MILLS, F. C.

"An hypothesis concerning the duration of business cycles," JOURNAL OF THE AMERICAN STATISTICAL ASSOCIATION,

December, 1926.

Pp. 11.

Finds statistical support for the hypothesis that the length of the cycle decreases as a country passes from the early stages of industrialization, and then increases again as the rate of economic transition falls off.

The increase of statistical data, the improvement of statistical technique, and the endowment of social research are enabling a larger use of quantitative analysis. Because of the difference between the conception of nature borrowed by qualitative theory from Newtonian mechanics and the statistical conception of nature quantitative theorists usually find it necessary to formulate problems in a way different from that adopted by qualitative theorists, making the treatment of behavior more objective, emphasizing the importance of institutions, and promoting the development of an experimental technique. Abstract by M. A. Copeland, AMERICAN ECONOMIC REVIEW, XV, June 1925, p. 377.
