Preface

This annual *Supplement to Producer Price Indexes* presents monthly indexes and annual averages for 1991. Indexes shown in the *Supplement* are not seasonally adjusted. The *Supplement* also provides information on the relative importance of components at the end of the year.

Information on changes in the sample for producer price indexes during 1991 can be found in the January 1991, February 1991, and July 1991 issues of *Producer Price Indexes*.

Price Highlights, 1991

Prices received by domestic producers turned down broadly in 1991, after registering substantial advances a year earlier. The Producer Price Index (PPI) for Finished Goods—a measure of changes in selling prices charged by domestic producers of items such as meats, gasoline, apparel, and trucks—edged down 0.1 percent from December 1990 to December 1991, following an increase of 5.7 percent in the preceding year. Similarly, the Intermediate Goods Price Index—which focuses on price movements for items such as animal feeds, diesel fuel, yarns, and motor vehicle parts—moved down 2.6 percent in 1991 after a 4.3-percent rise the year before. Even more dramatic was the turnabout in the index for Crude Materials for Further Processing—a category encompassing such basic items as grains, crude oil, raw cotton, and ores—which switched from a climb of 6.0 percent in 1990 to a slump of 11.6 percent a year later.

A dramatic reversal in energy prices accounted for most of the differences between 1990 and 1991 movements for each of the three major stage-of-processing categories. Many nonenergy goods also contributed a share.

Among finished goods, the index for energy swung from an upward surge of 30.7 percent in 1990 to a drop of 9.6 percent in 1991. Consumer food prices also turned down, declining 1.6 percent, after rising 2.6 percent in 1990. The index for finished goods other than foods and energy, sometimes referred to as the “core” or “underlying” rate of inflation, slowed from a climb of 3.5 percent in 1990 to 3.1 percent; within this category, the increase in capital equipment prices decelerated more than did the advances for consumer goods. Among the categories for intermediate and crude goods, energy prices turned down sharply. Prices for intermediate foods and feeds inched down only slightly, following a larger drop in 1990, while the crude foodstuffs index decreased more in 1991 than in the preceding year. Prices for intermediate goods other than foods and energy fell less than 1 percent, after a rise of nearly 2 percent in 1990. Basic industrial material prices declined considerably, following a small rise in 1990.

Both the sharp rise in late 1990 and the 1991 fall in energy prices reflected the impact of the events in the Middle East. The Iraqi invasion of Kuwait in August 1990 prompted widespread fears that oil supplies would be seriously disrupted by an outbreak of military hostilities in the Persian Gulf region. Consequently, crude petroleum prices were bid up substantially. The flow of oil continued much as

before, however, largely because Saudi Arabia boosted its own output to make up for the cutoff of supplies from Iraq and Kuwait. The rapid success of the allied air campaign in January 1991 quickly erased fears of major oil supply interruptions, resulting in a sharp drop in prices for petroleum and petroleum products.

The continued weakness of the economy, both in this country and in many other nations, had a less spectacular but more pervasive effect on price movements in 1991. The coincidence of the beginning of the economic slowdown in July 1990 and the Iraqi invasion of Kuwait immediately thereafter encouraged the notion that the resolution of the Kuwaiti crisis would end the slowdown as well. With a resurgence of consumer confidence in the wake of the Desert Storm operation, there was a widespread perception by midyear that the slowdown was over.

The sluggishness which dominated the remainder of 1991 failed to match the usual profile of recovery from an economic setback, as many of the more serious problems underlying the recession reemerged with relatively little improvement. Consumer spending failed to rebound vigorously, partly because of the continuing burden of consumer debt incurred in recent years and partly because of caution due to fears of potential layoffs. Rapid drops in interest rates, while assisting homeowners who refinanced their mortgages, also reduced the spending power of consumers who held significant amounts in certificates of deposit and other savings instruments and accounts.

The American dollar weakened considerably against several major foreign currencies, as lower U.S. interest rates induced more foreign investment to flow back abroad. While the weaker dollar stimulated American exports, this was offset somewhat by falling demand from other countries which were suffering their own economic downturns. Imports continued to present formidable competition for many domestic goods, further limiting the ability of American firms to raise prices in hopes of restoring profit margins.

