# Price Movements

## October 2003

The Producer Price Index for Finished Goods advanced 0.8 percent in October, seasonally adjusted. This gain followed a 0.3-percent rise in September and a 0.4-percent increase in August. Rising prices for beef and veal, light motor trucks, and passenger cars led the increase in the finished goods index in October. At the earlier stages of processing, prices received by the manufacturers of intermediate goods went up 0.4 percent, after edging down 0.1 percent in the prior month. The rate of increase in the index for crude materials slowed from 3.4 percent in September to 2.6 percent in October. (See table A.)

Among finished goods, prices for finished consumer foods moved up 2.2 percent in October, compared with a 1.2-percent increase in the previous month. (Excluding beef and veal, the finished goods index would have risen 0.5 percent in October.) The index for finished goods other than foods and energy rose 0.5 percent, after showing no change in September. (Excluding passenger cars and light trucks, prices for finished goods other than foods and energy would have risen 0.2 percent in October.) By contrast, prices for finished energy goods inched down 0.1 percent in October, following a 0.1-percent gain a month earlier.

Before seasonal adjustment, the Producer Price Index for

Finished Goods increased 1.1 percent in October to 145.5 (1982=100). From October 2002 to October 2003, prices for finished goods advanced 3.4 percent. Over the same period, the index for finished consumer foods rose 8.5 percent, finished energy goods prices went up 9.2 percent, and the index for finished goods other than foods and energy climbed 0.5 percent. Prices for intermediate goods moved up 3.4 percent, and the crude goods index jumped 22.8 percent.

### Finished goods

Prices for finished consumer foods rose 2.2 percent in October, compared with a 1.2-percent gain in the preceding month. An 18.3-percent upsurge in October's beef and veal index followed a 4.2-percent increase in September and led the acceleration in the finished consumer foods index. Prices for fresh fruits and melons, processed young chickens, shortening and cooking oils, processed fruits and vegetables, and confectionery end products turned up, following decreases in September. On the other hand, the fresh and dry vegetables index dropped 9.1 percent in October, after advancing 20.7 percent in the previous month. The finfish

# Report on Quality Changes for 2004 Model Vehicles

## Passenger cars

The value of quality changes for a sample of fifteen 2004 model-year domestic passenger cars included in the Producer Price Index (PPI) for October averaged \$75.86, according to estimates by the Bureau of Labor Statistics (BLS) of the U.S. Department of Labor. This change represents 18.7 percent of the average \$405.31 increase in manufacturers' invoice prices for this year's models as compared with last year's models.

The retail equivalent value of these quality changes averaged \$82.96, representing 17.8 percent of the average \$467.28 over-the-year increase in manufacturers' suggested list prices.

The \$82.96 estimated retail value of quality change breaks down as follows:

- \$24.00 for powertrain improvements
- \$37.16 for federally mandated and nonmandated safety improvements, such as changes to brake and airbag systems
- \$21.80 for other quality changes, such as emission improvements, theft protection, changes in audio systems, and changes in levels of standard or optional equipment

## Light trucks

The value of quality changes for a sample of eighteen 2004 model-year domestic light trucks included in the PPI for October averaged \$131.26. This change represents 25.4 percent of the average \$516.26 increase in manufacturers' invoice prices for this year's models, as compared with last year's models.

The retail equivalent value of quality changes for domestic light trucks averaged \$145.05, representing 24.8 percent of the average \$585.91 over-the-year increase in manufacturers' suggested list prices.

The \$145.05 estimated retail value of quality change breaks down as follows:

- \$90.17 for federally mandated and non-mandated safety improvements, such as head impact protection, brake improvements, and airbag systems improvements
- \$38.21 for emission improvements, in accordance with the 1990 Clean Air Act Amendments
- \$16.67 for other quality changes, such as powertrain improvement, theft protection, changes in audio systems, and changes in levels of standard or optional equipment

Estimates of the value of quality change are based on a review by BLS of data supplied by producers for similarly equipped 2003 and 2004 domestic models priced for the PPI. Most of the estimates of quality changes in this release are derived from information supplied for the PPI for October. These data also form the basis of the new vehicle quality adjustment for the Consumer Price Index (CPI). However, it should be noted that, effective with the release of data for January 1999, changes made solely for the purpose of meeting air pollution standards are no longer considered quality improvements for CPI calculation purposes.

