Price Movements December 1981

The Producer Price Index for Finished Goods moved up 0.3 percent from November to December on a seasonally adjusted basis. The December rise followed increases of 0.5 and 0.6 percent in November and October. The intermediate goods index rose 0.4 percent, about the same as in the previous month. Crude material prices dropped 1.3 percent, the fifth consecutive monthly decline (table A).

Among finished goods, the index for consumer goods other than foods and energy showed no change, in contrast to the substantial advances recorded in both of the 2 preceding months. Price indexes for capital equipment and finished energy goods continued to rise, although not as much as in November. Prices for finished consumer foods showed a slight rise following 3 months of small decreases.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.3 percent to end the

year at 275.3 (1967 = 100). From December 1980 to December 1981, the Finished Goods Price Index rose 7.0 percent, considerably less than the 11.8 percent jump in 1980. The deceleration was broad-based. Although the 14.3 percent climb in the finished energy goods index was much larger than the increases registered for other major categories of finished goods in 1981, it was still far less than the 27.8 percent surge this index recorded in 1980. Energy prices advanced rapidly early in 1981 but then registered much smaller increases or moderate declines during the rest of the year. Consumer food prices rose only 1.5 percent in 1981, following a 7.5 percent advance during the previous year. The upward movement in the index for finished consumer goods other than foods and energy slowed from 10.4 percent in 1980 to 6.9 percent in 1981. The capital equipment index showed a less pronounced deceleration, slowing to a 9.2 percent rise from an 11.4

percent climb in 1980. Prices for intermediate materials rose about half as much in 1981 (6.1 percent) as in the preceding year (12.6 percent), and crude materials turned down with a 3.7 percent drop, following a 12.8 percent climb in 1980.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods moved up 0.2 percent on a seasonally adjusted basis in December, following a 0.5 percent increase in November. The index for finished consumer goods less foods and energy registered no change, after rising 0.8 percent a month earlier. Prices turned down for cosmetics, dinnerware, glassware, and alcoholic beverages. Increases were recorded for a broad range of other products, including passenger cars, soaps and detergents, books, costume jewelry, and over-the-counter drugs.

The finished energy goods index rose 0.7 percent, somewhat less than the 0.9 percent advance in November. Although the gasoline index moved down, home heating oil prices turned up after declining for several months. Prices for natural gas rose 3.6 percent, following a 2.1 percent rise in November.

The consumer foods index edged up 0.1 percent, following 3 consecutive modest declines. Prices for fresh and dried vegetables soared nearly 22 percent, after falling sharply in each of the previous 3 months.

Beef and veal prices were virtually unchanged after decreasing 3.2 percent in both October and November. On the other hand, prices declined even more than in November for pork, eggs, processed poultry, and milled rice. Prices rose much less than in the previous month for refined sugar, soft drinks, and flour base mixes and doughs. Fresh fruit prices were virtually unchanged after an 18.3 percent advance in November.

Capital equipment. The Producer Price Index for capital equipment advanced 0.6 percent, somewhat less than the 0.8 percent rise in November. Price increases slowed markedly for railroad equipment, truck trailers, industrial process furnaces and ovens, oilfield and gasfield machinery, agricultural machinery, machine tools, and pumps. Price indexes turned down after rising in November for aircraft and transformers. On the other hand, price increases accelerated for construction machinery, printing trades machinery, and mining machinery.

Intermediate materials

The Producer Price Index for Intermediate Materials, Supplies, and Components rose 0.4 percent from November to December on a seasonally adjusted basis, about the same as in the previous month. The movements of most intermediate goods categories were quite similar to those in November.

The nondurable manufacturing materials index edged up 0.2 percent. Higher prices for plastic resins, inedible fats and oils, synthetic fibers, and leather were largely offset by decreases for industrial chemicals, finished fabrics, and nitrogenates. The index for durable manufacturing materials likewise rose 0.2 percent. Although higher prices were recorded for aluminum sheets and plates, prices fell for most other nonferrous metals.

The index for construction materials advanced 0.6 percent, somewhat more than in either of the 2 preceding months. Prices moved up for millwork, plywood, softwood lumber, concrete products, switchgear and switchboards, plastic construction products, and heating equipment. In contrast, prices declined for building paper and board and for copper wire and cable.

