Price Movements

January 1990

The Producer Price Index for Finished Goods moved up 1.8 percent seasonally adjusted from December to January. This followed increases of about 0.6 percent in 3 of the 4 immediately preceding months. The Intermediate Goods Price Index climbed 1.2 percent in January after showing no net change during the second half of 1989. Prices received by domestic producers of crude goods advanced 2.4 percent following a 1.6-percent advance in December and a 0.7-percent rise in November. (See table A.)

The unusually large advance in the finished goods index was caused primarily by a 13.6-percent jump in the index for energy goods. Consumer food prices also rose sharply, climbing more than 2 percent. In contrast, the index for finished goods other than foods and energy inched up only 0.1 percent following a 0.5-percent advance in December. Energy prices also accounted for most of the increases at earlier stages of processing; material prices outside of the food and energy sectors edged up only marginally. (See table B.)

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 1.9 percent in January to 117.5 (1982=100).

From January 1989 to January 1990, the Finished Goods Price Index moved up 5.8 percent, the Intermediate Goods

Price Index rose 2.5 percent, and the Crude Goods Price Index increased 5.2 percent. Finished consumer food prices were up 5.9 percent over the year; however, the index for intermediate foods and feeds dropped 2.0 percent, and crude foodstuffs and feedstuffs rose 1.0 percent. The index for finished energy goods climbed 19.7 percent from January 1989 to January 1990; at the intermediate and crude stages of processing, energy prices were up 18.3 and 15.7 percent, respectively. Excluding the often-volatile food and energy sectors, finished goods moved up 3.8 percent, intermediate goods inched up 0.3 percent, and crude goods fell 5.8 percent.

Finished goods

Finished consumer goods. The Producer Price Index for finished consumer goods rose 2.5 percent seasonally adjusted in January following a 0.7-percent increase a month earlier. Prices for finished energy goods soared 13.6 percent after a 1.9-percent rise in December. Prices increases accelerated sharply for the both gasoline (16.7 percent in January vs. 1.5 percent in December) and home heating oil (25.3 vs. 6.8 percent). The index for natural gas moved up 3.2 per-

cent in January, twice as much as in the previous month.

The consumer foods index advanced 2.1 percent in January after rising 0.6 percent a month earlier. Much of the acceleration in price increases was due to the index for fresh and dried vegetables, which jumped 58 percent. Prices more than doubled for cabbage, lettuce, and tomatoes, while snap beans and dried beans nearly doubled; each of these except dried beans had fallen sharply in December. Prices also turned up after falling in the previous month for fish, soft drinks, fresh fruits, and pork. Prices rose more than a month earlier for eggs, processed fruits and vegetables, and bakery products. Price declines slowed for shortening and cooking oils and milled rice. In contrast, beef and dairy product prices were unchanged after rising in December. Prices turned down after rising a month earlier for processed chickens and pasta. Prices fell more than a month earlier for processed turkeys and roasted coffee.

The index for consumer goods less foods and energy showed no change following a 0.6-percent rise in December. Indexes for both passenger cars and light trucks fell, and price declines accelerated for tires and tubes. Prices turned down after rising a month earlier for tobacco products. Price increases slowed considerably for prescription drugs, soaps and detergents, cosmetics, periodicals, and household appliances. In contrast, prices turned up after decreasing in the previous month for children's apparel, alcoholic beverages, and household glassware. Price increases accelerated for women's and men's apparel and newspapers.

Capital equipment. The Producer Price Index for capital equipment moved up 0.2 percent for the second consecutive month. In January, substantial increases were recorded for aircraft, communication equipment, construction machinery, commercial furniture, photographic equipment, and transformers.

In contrast, prices for motor vehicles and electromedical equipment fell.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components rose 1.2 percent, seasonally adjusted. The most dramatic advances were in the intermediate energy category. While the index for intermediate goods other than energy registered no change for January, this reflected a balance between sharp decreases for several nondurable manufacturing materials on the one hand and increases for a number of manufacturing and construction components on the other. (See table B.)

The intermediate energy goods index moved up 8.8 percent in January. Although the index for liquefied petroleum gas surged nearly 50 percent, prices remained substantially below the record levels reached during the early 1980's. Unusually large increases also occurred for gasoline, diesel fuel, jet fuels, and residual fuels. The electric power index continued to move up at a moderate pace.

