(2)

Title: Policy Expectations Implied by Futures Rates
Series: December 2009 Fed Funds implied rate, December 2010 Eurodollar rate implied by contract less 15-day moving average of forward Libor-Fed Funds Basis Swap
Horizon: August 1, 2008 - June 19, 2009
Description: December 2009 rate nearly remains constant, while December 2010 rate increases.

```

(4)

Title: Factors Driving 10-Year Yield Change Over Intermeeting Period
Series: Aggregated Primary Dealer responses indicating importance of various factors in the 10-Year Yield Horizon: As of June 17, 2009
Description: Primary Dealers indicate importance of varying factors in the change of the 10-Year Yield.

Factors with average level of importance from "Important" down to "Somewhat important": Improved economic outlook, Reduction in downside inflation risk, Increase in Treasury supply, Mortgage convexity hedging, Increase in upside inflation risk.

(7)

Title: Supply of Treasury Debt
Series: SOMA Treasury Holdings, Other Treasury Securities Outstanding, and SOMA as a Percent of Total Horizon: January 2007 - June 2009
Description: Supply of Treasury debt increases while SOMA as a percent of total decreases.

Source: Federal Reserve Bank of New York

## Bottom panel

(8)

Title: Mortgage and Treasury Rates
Series: Fannie Mae 30-Year Current Coupon, Blended 5-and 10-Year Treasury yield, Fannie Mae Option Adjusted Spread to Treasury
Horizon: June 1, 2008 - June 19, 2009
Description: Rates increase after March 18 MBS program expansion.

## Page 3

## Top panel

(9)

Title: Breakeven Inflation Rates
Series: 5-Year Spot Breakeven Rate and 5-Year, 5-Year Forward Breakeven Rate Horizon: August 1, 2007 - June 19, 2009
Description: Breakeven inflation rates increase.

Source: Barclays

## Middle panel

(10)

Title: Probability Distribution of CPI Inflation Rate in 2014-2019
Series: Primary Dealer estimates for March, April, and June distributions of CPI rates
Horizon: 2014-2019
Description: Primary Dealer estimates for March, April, and June distributions of CPI rates

Estimated probability of 2.0-2.5\% and 2.5-3.0\% increased with each estimate. For June, 2.0-2.5\% shows greatest probability at about $35 \%$, and $2.5-3.0 \%$ shows second-greatest probability at about $25 \%$.

(11)

Title: Yield Curve Slope
Series: 10-Year Treasury Note Yield less Fed Funds rate, and NBER Recession Periods
Horizon: January 1, 1982 - June 19, 2009
Description: 10-Year Treasury yield spread to Fed Funds rate widens.

Shaded bars indicate periods of business recession as defined by the National Bureau of Economic Research (NBER): July 1981November 1982, July 1990-March 1991, March 2001-November 2001, and December 2007-present (June 2009).

Title: Balance Sheet Assets by Category
Series: Federal Reserve balance sheet assets categorized by All Other, Lending to Systemically Important Institutions, Short-Term Liquidity Facilities, Large-Scale Asset Purchases, and Legacy Treasuries
Horizon: August 1, 2008 - June 17, 2009
Description: Short-term liquidity facility assets decline while large-scale asset purchases increase.
Source: Federal Reserve Bank of New York

# Appendix 2: Materials used by Mr. Carpenter 

Material for<br>FOMC Briefing on Projections of the Balance Sheet, the Monetary Base, and Federal Reserve Income Seth Carpenter<br>June 23, 2009

Class I FOMC - Restricted Controlled (FR)

# Exhibit 1: Individual Balance Sheet Item Profiles 

## Asset Purchases and Federal Reserve Liquidity and Credit Facilities

Twelve line charts, each showing a date range from 39783 (December 2008, expressed as an integer in days from the beginning of the twentieth century) through 42705 (December 2016). Except as noted, each chart shows two curves, "Current" and "April" projections.

- Temporary holdings of longer-term Treasuries are depicted to increase from zero at the end of 2008 to a late-2009 peak in each of four projections: "baseline," "expanded purchases," "April baseline," and "April expanded purchases." Each of the baseline scenarios peaks at approximately $\$ 300$ billion and decreases to a level around $\$ 50$ billion by the end of 2016. The expanded scenarios peak around $\$ 750$ billion and decrease to approximately $\$ 100$ billion and $\$ 150$ billion under the April and current projections, respectively.