Large increases were recorded for several items in the manufacturing components category, such as metal automotive stampings, plastic parts and components, fluid power equipment, and mechanical power transmission equipment. In other categories, prices rose for rubber hose, but decreased for mixed fertilizers and laminated plastic sheets.

The intermediate energy index moved up 0.6 percent. Higher prices for electric power and diesel fuel were partly offset by reduced prices for residual fuel, commercial jet fuel, and gasoline. The intermediate foods and feeds index moved down 0.3 percent, following 3 months of much sharper declines. Prices fell for flour and confectionery materials, but rose for refined sugar used in food manufacturing.

Crude materials

The Producer Price Index for Crude Materials for Further Processing declined 1.3 percent on a seasonally adjusted basis, about the same as in November. The index for foodstuffs and feedstuffs moved down 2.5 percent, the fourth consecutive monthly decline of about that size. Prices for cattle and corn moved down somewhat more than in the previous month. Hog prices fell 9.0 percent after rising slightly in November. Prices for fluid milk, oilseeds, and hay also decreased but less than in November. On the other hand, prices for raw cane sugar moved up sharply for the third consecutive month. Cocoa beans prices rose almost 6 percent, in contrast to an 11.4 percent drop in the preceding month. Green coffee bean prices also moved up but far less than the surge of nearly 14 percent in November.

The index for crude nonfood materials other than energy moved down 2.5 percent, somewhat less than the 3.2 percent decline in the previous month. Prices for scrap metals, wastepaper, and cotton fell but less than in November. On the other hand, prices for cattle hides rose 6.1 percent, after falling in each of the 2 previous months. Prices for crude natural rubber rebounded with an advance of 8.4 percent, after falling in almost every month in the past year. Prices for sand and gravel, iron ore, and potash also rose.

The crude energy materials index rose 1.3 percent, after moving up 0.5 percent in November. Prices for natural gas increased 3.6 percent, substantially more than in the previous month. Coal prices continued to rise moderately, and crude petroleum prices edged up 0.2 percent.

Postponement of Rebasing of Producer Price Indexes

Because of severe budget constraints, the Bureau of Labor Statistics will not be able to carry out by January 1982 the Government directive to rebase the Producer Price Index to the new U.S. Government 1977 = 100 reference base. Postponement is required because of the high cost of both the direct production work necessary to prepare the data and the information services to explain the change.

¹ Comprehensive relative importance figures are computed once each year in December. Data shown are expressed as a percent of total finished goods, total intermediate materials, or total crude materials. Data shown will not add up to 100.000 because not all commodity components of each stage-of-processing (SOP) index are shown; relative importance figures shown account for about 89 percent of total finished goods, about 88 percent of total intermediate materials, and about 96 percent of total crude materials. For each commodity component of the Finished Goods Index which is allocated to both capital equipment and finished consumer goods excluding foods, the relative importance figure shown

reflects only the share allocated to the SOP grouping under which it is listed. For example, the relative importance figure shown for household furniture under the SOP grouping for finished consumer goods excluding foods includes the share allocated to that SOP grouping but not the share allocated to capital equipment.

² All data are subject to revision 4 months after original publication.

¹ Indexes with a commodity point code of .99 are calculated by a revised methodology. See "Technical Note on Data from the Producer Price Index Revision" at the back of this publication.

² Data for August 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Not available.

⁴ Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8.

⁵ Prices for all items in this grouping are lagged 1 month.

⁶ Regional refined petroleum product prices and price indexes are presented in table 7.

⁷ Prices for some items in this grouping are lagged 1 month.

N.E.C. = Not elsewhere classified.

NOTE: Titles of some commodities are not shown in this table because they fail to meet our publication criteria.

¹ Data for August 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. All prices are lagged 1 month. Data are not seasonally adjusted.

² Caution should be used in interpreting month-to-month changes because of low response rates, which ranged from 30 to 60 percent for these indexes.

Changes in Methodology of Calculating Regional Bituminous Coal Price Indexes

Effective with the release of January 1982 Producer Price Indexes in February, indexes for bituminous coal by region will be calculated in accordance with the methodology of the Producer Price Index Revision program. Substantially expanded coverage and the use of probability sampling techniques are among the principal benefits of this change in methodology.

As a result, indexes for bituminous coal by region which now appear in table 8 will be discontinued after the December 1981 issue of *Producer Prices and Price Indexes*. Data for new regional bituminous coal indexes, on a base of December 1981 = 100, will appear in table 4, "Producer price indexes for the net output of selected industries and their products," starting with the January 1982 issue. That issue will also list new indexes

in table 4 corresponding to indexes previously appearing in table 8.

