

Prefatory Note

The attached document represents the most complete and accurate version available based on original copies culled from the files of the FOMC Secretariat at the Board of Governors of the Federal Reserve System. This electronic document was created through a comprehensive digitization process which included identifying the best-preserved paper copies, scanning those copies,¹ and then making the scanned versions text-searchable.² Though a stringent quality assurance process was employed, some imperfections may remain.

Please note that some material may have been redacted from this document if that material was received on a confidential basis. Redacted material is indicated by occasional gaps in the text or by gray boxes around non-text content. All redacted passages are exempt from disclosure under applicable provisions of the Freedom of Information Act.

¹ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).

² A two-step process was used. An advanced optical character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.

MONEY MARKET AND RESERVE RELATIONSHIPS

Recent developments

(1) The relatively firm conditions prevailing in money and short-term credit markets around the time of the last Committee meeting were generally maintained in the ensuing four week period dominated by "even keel." With money markets firm, international financial markets in flux, and with a large volume of new demands on the credit markets from Federal and private sectors, most long- and short-term interest rates rose further over the period.

(2) The 3-month Treasury bill rate, however, did not show any sustained upward movement since the last Committee meeting. In fact, as of the close of business Friday, the 3-month bill was yielding around 5.42 per cent, down a few basis points from its level four weeks earlier. Over that interval, the bill fluctuated in a fairly narrow range, generally in the upper half of the 5.25-5.60 per cent range specified in the previous Blue Book. Longer-term bill rates, however, rose about 10 basis points over the interval, as did certain other short-term market rates, such as yields on certificates of deposits and bankers' acceptances. Offering rates by banks for CD's in the 3-month area generally moved up to the 6 per cent Regulation Q ceiling rate, and some banks are reported to be offering the 6-1/4 per cent ceiling for six-month money. The one leading bank whose prime loan rate was relatively low moved that rate up to 6-1/4 per cent.

(3) The disparate movement of the 3-month bill rate relative to other short-term rates reflected in part the development of a shortage

November 22, 1968.

in the trading supply of such bills in the face of heavy demand from foreign and other sources. Net purchases of bills in the market by foreign accounts (through the agency of the System) have totalled around \$850 million since the beginning of November, mostly in the short-term area. The increased spread of longer-term over short-term bill rates also appeared to reflect general market uncertainties, including a view that evolving credit conditions were on the tight side as compared with earlier anticipations. However, the Treasury's recently announced offering of only \$2 billion in June tax bills--at the lower end of the range expected in the market--helped to moderate pressures affecting longer-term bills.

(4) During the first three weeks since the last meeting of the Committee the Federal funds rate mostly tended to be around 6 per cent or above, as compared with a neighborhood of $5\frac{7}{8}$ - 6 per cent in October. In recent days, however, the funds market has eased sharply, reflecting in the main reserve gluts around the end of the statement week just past, when float turned out to be unexpectedly high, when banks accumulated reserves in excess of need early in the week, and when foreign funds became temporarily more available in the Federal funds market. Rates on new loans to dealers were firm at $6\frac{3}{8}$ per cent or above for the bulk of the period since the previous FOMC meeting.

(5) In the four statement weeks ending November 20, member bank excess reserves have averaged \$286 million, somewhat higher than in the previous four weeks, while member bank borrowings have averaged \$519 million, also somewhat higher than earlier. Net borrowed reserves during the past four statement weeks have been in a \$150-350 million range.

(6) Current estimates of the bank credit proxy for November show a $10\frac{1}{2}$ per cent annual rate of increase on average. Euro-dollar borrowings may add about $\frac{1}{2}$ percentage point to the proxy on average. With one week still to go in the month, the bank credit estimate is, of course,

subject to change in either direction by a percentage point or two. In the course of November, week-by-week estimates of the credit proxy varied throughout the 9-12 per cent average annual rate range projected for the last Committee meeting, as there were wide fluctuations in reported weekly deposit figures. It should be noted, however, that after mid-month the range originally projected had to be adjusted to 8-11 per cent because the earlier assumption as to timing of the Treasury tax bill financing was not borne out; in the previous Blue Book the financing had been assumed for payment on November 27, whereas it has now been announced for payment on December 2 (in the amount of \$2 billion).

