Price Movements

November 1978

The Producer Price Index for Finished Goods moved up 0.8 percent from October to November on a seasonally adjusted basis. The November increase followed advances of 0.9 percent in both October and September (table A). Prices for intermediate (semifinished) and crude goods rose considerably less than in October. Price increases for foods and food-related materials eased at all stages of processing.

Among finished goods, prices for consumer foods rose much less than in either of the 2 preceding months. Prices for finished goods excluding foods, however, increased more rapidly. Capital equipment prices advanced more than in any month since October 1977. Prices for consumer durables moved up after showing no change in October, but the November pace was somewhat slower than in the first 9 months of 1978. The index for consumer nondurables other than foods rose more than in any other month so far this year except for October (table B).

Before seasonal adjustment, the Producer Price Index for Finished Goods increased 0.5 percent to 200.6 (1967=100).

Over the year, the Finished Goods Price Index rose 8.7 percent. The finished consumer foods index was up 11.2 percent from November 1977 to November 1978, the index for finished consumer goods excluding foods rose 7.8 percent, and the capital equipment index was 7.9 percent higher than a year ago. The Producer Price Index for intermediate goods increased 8.2 percent over the year, and crude material prices advanced 18.0 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods (those eventually sold to retailers) rose 0.7 percent in November after seasonal adjustment, somewhat less than in October (1.0 percent) and September (0.9 percent). Price increases slowed down markedly for finished consumer foods, but prices for consumer goods other than foods moved up slightly more than in October.

The finished consumer foods index rose 0.6 percent in November, after increasing 1.7 percent in both October and

September. The slowdown in price increases for food was due in part to a downturn in prices for beef and veal and fresh fruits and a considerably smaller increase for pork. In November, prices were higher for fresh and dried vegetables, processed poultry, eggs, refined sugar in consumer size packages, and processed fruits and vegetables. Prices were lower for milled rice and roasted coffee.

The index for consumer nondurable goods other than foods moved up 0.9 percent in November, after rising 1.1 percent in October and 0.6 percent in September. Prices increased less in November for nonalcoholic beverages, apparel, leather footwear, and gasoline. On the other hand, prices increased faster than in October for sanitary papers and health products and for both prescription and over-the-counter drugs. As in October, large increases were registered for tires and tubes, home heating oil, and alcoholic beverages. Prices for tobacco products declined.

Prices for consumer durables rose 0.5 percent over the month after showing no change in October and after rising an average of 1 percent during the preceding 9 months. Prices were higher for passenger cars, household flatware, and cutlery, while prices for jewelry declined.

Capital equipment. The Producer Price Index for capital equipment moved up 1.0 percent over the month; these prices had registered an average monthly increase of 0.6 percent during the first 10 months of 1978. Some of the largest price rises in November occurred for transformers and power regulators, special purpose machinery, machine tools, power driven hand tools, pumps and compressors, aircraft, and railroad equipment. Prices for agricultural

and construction machinery, however, moved up much less than in October, and motor truck prices edged down after a small increase in the previous month.

Intermediate materials

The Producer Price Index for intermediate materials, supplies, and components rose 0.7 percent in November on a seasonally adjusted basis. This increase was smaller than the 1.2 percent rise in October and was the same as the average monthly increase thus far in 1978.

Prices for intermediate materials excluding foods and feeds advanced 0.8 percent, compared with a 1.1 percent rise in October and an average monthly advance of 0.6 percent in the 9 months before that. Price increases for durable manufacturing materials slowed: Prices for gold, silver, tin, and copper cathode fell, and finished steel products advanced less than in the previous month. On the other hand, prices for copper and aluminum mill shapes and copper wire and cable rose sharply, partly reflecting earlier increases in primary metal prices. Among nondurable manufacturing materials, the industrial chemicals index turned down, and prices for woodpulp, paper, and paperboard registered smaller increases than in October. Higher prices were recorded for inedible fats and oils, leather, textile products, and synthetic rubber. The index for plastic resins and materials moved up for the first time since May.

