Producer Price Indexes — (ISSN 0882-5270) is a monthly report on producer price movements including text, tables, and technical notes. An annual supplement contains monthly data for the calendar year, annual averages, and information on weights.

A subscription may be ordered for 1 or 2 years from: New Orders, Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15250-7954. Subscription price per year: \$34 domestic (includes supplement), \$42.50 foreign. Prices are subject to change by the U.S. Government Printing Office.

Send correspondence on subscription matters, including address changes and missing issues, to the Superintendent of Documents, U.S. Government Printing Office, Washington DC 20402, (202) 512-2303. POSTMASTER: Send address changes to *Producer Price Indexes*, U.S. Government Printing Office, Washington, DC 20402.

Producer Price Indexes

Data for 1993

Preface

This annual *Supplement to Producer Price Indexes* presents monthly indexes and annual averages for 1993. Indexes shown in the *Supplement* are not seasonally adjusted. The *Supplement* also provides information on the relative importance of components at the end of the year. It also

summarizes the major price developments during 1993.

Information on changes in the sample for producer price indexes during 1993 can be found in the January 1993 and July 1993 issues of *Producer Price Indexes*.

Price Highlights, 1993

Prices received by domestic producers of finished goods moved up 0.2 percent in 1993, following a 1.6-percent advance in 1992 and a dip of 0.1 percent in 1991. The increase in the index for finished goods other than foods and energy, which includes consumer goods such as passenger cars and apparel as well as capital equipment such as trucks and machine tools, continued to slow in 1993. After gains of 2.0 percent in 1992 and 3.1 percent in 1991, this measure rose only 0.4 percent in 1993. In addition, the energy goods index, chiefly gasoline, home heating oil, and residential gas and electricity, decreased 4.1 percent, far more than its slight decline in the previous year, but not as much as its slump of 9.6 percent following Operation Desert Storm in 1991. Prices for foods such as meats, bread, and fresh produce, however, increased 2.4 percent in 1993, after a smaller climb in 1992 and a drop in 1991.

The Intermediate Goods Price Index, which measures the movement of prices for goods such as flour, steel, lumber, industrial chemicals, diesel fuel, and paper boxes, advanced 1.0 percent in 1993, the same as during the previous year. The Crude Goods Price Index, which measures price movements for items such as wheat, scrap metals, logs, crude petroleum, and cotton, moved up 0.1 percent following an increase of 3.3 percent in 1992. In 1993, prices for food-related materials were up but energy items were down in the intermediate and crude stages. Prices for intermediate goods other than foods and energy rose 1.6 percent over the year, somewhat more than in 1992, while basic industrial material prices climbed 10.7 percent, much more than the 1992 advance of 5.7 percent.

The generally moderate rate of recovery from the last recession, the impetus of private-industry cost cutting that enhanced productivity, and weak foreign demand were among the factors contributing to the continuation of relatively low rates of price increases for most products in 1993.

After surging strongly at the close of 1992, the economy slowed considerably through much of 1993 before strengthening again toward the end of the year. By December, the Federal Reserve Board's capacity utilization index for mining, manufacturing, and utilities was up to 82.9 percent, a level not seen since mid-1989. Consumer demand for cars, light trucks, and some household durables was stronger than in recent years; however, demand for many other kinds of con-

sumer goods was sluggish until employment and income gains in the fourth quarter boosted consumer confidence and retail sales. The residential housing market was weak through the first half of the year, but improved later in the year, partly reflecting the impact of a sharp drop in mortgage interest rates. The general decline in interest rates during the year helped put more disposable income into consumers' pockets, particularly by making possible new waves of refinancing that often dramatically cut required monthly mortgage payments.

Spending for capital equipment (as measured by data on expenditures for producers' durable equipment) rose 18.5 percent in 1993; to boost productivity, industry, as in other recent years, often concentrated capital expenditures in upgraded computer systems. Many firms, unable to impose lasting price hikes, continued to emphasize cuts in labor costs that often brought about significant reductions in their work force.

Manufacturing productivity advanced 4.8 percent in 1993, compared with 3.7 percent in the previous year, while unit labor costs in manufacturing dropped 2.9 percent. The Employment Cost Index for total compensation for workers in private industry was up 3.6 percent from December 1992 to December 1993, virtually the same as in 1992. Business spending on inventories remained tightly constrained, partly reflecting the spread of the "just-in-time" philosophy to minimize corporate funds locked up in inventory.

Efforts to reduce Federal spending, particularly in the defense budget, restrained the general recovery. The commercial construction market remained sluggish in most parts of the country because of the surplus of office space resulting from overbuilding in the 1980s. But public construction spending on infrastructure and other projects advanced over 1992 levels.

