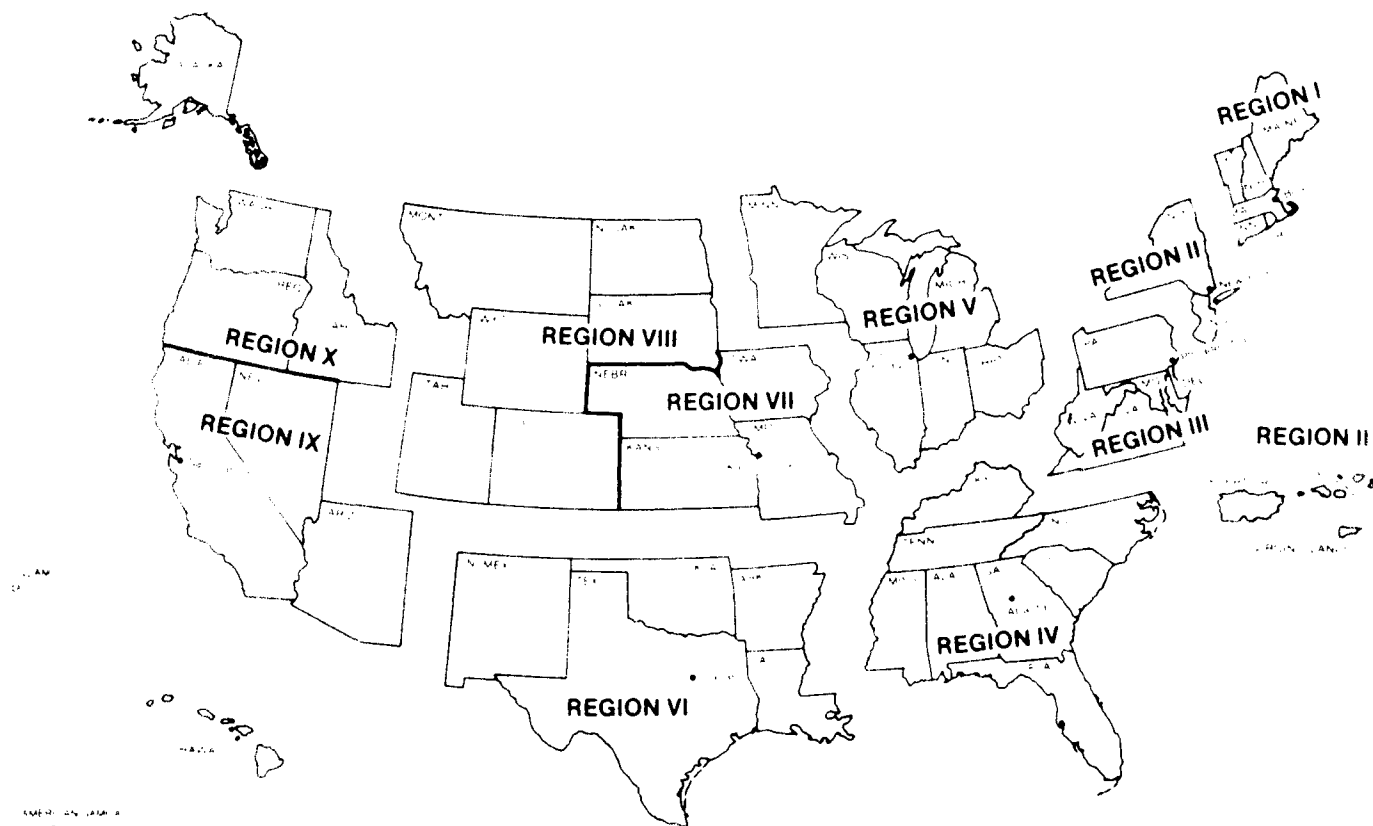

traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

For further information on the underlying concepts and methodology of both the traditional PPI and the PPIR, see Chapter 7, "Producer Prices," in *BLS Handbook of Methods* (1982), Bulletin 2134-1. Reprints are available from the Bureau of Labor Statistics on request.
