FOR RELEASE 3:00 P.M., CST, APRIL 17, 1952

ADDRESS OF

H. EARL COOK

DIRECTOR, FEDERAL DEPOSIT INSURANCE CORPORATION

Before the

ANNUAL CONVENTION OF THE AMERICAN INDUSTRIAL BANKERS ASSOCIATION

Biloxi, Mississippi

April 17, 1952

ADDRESS OF H. EARL COOK, DIRECTOR, FEDERAL DEPOSIT INSURANCE CORPORATION, BEFORE THE ANNUAL CONVENTION OF THE AMERICAN INDUSTRIAL BANKERS ASSOCIATION.

Biloxi, Mississippi

April 17, 1952

"FEDERAL DEPOSIT INSURANCE CORPORATION AND THE INSURED BANKS"

I am honored, indeed, by this invitation to address the American Industrial Bankers Association. We of Federal Deposit Insurance Corporation were privileged, in February, to have a representative group of your membership visit with us in Washington. Mr. Finley, Mr. Hall, Mr. Mayer, Mr. Yeager, Mr. Campbell, Mr. Rock, Mr. Francis and, of course, the genial Myron Bone spent a busy day telling us of your problems and listening to ours. We of the Corporation profited greatly from this discussion.

What we told your representatives on that occasion is substantially what I am going to tell the entire group today. It is, essentially, a story of what we find in insured banks, what we recommend as courses of action for insured banks, and what we are doing to protect depositors.

There are several ways by which one might approach the subject "Federal Deposit Insurance Corporation and the Insured Banks". To avoid getting lost in its intricacies, I have decided to group my remarks about three main aspects of deposit insurance: (1) the scope of its objectives; (2) its effects upon banks and bank depositors; and (3) the influence it has exerted upon the character and structure of our banking system.

(1) SCOPE OF DEPOSIT INSURANCE. The scope of deposit insurance was recently defined in the Corporation's response to one of the questions asked by the Patman Subcommittee on General Credit Control and Debt Management of the Joint Committee on the Economic Report. There we state that "the principal

purposes of Federal Deposit Insurance are to protect depositors, to maintain the confidence of depositors in banks, to raise standards of bank management, increase the soundness of the banking system, and to aid in protecting the circulating medium."

This contemporary statement of the purposes of deposit insurance seems to agree on the whole with its original purposes. Federal deposit insurance had been proposed in Congressional legislation as far back as 1886. It was not until the crisis of 1932-1933, however, that it captured the popular support necessary to make it a reality. It is difficult to recapture all the drama, zeal and doubt that coalesced in the first Federal Deposit Insurance Act of 1933. Depositors at that time were losing not only their money but also their confidence in banks.

Banks were failing on all sides, and the shortage of money was causing widespread stress. Few people stopped to analyze their troubles or tried to determine their basic cause. However, such arguments as were advanced in support of deposit insurance before Congressional Committees and elsewhere in those formative days indicate that there has been consistent concern with the same general objectives.

(a) Limitation of Coverage. One of the most vexing problems of deposit insurance has concerned the proper extent of depositor protection. At first only deposits up to \$2,500 were fully protected; for most of the period under which the plan has operated maximum protection was \$5,000 for each depositor; since September 21, 1950 the upper limit of complete protection has been \$10,000. Beyond this, there have been suggestions that all deposits in insured banks should be fully protected.

Several considerations have prompted the restriction of complete protection to small depositors. Since \$10,000 today is roughly the equivalent of \$5,000 in 1934, this principle of protection directed primarily to small depositors has been a consistent objective. We believe it is the small depositor who most needs

protection. According to a survey we made last September, 110 million accounts in insured banks are fully protected. This amounts to 98.5 percent of all deposit accounts in insured banks. We believe that there would be few advantages in providing complete coverage.

