Sec. 2. That for the purpose of more effectually providing for the national security and defense and prosecuting the war by establishing credits in the United States for foreign governments, the Secretary of the Treasury, with the approval of the President, is hereby authorized, on behalf of the United States, to purchase, at par, from such foreign governments then engaged in war with the enemies of the United States, their obligations hereafter issued, bearing the same rate of interest and containing in their essentials the same terms and conditions as those of the United States issued under authority of this act; to enter into such arrangements as may be necessary or desirable for establishing such credits and for purchasing such obligations of foreign governments and for the subsequent payment thereof before maturity, but such arrangements shall provide that if any of the bonds of the United States issued and used for the purchase of such foreign obligations shall thereafter be converted into other bonds of the United States bearing a higher rate of interest than three and one-half per centum per annum under the provisions of section five of this act, then and in that event the obligations of such foreign governments held by the United States shall be, by such foreign governments, converted in like manner and extent into obligations bearing the same rate of interest as the bonds of the United States issued under the provisions of section five of this act. For the purposes of this section there is appropriated, out of any money in the Treasury not otherwise appropriated, the sum of $3,000,000,000, or so much thereof as may be necessary:[1] *Provided*, That the authority granted by this section to the Secretary of the Treasury to purchase bonds from foreign governments, as aforesaid, shall cease upon the termination of the war between the United States and the Imperial German Government.

Sec. 3. That the Secretary of the Treasury, under such terms and conditions as he may prescribe, is hereby authorized to receive on or before maturity payment for any obligations of such foreign governments purchased on behalf of the United States, and to sell at not less than the purchase price any of such obligations and to apply the proceeds thereof and any payments made by foreign governments on account of their said obligations to the redemption or purchase at not more than par and accrued interest of any bonds of the United States issued under authority of this act; and if such bonds are not available for this purpose the Secretary of the Treasury shall redeem or purchase any other outstanding interest-bearing obligations of the United States which may at such time be subject to call or which may be purchased at not more than par and accrued interest.[2]

Senator Harrison. I am sure that this committee appreciates Mr. Garvan's statement.

Senator Watson. Very much, indeed.

Senator Harrison. This afternoon we have two or three witnesses who will be here at 2 o'clock.

Senator Watson. The committee will rise until 2 o'clock.

(Whereupon, at 12.12 o'clock p. m., a recess was taken until 2 o'clock p. m.)

#### AFTER RECESS

The Senate Finance Committee resumed the hearing at 2 o'clock p. m., Thursday, February 23, 1933, at the expiration of the noon recess.

---

[1] Sec. 2 of the second Liberty bond act, a amended, made an appropriation of $7,000,000,000 for the purchase of such foreign obligations, and in addition the unexpended balance of the $,000,000,000 herein authorized. See also secs. 2 and 3 of second Liberty bond act and secs. 7 and 8 of victory Liberty loan act

[2] See secs. 2 and 3 of second Liberty bond act.

Senator HARRISON (presiding). The committee has received from Mr. W. P. Sterns, Ph. D., of 1833 Lamont Street NW., Washington, D. C., an article which appeared in the Journal of Political Economy for September, 1898, entitled "A New Standard and a New Currency," also copies of two statements prepared by him recently dealing with the question of currency, which he desires to have published in the hearings. If there is no objection they will be incorporated at this point.

(The article and statements are as follows:)

A NEW STANDARD AND A NEW CURRENCY

In 1896 the people refused to sanction a currency policy that, in their opinion, would have resulted in silver monometallism and would have involved injustice to the creditor. May it not be a mistake to assume that this refusal was equivalent to a positive declaration in favor of gold monometallism, or that they would not as decisively reject any currency policy that seems careless of the rights of the debtor? Is it not probable that the policy that receives their positive sanction

