appendix, pp. 176-89.

PERSONS, Warren M.

"Fisher's formula for index numbers,"  
REVIEW OF ECONOMIC STATISTICS,  
May, 1921.

Pp. 11.

---

Fisher's formula is 'the best' measure of general exchange value if we desire to compare two years only, and not a series of years each with the other; his correlative formulas for prices, and quantities are 'the best' only if we are interested in the same quantities in both cases ... The geometric average with constant weights (or weights changed only occasionally) appears to be 'ideally' better than Fisher's formula if we desire to compare a series of years each with the other. In addition, the geometric average has the practical advantage that fewer data and half the labor are required for its computation. The accuracy of the geometric mean combined with relative ease in calculation make it superior for most purposes to Fisher's index.

years," JOURNAL OF THE AMERICAN STATISTICAL ASSOCIATION,  
September, 1924.**

SNYDER, Carl

A new index of general price level, JOURNAL OF  
THE AMERICAN STATISTICAL ASSOCIATION,

June, 1924.

Pp. 7.

---

His general price level index is a composite of wholesale commodity prices, wages, cost of living and rents. Its accuracy is checked by dividing it into the estimated total of checks against bank deposits (the latter as a measure of payments of all kinds in exchange of goods, property and services) and comparing the result (being thus an estimate of total quantity of trade) with two measures of trade activity recently calculated by the author. Professor Fisher will be interested in the acceptance of his factor-reversal test implied in this procedure. Abstract by B.D. Mudgett, AMERICAN ECONOMIC REVIEW, XIV, Dec. 1924, p. 596.

June, 1924.

SNYDER, Carl

A new index of business activity, JOURNAL OF  
THE AMERICAN STATISTICAL ASSOCIATION,

March, 1924.

Pp. 6.

---

To test the accuracy of the new index of volume of trade published by the N.Y. Federal Reserve Bank, Mr. Snyder has prepared this index of the rate of turnover of bank deposits. The two curves show a close correspondence and seem to substantiate his former conclusion that the variations in business activity are probably not more than 5% above or below normal, Abstract by B. D. Mudgett, AMERICAN ECONOMIC REVIEW, XIV, June 1924, p. 401.

SNYDER, Carl.

A new index of the volume of trade, JOURNAL OF THE  
AMERICAN STATISTICAL ASSOCIATION,

December, 1923.

Pp. 15.

---

A trade index 1919 to Dec. 1923 constructed from 28 series now available for measuring business activity. Group indexes are constructed for (1) productive activity, (2) primary distribution, (3) distribution to consumers, (4) general business activity, and (5) financial activity; and finally a weighted composite of all. General explanations are given of methods of measuring trend and Seasonal and, where necessary, of allowing for influence of price changes. A full account of methods of computation with complete data is promised later. Abstract by

Bruce D. Mudgett, AMERICAN ECONOMIC REVIEW, XIV,  
June, 1924, p. 400.

JOURNAL OF THE AMERICAN STATISTICAL ASSOCIATION,  
June, 1924.

Pp. 11.

---

A history of the efforts of the Federal Reserve Board to develop better banking and other statistics. An 'inside' view (since the author assisted in a major portion of this effort) which gives in some detail the obstacles met and the frequent discouragements. It is unfortunate that the author persists in the notion that the 'conflict' between the gatherers of better statistics and the mathematical analysis cannot be resolved. Abstract by Bruce D. Mudgett, AMERICAN ECONOMIC REVIEW, XIV, Dec. 1924, pp. 596-7.

WORKING, Holbrook

"Prices and the Quantity of Circulating Medium, 1890-1921," QUARTERLY JOURNAL OF ECONOMICS,  
Feb. 1923, 28 pp.

---

An interesting, although not entirely convincing, attempt to establish a method of forecasting changes in the general price level through the use of the "equation of exchange." Author claims feasonable suceess for the period of 1890-1916. Extraneous factors apparently vitiate the method during the period of the war. Results are held as a final and conclusive proof of the validity of the arguments for the quantity theory of money.