There are also some positive benefits to be derived from limited protection. The Corporation is mindful that the presence of uninsured deposits is a disciplinary influence upon bank management, injecting an element of caution that promotes the soundness of the banks and the safety of deposits. Limited protection also takes account of one of the facts of life, namely, that institutions, like individuals, have limited capacities. Though the Corporation has a fund of over \$1 billion, an amount which is adequate for any probable need based on experience, it nevertheless is aware that a wave of adverse conditions could quickly exhaust its

Pesources. It is only elementary prudence that the Corporation's liability should be limited to a level within its proximate capacity.

(b) Protection of Money Supply. The assurance of an adequate money supply, increasing in accordance with the growth of production and the needs of trade, is one of our major economic objectives. It is this objective which is behind the thinking of those who counsel full coverage, and it is one for which the Corporation has complete sympathy. However, the experience of the past 18 years has shown that it is a collateral advantage which can be secured without committing the Corporation to measures which may subvert its main objective of protecting depositors. One effect of restricting insurance to deposits of \$10,000 and less is thus to deny maximum protection to the money supply so that depositors may be better protected.

As it is, 5h percent of total deposits in insured banks are now a guaranteed of our money supply. The proportion passed the half-way mark for the first time when coverage was raised to \$10,000. By any standard, this is a substantial assurance of monetary stability. The relative stability of deposits of small

depositors — now insured — and of large uninsured deposits, mostly held by businesses, has long been a debatable point. It is quite possible that deposit insurance protects the kind of deposits which, from the standpoint of maintaining the money supply, least need protection. However, the gravity of this gap in protection is moderated by the fact that large, uninsured deposits are ordinarily placed in banks whose failure is almost unthinkable. By that, I mean that large depositors usually make a searching study of the condition of banks to which they entrust deposits in amounts exceeding the \$10,000 guarantee. To the extent that they are successful in their selections, the economy can well forego the insurance of this segment of deposits.

Bank deposits are the main element of our money supply, and the Federal Deposit Insurance Corporation recognizes its responsibility to protect their jor segment. At the same time, it recognizes that the primary responsibility for the money supply lies elsewhere, not only in respect to broad policies which determine the amount of money but also insofar as the stability of uninsured deposits depends upon the soundness and proper supervision of the banks which hold them.

(c) Insurance Against Defalcations -- An Unexpected Role. One of the major risks which has enlisted the protection of deposit insurance was dimly if at all foreseen by the architects of the Federal Deposit Insurance Corporation. Almost nothing was said in those early days of the infidelity of employees as a cause of bank failure. Instead, attention was focused on the perverse operation of the economic system, the defective capital and asset structure of banks, and the behavior of depositors under pressure of panic conditions.

The magnitude of this error in expectation may be shown by a simple statistic.

On the beginning of Federal deposit insurance to the end of 1951, 106 insured banks closed their doors because of defalcations. These closings due to employee infidelit;

comprise over a fourth of all collapses of insured banks since 1934. Even more disquieting is the accelerating importance of this source of bank difficulty. During the nine years ending with 1951, 21 of the 27 banks which required the financial assistance of the Corporation were forced into difficulties directly because of defalcations, and subsequent examination revealed defalcations in some of the others. It is obvious that, like any other business group, banks have not escaped the moral laxity which has afflicted our national life and is even now the subject of widespread concern.

The rise of defalcations as the greatest single cause of bank failure has grave implications for deposit insurance. It has required the diversion of resources which were intended for other purposes. More than that, it has revealed the inadequacy of resources which banks themselves had provided against such loss.

106 cases mentioned above involved defalcations of almost \$15\$ million; fidelity bonds held by the banks and designed to protect them from this loss were less than in million. The Federal Deposit Insurance Corporation had to put up most of the difference, some of which it has recovered, or will. However, none of this outlay would have been required had the original purposes of deposit insurance been operative.

ed conditions. In the case of defalcations it doubly protects banks by insuring them, as it were, against themselves. Protection against defalcations is not, however, a function of deposit insurance that merits cultivation. Banks have the responsibility to protect themselves against loss from infidelity; this they can do by purchasing fidelity bonds, tightening internal controls, providing regular audits, and similar measures. The essence of preventive measures against defalcations goes even beyond these disciplinary operations to bank-sponsored measures to promote the self-respect and well-being of their employees. In the final analysis, contented

employees are the best safeguard against wrong-doing.