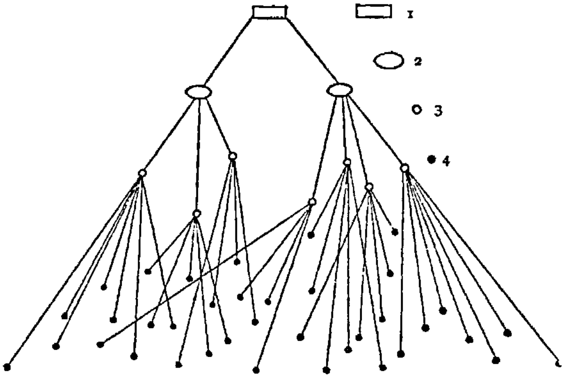

FIGURE I.—Illustrating the organization of demand-deposit banks in the United States

must not only provide every positive safeguard to the creditor, but must also afford the debtor every practicable facility for meeting his obligations? Such equal regard for the rights of both debtor and creditor is the purpose of the monetary system outlined in this article. An attempt will be made to set forth clearly and simply: (1) those measures intended to improve the media of exchange and facilitate the payment of debts in times of crisis; (2) those intended to provide for the stability of the standard and secure the rights of the creditor; (3) some general advantages to be gained by adopting the system.

1. The Government control of the proposed system will be through an issue department, of which the Comptroller of the Currency will be the administrative head. Bank checks constitute more than half of the media of exchange in the United States. It follows that there can be no effective regulation of the means of payment by the Government until all demand-deposit banks come under its control. To this end banks that organize under the new national system will be exempt from a tax on demand deposits that will be made high enough to cause all other banks to retire from business.

The deposits in the banks will then be converted into a means of payment, practically legal tender, but much more available than ordinary legal-tender money. This will be accomplished by requiring every bank to receive on deposit certified checks on, or checks on ascertained deposits in, any other bank in the system, even though such bank has suspended payments.[1] The clearing system that is to be introduced will quickly shift the burden of such payments from the individual banks to the banks as a whole.

But if the bankers are to suffer the losses arising from dishonest and inefficient banking, they should be given the power to prevent such banking. For this purpose a great part of the regulation of the banking business is entrusted to the banks. Every bank must belong to an association. The capital of the banks in each association must amount to at least $25,000,000. The central office of the association must be in some city of more than 50,000 inhabitants. Each association must be a member of some district clearing house. There will be six or seven of these district clearing houses, located by law in the most important business centers. Each bank will have one vote in its association; each associtaion one vote in its district clearing house. The association will regulate the business of banking among its banks, and its own administration subject to its district clearing house. The district clearing house will regulate matters common to all its associations and its own administration. The comptroller will have power to veto or revoke any regulation that grants special privileges to any bank or set of banks, and to decide controversies between district clearing houses and associations as to province of legislation.

Upon petition of three district clearing houses the President will appoint a special commission of inquiry as to regulations cited in the petition, which will have power to revoke such regulations if they are found to operate unjustly to the special advantage of any bank or set of banks. The organization of banks and their entrance into associations will be so regulated by law that every community that can support a bank will have one, and that monopoly in the business will be an impossibility. Figure I is intended to give a graphic representation of the organization of the banks. A glance will show that the banks in any association are not confined within territorial limits.[2]

The system of clearing will be regulated by law. Once every day each bank will send to its association all checks paid for other banks, and at the same time report the amounts of its reserve and deposits.[3] The association will credit each bank with checks received from it and charge it with its own checks received from other banks. At 12 m. each day the association will report to the banks their balances and any change in reserve requirements. In each association city there will be located a representative of all other associations, whose business it will be to receive checks paid for the banks of those associations and officially acknowledge the debit for their payment. This official acknowledgment will be made by attaching his signature to the report telegraphed by the local association at 12 m. each day to its district clearing house giving the amount of its payments for other associations. The association will also report the amounts of the reserves and deposits held by its banks. Each district clearing house will forward to the others the reports of payments made for their respective associations as fast as they are received. Such reported payments will be cleared and the balances reported to the associations at 1 p. m., together with any new requirements as to reserves. They will at the same time report to the issue department net payments made for other districts and amounts of deposits and reserves in their own district. The issue department will clear these payments and report balances and new reserve requirements to district clearing houses at 2 p. m. All balances, less required reserves, will be subject to check the same as deposits. Figure II illustrates the operation of such daily clearings among as few banks as could be organized under the proposed plan. The district clearing houses must keep on deposit in the issue department for the payment of balances at least 1 per cent of all deposits in their respective districts. This requirement can be increased at any time by the comptroller.