Although foreign demand for U.S. made goods was somewhat constrained by the relatively weak economies of many major U.S. trading partners, such as Japan and Germany, exports to Great Britain, Canada, and some developing countries increased. Imports remained heavy for some products; however, market shares for cars and some other goods made in Japan were eroded by currency fluctuations and the continued trend by foreign producers to build manufacturing plants in this country.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents.

² Industry and product class indexes may include products not shown separately.

³ Not available.

n.e.c. = Not elsewhere classified.

mfp = Made from purchased materials.

n.s.k. = Not specified by kind.

Note: Indexes in this table are calculated by a revised methodology. See Technical Notes at the back of this publication. The annual average calculation method for the PPIR differs from that of the PPI (table 4). The PPIR method averages the unrounded monthly indexes, and also includes unpublished monthly data. Therefore, the annual averages may not agree with those computed by averaging the monthly indexes as shown above.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the primary product indexes in table 3 that are weighted using 1977 input/output relationships. These indexes only include inputs to construction which are produced by the mining and

manufacturing sectors of the economy, excluding capital equipment. Since they do not include labor or capital costs, these indexes should not be regarded as comprehensive measures of change in construction costs. See note on page 190 of *Producer Price Indexes Data for July 1986*.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the industry indexes in table 3. Industries are allocated to stages of process based on inter-industry shipment patterns from the 1977 input/output relationships.

¹ Monthly data and annual averages have been revised to reflect the availability of late reports and corrections by respondents. Indexes in this table are derived from the product indexes in table 3. These indexes are composed of the goods used by the industries in each of the industry stage-of-process output indexes as shown by the 1977

input/output relationships. These material inputs include only domestic material input and do not include any imported materials which may be used.

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1993 based on 1987 shipment values from the *Census of Manufactures* and other sources, after the sample revision effective January 1994; the "Former" relative importance figures are for the same month before the revision of the index sample.

Except for recodes, a dash in the "Former" column indicates that the series was introduced in January 1994 and a dash in the "Revised" column indicates that the series was discontinued as of January 1994. Groupings and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents either a percentage less than 0.0005 or a grouping newly introduced or deleted in January 1994 (if the 0.000 appears in the "Former" or "Revised" column, respectively).

¹ The relative importance of a component represents its value weight that is allocated to a particular stage-of-processing (SOP) category—finished goods, intermediate materials, or crude materials—expressed as a percentage of the total weight of the SOP category. The "Revised" column shows relative importance figures for December 1993 based on 1987 shipment values from the *Census of Manufactures* and other sources, after the sample revision effective January 1994; the "Former" relative importance figures are for the same month before the revision of the

index sample. Groupings and subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents either a percentage less than 0.0005 or a grouping newly introduced or deleted in January 1994 (if the 0.000 appears in the "Former" or "Revised" column, respectively). Newly introduced or deleted groupings may be identified by referring to table 10.

¹ All relative importance figures in this table are expressed as a percentage of the all commodities index. The "Revised" column shows relative importance figures for December 1993 based on weights taken from 1987 shipment values from the *Census of Manufactures* and other sources, and reflects all sample revisions effective January 1994. The "Former" column provides relative importance figures for the same month based on weights taken from 1987 shipment values, before the January 1994 sample revisions. Except for recodes, a dash in the "Revised" column indicates a series that was discontinued as of January 1994, while a dash in the "Former" column indicates a series

introduced that same month. Subtotals may not add exactly to totals because of rounding differences. The value 0.000 represents a percentage less than 0.0005.

² The relative importance data for the three major SOP groupings—finished goods, intermediate materials, and crude materials—do not add up to 100.000 because they exclude the portion of goods allocated to government purchases and exports.

Technical Notes

Brief Explanation of Producer Price Indexes

Producer price indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. Most of the information used in calculating the indexes is obtained through the systematic sampling of nearly every industry in the manufacturing and mining sectors of the economy. The PPI program also includes some information from other sectors—agriculture, fishing, forestry, services, and gas and electricity. Because producer price indexes are designed to measure only the change in prices received for the output of domestic industries, imports are not included. The sample currently contains about 3,200 commodities and 80,000 quotations per month.

There are three primary systems of indexes within the PPI program: (1) Stage-of-processing indexes; (2) commodity indexes and; (3) indexes for the net output of industries and their products. The stage-of-processing structure (table 1) organizes products by class of buyer and degree of fabrication. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products (table 3). The commodity structure (table 4) organizes products by similarity of end-use or material composition.

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, and nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses items that are physically complete but that are purchased by

business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the

first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

The illustration shows examples of how products are classified by stage of processing.

