## OUTLOOK FOR BANK RESERVES AND TREASURY FINANC ING

Estimated changes in bank reserves, in Reserve Bank holdings of Government securities, and in Treasury deposits for the rest of this fiscal year are presented by weeks through March and by months in the attached tables.

In addition, alternate estimates of Treasury cash transactions and balances are shown by quarters for the fiscal year 1950 in separate tables assuming (I) a low level of budget expenditures, 45 billion dollars, and (II) a high level of budget expenditures, 52 billion dollars.

The estimates for the fiscal year 1949 are based on the following principal assumptions:
(1) Except for the expected retirement of 400 million dollars of bills in December, no provision is made for cash retirements or Treasury purchases of Government securities other than the voluntary redemptions of maturing issues.
(2) Treasury deposits with Federal Reserve Banks will be maintained at a relatively stable level so as to neutralize the effect of Treasury transactions on bank reserves, except in months of large tax receipts .' (Mar., June, Sept.) when balances are permitted to decline in the firbt half and to rise in the second half of the month.
(3) Bank loans show a moderate further expansion.
(4) No Reserve Bank purchases from nonbank investors are assumed. Actually, resumption of net sales by nonbank investors (whether to the Federal Reserve or to cormercial banks) may be expected, although in considerably smaller volume than in the past, unless a recession occurs sooner than expected.
(5) Purchases or sales of Government securities between Reserve Banks and commercial banks will be such as to provide banks with reserves needed or to absorb all excess reserves.

Estimates for the first quarter of 1949 are subject to a particularly wide margin of error because of the uncertainty as to final individual income tax payments which contain all adjustments for over- or under-estimates of taxes in 1948, and also as to the corporate tax liability on 1948 incomes, the first instalment of which is due in March. Figures for later periods are also subject to possible wide variations in both income and expenditures.

On the basis of the above assumptions Treasury operations will supply additional resomyes during the early parts of January and March, and drain reserves during the latter parts of those months. The holiday currency outflow and Treasury calls for retirement of bills will absorb reserve funds in December,
and banks may need to sell substantial amounts of securities to the Federal Reserve to maintain their reserve positions.

Early in January the return flow of currency and some decrease in Treasury balances at the Reserve Banks will supply banks with a substantial amount of funds and enable them to purchase securities from the System, but this situation will be sharply reversed in the latter part of the month.

On balance turing the first quarter of 1949, the banks will have a small amount of reserve funds which they can use to pur chase securities from the Federal Reserve or to expand other credit. The Treasury could easily offset this increase by making additional calls on war loan accounts, and using the proceeds to retire securities held by the Federal Reserve. The total of Treasury balances (including a billion dollars of free gold) will probably increase from 4.1 billion at the end of December to 7.3 billion at the end of March, and then decline to $5.1 / \mathrm{at}$ the end of May. Two billion dollars or more of these funds could be used to retire debt without unduly reducing the Treasury's cash balance during this fiscal year, although it might necessitate some borrowing during the following October - December quarter.

## Fiscal year 1950

In the last six months of calendar year 1949 the Treasury will have a substantial cash deficit even on the basis of the low estimate of expenditures. Its cash balances will be reduced by about 2 billion dollars in this period, and most of this reduction will come in the last quarter. As a result, if a substantial amount of funds were used for debt retirement in the first half of the calendar year, the Treasury might have difficulty in meeting the deficit in the last half of the year without drawing its balances to too low a level. An increase in corporate taxes on 1949 incomes would not solve this problem, as the taxes would not be payable until 1950. The Treasury, however, could borrow in the market or it could hold back on debt retirement sufficiently in the first half of the year to keep enough funds to meet its last quarter obligations.

In the first quarter of 1950 there would be the usual seasonal surplus. For the fiscal year as a whole, on the basis of the lower estimate of expenditures, the cash surplus would be about a bi\$lion dollars compared with about 3 billions in fiscal year 1949 and 9 billions in fiscal year 1948. On the basis of the very large estimate of expenditures, indicated in Projection II, there would be a cash deficit of nearly 4 billions for the entire fiscal year. A substantial increase in taxes would be needed to eliminate this deficit.