- (2) EFFECTS OF DEPOSIT INSURANCE. Turning now from the purposes of deposit insurance to its effects, we may consider briefly its impact upon bank depositors and the banks themselves. Since we have already mentioned some of its effects on depositors, only a supplementary comment or two is necessary here.
- (a) Effect on Depositors. In the period since the Federal Deposit
 Insurance Corporation started operations over 1,350,000 depositors have faced
 possible loss due to difficulties in insured banks. However, because of deposit
 insurance, fewer than 50,000 sustained any loss, their total loss amounting to less
 than \$2 million. In contrast, during the 70 years before deposit insurance, losses
 to depositors totaled about \$3,500 million. In terms of average annual rates,
 losses to insured depositors since the Federal Deposit Insurance Corporation entered

 picture in 1934 have been less than 1 percent of what depositors lost in the 70
 previous years. These depositors have been paid off promptly, or have been credited
 with deposits in another bank, depending upon the method of protection used in the
 given situation. This prompt handling of depositors! claims has gained for the
 Federal Deposit Insurance Corporation a position of such respect and confidence that
 virtually no one worries today about the safety of his bank deposit.

Since our whole banking structure is built upon depositor confidence, the significance of this revolution in attitude since the dark days of 1933 can hardly be exaggerated. Indeed, we have done almost too well, for the popular attitude now is that all bank deposits are insured. Perhaps you have heard reports, as we have, of depositors who have been rudely awakened to the fact that not all deposits are insured. We have now a new kind of danger — over-confidence. Depositors may become too complacent about the safety of their deposits, and neglect, to inform or concern themselves about the measures necessary to continue deposit insurance along the paths which have proved so effective. In addition to this, the risk of loss is

an immediate reality facing depositors in the 1,000 or so banks which still remain outside the fold. Depositors' losses, from whatever source or reason, cast suspicion upon the institution which is supposed in the popular mind to have banished such losses from our economic system.

(b) Effect on Banks. The revival of depositor confidence has its corollary in the rejuvenation of the banking system. Early fears that insurance would encourage reckless and irresponsible banking practices soon proved unwarranted. Instead, the quality of bank assets steadily improved under the joint stimulus of rigorous examination standards and the upward trend of economic conditions. In like manner there has been a steady growth in the amount of deposits, except for the leveling-off of the powtwar years, as deposits were freed from the erratic fluctuations of depositors' confidence. The attitude of depositors is not, of course, the only factor in determining the money supply; the hard realities of reserves, interest rates, and other forces also have their effect. But the climate of confidence provides a framework without which all of the other factors working together would have been powerless.

Bankers themselves would probably say, however, that they have felt the influence of the Federal Deposit Insurance Corporation in much less subtle fashion. They have been much more conscious of bank examinations and other supervisory actions. In the course of examining its risk, the Corporation has taken advantage of the opportunity to impress upon bankers the precepts of sound banking, as it understands them, and to demonstrate in practical ways some of the proven techniques which make for greater efficiency in bank operations. The Corporation has also contributed to sounder banking, albeit reluctantly, by losing many of its best examiners to banks; our regrets on this score are moderated, however, by the belief that our loss is still to our advantage, paradoxical as that may sound.

The number of banks has changed very little since the beginning of Federal

deposit insurance, the main reason being the sharp decline in bank failures. Since the Corporation began operations in 1934, 418 insured banks have required its assistance. During an equal period before its organization over 15,000 banks failed, more banks than are now in existence.