Even though all regional bituminous coal indexes currently in table 8 are to be discontinued, tables of historical data on a December 1981 = 100 base for these indexes will be available from the Bureau of Labor Statistics on request. These tables should be especially useful for those firms which have been using table 8 indexes to implement escalation clauses of long-term business contracts.

For further information, please write: Mr. Thomas R. Tibbetts, Assistant Commissioner for Industrial Prices and Price Indexes, Bureau of Labor Statistics, 600 E Street, N.W., Washington, D.C. 20212.

² Not available.

NOTE: These indexes are designed to measure changes in the price of coal sold in contract sales transactions (excluding captive production) in various domestic mining regions. Prices are reported by coal operators or sales agents, f.o.b. mine, per net short ton.

¹ Standard Transportation Commodity Code.² The price index for total railroad freight also includes STCC groups not shown separately.³ The figure shown for each item is its percent of total railroad freight.⁴ Dec. 1978 = 100.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or shipper costs that result from changes in services or mode.

Introduction of U.S. Postal Service Indexes

Publication of producer price indexes for the U.S. Postal Service (USPS) and its major services begins with this issue of *Producer Prices and Price Indexes* (table 16). Included in this issue are historical indexes from January 1977 to the present (table 17). These indexes are designed to measure changes in the prices charged by USPS to all users of its services. Unlike the Consumer Price Index for postal services, which measures prices paid by households, these indexes measure prices received by USPS for services to business and government users, as well as to final consumers.

Prices used to calculate these indexes are derived from rates in effect on the 15th of the index month, obtained from the USPS publication, *Postal Bulletin*, and from other official USPS sources. The classification of services is based on the Standard Industrial Classification (SIC). The 5-digit and 7-digit product index classification was developed by BLS based on the traditional classification scheme of USPS. The relative importance of each 5-digit and 7-digit product index, based on December 1981 value weights, is included in table 16.

Brief definitions of the services included in each index series follow. These definitions are derived from highly detailed legal definitions contained in the U.S. Postal Rate Commission's recommended domestic mail classification schedule, Docket No. MC76-5, *Opinion and Recommended Decision*, Volume 2, Nov. 29, 1978.

First class mail, 4311-1, is any matter eligible for mailing which is sealed against postal inspection and which is wholly or partially in handwriting or typewriting. It is divided into three components: Letter mail, 4311-111, which is limited to 12 ounces; post cards, 4311-112, which may not exceed the dimensions 6 in. by 4.25 in. by .0095 in.; and priority mail, 4311-113, which is first class mail weighing from 12 ounces to 70 pounds.

Second class mail, 4311-2, consists of newspapers or other periodicals which must be issued at least four times per year, be formed of printed sheets, have a known office of publication and a legitimate list of subscribers, and be originated to disseminate information of a public character. It includes six components: In-county mail, 4311-211, which is mailed and delivered in the county where published; regular rate mail,

4311-212, all second class mail not qualifying for in-county, nonprofit, classroom, or transient status; nonprofit rate mail, 4311-213, which must be entered by authorized nonprofit organizations; classroom rate mail, 4311-214, which consists of religious, educational, or scientific publications designed for use in school classrooms; transient rate mail, 4311-215, which is forwarded or returned mail originated by persons other than publishers or by publishers to persons not included on mailing lists; and controlled circulation rate mail, 4311-216, which must have at least 24 pages, be issued at least four times per year, not be owned or controlled by one or more individuals or businesses, devote at least 25 percent of pages to nonadvertising, and be circulated free.

Third class mail, 4311-3, is any mail weighing less than 16 ounces which is not mailed as first or second class mail. It is divided into three components: Single piece mail, 4311-311; regular bulk mail, 4311-312, which consists of properly prepared and presorted pieces of identical size and weight in quantities of not less than 50 lbs. or of 200 or more pieces; and nonprofit bulk mail, 4311-313, which is regular bulk mail originated by an authorized nonprofit organization.