Prices for materials and components for construction continued to rise in November, led by advances for lumber and plywood. Substantially higher prices were also registered for gypsum products, asphalt roofing, structural clay

products, and plastic construction products. Among other intermediate goods, prices for electric motors registered the largest advance in more than 2 years, electronic components and accessories rose more than in any month since January, and diesel fuel prices increased more than in most recent months. In contrast, the index for electronic power moved down, and prices for motor vehicle parts rose much less than in October.

The intermediate foods and feeds index declined 0.3 percent from October to November, after 2 months of substantial increases. Prices fell for both crude vegetable oils and refined sugar for use in food manufacturing. On the other hand, prices for flour, animal fats and oils, and manufactured animal feeds moved up.

Crude materials

The Producer Price Index for crude materials for further processing was up 1.5 percent, seasonally adjusted, in

November, following a 3.0 percent increase in October. Most of the deceleration was caused by a smaller increase in the crude foodstuffs and feedstuffs index, which rose 1.3 percent compared with 3.6 percent in the previous month. Prices fell after rising in October for fresh fruits, raw cane sugar, livestock, and oilseeds. On the other hand, grain prices moved up substantially for the second consecutive month following 5 months of falling prices. Prices for live poultry, green coffee, and cocoa beans moved up after declining in October.

The crude nonfood materials index advanced 1.8 percent, slightly less than the 2.1 percent increase in the preceding month but more than the 1.0 percent average rise in the first 9 months of the year. Large price increases were recorded for iron and steel scrap, crude natural rubber, and wastepaper. On the other hand, lower prices were registered for hides and skins.

¹ Commodities at the subproduct class (8-digit) level are assigned to stage-of-processing (SOP) indexes according to the amount of processing, manufacturing, or assembling to which those commodities are subjected before they enter the market. The weight of each subproduct class is allocated among the various SOP indexes in accordance with the relative proportion of output consumed at each level of processing. SOP allocations are placed within parentheses for those commodity groupings whose subproduct classes are not

uniformly divided among different stage-of-processing categories. Such figures indicate the weighted average allocated to a particular stage-of-processing category as of December 1977.

² Seasonal commodity—no price available this month.

³ Some of the titles of the individual commodity price indexes included in this grouping are not shown.

⁴ Not available.

⁵ Prices for some items in this grouping are lagged 1 month.

⁶ Regional price indexes for bituminous coal, industrial sizes, contract are presented in table 8 of

this report.

⁷ Prices for natural gas (05-31) are lagged 1 month.

⁸ Includes only domestic production.

⁹ Prices for gasoline (05-71), light distillate (05-72), middle distillate (05-73), and residual fuels (05-74), are lagged 1 month.

¹⁰ Regional refined petroleum product prices and price indexes are presented in table 7 of this report.

¹¹ Some prices for industrial chemicals (06-1) are lagged 1 month.

¹ Data for July 1978 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision four months after original publication. All prices have been lagged one month since February 1973.

² Caution should be used in interpreting month-to-month changes, because of low response rates from the sample of reporters which ranged from 30 to 60 percent for these particular indexes.

¹ Standard Transportation Commodity Code.

² The price index for total railroad freight also includes STCC groups not shown separately.

NOTE: The index is designed to measure changes in the prices of shipping goods by rail in

the United States. The representative prices and sample used for the index reflect the railroads' prices for shipping a fixed set of commodities under specified and unchanging conditions. The index is not intended to measure changes in railroad revenue or in shipper costs that result from changes in services or mode.

Technical Note: Test Data for Producer Price Index Revision

Test data from the pilot survey for the Producer Price Index (PPI) revision have been developed for the period beginning January 1978 and are published each month in table 14, "Producer price indexes for the net output of selected industries and products," in this report. The revision is being undertaken as a comprehensive effort to make major improvements in the measurement of price changes by domestic producers of goods and services. The data now available are from a pilot survey conducted to test the methods and procedures for the comprehensive revision. The revision will be conducted on an industry-by-industry basis. The results for the first industries in the full-scale survey will be available in the fall of 1979. Coverage of all mining and manufacturing industries is scheduled for completion in 1984.