In contrast to other categories of intermediate goods, the materials for nondurable manufacturing index fell 0.8 percent, accentuating its recent downward trend. The most notable price declines were for industrial chemicals, plastic resins, paperboard, phosphates, inedible fats and oils, and paint materials. Prices climbed, however, for processed yarns and nitrogenates. The durable manufacturing materials index edged up 0.1 percent, after dropping 1.7 percent a month earlier. Prices rose for primary copper and lead but moved down for steel mill products, copper and brass mill shapes, primary zinc, and precious metals.

Following two consecutive declines, the index for construction materials and components moved up 0.2 percent. Prices

increased for prepared paints, unitary air conditioners, switchgear and switchboards, heating equipment, asphalt roofing, and plumbing fixtures and brass fittings. Plywood prices moved down, however. The components for manufacturing index rose 0.5 percent, more than in any other recent month. Substantial advances took place for aircraft engines and auxiliary equipment, motor vehicle parts, ball and roller bearings, and internal combustion engines. In contrast, prices for digital integrated circuits fell considerably. Among other categories, higher prices were recorded for formula feeds, glass containers, and photographic supplies, while prices for crude vegetable oils declined.

Crude goods

After rising 1.6 percent in December, the Producer Price Index for Crude Materials for Further Processing advanced 2.4 percent in January, seasonally adjusted. Increases for energy materials accelerated and other non-food items also rose, but advances slowed among foodstuffs. (See table B.)

The crude energy materials index jumped 5.0 percent, more than double the 2.2-percent increase registered in the previous month. The indexes for both crude petroleum and natural gas advanced much more than in December. Coal prices turned up after falling in December.

The index for crude nonfood materials other than energy edged up 0.2 percent following declines of more than 2 percent in both November and December. Prices turned up for copper base scrap, ferrous scrap, and softwood logs after showing December declines. Price decreases slowed for aluminum base scrap, nonferrous metal ores, and raw cotton. Wastepaper prices remained unchanged after falling for 3 consecutive months. In contrast, prices fell substantially for cattle hides

after rising in December.

The crude foodstuffs and feedstuffs index increased 1.0 percent following a rise of 2.5 percent in the previous month. Price advances slowed for cattle and fluid milk. Prices for hogs, live chickens, soybeans, and corn turned down after advancing in December. On the other hand, raw cane sugar prices were up after showing no change in December. Price declines slowed for wheat.

Net output price indexes for mining and manufacturing industries

The Producer Price Index for the net output of total manufacturing industries moved up 1.4 percent from December to January. (Net output price indexes are not seasonally adjusted.) This index rose 0.3 percent in December and showed no change in the month before that. The January index was dominated by a 14.8-percent surge for the petroleum refining industry group. Substantial increases were also recorded in January for the printing and publishing industry group (1.3 percent) and for the measuring instrument group (1.2 percent). Most other indexes for major manufacturing industry groups increased in a range between 0.3 and 0.6 percent. The index for primary metal industries, however, moved down 0.3 percent. Over the year from January 1989 to January 1990, the index for the net output of total manufacturing industries advanced 4.7 percent, led by the 27.6-percent climb for petroleum refining.

The index for the net output of total mining industries increased 4.5 percent over the month and 8.8 percent over the year. In January, the oil and gas extraction industry group index moved up 6.3 percent, while the metal mining index decreased 3.5 percent.

Price Highlights, 1989

Craig Howell, Roger Burns, Andrew Clem, and William Thomas

Prices received by domestic producers of finished goods rose 4.8 percent in 1989, the fastest pace since 1981's climb of 7.1 percent. The acceleration from the 4.0-percent advance registered in 1988 was due to an upturn in the index for finished energy goods, which increased 9.6 percent in 1989 after falling 3.6 percent a year earlier. Consumer food prices rose a little less than in 1988 (5.0 vs. 5.7 percent). The index for finished goods other than foods and energy, often considered a good measure of the so-called "underlying rate of inflation," moved up 4.2 percent, about as much as the year before. Of the three major categories within this grouping, capital equipment and consumer durables both rose about 3.5 percent each year, while consumer nondurables other than foods and energy moved up about 5.5 percent in both 1989 and 1988.