The long accepted principle of uniformity of the currency will be adopted. Metals will not be used unless for small change. The currency will be restricted to the United States demand notes of the issue department. These will be a legal tender for all debts, public and private. All money, including gold and silver, now legal tender will cease to be so. But United States coins and demand obligations of the United States will be redeemed by the issue department in United States demand notes, if presented before a designated date. These notes may also be obtained from the issue department in exchange for either gold or silver, without

[1] A bank will not be required to honor checks on such deposits to more than one-half the amount of its reserves till the deposited check has been cleared. The system of clearing to be introduced makes the time required for this purpose very short. Some officer of evey bank, even though suspended, will be required to certify to deposits on request.

[2] Banks may change their association if such change is acceptable to the Comptroller and to the association they wish to enter. An association can change its district clearing house under like conditions.

[3] It is expected that local clearings will be made before this report to the association.

restriction as to quantity. The prices that are paid for these metals will vary in accordance with legal regulations.

In order to afford the country districts of the South and West as great credit facilities as are practicable, and to do away with the losses occasioned by crises and panics, so far as possible, the issue department will deposit demand notes with banks under certain conditions. If a bank wishes a deposit of notes from the issue department, it must deposit acceptable short-time banking paper with its association. The association must then issue to the bank, association certificates up to 75 per cent of the collateral accepted. On receiving these certificates as collateral the issue department will deposit with the bank an equal amount of demand notes. While a bank's deposits bear a ratio to its capital less than 60 per cent of the average ratio of deposits to capital throughout the system, the bank will pay the issue department 2 per cent interest; while such ratio is between 60 and 80 per cent of the average ratio, the rate will be 4 per cent; while it is between 80 and 100 per cent the rate will be 6 per cent. So long as the issue department has notes on deposit with the bank it will prevent such ratio rising above 100 per cent by checking out the excess as fast as it appears. It is expected that these deposits will enable the small banks in the South and West, where the use of deposit currency is extremely limited, to afford their patrons nearly the same facilities for making payments that are enjoyed in the great financial centers of the North and East.

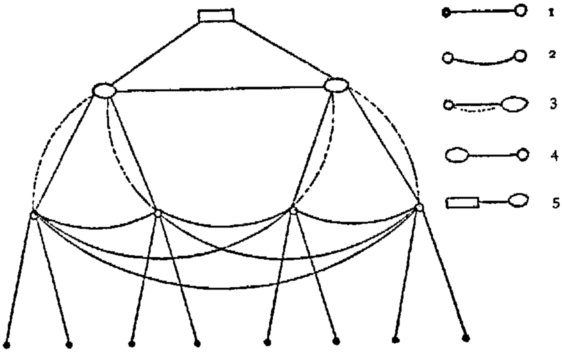

FIGURE II.—Illustrating the system of clearing

1. Routes of checks and reports between banks and associations. 2. Routes of checks returned by association representatives. 3. Route of double telegraphic report from association representatives and associations to district clearing house. 4. Route of report from district clearing house to associations. 5. Route of reports between district clearing houses and issue department.

The advantage of these deposits in a critical emergency may be illustrated by the following example. A bank holding a reserve of 25 per cent has deposits that bear a ratio to its capital equal to such ratio throughout the system. Some very remarkable crisis makes it necessary for it to redeem all of its deposit liabilities within a few days. If its loans and discounts have been judiciously made the bank will, through this accommodation from the issue department, be able to meet such a drain without making a collection beyond what may be necessary to make up a possible excess of its reserves over its capital.