- Agency debt is depicted to increase from its December 2008 level of $\$ 20$ billion to a peak of $\$ 200$ billion in early 2009, and then decrease to approximately $\$ 25$ billion at the end of the projection period. In the April projection, agency debt remains at the $\$ 200$ billion peak through the end of 2011 and then decreases to $\$ 25$ billion by the end of the projection period, whereas the current projection depicts agency debt beginning to decline immediately following the peak.
- Agency MBS is depicted to increase from zero at the beginning of the period to a peak of just over \$1200 billion in early 2009, and then decrease to $\$ 600$ billion under the April projection and $\$ 800$ billion under the current projection.
- Primary and secondary credit facilities decrease from over $\$ 90$ billion in December 2008 to near zero by early 2011 and 2012 in the current and April projections, respectively.
- Term auction facility (TAF) credit decreases from over $\$ 400$ billion to zero by the end of 2010 and 2011 in the current and April projections, respectively.
- Foreign central bank liquidity swaps are shown to decrease from over $\$ 500$ billion at the beginning of the projection period to zero by the end of 2010 in both projections. The rate of decrease through 2009 is greater in the current projection than in the April projection.
- Credit extended to AIG is depicted to increase from the December 2008 level of just under $\$ 40$ billion to approximately $\$ 45$ billion in early 2009, and then to decrease to zero at the end of 2014 in both projections.
- Current projections for the three Maiden Lane facilities. Maiden Lane III is projected to decrease from over $\$ 25$ billion to zero by the end of 2012, including a sharp drop of about $\$ 7$ billion in mid-2009. Maiden Lane and Maiden Lane II are depicted to decrease from over $\$ 25$ billion and $\$ 20$ billion, respectively, to zero at the end of 2015.
- Loans extended through the first wave of the Term Asset-Backed Securities Loan Facility (TALF v1.0) are depicted in both projections to increase from zero at the beginning of the projection period to $\$ 100$ billion at the end of 2009. Under the April projection, TALF v1.0 maintains a $\$ 100$ billion level through early 2012 and declines to zero by early 2013. The current projection shows TALF v1.0 increasing to $\$ 125$ billion by early 2010, maintaining that level through mid-2012 and decreasing to zero by early 2014.
- For loans extended through subsequent waves of the TALF (TALF v2.0/3.0), the April projection shows credit outstanding rising from zero to $\$ 400$ billion at the end of 2010, remaining at that level until early 2011, and falling to zero at the end of 2013. In the current projection, TALF v2.0/3.0 increases from zero to $\$ 50$ billion at the end of 2010, remains at that level until mid-2014, and declines to zero at the end of 2015.
- Credit extended through the Commercial Paper Funding Facility (CPFF) is depicted to decline from over $\$ 300$ billion at the beginning of the projection period to zero at the end of 2010 under both the current and April projections. The rate of decrease through 2009 is greater in the current projection than in the April projection.
- Credit extended through the Asset-Backed Commercial Paper Liquidity Facility (AMLF) is depicted in both projections to decrease from the December 2008 level of nearly $\$ 25$ billion to around $\$ 5$ billion in mid2009. The April projection shows a gradual decline to zero at the end of 2010. In the current projection, AMLF spikes to a level over $\$ 25$ billion in mid-2009, then decreases to a low level in early 2010, and to zero by the end of 2010.

## Federal Reserve Liabilities and Capital

Four line charts, each showing a date range from 39783 (December 2008, expressed as an integer in days from the beginning of the twentieth century) through 42705 (December 2016).

- Federal Reserve notes are depicted to increase from their December 2008 level of just under $\$ 900$ billion to over $\$ 1200$ billion at the end of the period.
- Current and April projections are shown for the Treasury General Account (TGA) and the Supplementary Financing Program (SFP). The TGA declines from the December 2008 level of just over $\$ 100$ billion to around $\$ 25$ billion in early 2009. In the April projection, the TGA peaks in mid-2009 just below $\$ 100$ billion and declines to $\$ 5$ billion by the end of 2009 . Under the current projection, the TGA peaks at a level over $\$ 130$ billion in mid-2009, then dips below $\$ 25$ billion and returns to a level above $\$ 100$ billion again within a few months. Then, the current projection for the TGA declines to $\$ 5$ billion by the end of 2009. The SFP drops from its December 2008 level of over $\$ 250$ billion to $\$ 200$ billion in mid-2009 in both projections. The level decreases to zero by the end of 2009 in the April projection, and by mid-2010 under the current projection.
- Capital is depicted to remain at a level of just over $\$ 40$ billion through the entire period under the April projection, and to increase smoothly to a level of $\$ 129$ billion at the end of the period under the current projection.