As was the case at the finished goods level, earlier stages of processing saw a decided resurgence in energy prices. Prices for both intermediate and crude energy goods rose at double-digit rates after falling in 1988. The slowdown in 1989 of food-related indexes was much more pronounced at the intermediate and the crude goods levels than for finished goods as the impact of the severe drought of 1988 waned. The intermediate foods and feeds index showed no change in 1989 following a 10.8-percent boost a year earlier, while the increase in the index for crude foodstuffs and feedstuffs decelerated from 14.2 percent in 1988 to 2.6 percent a year later.

The most notable discrepancy in price movements between the finished goods stage and the other stages was to be found outside the often-volatile food and energy sectors. While the index for finished goods outside these sectors rose almost equally in 1988 and 1989, the index for such items at the intermediate level slowed dramatically from 7.2 to 0.9 percent. By the same token, the index for crude nonfood materials other than energy (often referred to as the index for basic industrial materials) shifted from a 7.5-percent advance in 1988 to a 3.8-percent decline. Increases in productive capacity, as well as a more sluggish economy, contributed to these material price movements in 1989.

The slowdown or reversal in prices for many kinds of manufacturing materials was not reflected in a deceleration in price advances at the finished goods level. This mirrored the fact that an earlier acceleration in material price increases had failed to result in a proportionate rise for finished goods. Part of the explanation for this development may be that the

passthrough of material price changes at successive stages of processing was more muted in recent years in some industries than might have been expected on the basis of previous experience. The strategies of domestic producers of some finished goods may have grown closer to the volatility-dampening pattern often observed for supermarkets. Supermarkets may absorb rather than pass through sudden food cost runups and then recover any losses by holding retail prices level when those food costs retreat. The rapid rise in manufacturing productivity in the 1980's, impelled in large part by the need to cut costs to remain competitive with imports, would have facilitated the ability of domestic producers to pursue a volatility-dampening strategy rather than the more traditional pass-through strategy.

Another part of the explanation focuses on the normal lags and dampened effects in passing through material costs to the finished goods level. The fact that the index for finished goods less foods and feeds slowed from a 5.3-percent seasonally adjusted annual rate of increase in the first half of 1989 to a 3.3-percent rate in the second half might indicate that the slowdown or reversal in material cost increases was in fact being reflected at the finished goods level. In addition, price movements are usually dampened across successive stages of processing because costs for labor, capital, and other factors of production are less volatile than material price movements and account for a larger share of total costs at more advanced stages of processing. In any event, the continued growth in labor costs in most industries served to offset the impact of lower costs for many manufacturing materials in 1989.

Energy goods

The upturns in energy prices noted at each of the three stages of processing occurred chiefly in the first half of 1989. The crude energy index, for example, climbed at a 35.4-percent rate from December 1988 to June 1989 but slowed to a rate of just 2.6 percent in the second half, resulting in a 17.9-percent advance for the year as a whole. Increases were registered for all three major categories within this grouping—crude oil, natural gas, and coal.

By June, crude petroleum prices were nearly one-third higher than their December levels. Greater restraints on oil production imposed by OPEC (Organization of Petroleum Exporting Countries) in late 1988 boosted world prices early in the year. The continued decline in U.S. oil production and the consequent increase in crude imports have made domestic petroleum prices even more sensitive to world supplies.

The authors are economists in the Division of Industrial Prices and Price Indexes, Bureau of Labor Statistics

In June, OPEC nations agreed to establish a higher production level. The resulting increase in supplies eased crude oil price advances during the latter half of the year. Year-end crude petroleum prices were 35 percent higher than their December 1988 levels.

The index for natural gas was up 3.5 percent in 1989 after inching up 0.4 percent in the previous year. Increases were noted mostly in the beginning of the year following, in part, the pattern of crude oil prices. Coal prices advanced 2.4 percent for the year, the increases occurring chiefly around midyear when a labor dispute reduced output. However, the strike's impact on prices was muted because of adequate inventories held by electric utilities and by coal companies; in addition, production levels rebounded by the end of the year. Increased export demand from Europe helped to bolster prices.

The intermediate energy goods index rose 11.8 percent in 1989. Prices increased by about 30 percent over the year for liquefied petroleum gas, diesel fuel, jet fuels, and residual fuel. Electric power climbed 5 percent following a marginal rise in 1988.