It is believed that in giving the legal-tender currency a basis that is practically as broad as the combined stocks of gold and silver plus all the acceptable bank paper the country can furnish, this system offers to the debtor every protection against an appreciating standard that is now practicable; and that this, together with the extraordinary facility it affords for making payments in any section of the country, must satisfy the demands of every honorable advocate of debtors' rights.

2. It remains to be seen whether these provisions can be enforced without doing injustice to the creditor, with a probable gain to the general credit of the country, and without conferring dangerous powers on any man or set of men. The first step in this direction will be the complete separation of the issue department from the fiscal administration of the Government. The resources of the department and its power of issue will be as independent of control by Congress as those of any national bank at the present time. Through this department the comptroller will buy and sell gold, silver, and United States bonds, make such deposits in banks as have been indicated, and exercise supervision over the banking system.

The Treasury will at once turn over to the issue department all money and bullion in its possession and receive for the same United States demand notes. The comptroller will then go on the market and buy or sell at the best prices in United States demand notes, a sufficient quantity of silver to make the stocks of the two metals held by him equal in value. The stock of silver will be estimated at the price at which the last purchase or sale is made.

The gold will be stamped into ingots containing 2,322 grains of pure gold, or 2,580 grains of standard gold, the silver into ingots containing $25 worth of silver.[4] The size of the gold ingots will be permanent. The size of the silver ingots will not be changed till the end of a designated period of time, during which the abnormal effects of the initiation of the system, on the value of silver, will be expected to exhaust themselves. It will then be changed so that four ingots will contain $100 worth of silver at the department's selling price, and will remain unchanged thereafter. These gold and silver ingots will be sold in unlimited quantities to anyone offering demand notes for them. Until the change of silver ingots to their permanent size the selling price of the gold ingot will remain fixed at $100. The issue department will pay $99 in demand notes for the amount of gold in an ingot.[5] Whenever the stocks of metal are equal in value[6] the first

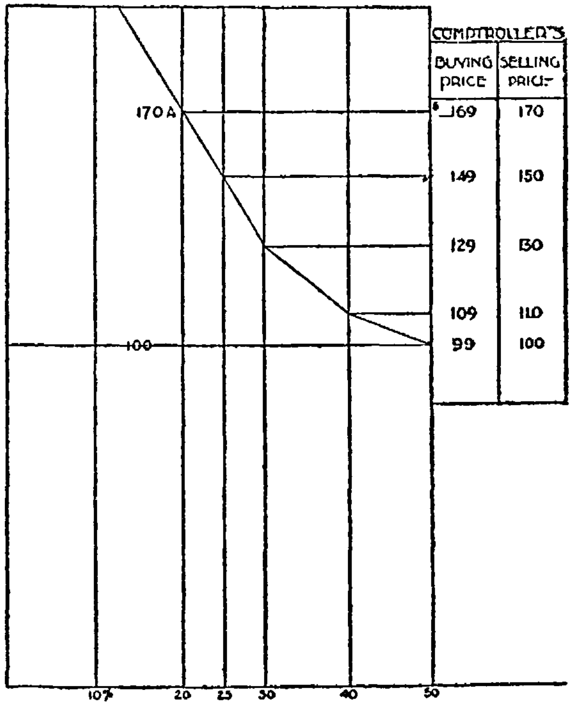

FIGURE III.—Showing the increase in the issue department's prices of silver when gold is held in excess of 50 per cent of the total stock

prices of silver will be the same as those of gold. During the first period, in which the size of the silver ingot is only temporarily fixed, if the stock of silver is decreased in value by purchases of gold or sales of silver, to 49 per cent of the whole stock, its purchase and sale prices will be raised to $100 and $101 respectively. A like increase in the prices will be made for each 1 per cent of decrease in the stock of silver until its value is but 40 per cent of that of the shole stock. Whenever the stock of silver increases the prices will fall, returning along the same road toward an equality with those of gold. Figure III shows that whenever 40 per cent of the

[4] The same price will be used here as in estimating the stock.

