Producer Price Indexes—(ISSN 0882-5270) is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights.

A subscription may be ordered for 1 or 2 years from: New Orders, Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15250-7954. Subscription price per year: \$37 domestic (includes supplement), \$46.25 foreign. Single copy prices: \$12; foreign \$15.00. Supplements are \$21; \$26.25 foreign. Prices are subject to change by the U.S. Government Printing Office.

Send correspondence on subscription matters, including address changes and missing issues, to the Superintendent of Documents, U.S. Government Printing Office, Washington DC 20402, (202) 512-2311. POSTMASTER: Send address changes to *Producer Price Indexes*, U.S. Government Printing Office, Washington, DC 20402.

Price Movements

February 1993

The Producer Price Index for Finished Goods moved up 0.4 percent, seasonally adjusted, from January to February. The February advance followed rises of 0.2 percent in January and 0.1 percent in December. The Intermediate Goods Price Index climbed 0.5 percent in February after increasing 0.3 percent a month earlier. Crude material prices decreased 0.5 percent over the month in the wake of a 0.7-percent increase in January. (See table A.)

Among finished goods, the index for energy goods climbed considerably more than in the previous month. Consumer food prices inched down following a much larger January decline. Prices for finished goods other than foods and energy rose 0.3 percent in February after a 0.4-percent increase a month earlier.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved up 0.2 percent in February to 124.3 (1982=100). From February 1992 to February 1993, the Finished Goods Price Index rose 1.8 percent. During the same period, consumer food prices edged up 0.5 percent, the index for finished energy goods rose 3.5 percent, and prices for finished goods other than foods and energy increased 2.0 percent. Prices for intermediate goods were 1.8 percent higher than a year earlier, and the Crude Goods Price Index was up 2.5 percent in the 12 months ended in February 1993.

Finished goods

The index for finished consumer foods inched down 0.1 percent, seasonally adjusted, from January to February following a drop of 0.9 percent in the preceding month. Prices for fresh and dry vegetables fell 4.7 percent in February in the wake of a decline of 19.2 percent the month before. Indexes for processed fruits and vegetables and for fresh fruits and melons also fell less than in January. In addition, prices for processed young chickens, finfish and shellfish, dairy products, roasted coffee, and eggs for fresh use turned up following January decreases. In contrast, indexes for bakery products, pork, and processed turkeys turned down after rising in the previous month.

Prices for finished energy goods advanced 1.7 percent over the month after rising 0.9 percent in January. The February acceleration was due to the home heating oil index, which jumped 18.5 percent after seasonal adjustment following a small drop a month earlier; before seasonal adjustment, home heating oil prices rose 6.3 percent in February. By contrast, the residential electricity index was down slightly after rising in January, and the residential gas index declined much more than in the preceding month. Gasoline prices rose a little less than in January.

The index for consumer goods other than foods and energy moved up 0.3 percent over the month after a rise of

figures shown above and elsewhere in this report may differ from those previously published.

0.4 percent in January. Passenger cars and tobacco products dominated the February increase: The new cars index moved up 0.6 percent both before and after seasonal adjustment, while the tobacco products index rose 1.0 percent, seasonally adjusted, and 0.1 percent before seasonal adjustment. In addition, higher prices were recorded in February for cosmetics, household appliances, men's and boys' apparel, and household furniture. Prices moved down, however, for alcoholic beverages, books, and for luggage and small leather goods.

The capital equipment index advanced 0.5 percent in February following an increase of 0.3 percent in the previous month. Prices for light motor trucks and civilian aircraft rose more than in January. The communication equipment index turned up after showing no change in January. By contrast, the heavy motor trucks index moved up much less than in the preceding month.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components rose 0.5 percent in February after a 0.3-percent increase in January. The index for energy goods turned up after decreasing in January, and prices for materials for durable manufacturing advanced much more than in the previous month. In contrast, the index for foods and feeds turned down following a January increase. (See table B.)