(7) Growth in bank credit in November was accompanied by only about a 1 per cent annual rate of expansion in nonborrowed reserves on current estimates. With the cost of reserve funds in the Federal funds and Euro-dollar markets generally higher than in the previous month, banks--to sustain credit expansion--increased their borrowings from the Federal Reserve more than seasonally, and they also appear to have economized further on excess reserves after adjusting for past seasonal patterns. (The increase in excess reserves noted in paragraph (5) would represent a less than seasonal rise.)

(8) The reception of the Treasury's November refunding operation turned out to generate somewhat more total attrition than assumed by the staff; about 25 per cent of the November maturities and 50 per cent of the December maturities were not exchanged. But the interest in the re-opened 5-3/4 per cent 6-year note was greater than many in the market had anticipated, with public subscriptions reaching \$1.3 billion. Dealers took around \$250 million, net, of this issue into position, and sold out about one-third by payment date. Their total

position in securities maturing in more than 5 years was around \$630 million on Thursday, November 21, or about \$100 million higher than such positions on October 29, just before books were closed on the mid-November refunding. Dealers appear to have rather mixed attitudes toward these positions; on balance they are not pressing them actively onto the market at this time.

(9) Time deposit growth in November is estimated at a 12 per cent annual rate, in line with earlier projections. However, growth in the money supply, estimated at a 10 per cent annual rate, is slightly in excess of earlier projections, mainly because of an unanticipated bulge in currency in circulation.

(10) Comparative average annual rates of change for major deposit and reserve aggregates are shown below.

	<u>May '67-</u> <u>Nov. '67</u>	<u>Dec. '67-</u> <u>June '68</u>	<u>July '68-</u> <u>Nov. '68^P</u>

Prospective Developments.

(11) Prevailing money market conditions might be taken to encompass a Federal funds rate fluctuating in the neighborhood of 5-7/8--6 per cent, member bank borrowings averaging in a \$400-\$600 million range, and net borrowed reserves fluctuating widely, probably in a \$100-\$400 million area. These specifications assume banks may be somewhat more willing to borrow at a given Federal funds rate than they were in most of November, as they move into the December period of traditional seasonal pressures. Maintenance of the above money market conditions between now and the next meeting of the Committee on December 17 may be associated with some moderate further upward pressures on short-term interest rates, and with a slower growth in bank credit (as measured by the proxy on a daily average basis for the month.)

(12) Under these money market conditions, it would appear that the 3-month Treasury bill rate may be expected to be in a 5.30-5.60 per cent range between now and mid-December. However, the bill rate could be pushed to or even somewhat beyond either end of this range depending on the way in which international exchange market uncertainties are resolved (unknown by Friday 6:30 p.m.). Effects will stem both from shifts in market attitudes and also from the extent and timing of foreign purchases or sales of Treasury bills, as well as use of swap facilities.

(13) Apart from international influences, there will be seasonal upward pressures on the bill rate that might be accentuated by enlarged corporate tax payments around mid-December. It is also possible that the Treasury may have to maintain a relatively low cash balance at the Federal Reserve until mid-December tax payments begin coming in, with the result that commensurately less Federal Reserve open market purchases would be made. On the other hand, these interest rate pressures may be offset to some extent because the market is likely soon to begin focusing on the probability that the Treasury will be able to repay some debt in the first half of next year.

(14) In projecting a slowing of bank credit growth in December-- to a 5-8 per cent, annual rate, range^{1/}--the staff has assumed that CD attrition will be around \$800 million, or no more than seasonal proportions. This projection assumes that the 3-month bill rate begins to decline in

^{1/} As noted earlier, the staff estimates for November are based on partial data. If final numbers for November turn out to be significantly lower (or higher), then the present projection for December's annual rate of growth would have to be commensurately higher (or lower) for the average December level herein projected to be achieved. Euro-dollar borrowings would add 1/2 percentage point to the projection, assuming little change in such borrowings from their current level.

the latter part of December from a seasonal peak. It presumes that maintenance of a Federal funds rate consistently in a 5-7/8--6 per cent area will encourage the market in the view that any upward movement of bill rates that may develop is likely to be temporary and that, therefore, banks will be able to count on a relatively normal recovery from mid-December CD attrition. If the 3-month bill rate were to reach or exceed the upper end of the range cited, it might become extremely difficult for banks, except for a few prime banks, to avoid more than seasonal attrition of outstanding CD's. There is somewhat more scope under the Regulation Q ceilings for banks to issue longer-term CD's, but the availability of such funds will probably be limited, particularly for seasonal reasons, next month.