The index for finished energy goods jumped at a 33.6-percent annual rate during the first half but then fell at a 10.2-percent rate in the latter half of the year. Prices for refined petroleum products rose markedly in the spring, prompted by a rise in crude petroleum costs. There was a temporary jump in prices in response to concerns about the Alaskan oil spill in March, but that event had only a short-lived effect. Although gasoline prices fell markedly during the latter half of the year, December price levels were, nonetheless, 9.2 percent above their year-ago levels.

Home heating oil prices advanced by a third in 1989. Prices were pushed up by increases for crude petroleum in the spring, and rose even more rapidly towards the end of the year as a frigid spell boosted demand at a time of already-low inventories.

Foods and related products

At the farm level, the Producer Price Index for crude foodstuffs and feedstuffs moved up 2.6 percent in 1989. This followed a 14.2-percent advance in 1988, when the 2-year rain deficit resulted in a sharp reduction in agricultural harvests. The grains index fell 7.3 percent in 1989 after skyrocketing almost 40 percent a year earlier. Prices for corn and oats turned down substantially, and wheat and barley prices rose far less than in the previous year, as more favorable growing weather increased supplies well beyond the drought-suppressed levels of 1988.

Among oilseeds, prices for soybeans fell almost 25 percent from December 1988 to December 1989, reflecting ample post-drought supplies; prices might have fallen even lower except for smaller-than-expected harvests from other producing countries, such as Brazil. After surging about 63 percent higher in 1988, prices for live chickens turned down 20 percent in 1989, reflecting increased broiler production.

In contrast, prices for hogs and live turkeys turned up after falling a year earlier, and prices rose more rapidly than a year earlier for fluid milk, cattle, and raw cane sugar. Although hog production increased slightly in 1989 and prices generally fell during the second quarter, hog prices soared from September to December to end the year about 15 percent above December 1988 levels; the upturn was due to decreased fourth-quarter production coupled with strong domestic and export demand for pork. Vigorous consumer demand and aggressive promotion of new turkey products led to higher turkey prices. Price increases for fluid milk accelerated to 19.2 percent in 1989, with most of the advance recorded in the second half of the year; static production at the farm level was insufficient to cope with good demand from manufacturers of dairy products. Cattle prices moved up 7.8 percent in response to lower commercial beef production. Supplies of raw cane sugar were tight in world markets. Pecan prices jumped 70 percent because of short supplies.

At the intermediate stage of processing, prices for foods and feeds were unchanged in 1989 after advancing almost 11 percent in 1988. Prices turned down after rising a year earlier for crude vegetable oils and prepared animal feeds, price increases slowed for flour and confectionery materials, and prices for refined sugar rose about 7 percent for the second consecutive year.

Prices for prepared animal feeds moved down 8.7 percent because supplies of coarse grains were about 50 percent above year-earlier levels. Lower prices for soybeans and other legume inputs caused prices for crude vegetable oils to fall 10 percent. Corn sweetener prices rose over the year in response to short supplies of corn syrup. Higher costs for raw sugar were passed on by refiners in the form of higher prices for refined sugar.

The index for finished consumer foods rose 5.0 percent, slightly less than in 1988. Prices turned down after rising a year earlier for fresh and dried vegetables, processed chickens, fish, roasted coffee, and shortening and cooking oils. Prices for fresh fruits fell much more than in 1988. In contrast, egg prices rose over 40 percent for the second consecutive year. Price increases accelerated sharply for pork, processed turkeys, and dairy products, and milled rice prices turned up after falling a year earlier. Prices also rose, but less than in 1988, for bakery products, pasta, beef and veal, processed fruits and vegetables, and confectionery end products.

The index for fresh and dried vegetables moved down in 1989, reflecting good harvests compared to 1988. However, both white and sweet potato prices advanced, chiefly because of heavy export demand. Tomato prices also increased, despite a bumper California crop, because of heavy demand from processors. Processed chicken prices declined in response to higher production levels. The decline in the fish index was led by salmon prices. Roasted coffee prices decreased 3.5 percent as supplies of coffee beans increased in the wake of the expiration of the agreement among coffee exporting nations. Lower soybean costs led to a modest decline in the index for shortening and cooking oils. Although the index for citrus

fruits rose because of short supplies as a result of freeze damage in Florida in February, other fruits decreased in price. Apple prices were lower because of the adverse impact of the Alar controversy and abundant supplies from a bumper crop, while decreased demand for wine grapes helped to hold grape prices down. Demand for crushing grapes declined because of high inventories of wine from the large 1988 crush.