- Reserve balances are depicted under baseline and expanded purchases scenarios from the current and the April projections. In both of the April scenarios, reserve balances increase from their December 2008 level of around $\$ 750$ billion to peak in late 2009 at nearly $\$ 2500$ billion and $\$ 3000$ billion, respectively. Both projections then decrease to approximately $\$ 25$ billion by the end of 2015. In the current baseline and expanded scenarios, reserve balances peak in late 2009 over $\$ 1500$ billion and $\$ 2000$ billion, respectively, and decrease to approximately $\$ 25$ billion and $\$ 100$ billion, respectively, by the end of 2016 .
*Corrected versions of these charts are available on pages 248-249 of 261.

## Exhibit 2: Baseline Balance Sheet Projections

This exhibit provides a graphical description of the assumptions underlying the baseline balance sheet projections.

## Top panel <br> Federal Reserve Assets

A line chart presents nine categories of assets: Treasury securities, Agency debt, Agency MBS, Repurchase agreements, TAF, Central bank swaps, TALF, Other loans and facilities, and Other assets. Each is depicted by a different color and the chart stacks the colors so that the share of the total that each asset represents is depicted. The date range for all projections is from 2006 to 2016. Total assets increase from their 2006 level of approximately $\$ 800$ billion to peak in late 2009 at a level of approximately $\$ 2800$ billion, and then decline fairly steadily until the end of 2016, ending at a level of approximately $\$ 1500$ billion.

## Bottom panel <br> Federal Reserve Liabilities and Capital

A stacked line chart presents six categories of liabilities and capital: Federal Reserve notes; Reverse repurchase agreements; Deposits, other than reserve balances; Reserve balances; Other liabilities; and Capital. Total liabilities and capital follow the same path as total assets.

## Exhibit 3: Expanded Balance Sheet Projections

This exhibit is similar to Exhibit 2, but shows the assumptions underlying the expanded balance sheet projections.

Top panel<br>Federal Reserve Assets

A stacked line chart shows Federal Reserve assets, which in this expanded scenario peak in late 2009 at a level of approximately $\$ 3250$ billion and decline steadily until the end of 2016, where they are at a level of approximately $\$ 1500$ billion.

## Bottom panel

## Federal Reserve Liabilities and Capital

A stacked line chart shows Federal Reserve Liabilities and Capital, which follow the same pattern as the expanded scenario for assets.

## Exhibit 4

Growth Rates for Monetary Base

| Date | Baseline Per | Expanded Purchases cent, annual r | April Baseline re |

## Exhibit 5 <br> Projected Federal Reserve Net Income

This exhibit has six line charts to describe three projections ("baseline," "market based," and "high interest rate"), each over a date range from 2008 to 2016. The three left-hand panels present net income and total expenses, each in a different color. These items are stacked and sum to show gross income. The right-hand panels show remittance and dividends, transfers, etc. in different colors. These items are stacked and sum to show net income.

## Top-left panel

Baseline
In the baseline scenario, gross income is depicted to increase from its 2008 level of approximately $\$ 50$ billion to peak in 2010 at nearly $\$ 90$ billion and decline gradually through the end of the period to approximately $\$ 60$ billion.

## Top-right panel

## Baseline

Baseline net income is depicted to increase from its December 2008 level of approximately $\$ 40$ billion to peak in 2010 at approximately $\$ 80$ billion, decrease through 2013 to approximately $\$ 45$ billion, and then increase from 2014 through the end of the projection period to just over $\$ 50$ billion.

## Middle-left panel <br> Market based

In the market based scenario, gross income peaks in 2010 around $\$ 90$ billion and decreases gradually through the end of the period, ending at a level of approximately $\$ 70$ billion.

## Middle-right panel <br> Market based

Net income is depicted to peak in 2010 at approximately $\$ 70$ billion, decrease until 2012 to approximately $\$ 40$ billion and then increase through the end of the projection period to approximately $\$ 60$ billion.

## Bottom-left panel <br> High interest rate

In the high interest rate scenario, gross income peaks in 2010 at around $\$ 110$ billion and declines gradually through the end of the projection period to a level of about $\$ 80$ billion.

## Bottom-right panel <br> High interest rate

Net income is depicted declining sharply from approximately $\$ 45$ billion in 2009 to a level of approximately negative $\$ 5$ billion in 2011, then increasing gradually through the end of the period to about $\$ 50$ billion.

