Workbook (35 problems)
Text on the mechanics of expansion and contraction of bank credit. It deals with 2 problems: (1) problems to demonstrate the expansion of credit in a single-bank economy, multiple-bank economy, and a banking system with a central bank. (Using the balance sheet approach.) (2) problems dealing with the factors actually determining bank reserves in the U.S., the effects of government borrowing from the banks, the relationship between the banking system, interest rates, economic activity, and related items.

Emphasis is on the role of banking in the economy, rather than on monetary theory.

The banking process from the point of view of the individual bank is explained as is the relationship of the individual bank to the whole banking system. Processes by which bank deposits increase and decrease are given emphasis. A chapter is devoted to explanation of factors which determine the reserve balances of banks and the theory of bank reserves. Although

emphasis is placed on banking, monetary theory and US Treasury operations are given adequate treatment