Tight supplies as a result of reduced laying flocks led to a 40.9-percent rise in egg prices in 1989, almost as large as the 42.1-percent surge of 1988. After virtually no change a year earlier, pork prices rose 19.4 percent in 1989, reflecting strong domestic and export demand coupled with decreased year-end marketings. Increased demand for turkey and new turkey products help to raise the index for processed turkeys 7.6 percent. The index for dairy products climbed 14.3 percent, far more than the rise of 4.4 percent in 1988. Dairy markets tightened because of strong demand for cheese, an increase in nonfat dry milk exports, and static milk production. However, increased production of low-fat liquid milk and nonfat dry milk led to larger supplies of butter and consequently an 8-percent drop in butter prices.

Prices for breakfast cereals rose considerably in 1989 as strong demand, particularly for nutritious cereal products, led manufacturers to alter existing product lines or, more commonly, to introduce new products in the marketplace. The increase of 5.4 percent for bakery products was broad-based. Beef and veal prices rose 5.9 percent as total commercial beef production fell about 2 percent over the year.

Nondurables other than foods and energy

Although intermediate material cost pressures abated in 1989, this was not reflected, generally, in the prices of finished nondurable goods. Consumer demand for nondurables remained sluggish through most of the year; however, a generally high rate of capacity utilization facilitated price increases by some manufacturers.

The Producer Price Index for consumer nondurable goods less foods and energy advanced 5.3 percent from December 1988 to December 1989, nearly as much as the year before. Most products in this category registered increases of about the same magnitude as the year before, with a few exceptions. However, the index for nondurable manufacturing materials turned down 0.8 percent in 1989, after surging 11.4 percent in 1988. A further paradox was the sharp upturn in several crude nondurable materials following declines in 1988, the opposite trend of the nondurable goods category at the intermediate level.

Although prices for crude petroleum rebounded in 1989 after dropping in the year before, this upturn contrasted with the movements of two intermediate products closely related to petroleum. Industrial chemical prices turned down 2.1 percent after advancing 16.3 percent in 1988, and plastic resins and materials fell 12.4 percent following double-digit jumps in the 2 preceding years. New plant start-ups resulted in a 4-percent expansion in aggregate capacity for the domestic

chemical industry during 1989, and weakening demand from housing, automotive, and other markets created an oversupply. Prices for ethylene, propylene, and toluene (all key petrochemical feedstocks) fell nearly 30 percent over the year, while other chemicals showed mixed movements. Among plastic resins, polyethylene resin prices fell because of ample inventories and lower feedstock costs. Polypropylene prices dropped in the wake of cancellation of large orders from China, coupled with increased foreign competition.

Led by sharp advances for polyester and rayon fibers, synthetic fiber prices advanced 7.0 percent, about the same as the year before. The closure of a rayon-producing plant in Virginia for environmental reasons resulted in tight supplies. Raw cotton prices surged 15.7 percent for the year after an 8.7-percent decline in the previous year. Whereas 1988 had been marked by slow domestic demand for cotton goods coupled with a glut on the world market, demand improved during 1989 at the same time that supplies tightened overseas because of such factors as political upheaval in China. Thus, American exports of cotton in late 1989 were two-thirds above year-earlier levels, and prices firmed. Prices for processed yarns, gray fabrics, and finished fabrics all continued to climb slowly but steadily. The textile mill capacity utilization rate remained around 90 percent for most of 1989; the rate for nondurable manufacturing industries in general was around 86 percent.

No outstanding trends were evident among apparel prices, as small increases predominated. Apparel imports from East Asian and Caribbean Basin nations continued to increase during 1989, providing competition that made it difficult for domestic producers to raise their prices. Men's and boys' apparel prices rose 3.4 percent, about the same as in each of the 2 years before. Knit underwear and hosiery prices were nearly flat, thus moderating the effect of increases in the 4- to 6-percent range for a few other items. Women's apparel prices only moved up 1.0 percent over the year, in spite of a stronger market compared with 1988, when prices rose 3.2 percent.