The four industries covered in the pilot survey are: Soybean oil mills (SIC 2075), newspaper printing and publishing (SIC 2711), concrete products other than block and brick (SIC 3272), and household laundry equipment (SIC 3633). These industries were selected because they offered a wide range of pricing problems on which to test the new techniques. Indexes covering some of these same industries will continue to be calculated under the old program. The new indexes will not begin replacing the old ones in the Producer Price Index until early 1980.

These pilot survey indexes differ from indexes in the current Producer Price Index in a number of important respects:

- (1) They are *industry-based* indexes. The entire output of each industry is sampled, including secondary production and miscellaneous receipts. The current Producer Price Indexes are based on a sample of major products. Even the Industry-Sector Price Indexes (ISPI's) are derived from these product indexes. The current ISPI's do not price miscellaneous receipts, and the prices for primary and secondary production are obtained from any producer of the product even if that producer does not belong to the industry. The newly published pilot survey indexes are derived from prices supplied strictly by producers within the industry. As a result, the pilot product indexes apply only to the production within the industry. After all mining and manufacturing industries are covered by the revision, product indexes will be constructed covering all production of the product.

- (2) These new indexes are classified in accordance with the *Standard Industrial Classification* (SIC) system and incorporate most features of the Census of Manufactures product code extensions of the SIC. The coding will make the data easier to use in conjunction with other industry-oriented economic data.
- (3) *Net output values of shipments* are used as weights in preparing the index. Net output values refer to the value of shipments leaving the industry. In contrast, the weights used in the current PPI's and ISPI's are gross shipment values, which include shipments *within* an industry. The resulting multiple counting of price changes is one of the major defects of the current indexes. The current stage-of-processing indexes partially correct this defect, but the new indexes consistently correct it at all levels.
- (4) Increased emphasis is being given to obtaining actual *transaction prices at the time of shipment*. Although it has been a general objective of the current program to obtain transaction prices, they have not been obtained for significant portions of the index. In addition, some products in the current PPI intentionally have been priced at order prices rather than shipment prices.
- (5) *Probability sampling* was used to select the firms to be asked to report prices. As a result, firms of all sizes are included in the sample. In addition, within the firm, the individual items to be priced and the terms of the transaction were chosen using probability techniques. In the current PPI, major companies selected on a judgment basis are asked to report prices for volume-selling items under "typical" transaction terms.

Since this is a pilot survey, a number of changes will be introduced as the full-scale survey is put in place. These changes include the following:

- (1) Greater product detail will generally be available because of larger sample sizes and increased capabilities to combine product areas that are not publishable by themselves. The 5-digit product class indexes, which cannot now be calculated, will be produced.
- (2) Ultimately, the survey will cover all shipments by all 493 industries in mining and manufacturing. The present PPI's cover only about 50 percent of

this value; the pilot survey covers about 2 percent of it.

- (3) Improved calculation techniques will be introduced, including the use of Census of Manufactures shipment data to weight the 7-digit product indexes to higher levels. The pilot indexes rely on the estimated relative importance of products based on shipment data derived from the survey

itself.

- (4) Estimates of sampling error will be published.

Early, in the April 1978 issue of the *Monthly Labor Review*. Reprints are available from the Bureau of Labor Statistics upon request.

Brief Explanation of Producer Price Indexes

Producer Price Indexes measure average changes in prices received in primary markets of the United States by producers of commodities in all stages of processing. These data were previously presented as the Wholesale Price Index. The name "Producer Price Indexes" is now being used to reflect more accurately the coverage of the data. The sample used for calculating these indexes continues to contain nearly 2,800 commodities and about 10,000 quotations selected to represent the movement of prices of all commodities produced in the manufacturing, agriculture, forestry, fishing, mining, gas and electricity, and public utilities sectors. The universe includes all commodities produced or imported for sale in commercial transactions in primary markets in the United States.

