Price Movements

July 1980

The Producer Price Index for Finished Goods advanced 1.7 percent from June to July on a seasonally adjusted basis. The July climb followed average monthly increases of 0.5 percent during the second quarter and 1.5 percent during the first 3 months of the year. Prices for intermediate (semifinished) goods increased 0.8 percent, the same as in the preceding month. Crude material prices jumped 6.3 percent, far more than in any other month for the last 6 years (table A).

Most of the acceleration in the Finished Goods Price Index in July was caused by a 3.8 percent rise in consumer food prices; in contrast, food prices had declined at an annual rate of 4.6 percent during the first half of 1980. Prices for finished goods other than foods rose 1.1 percent, as the indexes for capital equipment and for finished consumer goods other than foods both rose more than in either of the 2 previous months. Prices for finished energy goods, however, declined slightly for the second consecutive month (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 1.6 percent to 246.6 (1967=100). Over the year, the Finished Goods Price Index rose 14.1 percent. The index for finished consumer foods was up 6.5 percent from July 1979 to July 1980, energy prices climbed 54.5 percent, the index for finished consumer goods other than foods and energy increased 12.2 percent, and capital equipment prices rose 10.6 percent. The Producer Price Index for intermediate goods moved up 14.6 percent over the year, and crude material prices were 10.2 percent higher than a year ago.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 1.8 percent in July on a seasonally adjusted basis, considerably more than in either June (0.7 percent) or May (0.4 percent). The pronounced acceleration from June to July was mostly due to a 3.8 percent advance for the finished foods index, the sharpest

increase since November 1974. This acceleration partly reflected the effects of an unusually hot and dry summer in much of the country. Poultry prices jumped 23.5 percent, as millions of chickens were killed by the intense heat. Prices rose more than in June for both beef and veal (7.4 vs. 3.9 percent) and pork (13.7 vs. 0.8 percent). Prices turned up sharply after declining in June for fresh fruits and eggs. On the other hand, prices turned down for refined sugar in consumer size packages and roasted coffee. Milled rice prices declined for the fourth consecutive month. Fresh vegetable prices rose much less than in either of the 2 preceding months, as steep climbs for potatoes and carrots were largely offset by lower prices for other vegetables.

The index for finished consumer goods other than foods rose 0.9 percent, more than in either June or May. Among nonenergy goods, prices rose more than in June for passenger cars, apparel, nonalcoholic beverages, sanitary papers and health products, tobacco products, household furniture, and drugs. Prices turned up after declining in June for textile housefurnishings and costume jewelry. On the other hand, gold jewelry prices advanced much less than a month earlier.

Prices for energy goods, however, declined 0.6 percent for the second month in a row. These decreases followed a steady rise of nearly 75 percent during the 12 months ended in May. Gasoline prices fell 1.2 percent in July, and home heating oil prices were virtually unchanged.

Capital equipment. The index for capital equipment moved up 1.3 percent, after rising 0.9 percent in June and showing no change in May. Most of the acceleration was caused by a 3.2 percent rise in motor truck prices, following no change in the previous month. Price increases also accelerated for construction machinery, food products machinery, transformers and power regulators, oilfield machinery, and railroad equipment. On the other hand, prices rose more slowly for hand tools, unitary air conditioners, and generators and generator sets.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 0.8 percent in July on a seasonally adjusted basis, the same as in June. Large increases for some energy products and foods and feeds were partly offset by moderating prices in other categories.

The intermediate energy index advanced 2.6 percent, following more modest increases in the previous 3 months. Residual fuel prices jumped 12.4 percent, after falling at a 41.0 percent annual rate in the second quarter. Higher prices were also recorded for electric power, commercial jet fuel, and diesel fuel.

The intermediate foods and feeds index climbed 3.2 percent, after showing no change in June. Feed prices advanced 9.9 percent, following a sharp drop in June. Prices for refined vegetable oils, corn syrup, and flour also rose. On the other hand, the indexes for refined sugar used in

food manufacturing and animal fats and oils fell steeply.

The index for intermediate materials less foods and energy moved up 0.3 percent, less than the 0.9 percent June increase but about as much as in each of the 3 months prior to that. The durable manufacturing materials index declined 0.4 percent, largely because of a drop in prices for steel mill products. Silver prices decreased 2.8 percent after climbing 22.4 percent in the previous month, and gold prices rose much less than in June. Prices also declined for aluminum castings, lead, zinc, ferromanganese, and hardwood lumber. In contrast, higher prices were recorded for jewelers' materials, steel castings, and copper.