Signs of a slowdown in the paper industry finally appeared in 1989, as the rate of capacity utilization retreated somewhat from the 95-percent level of the year before. Paper prices edged up only 0.2 percent following an 11.5-percent jump in the previous 12-month period. Newsprint and form bond paper actually fell between 4 and 9 percent, partly because of increased capacity, while prices for some kinds of paper used for packaging continued to rise substantially. A decrease in paper usage was attributed to reduced advertising lineage in publications and to higher postage rates, which discouraged direct-mail advertising. Woodpulp and paperboard price increases slowed to 9.7 percent and 2.3 percent, respectively, after 2 consecutive years of much sharper advances. Woodpulp prices were bolstered by continued good export demand. In spite of continued woodpulp price hikes, prices for wastepaper once again slumped in 1989. Legislation mandating recycling efforts in several States caused a glut of

wastepaper, and paper manufacturers were unwilling or unable to substitute the additional recycled material for virgin pulp.

Circulation rates for publications reflected the cooling down of paper price hikes. Newspaper prices moved up 2.0 percent over the year, after a 6.7-percent rise in 1988, while periodical price increases slowed to 5.2 percent, from 8.0 percent in the prior year. However, prices for sanitary papers and health products surged 12.7 percent, reflecting successful efforts to restore profit margins following sharp cost hikes for pulp in recent years.

Although over-the-counter medications rose somewhat less than in 1988, prices for prescription pharmaceuticals advanced 9.6 percent, continuing their persistent sharp climb of the past decade. In no year since 1979 have prices for this group risen less than 8 percent, a record that is highly unusual in the PPI. The pharmaceutical industry faces high costs for research, development, and marketing of new drugs, while direct material costs are relatively insignificant.

Tobacco product prices advanced 13.3 percent, the third consecutive year of double-digit upward movements. As in the drug industry, marketing costs play a greater role than do material costs; leaf tobacco prices actually edged down following moderate increases in the last 2 years.

Fertilizer material prices turned down following 2 years of large increases; nitrogenates fell nearly 20 percent, and phosphates declined about 8 percent. Fertilizer use in 1989 was down, partly because planted acreage did not rise as much as expected after the 1988 drought. The 12.2-percent decrease in the inedible fats and oils index more than offset the upward movement of the previous year; lower fish and marine oil prices, reflecting a surge of imports of menhaden fish oil from Japan late in the year, were largely responsible. Prices for soaps and synthetic detergents (partly derived from tallow and other fats) moved down 3.0 percent, the only decline among consumer nonfood nonenergy nondurables. Although cattle hide prices climbed 26.7 percent after moving down 11 percent in 1988, this upturn had relatively little impact on leather or footwear prices, both of which continued to advance about as much as in the previous year.

Durable goods

The Producer Price Index for consumer durable goods moved up 3.2 percent from December 1988 to December 1989. This followed a 3.5-percent advance in 1988, which in turn represented a modest acceleration from 1987's increase of 0.6 percent. The capital equipment index followed a similar course, accelerating moderately from 1.3 percent in 1987 to 3.6 percent a year later and then increasing 3.7 percent in 1989.

At the intermediate stage of processing, the index for durable manufacturing materials, which had jumped 11.6 percent in 1987 and 10.1 percent in 1988, slumped 3.4 percent in 1989, declining in 8 out of the last 9 months of the year. Similarly, at the crude stage of processing, price in-

dexes for scrap metals and nonferrous metal ores turned down sharply after double-digit surges in both 1987 and 1988.

Durable manufacturing materials. Abrupt changes in direction for prices of nonferrous metals accounted for both the runup in the durable manufacturing materials index during 1987-88 and the subsequent downturn in 1989. Primary copper prices were especially volatile throughout the 3-year period, nearly doubling in 1987 and rising 28.5 percent a year later before sagging 27.1 percent in 1989. Indexes for copper and brass mill shapes and for copper base scrap echoed this pattern, although their annual price changes were not as large as those for primary copper.

Primary aluminum prices also contributed heavily to the movements in the durable manufacturing materials index, climbing nearly a third in 1987 and about 20 percent in 1988 and then decreasing 21.5 percent in 1989. This pattern was reflected in movements for aluminum mill shapes and aluminum base scrap, except that more often than not the annual price changes for these items were even larger than those for primary aluminum. The downturn in aluminum prices came despite increased input costs for energy and alumina and despite stronger demand from beverage can manufacturers.

Price movements for primary zinc, lead, gold, and silver followed, very roughly, the pattern set by copper and aluminum prices during the 1987-89 period, although the timing of price downturns was different in each instance.

Lower production levels in the automotive and appliance industries, as well as falling prices for aluminum, helped to force down zinc prices, while poor sales of storage batteries depressed lead prices; storage batteries used in automobiles account for about 80 percent of lead consumption in this country.