Producer Price Indexes can be organized by stage of processing or by commodity. The stage of processing structure organizes products by degree of fabrication (i.e., finished goods, intermediate or semifinished goods, and crude materials). The commodity structure organizes products by similarity of end-use or material composition.

Finished goods are commodities that will not undergo further processing and are ready for sale to the ultimate user, either an individual consumer or a business firm. Capital equipment (formerly called producer finished

goods) includes commodities such as motor trucks, farm equipment, and machine tools. Finished consumer goods include foods and other types of goods eventually purchased by retailers and used by consumers. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durables such as automobiles, household furniture, and jewelry, and nondurables such as apparel and gasoline.

Intermediate materials, supplies, and components are commodities that have been processed but require further processing before they become finished goods. Examples of such semifinished goods include flour, cotton yarns, steel mill products, belts and belting, lumber, liquefied petroleum gas, paper boxes, and motor vehicle parts.

Crude materials for further processing include products entering the market for the first time which have not been manufactured or fabricated but will be processed before becoming finished goods. Scrap materials are also included. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, natural gas, hides and skins, and iron and steel scrap.

For analysis of general price trends, stage of processing indexes are more useful than commodity grouping indexes. This is because commodity grouping indexes sometimes produce exaggerated or misleading signals of price changes by reflecting the same price movement through various stages of processing. For example, suppose that a price rise for steel scrap results in an increase in the price of steel sheet and then an advance in prices of automobiles produced from that steel. The All Commodities Wholesale Price Index and the Industrial Commodities Price Index collected monthly, primarily by mail questionnaire. Respondents are asked to provide net prices or to provide all applicable discounts. BLS attempts to base Producer Price Indexes on actual transaction prices; however, list or book prices are used if transaction prices are not available. Most prices are obtained directly from producers and would reflect the same price movement three times—once for the steel scrap, once for the steel sheet, and once for the automobiles. This multiple counting occurs because the weighting structure for the All Commodities WPI uses the total shipment values for all commodities at all stages of processing. On the other hand, the Finished Goods Price Index would reflect the change in automobile prices, the Intermediate Materials Price Index would reflect the steel sheet price change, and the Crude Materials Price Index would reflect the rise in the price of steel scrap.

A Note about Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The following example illustrates the computation of index point and percent changes. (See box.)

Percent changes for 3-month and 6-month periods are expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the current rate were maintained for a 12-month period.

<i>Index Point Change</i>	
Finished Goods Price Index	185.5
less previous index	<u>184.5</u>
equals index point change	1.0
<i>Index Percent Change</i>	
Index point change	1.0
divided by the previous index	<u>184.5</u>
equals	0.005
result multiplied by 100	0.005 x 100
equals index percent change	0.5

(See illustration on page 85).

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States, from the production or central marketing point. Price data are generally produced by companies on a voluntary and confidential basis, but some prices are taken from trade publications or from other Government agencies. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

In calculating Producer Price Indexes, price changes for the various commodities are averaged together with weights representing their importance in the total net selling value of all commodities as of 1972. The detailed data are aggregated to obtain indexes for stage of processing groupings, commodity groupings, durability of product groupings, and a number of special composite groupings. Each index measures price changes from a reference period which equals 100.0 (usually 1967, as designated by the Office of Management and Budget). An increase of 85 percent from the reference period in the Finished Goods Price Index, for example, is shown as 185.0. This change can also be expressed in dollars, as follows: "The price of a representative sample of finished goods sold in primary markets in the United States has risen from \$100 in 1967 to \$185."

A Note on Seasonally Adjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

For analyzing general price trends in the economy, seasonally adjusted data usually are preferred because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays.

For this reason, seasonally adjusted data more clearly reveal the underlying cyclical trends. Seasonally adjusted data are subject to revision when seasonal factors are revised each year.

The unadjusted data are of primary interest to users who need information which can be related to the actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. Unadjusted data generally are used in escalating contracts such as purchase agreements or real estate leases.
