Price Movements November 1980

The Producer Price Index for Finished Goods moved up 0.6 percent from October to November on a seasonally adjusted basis. The November increase followed a 0.8 percent rise in October. Prices for intermediate (semifinished) goods rose 1.0 percent, about the same as in October and substantially more than in September. Crude material prices advanced 1.1 percent, somewhat less than in either of the 2 previous months (table A).

Among finished goods, price increases slowed for motor vehicles and a broad range of capital goods. Consumer food prices rose 0.5 percent for the second consecutive month. In contrast, the finished energy goods index turned up after edging lower in most months since last spring.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.4 percent to 253.2

(1967 = 100). Over the year, the Finished Goods Price Index rose 11.9 percent. From November 1979 to November 1980, prices for consumer foods increased 7.1 percent, the energy goods index advanced 28.1 percent, finished consumer goods other than food and energy climbed 11.0 percent, and the capital equipment index was up 11.3 percent. The Producer Price Index for intermediate goods was 12.4 percent higher than a year ago, and crude material prices rose 16.1 percent over the year.

Finished goods

Finished consumer goods. The Producer Price Index for finished goods advanced 0.7 percent in November on a seasonally adjusted basis, following a 0.6 percent increase in October. Prices for finished energy goods advanced 1.3 percent, after falling 0.4

percent in both September and October. Gasoline prices climbed 1.7 percent, after declining for 5 consecutive months; home heating oil prices rose 0.9 percent following 2 months of small decreases.

Prices for consumer foods increased 0.5 percent for the second consecutive month. The largest advances occurred for pork, cereal and bakery products, dairy products, peanut butter, confectionery end products, fresh fruits and vegetables, pecans, vegetable oil end products and fish. Prices declined for beef and veal, processed poultry, and package cocoa. Refined sugar prices were virtually unchanged, following a 23 percent jump in October.

The index for finished consumer goods other than foods and energy increased 0.6 percent, somewhat less than the 0.9 percent upward movement in October. This deceleration was accounted for by slower price increases for passenger cars, which rose 0.7 percent after a 3.4 percent increase in the previous month, when 1981 models were introduced. Prices turned down for gold jewelry, disposable plastic dinnerware, and tires and tubes. In contrast, increases accelerated for beverages, cosmetics, tobacco products, and prescription drugs. Home electronic equipment prices advanced steeply, following several months of minor changes. Prices for over-the-counter drugs climbed rapidly for the third consecutive month. **Capital equipment.** The Producer Price Index for capital equipment rose 0.6 percent, after increasing

1.4 percent a month earlier. Prices for motor vehicles advanced much less than in October. Price increases also slowed for several other capital goods, particularly commercial furniture, railroad equipment, construction machinery, chemical industry machinery, generators, industrial materials handling equipment, and oilfield machinery. Prices for aircraft, transformers and power regulators, pumps and compressors, and hand tools moved down, following substantial advances in the preceding month.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components registered a 1.0 percent seasonally adjusted increase in November, about the same as the 0.9 percent rise in October. The intermediate energy index rose 1.7 percent, following a small decline in October. The upturn was almost entirely due to large advances for residual fuel oil and liquefied petroleum gas; other energy prices were virtually unchanged.

The intermediate foods and feeds index also increased 1.7 percent; this was considerably less than the 6.0 surge in the previous month. Most of the slowdown was caused by a much smaller price increase for refined sugar for food manufacturing. Flour prices turned down following 6 months of steady increases. On the other hand, prices turned up sharply after falling in the previous month for animal fats and

oils and refined vegetable oils. Prices for feeds and crude vegetable oils also were higher.

The index for intermediate materials less foods and energy rose 0.8 percent for the second consecutive month; in contrast, this index had registered average monthly increases of 0.4 percent during the 7 months ended in September. In November, prices for construction materials and nondurable manufacturing materials advanced more than in October, but increases slowed for durable manufacturing materials and manufacturing components.

The construction materials index moved up 1.1 percent, following a 0.5 percent increase in October. Prices advanced for plywood, millwork, fabricated structural metal products, and building paper and board. Prices for softwood lumber, gypsum products, plastic construction products, and insulation materials turned up after falling the month before. On the other hand, asphalt roofing prices declined for the fourth consecutive month.

The nondurable manufacturing materials index also rose considerably more than in the preceding month. Prices for inorganic industrial chemicals advanced even more sharply than in recent months, and prices for plastic resins and pharmaceutical materials moved up after little or no change in October. The indexes for paper, paperboard, gray fabrics, processed yarns and threads, and inedible fats and oils continued to increase substantially.

The durable manufacturing materials index increased 0.8 percent, following a 1.4 percent jump in the previous month. This slowdown was mostly due to lower prices for gold, silver, jewelers' materials, copper, lead, and tin. However, prices continued to increase substantially for finished steel mill products, aluminum and aluminum shapes, zinc, and flat glass.

