Price Movements

April 1981

The Producer Price Index for Finished Goods moved up 0.8 percent on a seasonally adjusted basis from March to April. Although this was considerably less than the 1.3 percent advance in March, it was about the same as in both January and February. Prices for intermediate materials climbed 1.1 percent for the fourth time in the last 5 months. Crude material prices advanced 1.5 percent, after falling 1.3 percent in the previous month (table A).

The deceleration in the Finished Goods Price Index from the unusually high March advance was caused primarily by a considerably slower increase in finished energy prices. Another moderating influence was the consumer foods index, which showed no change following a 0.8 percent rise in March. On the other hand, prices for finished goods other than food and energy moved up 1.0 percent, twice as much as in March.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.9 percent to 267.7

(1967 = 100). From April 1980 to April 1981, this index rose 10.6 percent. The finished energy goods index climbed 21.0 percent over the year, the consumer foods index increased 9.3 percent, the index for finished consumer goods other than food and energy rose 8.4 percent, and capital equipment prices advanced 10.3 percent. The Producer Price Index for intermediate goods rose 10.8 percent since April 1980, and crude material prices were 17.1 percent higher than a year ago.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 0.8 percent, much slower than the 1.4 percent advance in March, but about the same as in both January and February. Finished energy prices increased 1.6 percent, after advancing 6.1 percent in March. Prices for gasoline rose 1.3 percent in April, compared with 7.5 percent in the previous month; home

heating oil prices increased 1.7 percent, compared with 9.0 percent in March. On the other hand, natural gas prices rose more rapidly in April (2.0 percent) than in March (1.3 percent). Price increases for finished lubricants also accelerated.

The index for consumer finished foods was unchanged from March to April, as large increases for some items were offset by declines for other foods. The largest increases occurred for eggs, pork, bakery products, fresh fruits, and orange juice. The largest declines were for fresh and dried vegetables, processed poultry, refined sugar, roasted coffee, milled rice, and whole black pepper. Beef prices also fell but much less than in any of the 3 preceding months.

The index for finished consumer goods other than foods and energy rose 0.9 percent, compared with 0.4 percent in March. Prices rose 1.4 percent for passenger cars, after a 0.3 percent increase in the previous month. Tobacco product prices climbed 5.1 percent, following a year of generally small increases. Prices also rose more than in March for apparel, books, and alcoholic beverages. Gold jewelry prices were unchanged after falling rapidly for several months.

Capital equipment. The Producer Price Index for capital equipment moved up 0.9 percent in April, following a 0.7 percent rise in March. Motor truck prices rose nearly 2 percent, considerably more than in the previous month. Prices were also higher for most

other capital goods; some of the largest increases included food industry machinery, construction machinery, agricultural machinery, oilfield machinery, office and store machines, and generators.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components advanced 1.1 percent in April on a seasonally adjusted basis, the same as in March. Although energy price increases slowed markedly, large upward movements occurred for many industrial materials, partly reflecting the pass-through of the surge in petroleum prices which took place earlier in the year.

The index for intermediate materials less foods and energy rose 1.0 percent, more than in any of the 3 preceding months. The construction materials index advanced 1.5 percent, the largest jump in over a year. Large increases were registered for such oil-based products as bituminous paving materials and asphalt roofing. In addition, price increases accelerated for plywood and fabricated structural metal products. Prices turned up after declining in March for softwood lumber, plumbing fixtures and brass fitting, and building paper and board.

The nondurables manufacturing materials index increased 1.0 percent, following rises of 0.7 percent in

both February and March. Prices moved up substantially for several goods made from petroleum feedstocks, including industrial chemicals, plastic resins, synthetic fibers, and synthetic rubber. Advances also occurred for rosin, nitrogenates, paint materials, leather, and inedible fats and oils.

The index for durable manufacturing materials registered a 1.2 percent increase; this index had shown very little net change over the previous 5 months. Prices were higher for flat glass, lead, and zinc; in addition, copper, gold, and jewelers' material prices were virtually unchanged after declining for several months. Prices for tin and silver continued to drop, but not as much as in the most other recent months.

Among manufacturing components, prices rose for diesel engines, electric motors, and mechanical power transmission equipment. Within other categories of intermediate goods, there were large increases for unsupported plastic film, paper boxes and containers, glass containers, cutting tools, tractor parts, and explosives. In contrast, prices declined for metal containers, pesticides, and laminated plastic sheets.

The intermediate energy index moved up 1.6 percent, following a 4.3 percent surge in the previous month. Increases slowed considerably for diesel fuel and kerosene and prices for residual fuel decreased slightly. On the other hand, commercial jet fuel prices rose nearly as much as in March, the index for electric power turned up following a small decline the month before. Prices also increased for liquefied petroleum gas and lubricating oil materials.

The index for intermediate foods and feeds moved up 0.5 percent, after declining during each of the previous 4 months. Prices were substantially higher for feeds, flour, honey, and crude and refined vegetable oils. These increases were largely offset by sharply lower prices for refined sugar used in food manufacturing. Prices for corn syrup and animal fats and oils also decreased.