Fourth class mail, 4311-4, is mail weighing 16 ounces or more and not mailed as first or second class mail. It includes four subclasses: Parcel post, 4311-411, which is any fourth class mail not qualifying as special, library, or bound printed matter; bound printed matter, 4311-412, which is fourth class mail weighing not more than 10 lbs. and which consists of advertising, promotional, directory, or editorial material; special rate mail, 4311-413, which includes books, films, printed music, records, manuscripts, and medical information; and 4311-414, library rate mail, which is matter loaned or exchanged between schools, public libraries, museums, and various nonprofit organizations.

International mail, 4311-5, consists of mail between countries. It has three major components: International air mail, 4311-511, which includes all international mail receiving high priority service; international surface mail, 4311-512, which is all types of international mail

assigned low priority service; and terminal dues and transit fees, 4311-513, which are compensation received for handling incoming mail from foreign postal authorities.

Special services and fees, 4311-6, consists of three subclasses: Special services, 4311-611, which include C.O.D., return receipt requested, restricted delivery, registry, special delivery, certified mail, insured mail, money orders, stamped envelopes, and postal lock boxes; domestic mail fees, 4311-612, which consist of business reply mail, address correction, dead letter return, certificates of mailing, parcel air lift, special handling and pre-sort mail permits; and 4311-613, other services and fees, which include permit imprint fees, on-site postage meter setting fees, and ZIP code sorting of mailing lists.

Other services or sources of USPS revenue are: Public service appropriation, 4311-911, the annual authorization by Congress, which is treated as a contribution toward institutional costs, since the appropriation supports no specific service output; express mail, 4311-912, high priority, guaranteed and insured delivery of pieces of mail weighing up to 70 lbs.; and mailgram service, 4311-913, the next day delivery of a telegram-formatted message sent electronically to the addressee's local post office.

The public service appropriation was included in the

USPS price index for two reasons. An industry output price index properly includes all revenues which support the output of goods and services of that industry. The public service appropriation provides revenue which supports, in general, the output of all USPS services, thereby augmenting the revenue generated from the explicit sale of each specific service. In the absence of this appropriation, the price of all or some of USPS services would have to be higher to call forth the same level of output. Moreover, the law which established the USPS calls for a gradual reduction of the public service appropriation from fiscal year 1981 through fiscal year 1985. If this appropriation were not included in the USPS price index, index levels as well as percent increases would be overstated during this period. Public service appropriation, 4311-911, has been specifically identified to enable users to track the appropriation's impact on the USPS price index.

The U.S. Postal Service index is based upon the universe of USPS service prices and is calculated from a modified Laspeyres formula similar to that used for other service industry price indexes.

More detailed information on the methodology used to develop indexes for the USPS may be obtained on request from the Bureau of Labor Statistics, Office of Prices and Living Conditions, Division of Industrial Prices and Price Indexes, 600 E Street, N.W., Room 5210, Washington, D.C. 20212.

¹ The figure shown for each item is its value weight expressed as a proportion of the total value weight for the U.S. Postal Service Index.

² Data for August 1981 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

³ Postal service prices contained in the Consumer Price Index are from

first class and fourth class mail.

⁴ On March 22, 1981 Controlled Circulation Rate Mail, 4311-216, was reclassified as Regular Rate Mail. Publication of the code 4311-216 from January 1977 through April 1981 only is included in table 17, historical price series.

Brief Explanation of Producer Price Indexes

Producer price indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer price indexes can be organized by stage of processing or by commodity. The stage-of-processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage-of-processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price change by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Price Index and the Industrial Commodities Price Index would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities Index uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap. (See illustration.)

To the extent possible, prices used in calculating producer price indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base producer price indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producing companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating producer price indexes, price changes for the various commodities are averaged together with

weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 125 percent from the reference period in the Finished Goods Price Index, for example, is shown as 225.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$225."

Index Point Change	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
Index Percent Change	
Index point change	<u>1.0</u>
divided by the previous index	184.5
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics published seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude

every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.

Data from the Producer Price Index Revision

Each month this report presents data from the Producer Price Index (PPI) revision in table 4. "Producer price indexes for the net output of selected industries and their products." Indexes for the four industries in the pilot program to test the methodology and concepts of the PPI revision formerly appeared in table 14. Table 4 includes data for additional Standard Industrial Classification (SIC) industries (4-digit level) and Census products (7-digit level); indexes for Census product classes (5- and 6-digit levels) and more detailed sub-products (9-digit level); and, for some industries, indexes for other sources of revenue. Thus, table 4 shows all official indexes arising from the ongoing PPI revision. By 1985, table 4 will cover all 493 SIC mining and manufacturing industries.