## Exhibit 6 <br> Projected Mark-to-Market Losses on the SOMA Portfolio

## Top panel

A line chart plots the same three scenarios that are used in Exhibit 5 from 2009 to 2016. The baseline scenario shows gains of as much as $\$ 50$ billion on the portfolio through 2013, and then losses increasing through 2016 to just over $\$ 50$ billion. In the market based scenario, losses increase from zero in 2009 to approximately $\$ 125$ billion in 2013, and remain at that level through 2016. The high interest rate scenario depicts losses in 2009 of about $\$ 100$ billion, increasing to a loss in 2011 of more than $\$ 250$ billion, and then decreasing to a loss of less than $\$ 200$ billion in 2016.

## Appendix 3: Materials used by Mr. English

## Material for FOMC Briefing on Possible Effects of Very High Reserve Balances on Bank Balance Sheets Bill English <br> June 23, 2009

Class II FOMC - Restricted (FR)

## Exhibit 1 <br> Reserve Balances and Regulatory Leverage Ratios

## Top-left panel <br> Reserve balances of depository institutions

Data plotted as curves. Reserve balances of depository institutions rises from about $\$ 40$ billion in 2008:Q3 to about $\$ 800$ billion in 2009:Q2. Thereafter, the data are projected. Under the Bluebook baseline scenario, reserve balances of depository institutions rise to a peak of about $\$ 1.7$ trillion in 2010:Q1 and then gradually decline, reaching about $\$ 1.4$ trillion in 2010:Q4. Under the Bluebook alternative scenario, reserve balances of depository institutions increase to a peak of about $\$ 2.1$ trillion in 2010:Q1 and then gradually decline, reaching about $\$ 1.8$ trillion in 2010:Q4.

Note. The data are quarterly averages in billions of dollars.
Source. Federal Reserve and staff estimates.

## Top-right panel <br> Regulatory leverage ratio

- Definition:
<br>( \frac\{Tier 1 capital\}\{Average total assets\} <br>)
- Ratio > 5.0 for a "well capitalized" bank

## Leverage Ratio Projections

## Middle-left panel

Projection assumptions

- Reserve balances expand in line with Bluebook scenarios
- Other assets unchanged
- Tier 1 capital declines

Middle-right panel
Baseline results

|  | Actual | Projected |
| :--- | :---: | :---: |
|  | 2009:Q1 | $2010:$ Q1 |

Note. Baseline scenario without any capital downstreamed to banks after 2009:Q1. All commercial banks with reserve balances.
Source. Call Reports and staff estimates.

## Bottom-left panel <br> Aggregate leverage ratio of commercial banks with reserve balances

Data plotted as curves. The aggregate leverage ratio of commercial banks with reserve balances moves in a narrow range around 7.5 percent between 1999:Q1 and 2009:Q1. Thereafter, the data are projected one year ahead, for the 2010:Q1 quarter. For the projection under the Bluebook baseline scenario, the aggregate leverage ratio of commercial banks with reserve balances is 6.99 percent in 2010:Q1. For the projection under the Bluebook alternative scenario, the aggregate leverage ratio of commercial banks with reserve balances is 6.83 percent in 2010:Q1. The projections are repeated under the assumption that all capital raised as a result of the SCAP is downstreamed to subsidiary banks. Under this assumption and for the projection under the Bluebook baseline scenario, the aggregate leverage ratio of commercial banks with reserve balances is 7.60 percent in 2010:Q1. Under this assumption and for the projection under the Bluebook alternative scenario, the aggregate leverage ratio of commercial banks with reserve balances is 7.43 percent in 2010:Q1.

Note. The data are quarterly in percent. A shaded bar indicates a period of business recession as defined by the National Bureau of Economic Research (NBER): March 2001-November 2001. A vertical line indicates the NBER Peak in December 2007.

Source. Call Reports and staff estimates.

## Bottom-right panel

## Other results

- Broadly similar results for BHCs
- Leverage ratios for some individual banks could fall to low levels relative to regulatory norms
- Individual institutions can take steps to reduce unwanted reserves

## Exhibit 2 <br> Qualitative Information and Policy Options

## Top panel <br> Information from consultations with Federal Reserve System staff

- Banking organizations have not expressed material concerns about their reserve balances
- Some banks have maintained high levels of reserve balances as a liquidity buffer
- Some banks have profited by exploiting the spread between the rate paid on excess reserves and the cost of borrowing
- Banks thought that they could reduce their reserve balances if they chose
- Banking organizations have not discussed with System staff the possible effects of increased systemwide reserves

## Bottom-left panel <br> Summary

- Depository institutions should not be significantly adversely affected by the anticipated levels of reserve balances
- No policy response appears necessary at this time
- Considerable uncertainty remains
- Staff will continue to monitor the impact on depository institutions

## Bottom-right panel

Policy options

- Option 1: Drain reserves
- Option 2: Exclude reserve balances from leverage ratio for all banking institutions
- Option 3: Exclude reserve balances from leverage ratio for selected banking institutions
- Option 4: Issue supervisory guidance

# Appendix 4: Materials used by Messrs. Clouse and Hilton 

Material for FOMC Briefing on Reserve Management Tools to Target a Higher Policy Rate Jim Clouse<br>Spence Hilton<br>June 23, 2009

Class I FOMC - Restricted-Controlled (FR)

## Exhibit 1

This exhibit contains three line charts that depict hypothetical demand and supply curves in the reserve market to illustrate the effects of various reserve management tools.