(15) As of the end of October, CD's maturing in December totalled \$5.4 billion, of which about \$1 billion matured on the tax date. It is difficult to tell how much banks will have added to these liabilities by the end of November, although a comparison of market rates with Q ceiling rates would suggest that they would have sold relatively little more of December maturities. Assuming no substantial build-up in December CD maturities over the last few weeks, the attrition rate of around 15 per cent which we have assumed is not likely to require banks to undertake significant liquidity adjustments that would immediately alter lending attitudes, although banks are likely to add to portfolio investments at a reduced pace.

(16) Growth in time and savings deposits other than negotiable CD's is likely to slow down further in December, given the higher level

of market interest rates that has emerged and an anticipated moderation in the growth of personal income. Taking into account both CD's and other time and savings deposits, the total of banks' time deposits may be expected to rise in an 8-11 per cent, annual rate, range in December. Money supply growth next month may be in a 6-9 per cent, annual rate, range, reflecting for the most part a relatively sharp drop in U.S. Government deposits during the month, given the small size of the new tax bill financing and the substantial cash redemptions of the mid-December Treasury bond maturities that were not exchanged in November.

(17) Over the near-term, some further upward pressure on long-term interest rates remains possible. It would appear that banks would have to be considerably less active purchasers of securities, particularly of State and local Government obligations. And, while dealers have made progress in distributing the most recent longer-term Treasury note, their total positions in the over 5 year area (including the fairly sizable unsold balances from the August refunding) remain fairly large. In addition, a relatively large calendar of corporate bond issues may be developing for January, although this may have been discounted by the recent sharp rise of long-term interest rates.

(18) Policy alternative. If the Committee wishes to intensify the degree of monetary restraint at this time, it may wish to consider a constellation of money market conditions including a Federal funds rate fluctuating around 6-1/8 per cent, member bank borrowings in a \$550-\$700 million range, and net borrowed reserves of \$300-\$500 million. In view of the relatively firm money and short-term credit market conditions of recent weeks, and given anticipations of seasonal tightness by market participants, these money market variables would probably have to be rather

consistently toward the tight ends of the indicated ranges for the market to become aware of a shift in policy over the next three weeks.

(19) As the market absorbs the impact of a consistently tighter funds market and higher level of borrowings, there may be greater upward effects on longer-term bill rates and on bond yields than on the 3-month bill. The relatively small dealer holdings of short bills may tend to limit the rise in the 3-month bill rate. Longer-term bill rates are likely to be affected by banks' efforts to nail down whatever CD funds prove available in the maturity area beyond three months. Even so, banks could become uncertain about their ability to recoup December CD attrition, and would likely cut back participation in the municipal and U.S. Government securities markets fairly sharply. They are also likely to increase demands on the Euro-dollar market. Assuming existing ceiling rates, CD attrition in December might be in the order of \$1--\$1-1/4 billion--depending in part on the speed of adjustment of bill and other short-term market rates to the change in policy stance--and bank credit growth might slow to a 3-6 per cent annual rate.

MONEY MARKET AND RESERVE RELATIONSHIPS

Recent developments

(1) The relatively firm conditions prevailing in money and short-term credit markets around the time of the last Committee meeting were generally maintained in the ensuing four week period dominated by "even keel". With money markets firm, international financial markets in flux, and with a large volume of new demands on the credit markets from Federal and private sectors, most long- and short-term interest rates rose further over the period.

(2) The 3-month Treasury bill rate, however, did not show any sustained upward movement since the last Committee meeting. In fact, as of the close of business Friday, the 3-month bill was yielding around 5.42 per cent, down a few basis points from its level four weeks earlier. Over that interval, the bill fluctuated in a fairly narrow range, generally in the upper half of the 5.25-5.60 per cent range specified in the previous Blue Book. Longer-term bill rates, however, rose about 10 basis points over the interval, as did certain other short-term market rates, such as yields on certificates of deposits and bankers' acceptances. Offering rates by banks for CD's in the 3-month area generally moved up to the 6 per cent Regulation Q ceiling rate, and some banks are reported to be offering the 6-1/4 per cent ceiling for six-month money. The one leading bank whose prime loan rate was relatively low moved that rate up to 6-1/4 per cent.