# NAICS Conversion

The net output price indexes will be converted from the 1987 Standard Industrial Classification (SIC) basis to the 2002 North American Industry Classification System (NAICS) basis with the February 2004 release of January 2004 indexes. The NAICS conversion involves major definitional changes to many of the currently published SIC-based indexes. After the conversion to NAICS, SIC-based indexes will no longer be produced or published. Historical index data based on

the NAICS publication structure will be available, depending on the scope of the definitional changes between SIC and NAICS. A concordance between the two structures is available at <http://www.bls.gov/ppi/ppinaicstosic.htm> through our World Wide Web site.

<sup>1</sup> Indexes in this table are derived from the net-output-weighted industry price indexes shown in table 5. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings shown in table 6.

<sup>2</sup> Data for June 2003 have been revised to reflect the availability of late reports and corrections by

respondents. All data are subject to revision 4 months after original publication. Data are not seasonally adjusted.

<sup>1</sup> Industry and product class indexes may include products not shown separately.

<sup>2</sup> The indexes for June 2003 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

<sup>3</sup> Not available.

<sup>4</sup> Seasonal product—no price available this month.

<sup>5</sup> The special index for 9331, in which prices reflect premiums only, contrasts with the index shown elsewhere in this table for SIC 6331, where prices reflect premiums plus the amount of investment income earned on the invested portion of the premium.

n.e.c. = Not elsewhere classified.

Note: NAICS 2002 replaces the SIC classification system beginning with the release of PPI data for January 2004. See <http://www.bls.gov/ppi/ppinaics.htm> for details.

<sup>1</sup> Indexes in this table are derived from the primary product indexes in table 5 that are weighted using 1992 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the economy excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as

comprehensive measures of construction costs. See note on page 190 of the July 1986 issue of *Producer Price Indexes*.

## Brief Explanation of Producer Price Indexes

The term Producer Price Index (PPI) refers to a family of indexes that measure the average change over time in the selling prices received by domestic producers of goods and services. The PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI); CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices may differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 10,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the transportation, utilities, trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of producer price indexes: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

### Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances; and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton

yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

### Commodity Indexes

The commodity classification structure of the Producer Price Index organizes products by similarity of end use or material composition, regardless of their industry of origin. Fifteen major commodity groupings (2-digit level) make up the all commodities index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit).

Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding

industry-classified product indexes. In such instances, movements in the traditional commodity price indexes are identical to movements of their counterparts. Therefore, monthly percent changes for corresponding indexes will be virtually identical even though their respective index levels may differ.

## Industry Net-Output Price Indexes

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC). Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 5 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 5 correspond to 8-digit commodity indexes in table 6. In these cases, movements of the latter indexes are calculated on the basis of movements of their counterparts in table 5. Although most of these indexes continue to be published in table 6 on a base period of 1982 = 100 or some later base, corresponding indexes in table 5 are published on a base of the month of their introduction.

## Data Collection

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The Bureau of Labor Statistics (BLS) strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees is allowed access

to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

The BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI every January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced service industries includes the month in which an article describing the industry's content appeared in the *PPI Detailed Report*:

## Weights

Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes shown in table 5 are also now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

## Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. Reprints are available from the Bureau of Labor Statistics on request.

## Calculating Index Changes

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the finished goods price index, for example, is shown as 105.5. This change can

also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points, because index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

### Index point change

Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5

### Index percent change

Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

## Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted, and unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy, because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from BLS.)

In most cases, seasonal factors used in computing seasonally adjusted indexes have, in the past, been derived using the X-11-ARIMA Seasonal Adjustment Method. However, the PPI program upgraded to X-12 beginning in 1998. Each

year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior.<sup>1</sup> For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through the aggregative method, which combines movements of a wide variety of subproduct class (6-digit level) series.<sup>2</sup>

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

## Producer Price Index Data Via the Internet

In 1995, the Bureau of Labor Statistics (BLS) began posting producer price index (PPI) series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, usage of these sites eclipsed that of more traditional methods of data dissemination such as subscriptions to the *PPI Detailed Report*. For example, there have been approximately 1.1 million electronic accesses of PPI series during the 12 months ended July 31, 2001.