Although most closely watched indicators of future economic conditions signalled a strong recovery in 1991 which failed to materialize, one leading indicator which remained weak all year was the PPI for basic industrial materials. This index declined in most months of 1991, reflecting the sluggishness of the manufacturing sector.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

² Industry and product class indexes may include products not shown separately.

³ Not available.

n.e.c. = Not elsewhere classified.

mfp = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See Technical Notes at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.² Not available.³ Prices for all items in this grouping are lagged 1 month.⁴ Prices for some items in this grouping are lagged 1 month.⁵ n.e.c. = Not elsewhere classified.

NOTE: While data for some series may not be shown in this table for 6 months of the year, price movements for those missing

months may be discerned from the appropriate duplicate higher or lower level series. For example, data are not shown from July to December for commodity code 15-96-02-27, parts for watches and clocks; this series duplicates commodity code 15-96-02 with the same title (since there is only one series in the grouping). A cursory inspection shows that the 2 series when spliced together yield a continuous data series for the entire year. For further information on the duplicate indexes affected by this pattern, see "Revised Publication Status for Selected PPI Series" in *Producer Price Indexes Data for November 1991*, pp. 195 - 201.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Revised indexes may not agree with previously published revised data because of a comprehensive historical revision which became effective with the April 1992 issue of this publication.

² Telephone services contained in the Consumer Price Index cover not only local residential service, but also parts of toll service, equipment leasing (such as extension phones), and nonrecurring charges (such as installation).

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and manufacturing sectors of the

economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of changes in construction costs. See note on page 190 of *Producer Price Indexes Data for July 1986*.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the industry indexes in table 3. Industries are allocated to stages of process based on interindustry shipment patterns from the 1977 input/output relationships.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the

industries in each of the industry stage of process output indexes as shown by the 1977 input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

Table 10. Relative importance of subproduct classes in the Producer Price Index by stage of processing, December 1991¹—Continued

SOP code	Comm- odity code	Index	Relative importance		SOP code	Comm- odity code	Index	Relative importance

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1991 based on the new weights taken from 1987 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1992. The "Former" column provides relative importance figures for the same month based on the old weights taken from

1982 shipment values, before the January 1992 sample revisions. Except for recodes, a dash in the "Former" column indicates that the series was introduced in January 1992 and a dash in the "Revised" column indicates that the series was discontinued as of January 1992. Individual items and subtotals may not add exactly to totals because of rounding differences. The value of 0.000 represents a percentage less than 0.0005.

¹The relative importance of component represent its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of SOP category. The "Revised" column shows relative importance figures for December 1991 based on the new weights taken from 1987 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1992. The "Former" column provides relative importance figures for the same month based on the old weights taken from

1982 shipment values, before the January 1992 sample revisions. Groupings and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents either a percentage less than 0.0005 or a grouping newly introduced or deleted in January 1992 (if the 0.000 appears in the "Former" or "Revised" column, respectively). Newly introduced or deleted groupings may be identified by referring to Table 10.

¹ All relative importance figures in this table are expressed as a percentage of the All Commodities index. The "Revised" column shows relative importance figures for December 1991 based on the new weights taken from 1987 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1992. The "Former" column provides relative importance figures for the same month based on the old weights taken from 1982 shipment values, before the January 1992 sample revisions. Except for recodes, a dash in the "Revised" column indicates a series that was

discontinued as of January 1992, while a dash in the "Former" column indicates a series introduced that same month. Subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005.

² The relative importance data for the three major SOP groupings—Finished Goods, Intermediate Materials, and Crude Materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,100 commodities and 75,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes and; (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 3). The commodity structure (table 4) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by

business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the

first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 3. Although most such indexes continue to be published in table 4 on a base period of 1982 = 100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment

to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1987 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1987 through December 1991, PPI weights were derived from 1982 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982 = 100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not cause any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 16, "Producer Prices," in *BLS Handbook of Methods* (1988), Bulletin 2285. Reprints are available from the Bureau of Labor Statistics on request (202-523-1221).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

Index Point Change	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index Percent Change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Results multiplied by 100	0.034 x 100
Equals percent change	3.5

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about

the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, 1991 edition, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1983 through December 1987 were replaced at the beginning of 1988. Indexes for most broad commodity groupings and 8-digit individual commodities in table 4, as well as industry and Census product indexes in table 3, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 4 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories, and from a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behaviour abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