Along with the decline in the number of bank failures, the decrease in the number of new banks has contributed to stability in their number. Through its power to grant or withhold deposit insurance, the Corporation exerts a strong influence on the chartering of new banks, for the chartering authorities give considerable weight to a prospective bank's ability to qualify for deposit insurance. The requirements which a newly insured bank must meet are specified by statute, and are designed primarily to assure that the bank fulfills a local need and that it has good prospects of standing on its own feet in the competitive situation that it

The Corporation is sometimes criticized for its adherence to high standards in the granting of deposit insurance, and its alleged promotion of local monopolies. Let me reiterate, therefore, that we believe wholesome competition by new banks organized on a sound basis to be an essential part of our free enterprise system. We believe, however, that our job is less to provide profit opportunities than to assure such facilities in communities that need and can support them. We must not repeat the experiences of the twenties, when excessive expansion in the number of new banks was accompanied by a rising tide of bank suspensions.

(3) INFLUENCE UPON CHARACTER AND STRUCTURE OF BANKING SYSTEM. So far our concern with deposit insurance has been rather narrow in that we have considered its purposes and their expression in the reaction of the two groups immediately affected — banks and bank depositors. Now let us range a little more widely, and note the broader economic implications of two aspects of deposit insurance which the Corporation has stressed during the years.

(a) Promotion of Private Enterprise. Within the framework of public measures designed to stabilize the performance of our economy at high levels, the Federal Deposit Insurance Corporation has always championed the system of private enterprise. The advantages of free enterprise, both politically and economically, are too well appreciated to need repetition here. Pursuit of these advantages has, however, sometimes required the Corporation to take positions unpleasing to the banking community. The most notable case is with regard to capital standards and the deteriorating capital position of banks.

The Federal Deposit Insurance Corporation has repeatedly urged banks to strengthen their capital cushion. I should like to emphasize that our purpose is not solely, or even principally, the selfish one of protecting our own risk. We believe that bank capital should be adequate to justify and motivate the present sis of control of our banking system. Serious questions are bound to be raised when the legal owners of banks permit their equity to shrink to the point where they have little at stake in sound banking. No other industry risks as little as 7 percent on its enterprise. The ratio of bank capital to bank assets has been declining for a hundred years, and for many banks it has reached a point which casts suspicion upon the entire ownership structure.

The efforts of the Federal Deposit Insurance Corporation, persistent as they have been, have accomplished little more than a relaxation of the long-rum decline in the capital ratio. The Corporation seeks to prevent further deterioration by requiring the newly insured banks to have capital at least equal to the national average for all insured banks. The retention of current bank earnings has been barely sufficient to enable capital accounts to keep pace with the growth of assets and deposits. The only other source of additional capital, the sale of new stock to investors, has for several years been almost barren. We recognize that there are serious barriers to the building of bank capital. However, continued neglect

of the capital problem plays into the hands of critics of private enterprise, and pushes us closer to public management of our banking system.

our banking system has definite implications for its structure. Today there are nearly 15,000 banks in the United States, for the most part small, locally-owned and operated institutions. Some operate under National charter and some under the charter of States whose requirements vary in accordance with local traditions and circumstances. This large number of banks with differing personalities and the ability to adapt their policies and practices to local needs accounts for much of the vitality of our banking system. As an expression of our political system, whose duality maximizes the opportunity for testing new ideas and minimizes the risks of so doing, it embodies the essential genius of the American system of covernment.

The Federal Deposit Insurance Corporation has been a tireless champion of this dual banking system. It is often regarded as the spokesman for the smaller State banks whose particular responsibility it is to examine under the cooperative arrangements it has with the Comptroller of the Currency, the Federal Reserve System and the different State Supervisors of Banking. However, the Corporation prefers to think of itself as a champion, not of one group, but of the system which permits different groups to work together in harmony.

We need to remember that our banking structure contrasts sharply with that of most other countries, where banking has become concentrated in a small number of large institutions operated through branches. Their system may be best for them; that we do not and need not question. We should be careful, however, to conserve own dual banking structure. Cumbersome as it sometimes appears to be, it has helped to give us the strongest and most dynamic economy in the world, a true citadel of freedom in these trying times.