The nondurable manufacturing materials index moved up 0.3 percent, the smallest advance in over 2 years. Prices for plastic resins and materials and paperboard declined. The industrial chemicals index was virtually unchanged; industrial chemical prices had risen at an annual rate of almost 27 percent from December 1978 to June 1980. In contrast, prices for finished fabrics, synthetic fibers, leather, and pharmaceutical materials all rose more than in June.

The construction materials index increased 0.5 percent, after a 1.3 percent advance in the previous month. This slowdown was partly due to slight decreases in the indexes for copper wire and cable, bituminous paving materials, concrete products, and gypsum products. In addition, plywood prices rose much less than during either of the 2 preceding months. On the other hand, price increases accelerated for softwood lumber, millwork, and asphalt roofing.

Among other intermediate goods, large advances occurred for paper boxes and containers, electric motors, internal combustion engines, nonfarm tractor parts, electric lamps and bulbs, and metal forming machine tool parts. Price increases slowed, however, for several other items such as bearings, and prices for mining machinery parts and wooden pallets fell.

Crude materials

The Producer Price Index for crude materials for further processing accelerated sharply to a 6.3 percent increase in July on a seasonally adjusted basis. Foodstuff prices increased substantially following a small increase in June, prices for materials other than food and energy turned up substantially after falling for 4 consecutive months, and crude energy material prices continued to rise.

The index for crude foodstuff and feedstuff climbed 9.0 percent, following considerably smaller rises in May and June. During the first 4 months of the year, this index had decreased at an annual rate of 27.8 percent. Grain prices jumped 13.7 percent in July, after falling in 4 of the first 6 months of the year; sharply higher corn prices resulting from the Midwestern drought were primarily responsible for this turnaround. Live poultry prices moved up 27.5 percent as unusually hot weather killed millions of chickens, and soybean prices climbed about 25 percent because of heat-related damage. Hog prices advanced 26.0 percent following a 13.0 percent climb in June, and cattle price increases also accelerated. On the other hand, green coffee and raw cane sugar prices fell for the second consecutive month. Cocoa bean prices also fell.

The index for crude nonfood materials less energy increased 7.1 percent, after falling at an annual rate of nearly 40 percent during the preceding 4 months. Cotton prices rose about 9 percent, following a decrease of about 10 percent a month earlier. Prices for nonferrous and ferrous scrap metal also turned up, after falling sharply for several months. Prices for hides and skins rose more than 13 percent, almost as much as in the previous month. In contrast, wastepaper prices moved down substantially for the third consecutive month.

Prices for crude energy materials rose 1.4 percent, slightly more than the 1.1 percent rise in the preceding month. Natural gas prices moved up more than in June, but crude petroleum prices advanced much less.

Sample Changes

July 1980

Indexes for six more industries are now being calculated from the comprehensive program to revise the Producer Price Index. Output price indexes are available for these industries and their major products beginning this month. The PPI revision program now covers 27 industries, which account for 7.8 percent of all mining and manufacturing production.

The industries being published for the first time in this phase of the PPI revision are the following:

*Standard Industrial
Classification*

<i>(SIC) code</i>	<i>Industry</i>
2051	Bread, cake, and related products
3331	Primary smelted and refined copper
3333	Primary refined and smelted zinc
3334	Primary aluminum
3341	Secondary smelted and refined nonferrous metals
3433	Nonelectric heating equipment

Product indexes from the above industries will now be used to calculate 14 corresponding traditional commodity indexes.

Indexes from the PPI revision program are published in this report in table 4. Traditional commodity price indexes and Industry-Sector Price Indexes (ISPIs) continue to be published. However, traditional indexes which correspond to the new indexes published in the revision program are now based on the movements of the corresponding revision indexes. (See tables C and D.) As new industries are published, their product indexes also will be used in the traditional commodity and ISPI structures.

The next set of indexes for industries based on the PPI revision program will be introduced in January 1981. In 1983, an entirely new industry-based stage-of-processing structure will become the primary vehicle for publishing and analyzing price changes at the primary market level.

See Technical Note, "Data from the Producer Price Index Revision," at the back of this publication for further detail.

In July, 187 new items were added to the list of commodities included in the PPI.¹ Price movements for these items are based on the corresponding product indexes introduced from the PPI revision prior to July. This brings the number of commodity indexes whose movements are based on data from the PPI revision to 257.

The number of changes by major commodity group is shown in the following tabulation:

<i>Major commodity group</i>	<i>Commodity code</i>	<i>Items added</i>	<i>Items dropped</i>

¹ At the same time, 41 items were dropped, and 25 items and groupings were recoded and reclassified. (See tables E and F.)

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and

finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have

not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed

data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
Index Percent Change	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical

trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index

for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967=100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices*

at the time of shipment to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979.