## Top panel <br> Reserve Market

The chart displays a hypothetical demand for reserves, with the funds rate on the vertical axis and reserve balances on the horizontal axis. The hypothetical demand curve asymptotes to the level of the rate paid on excess reserves--the so-called IOER rate--at high levels of reserve balances. A second demand curve on the same chart shows what the demand curve might have looked like in the last quarter of 2008. This demand curve drops below the level of the IOER rate at high levels of reserve balances. With this demand curve, a rapid expansion of reserve balances such as that late in 2008 would push the federal funds rate below the IOER rate.

## Middle panel

Demand Side Tools
The chart displays the effect of various tools that might be employed to keep the funds rate close to the target rate even with high levels of reserve balances. The tools described in this panel are those that strengthen or shape the demand curve including increases in reserve requirements, a system of voluntary requirements, payment of interest on balances held by the government sponsored enterprises (GSEs), and collateralized funds transactions. The chart shows that these tools would tend to shift the demand curve to the right, or flatten the demand curve at high levels of reserve balances, or both. With a fixed quantity of reserves, these tools should then put upward pressure on the funds rate.

## Bottom panel <br> Supply Side Tools

The chart displays the effects of various tools focused on the supply of reserves. These tools include reverse RPs, term deposits, issuance of so-called "Fed bills," an expanded supplementary finance program, asset sales, or reductions in liquidity programs. In the diagram, all of these tools would shift the supply of reserves to the left and so put upward pressure on the funds rate.

## Appendix 5: Materials used by Mr. Madigan

Material for Briefing on Staff Proposal Regarding Liquidity Facilities
Brian Madigan
June 23, 2009
Class I FOMC - Restricted Controlled (FR)

Staff Proposal for Extension of and Modifications to Various Liquidity Facilities
[Note: In the following table, the word "Yes" indicates a checkmark in the original document.]

13 Extend ${ }^{\text {II }}$ Near-term Modification
(3)

Depository institution facilities

| 1. Primary credit |  | NA | None | Increase spread, eliminate term loans |
| :---: | :---: | :---: | :---: | :---: |
| 2. TAF |  | $\begin{array}{ll} \mathrm{NA} & 1 . \\ & 2 . \end{array}$ | Reduce auction amounts to $\$ 125$ billion Optionally, raise minimum bid rate | One small monthly or quarterly auction |
| 3. Foreign currency swaps |  | Yes | None | Allow to expire on $2 / 1 / 10$, but study possible longer-term facility |
| Primary dealer facilities |  |  |  |  |
| 4. PDCF | Yes | Yes | Increase haircuts for most types of investment-grade and noninvestmentgrade collateral | Later this year, restrict collateral to investment-grade <br> Allow to expire on $2 / 1 / 10$ |
| 5. TSLF | Yes | $\begin{array}{ll} \text { Yes } & 1 . \\ & 2 . \\ & 3 . \end{array}$ | Suspend Schedule 1 auctions <br> Offer $\$ 75$ billion of Schedule 2 monthly Terminate TOP auctions | Allow to expire on 2/1/10 |

## Specific market and institution facilities

| 6. AMLF | Yes | Yes | Require that ABCP pledged as collateral <br> has been purchased from a money fund <br> experiencing material redemptions. | Allow to expire on 2/1/10 |
| :--- | :--- | :--- | :--- | :--- |

## Medium-Term Outlook

## Top panel

Factors Affecting GDP Forecast

- Inventory dynamics provide a lift in the second half of this year.
- Housing stabilizes and we expect construction to turn up next year.
- Risk premiums on corporate equity and debt decline further, contributing to gains in wealth and a lower cost of capital.

Top-right panel
Interpreting Recent Output and Unemployment Gaps

- Output and unemployment gaps typically provide similar signals.
- Possible explanations for recent discrepancy:
- GDP data understate contraction.
- Participation boosted by EUC, wealth decline, or other factors.
- Changes in NAIRU or other elements of potential.

