# Operating Ratios of Member Banks in the Second Federal Reserve District for the Year 1938 Compared with 1937 

To all Member Banks in the<br>Second Federal Reserve District:

The annual compilation of operating ratios of member banks in the Second Federal Reserve District for the year 1938 is presented herein, with comparative ratios for 1937. Practically all member banks in the District are included and are grouped according to the amount of their deposits. Banks in New York City are segregated from those located outside New York City, and those located outside New York City are further subdivided according to the ratio of time deposits to total deposits.

Two additional ratios have been added to the compilation this year. Real estate taxes and other taxes paid, which formerly were included in "All other expenses," are now shown separately as percentages of total earnings from current operations. Another change in the ratios this year concerns "Income from Trust department." Such income is now shown separately as a percentage of total current earnings for only those banks in each group which had income from trust departments, and is also included in "All other earnings."

All groups of banks showed net profits in 1938, but the average percentage of profits to total earnings from current operations (Item 13) declined to 9.9 per cent in 1938 from 16.2 per cent in 1937 and 31.9 per cent in 1936. This decline may be attributed almost entirely to larger charge-offs for losses and depreciation on investments, caused by the depressed prices for medium and lower grade bonds that accompanied the recession in business in the early part of the year. In 1936 there were substantial profits and recoveries on investments which added considerably to net profits. The average net profit, after charge-offs and recoveries, for the 757 banks included in the compilation (Item 17) was equal to 2.2 per cent of capital funds in 1938, as compared with 4.3 per cent in 1937 and 8.9 per cent in 1936. From 1923 to 1929 net profits averaged about 10 per cent of total capital funds.

Although gross income of banks in this District was rather generally reduced in 1938 because of a somewhat smaller volume of loans and investments and a slightly lower rate of return on those assets, most banks managed to curtail expenses accordingly, so that the average ratio of total expenses to total earnings (Item 10) was 74.9 per cent in 1938, as compared with 75.8 per cent in 1937.

The proportion of investments to total loans and investments (Item 28) again decreased slightly in 1938 in the smaller banks of the District, but increased in most of the larger banks; the large banks in New York City showed a sizable increase from 50 per cent in 1937 to 56 per cent in 1938, caused by the reduced demand for loans. The average percentage of capital funds to deposits for all banks (Item 26) continued the slight downward trend of previous years.

As usual space has been provided for the insertion of the figures of any bank which may wish to compare its operations with those of other banks of similar size and character of deposits.

George L. Harrison, President.

All ratios are expressed in percentages and are arithmetical averages of the ratios of individual banks, rather than ratios based on aggregate figures