[5] This seigniorage charge of $1 is made on purchases of ingots as well as bullion. There is no particular reason for fixing it at $1.

[6] The value of each stock will always be estimated at the price at which it is being sold.

total stock is in silver, its purchase and sale prices will be $109 and $110, respectively. While the silver stock is between 30 and 40 per cent of the total stock, changes of a dollar in the prices will result from a change of one-half of 1 per cent in the stock. The figure shows that as a result of such changes when the value of the silver stock stands at 30 per cent ot the total the prices will be $129 and $130. Thereafter the change in prices will be made for every change of one-fourth of 1 per cent in the value of the stock of silver. The diagram shows that if silver appreciates in value 70 per cent (to A), 20 per cent of the issue department's stock will be in silver and 80 per cent in gold.

If, however, the purchases of silver are in excess of those of gold, similar changes in its prices will be made in the opposite direction. Figure IV shows that when the silver stock stands at 60 per cent of the total stock, its prices will be $89 and $90; that at 70 per cent its prices will be $69 and $70; and that if it depreciates in values on-half it will constitute three-fourths of the entire stock. After the silver ingots are changed to their permanent size, an excess in the stock of gold, instead of raising the price of silver, will cause a like decline in its own prices. Under these regulations the selling price of either metal can never exceed $100.

What would be the result of this unlimited purchase and sale of gold and silver by the issue department? It would be bimetallism, but not the old bimetallism. It would be bimetallism, but not the old bimetallism. We have here the same liberty to use both metals. We have also the same resort to the alternative

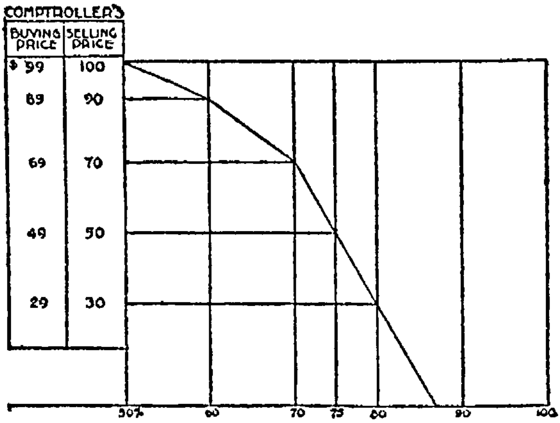

FIGURE IV.—Showing the decrease in the issue department's prices for either metal that is held in excess of 50 per cent of its whole stock

standard. Here the likeness ceases. In the old bimetallism the metal relatively depreciating in value always fixes the standard and its depreciation is retarded by the decreased use of the other metal. In the new bimetallism the metal relatively appreciating fixes the standard, and its appreciation is retarded by an increased use of the other metal. Under the old bimetallism the appreciation in the value of a metal often drives it entirely out of circulation. Under the new, every pound of gold and silver bullion in the country will always be available as money. The founders of our Government believed that the currency should be based on both metals; they also wished that the metals might be used at the market ratio. The new bimetallism gives the currency the bimetallic basis and provides for the use of the two metals at that ratio. Under the old bimetallism the change from one standard to the other occurred only at long intervals. Under the new, because of the use of the metals at the market ratio, the two standards may be in use on the same day. Under the old bimetallism the standard is sometimes lower than that of silver standard countries, and at all other times lower than that of gold standard countries. Under the new, the standard may at times be higher than that of some other countries, but never can be lower than that of any. Under the old bimetallism a given quantity of one of the metals determines the value of the dollar, and the whole demand for monetary metal centers upon the supply of that metal. Under the new, the constantly fluctuating metal equivalent of the dollar allows both metals to compete at all times in supplying the demand for monetary metal.

It is generally admitted that increased sources of supply decrease variations in value. The threatened adoption of the old bimetallism creates a panic in the commercial world. The adoption of the new would secure to the creditor payment in the best money in the world, whether that be gold or silver.

