

Supplement to Producer Price Indexes Data for 1987

U.S. Department of Labor
Bureau of Labor Statistics
July 1988

Producer Price Indexes is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights. A subscription may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

Material in this publication is in the public domain and, with appropriate credit, may be reproduced without permission. Second-class postage paid at Washington, DC, and at additional mailing offices.

Supplement to Producer Price Indexes Data for 1987

Preface

This annual *Supplement to Producer Price Indexes* presents monthly indexes and annual averages for 1987. Except for table 3, most data are shown on the new reference base of 1982 = 100. (See page 1.) Historical annual averages for a select group of indexes on the new base are presented in table 9. In addition, this supplement includes, for the first time, data on price indexes for material inputs to construction.

Indexes shown in the *Supplement* are not seasonally adjusted. The *Supplement* also provides information on the relative importance of index components at the end of the year.

Information on changes in the sample for producer price indexes during 1987 can be found in the July 1987 and January 1988 issues of *Producer Price Indexes*.

New Reference Base for Producer Price Indexes

Effective with the release of data for January 1988, many important producer price indexes were changed to a new reference base year, 1982=100. The standard index base had been 1967=100. The 1987 annual average for the Producer Price Index for Finished Goods on the 1982 base is 195.4, indicating that producer prices in 1987 were only about 5 percent higher than they were in 1982.

To illustrate the meaning of rebasing, the December 1987 value of the Finished Goods Price Index on the 1967 base was 296.8, which meant that prices received by producers of finished goods in December 1987 were nearly three times what they were 20 years before. The value of this index in 1967 on the 1982 base was 35.6, also showing that prices received by producers have nearly tripled since 1967.

The Government has a longstanding policy of periodically updating index bases because comparison with a recent base period is more relevant than comparison with a more distant period. The base year of 1982 coincides with the reference year of the PPI shipment weights, which have been taken primarily from the 1982 Census of Manufactures. The last rebasing of PPI data occurred in February 1971, when the 1967 base replaced the former 1957-59 base.

The shift in base period affects all indexes for stage-of-processing groupings, commodity groups, individual items, and durability-of-product groupings that had previously been expressed on a base of 1967=100 or another base through December 1981. Indexes with a base later than December 1981, as well as indexes for the net output of industries and their products, are not affected.

Tables of rebased historical data from January 1967 through December 1987 for most stage-of-processing groupings and some important commodity groupings appeared in table 21, pages 204 through 222 of *Producer Price Indexes, Data for January 1988*. Historical annual averages for a select group of indexes are shown in table 9 of this *Supplement*. Users may obtain other tables of historical data for particular PPI series rebased to 1982=100 from the Bureau of Labor Statistics on request. Users needing a large number of rebased historical tables may purchase from BLS an electronic data tape containing the complete PPI database, currently available for \$60, payable in advance; see the end of this note for ordering information.

Rebased historical indexes meet the needs of PPI users by allowing calculations of percent changes between future data on the 1982 base and earlier data on a consistent base. However, for those who prefer to convert official index data to the

old 1967 base, BLS also has available rebasing factors for each affected series. These rebasing factors allow data users to calculate approximately what a given index on the current official 1982 base would have been on the earlier reference base period, by dividing the 1982-based index by the appropriate rebasing factor. For example, if the index for apparel at some time in the future were 108.0 (1982=100), a data user could convert that to the old 1967 base by dividing it by its rebasing factor, 0.51454864, to yield 209.9 (1967=100), after rounding. This method requires a separate calculation of a 1967-based index each time a 1982-based index is released.

Rebasing factors also could be used to convert previously published 1967-based indexes to the 1982 base by multiplying the 1967-based indexes by the appropriate rebasing factor. In general, however, this should not be necessary because BLS has recalculated all earlier indexes. Rebased historical indexes can not always be precisely replicated by applying the rebasing factor because the BLS results were obtained with the use of more accurate, unrounded monthly indexes, whereas published indexes are rounded to one decimal place.

The shift to a new reference base does not in itself cause any substantive changes to previously published percent changes for affected PPI series; however, rounding differences may have some marginal impact.

The Bureau has for some time suggested that those using PPI data for contract escalation "provide for a change in the index base period" in developing their agreements (*Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570). The Bureau urges all users of the PPI to adopt the new index base period in escalation and other agreements that cite PPI indexes.

The Finished Goods Price Index is the only PPI that presently is officially published by BLS on the old 1967=100 base; this now appears each month in table 3 of the monthly news release. The all commodities index appears in this same table on the new 1982 base, but will no longer be published on the 1967 base or on the 1957-59 base.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

² Industry and product class indexes may include products not shown separately.

³ This index was introduced in midyear, and has been linked backward with a rebased PPI series. The annual average is computed from both the PPIR series and the corresponding rebased indexes for the PPI series.