The Producer Price Index for steel mill products rose about 6 percent in 1987 and again in 1988 before easing to a 1.1 percent rise in 1989. Demonstrating the turnaround in the steel market, the index for ferrous scrap jumped 42.7 and 13.5 percent, respectively, in 1987 and 1988 and then fell 16.1 percent in 1989.

The widespread downturn in metal prices during 1989 largely reflected weaker demand from many of the principal metal-consuming industries, such as motor vehicles, construction, and appliances. The slump in new car sales and the resulting unplanned bulge in dealer inventories, for example, led to substantial auto production cutbacks in the final quarter of 1989 and hence a sharp drop in purchases of steel, copper, and aluminum by domestic car manufacturers. Similarly, demand for metals used in residential, commercial, and other nonresidential construction was restrained by weakness in those sectors. Heavy sustained demand from military and commercial aircraft manufacturers, however, led to sharply higher prices for titanium sponge and titanium mill shapes. Demand from Japan and other East Asian nations also remained vigorous for many kinds of nonferrous scrap metals, cushioning the price drop for those items somewhat.

At the same time that demand growth was tapering off, expanded metal-producing capacity was being introduced in this country and elsewhere, much of it inspired by the substantial price boosts recorded in 1987-88. In addition, some of the problems that had restricted the production or availability of metals from other nations in recent years (e.g., labor unrest in South American copper mines) eased in the latter part of 1989. The result of rising capacity and falling demand was a considerable drop in capacity utilization rates in much of the metal-producing sector. The rate for the steel industry, for example, peaked at nearly 94 percent in March but fell to about 75 percent by yearend; accordingly, the steel price index climbed rapidly during the first quarter but then eased down for most of the rest of the year.

Components for manufacturing. The manufacturing components index moved up 2.9 percent from December 1988 to December 1989, after accelerating modestly from a 1.9-percent rise in 1987 to a 3.9-percent advance a year later. Most of the categories in the manufacturing components index followed a roughly parallel course during the 1987-89 period, responding to metal price movements and shifts in general industrial demand. One of the exceptionally volatile series among manufacturing components over this span was the index for ball and roller bearings, which surged from a 0.9-percent rise in 1987 to a 10.9-percent climb in 1988 before slowing to a 4.6-percent increase in 1989.

Durable finished goods. Although prices for most kinds of consumer durables and capital equipment rose about as much in 1989 as in 1988, there were also a few notable accelerations and slowdowns. Prices increased more than the year before for aircraft, ships, transformers and power regulators, construction machinery, and metal forming machine tools, all within the capital equipment grouping, as well as for household glassware, flatware, and appliances within consumer durables. But even among these items, only flatware, glassware, and transformers rose more than 6 percent from December 1988 to December 1989. Price advances slowed in 1989 for motor vehicles, mining machinery, printing trades machinery, commercial furniture, and mobile homes, while floor coverings edged down.

The extreme volatility in price movements for durable manufacturing materials during the 1987-89 period was reflected in a much more muted fashion in the behavior of the indexes for motor vehicles. The passenger car index followed a 3.5-percent decrease in 1987 with a 3.8-percent climb a year later and then decelerated to a 2.1-percent rise in 1989. Indexes for both light and heavy trucks followed the same pattern.

The price slowdown in 1989 also reflected the relatively sluggish state of consumer demand for new motor vehicles during much of the year. By midyear, domestic auto manufacturers were faced with an unusually high level of unsold inventories held by their dealers. Producers then changed their timing strategies by introducing price incen-

tives during the summer that were tantamount to liquidation allowances, in order to clear out excess inventories from dealer lots; in previous years, such allowances were not common until immediately before new model-year cars were ready for sale. The discounts effectively brought inventory levels to normal for a while but apparently at the expense of the new-year models. Poor demand at the end of the year led to another buildup in dealer inventories, widespread production cutbacks at auto factories, and another round of price rebates to spur consumer interest.

Construction materials

The Producer Price Index for intermediate materials and components for construction moved up 2.4 percent from December 1988 to December 1989, after rising 5.6 percent in 1988 and 4.2 percent in 1987. The 1989 deceleration was largely due to slower increases or downturns for construction materials manufactured from metals. However, prices strengthened for wood-derived construction materials.