### Retrieving PPI data from the PPI Web site

PPI data can be obtained from the PPI homepage by entering the WWW address (<http://www.bls.gov/ppi>). Scrolling down the page to the "Get Detailed Statistics" header reveals the following five methods of data retrieval:

- **Most Requested Series** is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including "all commodities" and the stage-of-processing indexes (for example, finished goods). Within each list, any one or all of the time series shown can be selected. The user can choose date ranges and output options after executing the query using the reformat button above the data output table.

- **Create Customized Tables** is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides the user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry (SIC-based) codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on the user's browser capability. The one screen option is a JavaScript application which utilizes a single screen to guide the user through the available time series data. The second option is the multiple screen, nonJava-based application. Both methods allow the user to browse the PPI coding structure and select multiple series codes. The user can choose data ranges and output options after executing the query using the reformat button above the data output table.

- **Series Report** is a form-based application that uses PPI time series identifiers (commodity or SIC codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

For PPI data, there are two basic formats to identify specific time series. For commodity codes and stage-of-processing

<sup>1</sup> Note that most broad commodity groupings and 8-digit individual commodities, as well as industry and census product indexes, are not seasonally adjusted and are, therefore, not included in this annual review.

<sup>2</sup> Tests previously conducted on the stage-of-processing indexes did not find significant residual seasonality.

codes, enter a “wpu” prefix (not seasonally adjusted) or a “wps” prefix (seasonally adjusted). For industry product codes, enter a “pcu” prefix and a “#” between the fourth and fifth characters of the product code. *In both cases, no spaces are required.*

*Example:*

<b>Commodity code</b>	<b>Will provide data for:</b>
wps063	Drugs and pharmaceuticals, seasonally adjusted
wpusop3000	Finished goods, not seasonally adjusted
<b>Product code</b>	<b>Will provide data for:</b>
pcu28__#	Chemicals and allied products, not seasonally adjusted
pcu3711#111	Passenger cars

Note that the first product code uses two underscores as placeholders to complete the reference to a two-digit product code time series.

- **Flat Files** and the FTP server are best suited for those users requiring access to either a large volume of time series data or other PPI-related documentation (such as seasonal factor and relative importance tables). For increased efficiency, it is suggested that users download files without opening, if their Internet browser permits. The FTP site can be accessed at ([ftp://ftp.bls.gov](http://ftp.bls.gov)) or directly from the links on the “Get Detailed Statistics” page or the PPI homepage.

Data and documentation available for download include:

	<i>Directory:</i>
• SIC Current Series	<a href="/pub/time.series/pc">/pub/time.series/pc</a>
• SIC Discontinued Series	<a href="/pub/time.series/pd">/pub/time.series/pd</a>
• Commodity Series	<a href="/pub/time.series/wp">/pub/time.series/wp</a>
• Special Requests	<a href="/pub/special.requests/ppi">/pub/special.requests/ppi</a>
• Latest News Release	<a href="/pub/news.release/ppi.txt">/pub/news.release/ppi.txt</a>

The FTP site maintains files to help with searches and downloads. These files are centrally located in the **/pub/doc** directory. Within this directory, go to the **overview.doc** file for an overview relating to all BLS data available through the FTP site. For *commodity-based PPI data* (which appear in tables 1, 2, 6, 7, and 8 of the PPI monthly detailed report), the program help file is **wp.doc**. For *industry-based PPI data* (which appear in tables 4, 5, 9, 10, and 11 of the monthly PPI report), the file is **pc.doc**. For industry-based time series that have been discontinued, go to **pd.doc**. (These and other help files also are maintained within each of the five directories listed above.)

#### **Other sources of PPI data**

PPI data also can be accessed via the BLS homepage (<http://www.bls.gov>). After clicking the “Get Detailed Statistics” link at the top of the homepage, the user may view a chart that lists all of the available BLS programs. The following four methods are available for PPI data: Most requested series, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data also are accessible from this page including: Economic news releases, series report, and economy at a glance.

#### **Additional information**

The PPI homepage (<http://www.bls.gov/ppi>) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The “Tables Created by BLS” section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.