## Middle-left panel

## Middle-right panel <br> Model Uncertainty and Resource Utilization

- Different methods imply different estimates of potential.
- Consider three methods:
- Staff estimate.
- Trend/cycle Phillips curve model.
- Estimated DSGE (EDO) model.

## Bottom panel

## Alternative Estimates of the Output Gap with Confidence Intervals

## Exhibit 5 <br> Risk II: Inflation Dynamics

Top-left panel
Expectations and Inflation

- Long-run inflation expectations have been reasonably well-anchored for some time.
- In our projection, this prevents a sharper deceleration in inflation.
- Un-mooring of expectations is a risk.

Top-right panel
Long-Term Inflation Expectations
Reuters/Michigan, next five to ten years

## Middle-left panel

## Resource Utilization and Inflation

- Inflation appears to be less sensitive to resource utilization than in the past.
- This reduced sensitivity contributed to our projection that inflation will decelerate by less than during similar earlier periods.
- If the effect of utilization on inflation were similar to that during the early 1980 s, we could see deflation.

## Bottom-left panel <br> Computers and Peripherals

A line chart shows two series, Shipments and Orders of computers and peripherals. Unit is billions of dollars, ratio scale. Shipments start at a level slightly under 9 billion dollars at the beginning of 2000 . From the end of 2000 to early 2003, the series steadily drops, to around 5.5 billion dollars in early 2003 , and after a brief rise, to just below 5 billion dollars in mid-2004. The series climbs, with a few sudden drops, reaching about 6 billion dollars at the beginning of 2006, before plummeting to around 4.5 billion at the end of 2006 . The series fluctuates between about 4.5 and 5.8 billion until early 2008, where it continues to drop steadily until the end of the series in May 2009, at a level of about 4.3 billion. The Orders series mostly follows the trajectory of the Shipments series. It begins at a level slightly above 8 billion dollars at the beginning of 2000. From the end of 2000 to early 2003, the series steadily drops, to around 5.5 billion dollars in early 2003 , and after a brief rise, to about 4.5 billion dollars in mid2004. The series fluctuates between about 4.8 and 5.3 billion dollars until the beginning of 2006, where it peaks slightly above 6 billion before plummeting to around 4.5 billion at the end of 2006 . The series fluctuates between about 4.5 and 5.8 billion until early 2008, where it continues to drop steadily until the end of the series in May 2009 , at a level of about 4.3 billion.

## Bottom-center panel

## Communications Equipment

A line chart shows two series, Shipments and Orders of communications equipment. Unit is billions of dollars, ratio scale. The Shipments series starts around 9 billion dollars in 2000, and climbs to around 10 billion in mid 2001 before falling to about 4.2 billion in early 2003. The series fluctuates between about 3.9 and 5 billion until hitting a high of about 5.8 billion in early 2006. The series continues to fluctuate, mostly exhibiting slight decreases until it falls from about 5.7 billion in early 2008 to under 4 billion by early 2009. The Orders series mostly follows the trajectory of the shipments series, but fluctuates much more wildly. It begins at a level of about 10 billion in early 2000, immediately falling to 8 billion and then rising to 14 billion, before falling again to 10 billion by early 2001. The series dips dramatically, to 6 billion by late-2001, under 4 billion in early 2002, and to just above 2 billion in late 2002. The series then fluctuates less dramatically, between about 3.8 and 6 billion, until early 2006 where it rises to about 6.5 billion, and fluctuates between about 5 and 6 billion before dipping to about 4 billion when the series ends in early 2009.

## Bottom-right panel

Other (non-high-tech, nontransportation)
A line chart shows two series, other Shipments and Orders. Unit is billions of dollars, ratio scale. Shipments starts at about 44 billion in early 2000, before steadily dropping to about 38 billion by early 2002 . The series rises to about 40 billion in late 2002, falls back to about 38 billion, and then steadily increases from early 2003, reaching about 52 billion in late 2006, and 54 billion at its peak in early 2008. The series then falls dramatically, first to 51 billion in mid-2008, and then again to about 44 billion by the beginning of 2009. The Orders series mostly follows the trajectory of the shipments series. It begins at a level slightly above 46 billion dollars in 2000, fluctuates between there and 42 billion in 2000, and then steadily drops to about 36 billion in early 2002. The series then
rises continuously, except a few small drops, hitting a peak of about 56 billion in mid-2006. After dropping to about 51 billion several months later, the series hits about 56 billion again in early 2008, before dropping dramatically to about 42 billion in early 2009 when the series ends.

