## Office Correspondence

To $\qquad$ Chairman Eccles $\qquad$
From_ Richard A. Nusgrave R que Alfred S. Sherrard

The attached table shows present and reduced income tax liabilities for selected levels of net income resulting from various methods of tex reduction, as follows:

Knutson: Flat reduction in present liability by 20 per cent for first 250,000 dollars of tax liability and 10 per cent thereafter.

Plan A: Reduction in first bracket rate from 20 per cent to 12 per cent without change in exemptions.

Plan B: Increase in present exemptions of 500 dollars per person to 750 dollars, without rate changes.

Plan C: Credit of 50 dollars per exemption against tex liability under present exemptions and rates.

Allen: Graduated reduction in liability ranging from 20 per cent for taxable incomes up to $\$ 2,500$ to 10 per cent for incomes over $\$ 10,000$.

With the exception of the Allen plan, each proposal would reduce income tax yield by approximately 3.5 billion from the estimated level under present law of 18 billion. Allan estimates his plan to cost about 2.8 billion, but this seems on the low side.

The Knutson, Allen and A plans would leave the number of taxpayers unchanged, while plans $B$ and $C$ would result in some reduction.

Estimated Number of Returns
(in millions of dollars)

|  | Taxable | NonTaxable | Total |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 37 |  | 11 | 48 |
| Present Law | 37 |  | 11 | 48 |
| Knutson | 37 |  | 11 | 48 |
| Plan A | 37 |  | 11 | 48 |
| Plan B | 26 |  | 18 | 44 |
| Plan C | 26 |  | 22 | 48 |
| Allen | 37 | 11 | 48 |  |

Under plan B where there would be a reduction in filing requirements, total returns as well as taxable returns would be reduced although nontaxable returns would show some increase. Under plan C where an increase in filing requirements would not be feasible, taxable returns only would be cut.

With respect to the distribution of tax relief by income groups, the table shows that the Knutson plan is by far the most favorable to high income recipients. The Allen plan is the same for low net incomes, but thereafter the reduction is less. On the whole, the Allan plan still emphasizes reductions in the upper income groups. Plans A, B and C are rather similar as far as distribution is concerned, reductions in all cases being most significant in the low income groups and negligible for large incomes. Because of the greater reduction in the number of returns and for administrative reasons, plan B appears preferable.

Attechment