After moving down 0.5 percent in January, the Producer Price Index for intermediate energy goods rose 0.7 percent in February. The index for diesel fuel climbed 7.2 percent after falling in each of the 6 previous months. Indexes for residual fuel and for industrial and commercial natural gas also turned up following January declines, while the index for liquefied petroleum gas

increased after showing no change in January. Jet fuel prices advanced more than in the preceding month. In contrast, prices for industrial and commercial electric power dropped considerably more in February than a month earlier.

In February, the Producer Price Index for materials for durable manufacturing advanced 1.4 percent after a 0.5-percent increase in January. Indexes for hot rolled steel sheet and strip and for flat glass turned up after dropping a month earlier. The copper and brass mill shapes index rose substantially more than in the previous month, and primary aluminum prices fell less. Indexes for hot rolled steel bars and for plywood, however, moved up less than they had in January, and prices for prepared paint, semifinished steel mill products, and primary copper turned down.

Prices for materials for nondurable manufacturing rose 0.3 percent in February after edging up 0.1 percent a month before. The index for paper climbed 0.6 percent after falling by about the same amount a month earlier. Indexes for intermediate and primary basic organic chemicals also turned up in February. The index for medicinal and botanical chemicals increased far more than they had in the prior month. Conversely, the index for miscellaneous basic organic chemicals rose less than a month earlier, phosphate prices turned down, and the paperboard index fell much more than they had in January.

The index for materials and components for construction climbed 1.1 percent following increases of almost 1 percent in both January and December; the February increase was the largest in nearly 12 years. Prices for fabricated structural metal products increased after falling in the previous month. The index for softwood lumber ad-

vanced 9.4 percent after a climb of nearly 7 percent in January; millwork prices also rose more than they had a month earlier. The plywood index, however, increased less rapidly. Prices for nonferrous wire and cable and for plastic construction products showed little or no change after moving up considerably in January.

The Producer Price Index for intermediate foods and feeds declined 0.4 percent in February after rising by the same amount in January. Prices for confectionery materials and crude vegetable oils fell after climbing a month earlier, and indexes for soft drink bases and for flour were unchanged following sizable January advances. In contrast, refined sugar prices turned up after falling a month ago, and the index for natural and processed cheese rose more than they had in January.

Crude goods

The Producer Price Index for Crude Materials for Further Processing turned down 0.5 percent, seasonally adjusted, following a rise of 0.7 percent in January. Most of the February downturn was due to the index for crude energy goods, which dropped after showing no change in January. In addition, both the basic industrials materials index and the crude foodstuffs and feedstuffs index rose less in February than they had in the previous month. (See table B.)

The index for crude energy goods fell 2.5 percent in February after remaining unchanged in January. The natural gas to pipelines index slumped 12.8 percent in February after rising 3.6 percent the month before. In contrast, the crude petroleum index turned up 7.8 percent after declining in the previous month. The coal index turned up slightly after a substantial December decrease.

The rise in the crude nonfood materials less energy index slowed somewhat to 2.2 percent in February after a climb of 3.1 percent in January. The aluminum base scrap index turned down nearly 5 percent after rising in January. Prices for copper base scrap, cattle hides, and for sand and gravel also turned down after increasing in the preceding month. In addition, the raw cotton index moved up much less than in January. By contrast, the rise in the softwood logs, bolts, and timber index accelerated to 6.8 percent following a boost of more than 4 percent a month earlier. The iron and steel scrap index also advanced more than in the previous month. In addition, the leaf tobacco index turned up after falling in January.

The index for crude foodstuffs and feedstuffs inched up 0.1 percent in February after increasing 0.3 percent in the preceding month. Increases were led by a surge in prices for Irish potatoes for processing. Indexes for breaker eggs, slaughter lambs, and unprocessed finfish also moved up. These increases were largely offset, however, by declines for corn, soybeans, slaughter turkeys, strawberries, and hogs.

