Angell, James W.

The components of the circular velocity of money. (In: Quar. Jr. of Economics Feb. 1937, p. 224-271)

It seems unlikely that the most comprehensive and useful explanations of absolute changes in the stock of money are those which run in terms of the propensity to consume, liquidity preferences or similar factors.

Considers the question as to whether changes in bank deposits are the result of changes in bank cash or whether changes in bank cash are the result of changes in bank deposits. Concludes that the former is true and that inasmuch as the Bank of England has power to affect changes in the volume of bank cash, it therefore has power to control the volume of bank deposits. An analysis of the extent to which a bank may increase its loans as the result of a given increase in its reserves, borrowed from a Federal Reserve bank. Contrary to the opinion of Prof. Phillips on the same subject, the conclusion is reached that loans may be increased to a considerable extent in excess of borrowed reserves so that increases in the discount rates of Reserve Banks can have little effect in restricting credit extended by member banks. Abstract by W. O. Weyforth, AMERICAN ECONOMIC REVIEW, XVII, Dec. 1928, p. 804.

REVIEW, XXIII, June 1933.

Neiswanger, W. A.

The expansion of bank credit. (In: The American Economic Review, June 1933, pp.245-263)

The expansion of demand deposits upon cash should be somewhere between 5 to 1 and 3.5 to 1. Actually, banks which successfully weathered the economic storm never permitted their ratio to exceed 3.6 to 1, until "hard times" forced the ratios up to between 4.5 and 5 to 1.

Circular-flow analysis of money and credit creation by banks, SCHWEIZERISCHE ZEITSCHRIFT FÜR VOLKSWIRTSCHAFT UND STATISTIK, Vol. 91, no. 2, June, 1955, pp. 198-215.

In dynamic economics, money-flow analysis must supplement price analysis. It is here attempted to include the creation of demand deposits by commercial banks into the examination of circular flow. It will be shown under what circumstances the extension of credit is to be considered as the creation of money or of credit, and what significance the distinction between the two has. Creation of credit occurs when banks, in extending credit, make available more money than they received as deposits backed by real values. This can be accomplished through the creation of new demand

deposits, through the mobilization of existing cash hoarded or previously withdrawn from circulation, or through the utilization of 'empty' deposits which are not backed by real values. Money can be created independently from credit creation. Credit creation is only one of the methods by which the amount of money can be increased.