Producer price indexes for the net output of industries and their products are grouped according to the Standard Industrial Classification (SIC) and the Census product code extension of the SIC. Industry price indexes are compatible with other economic time series organized by SIC codes, such as data on employment, wages, and productivity. Table 3 includes data for SIC industries and industry groups (2-, 3-, and 4-digit levels); indexes for Census product classes (5- and 6-digit levels), products (7-digit level), and more detailed subproducts (9-digit level); and, for some industries, indexes for other sources of revenue.

Indexes may be represented by one to three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not always exclusively, within the industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, some industries also may have secondary product indexes that show changes in prices received by establishments classified in the industry for products primary to some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, e.g., resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Some product indexes published in table 3 correspond to 8-digit commodity indexes in table 4. In these cases, movement of the latter indexes are calculated on the basis of movements of their counterparts in table 3. Although most such indexes continue to be published in table 4 on a base period of 1982 = 100 or some later base, corresponding indexes in table 3 are published on a base of the month of their introduction. Even though index levels for corresponding items may differ, monthly percent changes will be identical. (See "Calculating Index Changes," below.)

Producer price indexes are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment

to minimize the use of list prices. Prices are normally reported by mail questionnaire for the Tuesday of the week containing the 13th.

Price data are provided on a voluntary and confidential basis; no one but sworn BLS employees are allowed access to individual company price reports. The Bureau publishes price indexes instead of unit dollar prices. All producer price indexes are routinely subject to revision once, 4 months after original publication, to reflect the availability of late reports and corrections by respondents.

Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments in one industry to establishments classified in another industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes such as the all commodities index are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends. Weights for most traditional commodity groupings of the PPI, as well as all indexes (such as stage-of-processing indexes) calculated from traditional commodity groupings, currently reflect 1987 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1987 through December 1991, PPI weights were derived from 1982 shipment values. Industry indexes, which are based on the SIC system, continue to be calculated with 1977 net output weights.

Effective with publication of January 1988 data, many important PPI series (including all stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982 = 100, to coincide with the reference year of shipment weights. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not cause any changes to previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The new reference base is not used for indexes with a base later than December 1981, nor for indexes for the net output of industries and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 16, "Producer Prices," in *BLS Handbook of Methods* (1992), Bulletin 2414. Reprints are available from the Bureau of Labor Statistics on request (202-606-STAT).

Calculating Index Changes

Movements of price indexes from one month to another are usually expressed as percent changes rather than as changes in index points because index point changes are affected by the level of the index in relation to its base period, while percent changes are not. The box shows the computation of index point and percent changes.

<i>Index Point Change</i>	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
<i>Index Percent Change</i>	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Results multiplied by 100	0.034 x 100
Equals percent change	3.4

Percent changes for 3-month and 6-month periods can be expressed as annual rates that are computed according to the standard formula for compound growth rates. These data indicate what the percent change would be if the rate for a given 3- or 6-month span were maintained for a 12-month period.

Each index measures price changes from a reference period which equals 100.0 (1982 or some later month). An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change can also be expressed in dollars as follows: "Prices received by domestic producers of a systematic sample of finished goods have risen from \$100 in 1982 to \$105.50 today." Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods today are 10 percent lower than they were in 1982.

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, the Bureau of Labor Statistics publishes seasonally adjusted as well as unadjusted changes each month.

Seasonally adjusted data are preferred for analyzing general price trends in the economy because they eliminate the effect of changes that normally occur at about

the same time and in about the same magnitude every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends.

Unadjusted data are of primary interest to users who need information which can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited in escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, 1991 edition, available on request from BLS.)

Seasonal factors used in computing seasonally adjusted indexes are derived from the X-11 Seasonal Adjustment Method. Annual updates replace the most recent 5 years of seasonal data, e.g., data from January 1983 through December 1987 were replaced at the beginning of 1988. Indexes for most broad commodity groupings and 8-digit individual commodities in table 4, as well as industry and Census product indexes in table 3, do not undergo the seasonal adjustment process and, therefore, are published only as unadjusted data.

Some indexes are adjusted directly, independently of the seasonal movements of other more detailed series comprising the category in question. This is the case for all indexes in table 4 which are adjusted, as well as for certain basic stage-of-processing categories in table 1. Seasonal movements for most stage-of-processing indexes are derived indirectly by the aggregate method, which combines seasonal movements of the basic stage-of-processing categories, and from a wide variety of food and certain other subproduct class (6-digit level) series.

Direct seasonal adjustment produces a more complete elimination of seasonal movements than the aggregative method does. However, the direct seasonal adjustment process does not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonally adjusted data can also become problematic when previously stable and predictable timing patterns of pricing behaviour abruptly change. If the new timing pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will be chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.