Net output price indexes for mining, manufacturing, and other industries

Mining. In February, the Producer Price Index for the net output of total domestic mining industries fell 3.8 percent. This followed a January rise of 0.5 percent and a 3.8-percent decline in December. (Net output price indexes are not seasonally adjusted.) The downturn in February was mostly due to the oil and gas extraction industry group index, which fell 5.4 percent after increasing a month earlier. Prices also moved down after rising in the previous month for the industry group for nonmetallic minerals mining. By contrast, prices for the bituminous coal and lignite mining industry group turned up after falling a month earlier. In addition, prices for the metal mining industry group fell did not fall as much as in January. In February, the Producer Price Index for total mining stood at 75.8 (December 1984=100), 1.6 percent higher than a year earlier.

Manufacturing. The Producer Price Index for total domestic manufacturing industries increased 0.4 percent in February after rising 0.3 percent in January. While price increases accelerated for a few industry groups, this barely offset decelerations in price increases for some other categories. Prices for the petroleum refining industry group turned up 1.2 percent following a moderate decline in January. Prices also rose after falling a month earlier for the paper and allied products industry group. Price increases accelerated for the industry group for lumber and wood products (4.2 versus 3.1 percent), as well as for the transportation equipment, furniture and fixtures, and measuring instruments groups. In contrast, prices for the tobacco manufactures and the rubber and plastic products industry groups showed no change after rising substantially in January, and price increases slowed for the industry groups for printing and publishing and for chemicals and allied products. The index for the net output of the domestic manufacturing sector stood at 118.8 in February (December 1984=100), 2.1 percent higher than its level 12 months earlier.

Other. Prices turned up after falling a month earlier for Mississippi River transportation of freight, domestic deep sea transportation of freight, airports and airport services, tour operators, and truck rental and leasing. The index for passenger car rentals rose more than in January. In contrast, prices showed little or no change after rising considerably in the previous month for scheduled air passenger transportation and for travel agencies. The index for scrap and waste material collection continued to advance, although not as sharply as a month earlier. In addition, prices turned down after rising a month earlier for nonlocal trucking and for electric power utilities. Indexes for both natural gas utilities and radio broadcasting fell about 1 percent for the second consecutive month.

1/ Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of the July 1986 issue of Producer Price Indexes.

2/ Data for Oct. 1992 have been revised to reflect the availability of late reports and corrections by respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

1/ Indexes in this table are derived from the product indexes in table 5. These indexes are composed of the goods used by the industries in each of the industry stage of process output indexes as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

2/ All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

3/ Not available.

4/ Percent of final input to consumers.

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 80,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 5). The commodity structure (table 6) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 4 lists indexes for the net output of major mining and manufacturing industry groups at the 2-digit level. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product in-

dexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 5. Although most such indexes continue to be published in table 6 on a base period of 1982 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing

indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings currently reflect 1987 values of shipments as reported in the Census of Manufactures and other sources. From January 1987 through December 1991, PPI weights were derived from 1982 shipment values. Many industry indexes which are based on the SIC system, continue to be calculated with 1987 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982 = 100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not alter previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 16, "Producer Prices," in *BLS Handbook of Methods* (1992), Bulletin 2414. Reprints are available from the Bureau of Labor Statistics on request (202-523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The computation of index point and percent changes is shown in the box.

<i>Index point change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index percent change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Results multiplied by 100	0.034 x 100
Equals percent change	3.4

Percent changes for 3-month and 6-month period can be expressed as annual rates that are computed according

to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished Goods Price Index for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists; and commodity traders. It is the unadjusted data that are generally cited in escalating longterm contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*,

BLS Report 807, 1991 edition, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January through December 1991 were replaced at the beginning of 1992. Indexes for most broad commodity groupings and 8-digit individual commodities in table 6, as well as industry and Census product indexes in tables 4 and 5, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, i.e., independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 6 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines movements of the basic stage-of-processing categories with those of a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behavior abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