⁴ Not available.

n.e.c. = Not elsewhere classified.

mfpn = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See Technical Notes at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

¹ These indexes are calculated by combining the indexes listed below by commodity code after each special commodity grouping. The weights are those used for the comprehensive All Commodities index.

All commodities except farm products: 02 through 15

All foods: 011, 017, and 02 less 0261, 0262, and 029

Processed foods: 02 less 0261, 0262, and 029

Industrial commodities less fuels and related products and power: 03, 04, and 06 through 15

Selected textile mill products: 0327, 03370105, 03370109, 034, 03810168, 03810169, 03810272, 03810274, 03810298, 03810364, 03820102, 03820134, 03820303, 03830323, 03830324, 03830325 and 1231

Hosiery: 03810168, 03810169, 03810171, 03810272, 03810273, 03810363, 03810364, and 03810365

Underwear and nightwear: 03810174, 03810175, 03810176, 03810177, 03810178, 03810274, 03810275, 03810276, 03810277, 03810368, and 03810369

Chemicals and allied products, including synthetic rubber and synthetic fibers: 031, 06 less 064, and 071102

Pharmaceutical preparations: 0634, 0635, and 0636

Synthetic paint resins: 06220132, 066207, and 06620903

Volatile paint liquids: 06140141, 06140202, 06140341, 06140356, 06220306, 06220308, 06220309, and 06220311

Lumber and plywood (formerly entitled: Lumber and wood products, excluding millwork): 081 and 083

Steel mill products, including fabricated wire products: 1017 and 1088

Finished steel mill products, excluding fabricated wire products: 1017 less 101701 and 101702

Finished steel mill products, including fabricated wire products: 1017 and 1088 less 101701 and 101702

Special metals and metal products: 10, 111, and 141

Fabricated metal products: 103 through 108

Copper and copper products: 10220123, 10220162, 102301, 10240301, 10240302, 10240304, 10240305, 102502, 10260314, 10260317, 10260325, 10280301, 10280302, and 10280303

Machinery and motive products: 11 and 14

Machinery and equipment, except electrical: 111, 112, 113, 114, 116, 118, and 119

Agricultural machinery, including tractors: 1111 and 1112 less 11115211 and 111251

Metalworking machinery: 113A, 1132, 113304, 1137, and 1138

Total tractors: 1111 and 1128 less 11115211, 112802, and 112803

Agricultural machinery and equipment, less parts (old commodity code 111): 111 less 11115211 and 111251

Farm and garden tractors, less parts (old commodity code 1111): 1111 less 11115211

Agricultural machinery excluding tractors, less parts (old commodity code 1112): 1112 less 111251

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and

manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of change in construction costs. See note on page 190 of *Producer Price Indexes Data for July 1986*.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1987 based on 1982 shipment values from the Census of Manufactures and other sources, after the sample revision effective January 1988. The "Former" relative importance figures are for the same

month before the revision of the index sample. Except for recodes, a dash in the "Former" column indicates that the series was introduced in January 1988 and a dash in the "Revised" column indicates that the series was discontinued as of January 1988. Individual items and subtotals may not add exactly to totals because of rounding differences. The value of 0.000 represents a percentage less than 0.0005.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1987 based on 1982 shipment values from the Census of Manufactures and other sources after

the sample revision effective January 1988; "Former" relative importance figures are for the same month before index sample revisions. Individual items and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005, or indicates an item newly introduced or deleted in January 1988 (if the 0.000 appears in the "Former" or "Revised" column, respectively).

¹ All relative importance figures in this table are expressed as a percentage of the All Commodities index, based on the weights taken from 1982 shipment values from the Census of Manufactures and other sources. The "Revised" column shows relative importance figures for December 1987 and reflects all sample revisions effective January 1988. "Former" column provides relative importance figures for the same month, before the January 1988 sample revisions. Except for recodes, a dash in the "Revised" column indicates a series that was discontinued as of January 1988, while a dash in the "Former" column indicates a series

introduced that same month. Subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005.

² The relative importance data for three major SOP groupings—Finished Goods, Intermediate Materials, and Crude Materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes and; (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 3). The commodity structure (table 4) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable items that are physically complete but that are purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the

first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant. Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 3. Although most such indexes continue to be published in table 4 on a base period of 1982=100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping in-

dexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1982 values of shipments as reported in the Census of Manufactures and other sources. From January 1976 through December 1986, PPI weights were derived from 1972 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not cause any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index Percent Change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Results multiplied by 100	0.034 x 100
Equals percent change	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate

leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 570, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1983 through December 1987 were replaced at the beginning of 1988. Indexes for most broad commodity groupings and 8-digit individual commodities in table 4, as well as industry and Census product indexes in table 3, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 4 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories with those of a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behaviour abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