The manufacturing components index edged up 0.3 percent, considerably less than in most recent months. The deceleration resulted chiefly from smaller

increases for motor vehicle parts, electronic components, and bearings. In contrast, prices advanced more than in October for internal combustion engines, builders' hardware, and stationary fans and blowers. Among other intermediate goods, large increases occurred for photographic supplies, glass containers, and mining machinery parts.

Crude materials

The Producer Price Index for Crude Materials for Further Processing increased 1.1 percent in November on a seasonally adjusted basis, following a 1.9 percent rise in October. Although crude energy prices moved up about as much as in most recent months, other crude materials advanced considerably less than in October.

The index for crude foodstuffs and feedstuffs rose 0.6 percent, following a 1.5 percent climb in October. Prices for raw cane sugar and wheat dropped after rising dramatically in October. Prices for corn, cocoa beans, and live poultry also moved down over the month, and the soybean index increased much less than in most recent months.

The index for crude nonfood materials less energy moved up 2.2 percent, after rising 3.8 percent in October. Nonferrous scrap prices moved up less than in either of the previous 2 months, and iron and steel scrap prices fell after 3 months of rapid advances. Wastepaper prices also turned down. The hides and skins index advanced substantially, although not as much as in October. Raw cotton prices turned up after falling in the previous month. Higher prices were also registered for sand and gravel.

Prices for crude energy materials moved up 1.6 percent, about the same as the 1.8 percent rise in the previous month. Natural gas prices continued to rise substantially. Coal prices climbed 1.4 percent, the largest monthly advance since April 1978. Crude petroleum prices were virtually unchanged.

Upcoming Revisions in the Stage-of-Processing Indexes

Beginning with January 1981 data to be released on February 13, producer price indexes at all stages of processing will reflect updated industry input-output relationships and improved classification of some products. The text and tables 1 and 2 of this report are based on stage-of-processing data, developed from PPI commodity indexes regrouped into various categories—crude, intermediate, or finished goods—according to the latest available input-output values. (For a definition of the major stage-of-processing categories, see “Brief Explanation of Producer Price Indexes,” at the back of this publication).

The new stage-of-processing relationships will be based upon the 1972 input-output tables prepared by the Bureau of Economic Analysis of the U.S. Department of Commerce. Since January 1976, stage-of-processing indexes have been based on relationships from the 1967 input-output tables.

The most significant reclassification will be reflected in the Finished Goods Price Index and in the Crude Materials Price Index as a result of a change in the allocation of the natural gas index (PPI commodity code 05-31). Until now, the entire weight of this index

has been allocated to the stage-of-processing index for crude fuels. However, approximately half the weight of this index will be allocated to the stage-of-processing index for consumer nondurable goods excluding foods, since households purchase natural gas in an essentially unprocessed form. In addition, the Finished Goods Price Index will no longer incorporate weights reflecting the value of shipments purchased by the government or exported, since these categories do not fit the existing components of the Finished Goods index—finished consumer goods and capital equipment. New input-output tables are sufficiently detailed for the first time to permit the separation of weights for government purchases and exports, for which prices have not been collected.

Revised historical stage-of-processing indexes from January 1976 through December 1980 will also be released February 13 to reflect the updated stage-of-processing relationships and reclassifications, as well as the separation of the weights for government purchases and exports from the Finished Goods Price Index. Previously reported indexes for individual commodities and commodity groupings will not be affected by these revisions.

^{1/} Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 87 percent of total finished goods, about 89 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and

finished consumer goods excluding foods, the relative importance figure shown reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

^{2/} All data are subject to revision 4 months after original publication.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for July 1980 have been revised to reflect the availability of late reports and corrections by respondents. Data are not seasonally adjusted.

³ Seasonal commodity—no price available this month.

⁴ Some of the titles of the individual commodity price indexes included in this grouping are not shown.

⁵ Not available.

⁶ Prices for some items in this grouping are lagged 1 month.

⁷ Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of this report.

⁸ Prices for natural gas (05-31) are lagged 1 month.

⁹ Includes only domestic production. Some prices are lagged 1 month.

¹⁰ Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74) are lagged 1 month.

¹¹ Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

¹² Some prices for industrial chemicals (06-1) are lagged 1 month. N.E.C. Not elsewhere classified.

¹ Data for July 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

¹ Standard Transportation Commodity Code.

² The figure shown for each item is its percent of total railroad freight.

³ The price index for total railroad freight also includes STCC groups not shown separately.

⁴ Dec. 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, li-

quefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products

primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Early: "Improving the Measurement of Producer Price Change," April 1978; and "The Producer Price Index Revision: Overview and Pilot Survey Results," December 1979.