Traditional commodity price indexes and Industry-Sector Price Indexes (ISPI's) will continue to be published. In 1983, however, an entirely new structure will replace the traditional commodity structure as the primary vehicle for releasing and analyzing price changes at the primary market level.

Kinds of product indexes

Industries listed in table 4 may be represented by one to three kinds of product indexes. Every industry has *primary product indexes* to show changes in prices received by establishments classified in the industry for products made primarily, but not exclusively, within that industry. To be classified in an industry, an establishment must have a plurality of its total shipment value accounted for by primary products. In addition, some industries also may have *secondary product indexes* to show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries

have *miscellaneous receipts indexes* to show price changes in other sources of revenue received by establishments within the industry which are not derived from the sale of their products. Because of the distinction between primary and secondary products, an index for a product made in one industry may differ from the index for the same product made in another industry.

Corresponding indexes

Some 7-digit Census products published in table 4 correspond to 8-digit commodities published in table 6. Similarly, some 4-digit SIC industries and 5-digit Census product classes in table 4 correspond to the ISPI's in tables 11, 12, and 13. In these cases, movements in the commodity or Industry-Sector Price Indexes are calculated on the basis of the movements of their counterparts in table 4. Although most such indexes continue to be published in tables 6, 11, or 13 on their original base period of 1967 = 100 or some later base, the corresponding indexes in table 4 are published on a base of the month of their introduction. Therefore, index levels for corresponding items may differ, but monthly percent changes will be identical.

A point code of ".99" immediately after an 8-digit commodity code in table 6 identifies a commodity index that is calculated from a product index in table 4. A footnote after the industry or product class title in tables 11, 12, or 13 indicates an ISPI based on an index from table 4. The aggregation of commodity price indexes into commodity grouping indexes in table 6 continues to follow the traditional methodology; similarly, stage-of-processing price indexes in table 1 also are calculated from the commodity grouping indexes as in the past.

How new indexes differ from traditional commodity indexes

New indexes differ from traditional commodity indexes in a number of respects:

(1) New indexes are *industry-based*. The entire output of each industry is sampled, including primary and secondary production and miscellaneous receipts. Traditional commodity indexes are based on a selection of the most important commodities, and most Industry-Sector Price Indexes continue to be calculated from these traditional commodity indexes. In addition, traditional ISPI's do not cover miscellaneous receipts, and prices of products are included without systematic regard for the industry classification of the producer. New indexes, on the other hand, are based on prices of primary and secondary products made by producers classified in the specified industry; as a result, new indexes apply to production within the specified industry. As data from more mining and manufacturing industries become available, additional indexes will be constructed to cover each product regardless of the industry of origin.

(2) New indexes are easier to use with other industry-oriented economic data because they are *classified according to the SIC* and incorporate most features of the Census of Manufactures product code extensions of the SIC.

(3) New indexes use *net output values of shipments as weights*. Net output values refer to the value of shipments leaving the industry and exclude intra-industry shipments. In contrast, weights in traditional commodity price indexes and ISPI's include shipments within an industry. The resulting multiple-counting of price changes at successive stages of processing is one major defect of the traditional commodity grouping indexes. Stage-of-processing indexes partially correct this defect, but new indexes consistently correct it at all levels of aggregation. (Net output weights are not used, however, for traditional commodity indexes whose movements are based on corresponding new indexes.)

In the revision program, the relative importance of items within a product is based upon shipment value data and sampling weights from the revision survey itself. When detailed products are aggregated to the 5-digit product class and 4-digit industry levels, however, weights are taken from Census of Manufactures data, along with estimates of intra-industry shipments from input-output tables produced by the

Bureau of Economic Analysis of the U.S. Department of Commerce.

(4) New indexes emphasize *actual transaction prices at the time of shipment* to minimize the use of list prices and order prices, which occasionally have been used in traditional commodity price indexes and ISPI's. In addition, some traditional indexes have been calculated intentionally from order prices rather than from shipment prices.

(5) New indexes are based on prices reported by companies of all sizes and locations selected by *probability sampling*. In addition, individual items and transaction terms from these firms are chosen by probability techniques. (Estimates of sampling error will be published later.) In the traditional PPI program, major companies selected on a judgment basis have been asked to report prices for volume-selling items under "typical" transaction terms.
