More on the multiplier effects of a balanced budget, AMERICAN ECONOMIC REVIEW, vol. 45, March 1955.

Argument that an increase in govt. expenditures on goods and services matched by an equal use in taxes, will tend to result in a rise in natl. income equal to the tax-expenditure change, is likely to be misleading in 2 respects.

(1) the argument will be seen to apply equally well to all multiplier analysis, but it seems that the misunderstanding has been greatest in the balanced budget case. Several well-known provisos attached to the argument of Wallich.

Income might sometimes even be reduced. Case of a general sales tax. Assumptions on the nature of the tax structure and on the nature of governmental expenditures. "Leakages" in governmental tax-expenditure program.