The level of construction expenditures changed only sluggishly in 1989, partly because several years of strong building activity had reduced the pressure of pent-up demand. Residential construction spending was hindered in some areas by problems associated with restructuring the savings and loan industry. The persistence of high mortgage interest rates also dampened the residential construction market.

Prices for nonferrous wire and cable, which had soared 23.9 and 18.3 percent, respectively, in 1987 and 1988, fell 4.0 percent in 1989. Prices for fabricated structural metal products rose 3.2 percent in 1989 after an 8.1-percent climb the year before. Increases in indexes for other metal-intensive construction materials, such as plumbing fixtures and brass fittings, metal valves, and heating equipment, also slowed.

Other types of construction materials whose prices were weak in 1989 included plastic construction products, which dropped 4.7 percent after substantial advances in both 1987 and 1988, and most kinds of nonmetallic mineral products. The index for gypsum products, for example, decreased 4.3 percent, the fourth consecutive annual drop, partly reflecting the drop in single-family housing starts. Among crude materials for construction, the index for construction sand, gravel, and crushed stone nudged forward about 2 percent, just as in 1988.

In contrast to most kinds of construction materials, the plywood index advanced 10.3 percent after inching up 0.5 percent a year earlier. Similarly, indexes for softwood lumber and for building paper and board, both of which had declined marginally in 1988, turned up in 1989, and millwork price increases accelerated. At the crude stage of processing, the index for logs and timber, which had slowed from a surge of nearly 25 percent in 1987 to a far more modest rise of 2.7 percent a year later, recorded an 18.2-percent jump in 1989, partly because of increased exports to Canada and Japan.

Most of the relative price strength for wood-derived prod-

ucts in 1989 was due to a variety of supply disruptions and other unusual factors. Lumbering in the Pacific Northwest, for example, was impeded for much of the year by court-ordered restrictions in conjunction with an environment-

related lawsuit. Demand and prices for plywood soared in the aftermath of Hurricane Hugo and the Loma Prieta earthquake; however, plywood prices receded considerably by yearend.

Resampling of Industries

Twenty-eight resampled manufacturing industries and two resampled mining industries are being introduced this month. Under the resampling procedure, the sample for an industry is updated to reflect current conditions more accurately when the structure, membership, technology, or product mix of an industry has shifted significantly. The Bureau of Labor Statistics published the first results of this systematic process in July 1986. Subsequent efforts have been completed at 6-month intervals.

Indexes for the resampled industries and most of their products appear in table 5. Included for the first time are four new industry indexes for the air transportation and travel industries. In addition, two special grouping indexes have been introduced: Stainless steel mill products; and Iron ore pellets, all areas. These appear in table 8.

Recalculation of Seasonal Adjustment Factors

Effective with this issue of *Producer Price Indexes*, seasonal adjustment factors have been recalculated to reflect 1989 price movement patterns for stage-of-processing (SOP) and commodity groupings. This routine annual recalculation may affect seasonally adjusted indexes and percent changes from January 1985 to the present. Revised seasonally adjusted data for this period, as well as seasonal factors to be used through December 1990, are available on request from BLS. Table C shows 1989 monthly seasonally adjusted percent changes for the three major SOP categories calculated

with the old seasonal factors, compared with the percent changes for recalculated indexes that incorporate the new seasonal factors.

In addition, changes in the manufacturers' pattern for introducing new motor vehicles and the use of aggressive inventory management techniques have led to a deterioration in the quality of the seasonal adjustment for these items using standard methods. Therefore, BLS has modified its seasonal adjustment procedure for these indexes in an effort to cope with this problem.

¹ Indexes in this table are derived from the net-output-weighted industry price indexes shown in table 5. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly-titled indexes which are derived from traditional commodity groupings shown in table 6.

² Data for September 1989 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

^{1/} Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

1/ Indexes in this table are derived from the product indexes in table 5. These indexes are composed of the goods used by the industries in each of the industry stage of process output indexes as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

2/ All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

3/ Not available.

4/ Percent of final input to consumers.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classi-

fied in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on a base period of 1982=100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing

indexes) calculated from traditional commodity groupings, currently reflect 1982 values of shipments as reported in the Census of Manufactures and other sources. From January 1976 through December 1986, PPI weights were derived from 1972 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index Percent change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished

Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment

Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1983 through December 1987 were replaced at the beginning of 1988. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories with those of a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
