INDUSTRIAL PRODUCTION

G. 12.3

For release at 9:30 a.m. (EDT)
October 16, 1979

Industrial production increased by an estimated 0.5 percent in September, largely reflecting a rebound in production of motor vehicles. The index had declined 0.9 percent in August following gains of 0.1 percent in both June and July. At 152.3 percent of the 1967 average, the September index was 2.5 percent above the level of a year earlier and 0.5 percent lower than its recent high in March 1979. The index for the third quarter 1979 was 0.2 percent above the second quarter and at the same level as the first quarter of 1979.

Products. Output of consumer durable goods rose 3.2 percent in September, as auto assemblies--at an annual rate of 7.9 million units--were about 5 percent higher than the sharply curtailed rate of 7.5 million units in August. However, the September assembly rate was still well below the 8.9 million rate in the first half of the year. Output of home goods rose in September because of a pickup in production of appliances from their curtailed August level. Output of consumer nondurable goods increased slightly, mainly in foods. Production of business equipment increased 0.8 percent, reflecting an upturn in output of heavy trucks, a post-strike rebound in power equipment output, and continued strength in commercial equipment. With the rise in production of business vehicles from its low level in August, the output of transit equipment advanced sharply but remained below its July level. Production of construction supplies was again about unchanged in September.

Materials. Output of durable goods materials was practically unchanged as the production of parts for equipment and consumer durables increased somewhat while output of basic metals, such as raw steel, declined further. Production of nondurable goods materials rose by 0.4 percent. Energy materials output declined slightly in September as coal production was reduced.

P--PRELIMINARY

Explanatory Note

Coverage. The industrial production index is a measure of the physical output of the Nation's factories, mines, and electric and gas utilities expressed as a percentage of production in a base period, currently 1967. The 235 individual series representing Standard Industrial Classification (SIC), 1967 edition, codes 10-14, 19-39, 49, and 91 (part) are calculated first as index series relatives. These relatives are aggregated into: (1) market groupings (such as consumer goods, equipment, intermediate products, and materials) from which the total is derived and (2) industry groupings (for example, SIC 2-digit industries) and major aggregates of these groupings, such as manufacturing, mining, and utilities.

Timing. A first estimate of output for a month is published about the 15th of the following month. This estimate may revise in each of the next 3 months as new data become available. After the fourth month, indexes are not further revised until an annual or a benchmark revision.

Source data. The monthly indexes of industrial production are built up from data of two types: (1) directly-measured physical product data, (2) estimates of physical product output derived from input data adjusted by conversion factors that relate these inputs to physical output. The directly measured physical product data (lbs., tons, etc.) are obtained from reports of the Bureau of the Census, Bureau of Mines, other Government agencies, and trade associations. Estimates of physical output based on input data are used when appropriate monthly physical product data are not available. The major input data are (1) hours worked by production workers as indicated by the monthly establishment survey of the Bureau of Labor Statistics, and (2) industrial electric power use as ascertained from utilities by the Federal Reserve Banks. The input conversion estimates are based mainly on their historical trends and recent developments.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 version of the Method II seasonal adjustment procedure developed by the Bureau of the Census. The seasonal adjustment factors for the basic aggregate series in the summary table and in Tables 1 and 2 are reviewed and edited monthly. The seasonal factors currently being used were developed from data through 1978, edited to minimize the effect of the sharp cyclical decline and recovery in industrial production in 1974 and 1975.

Weights. The total index and various groupings of component series are combined on the basis of 1967 value-added weights (shown in the first column of the index tables). The gross-value-weighted product series are expressed in terms of 1972 dollars.

Formula. The symbolic expression for the total index (I) is:

$$I_t = \Sigma \left(\frac{q_{67}p_{67}}{\Sigma q_{67}p_{67}} \right) \cdot \left(\frac{q_t}{q_{67}} \right) \cdot 100 = \frac{\Sigma q_t p_{67}}{\Sigma q_{67} p_{67}} \cdot 100$$

where q is quantity, p is Census value-added per unit of output, and t represents the t -th period.

Reliability. The median of the revisions in total IP, without regard to sign, between the first and fourth estimates is 0.25 per cent; that is, in about half of the cases, the absolute value of the revision from the first to the fourth estimate was less than 0.25 per cent. (Calculated on the basis of data for the August 1971 to July 1976 period.)

Rounding. Changes shown for index components may not aggregate to changes for totals due to independent rounding.