## Bottom-left panel

## Real Adjusted Durable Goods Orders

A line chart shows one series, 3-month moving average. Unit is percent. The series starts at about -1.5 percent in early 2002, and fluctuates between its beginning level and 2 percent until late 2003, where it hits a peak of about 2.5 percent before plummeting to below -2 percent, quickly rising to about 1.5 percent, and then dipping again to about -2 percent in mid-2004. The series fluctuates with mostly upward movements until reaching about 2.3 percent in early 2005 , and then fluctuating between that level and 0 until mid 2006 , where the series falls to about 1.8 percent in early 2007, before rising to almost 1 percent, and falling again to about -1.2 percent in late 2007. The series continues to fluctuate between -1 and 1 percent until early 2008, where it abruptly falls to about -5.5 percent in late 2008. The three-month moving average moves back up to about 0.5 percent by May 2009.

Source: Calculated by FRB staff.

## Bottom-right panel

Inventory-Shipments Ratio at Durable Goods Manufacturers

A line chart shows one series, months' supply. The series starts at about 1.72 in 1996, before falling to about 1.51 in mid-1998. The series climbs to about 1.63 shortly after, before falling to about 1.49 in early 1999, and continues to hover around 1.5 until steadily rising from early 2000 and hitting a peak of about 1.65 in early 2001 . The series falls steadily, to about 1.45 in late 2002, quickly rises to 1.52 at the end of 2002, and then declines until reaching about 1.3 in early 2004. The series fluctuates between 1.3 and 1.4 until late 2006, where it begins climbing up, first hitting about 1.55 in early 2008, and then jumping to about 1.9 by May 2009.

Class I FOMC - Restricted Controlled (FR)

## April FOMC Statement

Information received since the Federal Open Market Committee met in March indicates that the economy has continued to contract, though the pace of contraction appears to be somewhat slower. Household spending has shown signs of stabilizing but remains constrained by ongoing job losses, lower housing wealth, and tight credit. Weak sales prospects and difficulties in obtaining credit have led businesses to cut back on inventories, fixed investment, and staffing. Although the economic outlook has improved modestly since the March meeting, partly reflecting some easing of financial market conditions, economic activity is likely to remain weak for a time. Nonetheless, the Committee continues to anticipate that policy actions to stabilize financial markets and institutions, fiscal and monetary stimulus, and market forces will contribute to a gradual resumption of sustainable economic growth in a context of price stability.

In light of increasing economic slack here and abroad, the Committee expects that inflation will remain subdued. Moreover, the Committee sees some risk that inflation could persist for a time below rates that best foster economic growth and price stability in the longer term.

In these circumstances, the Federal Reserve will employ all available tools to promote economic recovery and to preserve price stability. The Committee will maintain the target range for the federal funds rate at 0 to $1 / 4$ percent and anticipates that economic conditions are likely to warrant exceptionally low levels of the federal funds rate for an extended period. As previously announced, to provide support to mortgage lending and housing markets and to improve overall conditions in private credit markets, the Federal Reserve will purchase a total of up to $\$ 1.25$ trillion
of agency mortgage-backed securities and up to $\$ 200$ billion of agency debt by the end of the year. In addition, the Federal Reserve will buy up to $\$ 300$ billion of Treasury securities by autumn. The Committee will continue to evaluate the timing and overall amounts of its purchases of securities in light of the evolving economic outlook and conditions in financial markets. The Federal Reserve is facilitating the extension of credit to households and businesses and supporting the functioning of financial markets through a range of liquidity programs. The Committee will continue to carefully monitor the size and composition of the Federal Reserve's balance sheet in light of financial and economic developments.
[Note: In the June FOMC Statement Alternatives, strong emphasis (bold) indicates bold red underlined text in the original document.]

## June FOMC Statement -- Alternative A

Information received since the Federal Open Market Committee met in April suggests that the pace of economic contraction is slowing. Indicators of consumer and business sentiment have risen, and household expenditures have shown further signs of stabilizing; nonetheless, spending remains constrained by ongoing job losses, lower housing wealth, and tight credit. Businesses continue to cut back on fixed investment and staffing but are making progress in bringing inventory stocks into better alignment with sales. Although conditions in financial markets have generally improved, the Committee judges that further monetary policy stimulus is warranted to help ensure that the sharp rise in some longer-term interest rates over recent months does not undermine a recovery in overall economic activity.
Substantial resource slack is likely to persist here and abroad, and the Committee expects that inflation will remain subdued. Moreover, the Committee still sees some risk that inflation could persist for a time below rates that best foster economic growth and price stability in the longer term.
