## DOMESTIC NONFINANCIAL ECONOMY

## Retail Sales and Inventories

Total retail sales edged down in August after little change in July. Sales in the control category ${ }^{1}$ were flat in August; the control figure was revised up slightly for June to 0.9 percent, but was unrevised for July at 0.2 percent. On balance, the August level of nominal spending for the retail control was about $1-1 / 4$ percent above the second-quarter average.

The weakest category in August sales was the automotive group, which posted a decline of 1.8 percent, in part reflecting the decline in unit sales of automobiles from 10.8 million units in July to an estimated 10.3 million units in August at an annual rate (BEA basis). In addition, furniture and appliance stores posted a large decline in sales for a second month, after strong gains earlier this year. Sales at nondurable goods establishments were generally lackluster.

On a current-cost basis, retail inventories fell $\$ 2.1$ billion at an annual rate in July after a $\$ 22.8$ billion accumulation in the second quarter. The July decline was almost entirely in auto dealers' stocks; the current market value of nonauto retail inventories was little changed. Most types of retail establishments reported small inventory changes in July. For stores in the G.A.F. grouping, inventory

[^2]accumulation slowed to just under $\$ 1$ billion at an annual rate, compared with increases of $\$ 4.5$ billion in the second quarter and nearly \$8 billion in the first quarter. On the whole, the inventory-sales ratios for stores in this broad category have edged down somewhat in recent months.

For all manufacturing and trade, the current market value of inventories rose $\$ 26.5$ billion at an annual rate in July, about half the pace seen in the second quarter. The overall inventory-sales ratio for manufacturing and trade, at 1.50 months in July, was unchanged from June but notably below the 1.53 average around the turn of the year.

INTERNATIONAL DEVELOPMENTS

## U.S. Kerchandise Trade Through July

In July, the seasonally adjusted U.S. merchandise trade deficit was substantially smaller than the deficit recorded for June and was the lowest monthly deficit recorded since March 1985. At an annual rate, the July deficit was $\$ 110$ billion, well below the $\$ 120$ billion annual rate deficit recorded in the second quarter (column 7 in the table that follows). Month-to-month changes in the trade deficit are volatile; nonetheless, the July figures appear to be part of a steady improving trend that emerged at the beginning of the year.

Virtually all of the improvement in the trade deficit in July was due to a reduction in imports. Imports, which had risen strongly in June, declined even more in July to a rate last recorded in the third quarter of 1987 (column 4 in the table). Oil imports declined slightly in July with the volume easing a bit and the price of imports dropping by about $\$ 0.45$ per barrel from June levels. Imports of other industrial supplies decreased in July from the stronger levels recorded in May and June, and were less than the average for either the first or second quarters (by 2 to 5 percent); the July decline was partly in chemicals and partly in various metals. Imports of capital goods in July declined 10 percent from an unusually strong June level, returning to the average rate recorded in each of the preceding four months (and the average of the first quarter). Deliveries of large jets to U.S. customers declined from a high level in June. The decline in imports of machinery was spread over a broad range of categories. Imports of semiconductors in

July were an exception, being only marginally less than the strong June rate; steady increases throughout the year have raised the value of these imports 15 percent between January and July. Imports of automotive products from Canada dropped sharply in July (these shipments are subject to sharp seasonal swings in July and August). While imports of automotive products from the rest of the world increased somewhat in July, the rate of imports during the last four months was less than during the first quarter. Imports of consumer goods dropped sharply in July to a level that was about 3 to 4 percent below the average for both the first and second quarters. Nearly half of the decline was in apparel and in footwear, which did not rise as strongly this July as in previous Julys; the seasonal factor for apparel peaks in July, jumping to the 125 to 200 range for various items.

The value of exports in July was lower than the June rate, and somewhat under the average for the second quarter (column 1 in the table). There were increases in the value of agricultural exports in July; higher exports of soybeans and corn were only partly offset by declines in wheat and cotton exports. While a 5 percent increase in exports of capital goods in July was from a relatively low June level, the amount of exports in July was higher than the averages for either the first or second quarters (by 2 to 5 percent); about one-fourth of the increase in July was in exports of computers. Exports of industrial supplies were as strong in July as they were in June (which was about 4 percent above the average in the first quarter). Exports of consumer goods in July were as high as in May and June (and about 15 percent
above the first-quarter rate). Exports of automotive products declined sharply in July to the lowest level recorded since last July (reflecting strong seasonal movements only imperfectly captured in seasonal factors).
U. S. Merchandise Trade

Billions of Dollars, Seasonally Adjusted Annual Rates

Note: Monthly data on a Balance-of-Payments Basis are estimates; and are for Official Use Oniy.

[^0]:    ${ }^{1}$ In some cases, original copies needed to be photocopied before being scanned into electronic format. All scanned images were deskewed (to remove the effects of printer- and scanner-introduced tilting) and lightly cleaned (to remove dark spots caused by staple holes, hole punches, and other blemishes caused after initial printing).
    ${ }^{2}$ A two-step process was used. An advanced optimal character recognition computer program (OCR) first created electronic text from the document image. Where the OCR results were inconclusive, staff checked and corrected the text as necessary. Please note that the numbers and text in charts and tables were not reliably recognized by the OCR process and were not checked or corrected by staff.