Crude materials

The Producer Price Index for Crude Materials for Further Processing rose 1.5 percent in April on a seasonally adjusted basis, after falling 1.3 percent in March. Although energy prices rose less than 1 percent for the second consecutive month, prices turned up for other crude materials following 4 months of steep declines.

The index for crude foodstuffs and feedstuffs rose 1.5 percent; during the 4 months ended in March, in contrast, this index had registered an average monthly decline of 2.3 percent. An upturn in prices of cattle and hogs following several months of falling prices caused much of this turnaround. Prices for wheat and soybeans also turned up dramatically after falling markedly in February and March. Cocoa bean prices moved up substantially for the fourth consecutive month after decreasing steeply during most of 1980. On the other hand, raw cane sugar prices fell more than 12 percent for the third consecutive month, and live poultry prices declined even more than in the 3 preceding months.

After decreasing an average of 3.8 percent each month in the first quarter, the index for crude nonfood materials less energy increased 3.0 percent in April. Price increases accelerated for iron and steel scrap and raw cotton, both of which had fallen rapidly in January and February. On the other hand, prices for crude natural rubber moved down sharply for the fifth consecutive month. Prices for nonferrous scrap and wastepaper also fell but considerably less than in most other recent months.

The crude energy materials index rose 0.6 percent, following a 0.3 percent increase in March. Natural gas prices rose somewhat more than in the other recent months. Coal prices continued to rise slowly, and crude petroleum prices were unchanged for the second consecutive month after a substantial advance in February.

New Base for Producer Price Indexes

Beginning with the release of January 1982 data in February 1982, most Producer Price Indexes will shift to a new base year. All indexes currently expressed on a base of 1967 = 100, or any other base through December 1976, will be rebased to 1977 = 100. Only indexes with a base later than December 1976 will keep their current base. Rebasings of PPI data is part of a comprehensive rebasing of indexes published by the Federal Government. (See Technical Note, "Federal agencies updating base year of indexes to 1977," in the February 1981 issue of *Monthly Labor Review*.) The last rebasing of PPI data occurred in January 1971, when the current 1967 base was substituted for the former 1957-59 base.

Historical data for each PPI series on the new base will be available from BLS on request.

To convert any continuous index series on the 1967 base to a new continuous series on the 1977 base, divide each index value on the former base by the index value for the new base period and multiply by 100. For example, the August 1980 index for steel mill products was 301.0 (1967 = 100). To convert that index to a base of

1977 = 100, divide 301.0 by the 1977 annual average for steel mill products on a 1967 = 100 base, which was 229.9. The August 1980 index for steel mill products on a base of 1977 = 100 thus becomes:

$$(301.0/229.9) \times 100 = 130.9$$

Rebasing an index does not affect the calculation of percent changes over time, except for possible rounding differences, so long as all calculations are performed with indexes expressed on the same base. Long-term business contracts with escalation clauses which make changes in selling or buying prices dependent on percent changes in specified PPI series should, therefore, not be substantively affected by the rebasing next year. However, contracts with escalation clauses which make price changes dependent on changes in index points may be greatly affected by rebasing. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request.)

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 91 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown

reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

¹ Industry and product class indexes may include products not shown separately.

² Data for December 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Seasonal product—no price available this month.

NOTE: Indexes in this table are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

* Indexes for these industries have been revised from January 1981 through March 1981 to correct for a calculation error. Therefore, the March 1981 indexes included in this table may differ from those previously reported. The January revised figures will be published in the May issue of this report, and revised indexes for February will appear in the June issue.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for December 1980 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8.

⁵ Prices for all items in this grouping are lagged 1 month.

⁶ Regional refined petroleum product prices and price indexes are presented in table 7.

⁷ Prices for some items in this grouping are lagged 1 month.

N.E.C. = Not elsewhere classified.

NOTE: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

³ The figure shown for each item is its percent of total railroad freight.

⁴ Dec. 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, li-

quefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices

generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
Index Percent Change	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4, "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products

primary to some other industry. Finally, some industries have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding Indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be

constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry

shipments from input-output tables produced by the Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.

Perspectives on Working Women: A Databook

Bulletin 2080

During the 1970's, dramatic changes took place in women's participation in the labor market. At the beginning of the decade, about 31 million women, or 43 percent of all United States women 16 years of age or older, were in the labor force. By mid-1980, over 44 million, or more than half of all women, were working or looking for work.

This revolution in the role of women in the labor market is documented in *Perspectives on Working Women: A Databook*.

One hundred tables are included in the *Databook* under the following headings:

- I. Labor Force, Employment, and Unemployment
- II. Work Experience
- III. Marital and Family Status
- IV. School Enrollment and Education
- V. Earnings and Income
- VI. Race and Hispanic Origin
- VII. Additional Characteristics (absence, moonlighting, occupational mobility, etc.)
- VIII. The 1980's