In these circumstances, the Federal Reserve is employing a wide array of tools to promote economic recovery and to preserve price stability. The Committee will maintain the target range for the federal funds rate at 0 to $1 / 4$ percent and anticipates that economic conditions are likely to warrant exceptionally low levels of the federal funds rate [for an extended period|at least through mid-2010]. To provide additional support to mortgage lending and housing markets and to facilitate further improvement in private credit market conditions, the Committee decided to increase the total amount of its large-scale securities purchases. The Committee now anticipates that over the course of this year the Federal Reserve will purchase up to $\$ 1.25$ trillion of agency mortgage-backed securities, up to $\$ 200$ billion of agency debt, and up to $\$ 750$ billion of Treasury securities. The Committee will evaluate the timing, composition, and amounts of any additional purchases of securities in view of market conditions, the evolving economic outlook, and the necessity of ensuring that policy accommodation can ultimately be withdrawn smoothly and at the appropriate time. The Federal Reserve will also be monitoring the size and composition of its balance sheet and will make adjustments to its credit and liquidity programs as warranted in light of financial and economic developments.

## June FOMC Statement -- Alternative B

Information received since the Federal Open Market Committee met in April suggests that the pace of economic contraction is slowing. Conditions in financial markets have generally improved in recent months, and indicators of consumer and business sentiment have risen. Household spending has shown further signs of stabilizing but remains constrained by ongoing job losses, lower housing wealth, and tight credit. Businesses are cutting back on fixed investment and staffing but appear to be making progress in bringing inventory stocks into better alignment with sales. Although economic activity is likely to remain weak for a time, the Committee continues to anticipate that policy actions to stabilize financial markets and institutions, fiscal and monetary stimulus, and market forces will contribute to a gradual resumption of sustainable economic growth in a context of price stability.
The prices of energy and other commodities have risen of late. However, substantial resource slack is likely to dampen cost pressures, and the Committee expects that inflation will remain subdued for some time.
In these circumstances, the Federal Reserve will employ all available tools to promote economic recovery and to preserve price stability. The Committee will maintain the target range for the federal funds rate at 0 to $1 / 4$ percent and continues to anticipate that economic conditions are likely to warrant exceptionally low levels of the federal funds rate for an extended period. As previously announced, to provide support to mortgage lending and housing markets and to improve overall conditions in private credit markets, the Federal Reserve will purchase a total of up to $\$ 1.25$ trillion of agency mortgage-backed securities and up to $\$ 200$ billion of agency debt by the end of the year. In addition, the Federal Reserve will buy up to $\$ 300$ billion of Treasury securities by autumn. The Committee will continue to evaluate the timing and overall amounts of its purchases of securities in light of the evolving economic outlook and conditions in financial markets. The Federal Reserve is monitoring the size and composition of its balance sheet and will make adjustments to its credit and liquidity programs as
warranted. [Of course, the Committee will continue to take careful account of the necessity of ensuring that policy accommodation can ultimately be withdrawn smoothly and at the appropriate time.]

## June FOMC Statement -- Alternative C

Information received since the Federal Open Market Committee met in April suggests that the pace of economic contraction is slowing. Conditions in financial markets have improved in recent months, and indicators of consumer and business sentiment have risen. Household spending has shown further signs of stabilizing but remains constrained by ongoing job losses, lower housing wealth, and tight credit. Businesses have continued to cut back on fixed investment and staffing but appear to be making progress in bringing inventory stocks into better alignment with sales. The Committee anticipates that policy actions to stabilize financial markets and institutions, fiscal and monetary stimulus, and market forces will contribute to a gradual recovery in economic activity that is expected to begin later this year.
Although the prices of energy and other commodities have risen of late, core inflation has remained moderate, and the Committee expects that overall inflation will remain subdued.
In these circumstances, the Federal Reserve is employing a wide array of tools to promote economic recovery and to preserve price stability. The Committee will maintain the target range for the federal funds rate at 0 to $1 / 4$ percent and anticipates that economic conditions are likely to warrant exceptionally low levels of the federal funds rate until late this year. As previously announced, to provide support to mortgage lending and housing markets and to improve overall conditions in private credit markets, the Federal Reserve will purchase a total of up to $\$ 1.25$ trillion of agency mortgage-backed securities and up to $\$ 200$ billion of agency debt by the end of the year. In addition, the Federal Reserve will buy up to $\$ 300$ billion of Treasury securities by autumn. The Committee anticipates that the pace of purchases of such securities will taper off gradually by the end of this year. The Committee will continue to evaluate the timing, composition, and overall amounts of its securities purchases and to carefully monitor the Federal Reserve's balance sheet. The Federal Reserve will make adjustments to its credit and liquidity programs as warranted in light of the evolving economic outlook and conditions in financial markets.