Theoretical benefits to the creditor, however, will count for nothing if there can be any question of the comptroller's ability to supply demands for either metal whenever made. Those provisions of the system intended to enable him to do this will next be considered

He will be required to maintain the same ratio between his stock of gold and silver and the demand notes in circulation as the banks maintain between their reserves and deposits. As the changes in the metal stock are not subject to his own control it follows that he must have the power to vary the amount of notes outstanding in accordance with such changes. He is enabled to do this through his control of the amount of their reserve which the district clearing houses are required to keep on deposit in the issue department, and by the purchase and sale of United States bonds. If the district clearing house reports show an increase in the bank reserves, while on the same day the issue department's transactions in gold and silver indicate, by decreasing the ratio of the gold and silver stock to the amount of notes outstanding, a depreciation in the value of the demand notes, this increase in the bank reserves will be assumed to be the result of contractions in loans and discounts by the more prudent bankers, and a like contraction through out the entire system will be enforced by requiring an increased deposit of reserves in the issue department. This increased requirement will express itself in a draft on the district clearing houses for an amount of demand notes sufficient to contract the circulation outstanding to the required ratio with the issue department's stock of metal Any depreciation in the value of demand notes, from whatever cause, expressing itself in a run on the issue department's metal stock,[7] will always be met by a similar contraction of the amount outstanding by increasing the reserve deposit. For instance, if the bank reserves stand at 25 per cent and the excess of the comptroller's sales over his purchases is $1,000,000 he will draw on the district clearing houses for three millions. If the reserve is standing at 20 per cent he will draw for four millions.[8] It will be seen at once that an unreasonably low reserve held by the banks will cause these drafts to become disagreeably large. If the reports show the comptroller's reserve to be excessive, the reserve deposit requirement will at once be reduced, and notes from that deposit will be returned to the district clearing houses in sufficient amounts to restore the equilibrium by expanding the circulation. But if the district clearing house deposit with the issue department is at the 1 per cent limit, the comptroller will go on the market and buy United States bonds to expand the circulation to the required amount.

If there are no United States bonds to be bought on the market or if the holders of such bonds charge a premium that indicates a market demand for United States bonds bearing interest at a rate more than one-half of 1 per cent lower than any at that time on the market, the Secretary of the Treasury will issue bonds bearing the indicated rate, and sell the conptroller a sufficient quantity to produce the required expansion of the currency. This expansion will not be so immediately operative as those through the return of the reserve deposit, or through buying bonds from the public, but it is not to be expected that there would be many resorts to it. If at any time that part of the bank's reserves held by the comptroller amounts to 10 per cent of their deposits, he shall thereafter draw on the district clearing houses for only one-half the required contraction, and shall obtain the other half by the sale of United States bonds. Whenever his own stock of bonds is exhausted, the Secretary of the Treasury shall issue new bonds to him in exchange for demand notes in any amount that he may need for maintaining the required ratio between the notes outstanding and his stock of gold and silver.

To get a clear idea of this system of issuing notes and keeping them at par with the standard let us look upon the issue department as an independent bank of issue. It can get its notes into circulation only by buying gold and silver and bonds of the United States on which it will receive no interest, and by making deposits in banks under certain conditions. The amount if its issues in excess of purchases of gold and silver is limited by the amount of the deposit liabilities of the banks in excess of their reserves. It follows that the issue of notes can not

---

[7] This may sometimes be caused by the deposit of notes with the individual banks.

[8] It is hardly necessary to state that these drafts will be in proportion to the deposits held by the different districts.

become excessive except through an excess of bank loans and discounts. But if the banks raise general prices by unwarranted discounting, so that large imports and a demand for gold or silver for export are occasioned, they are at once reminded of their folly by the increased deposit of reserve required by the comptroller.[9] The justice of this increase in the requirement is evident, as it will never be made except as the result of their own indiscretion in expanding the deposit-currency. Since the banks alone can occasion an inroad upon the comptroller's stock of gold and silver, it is but right to place their assets, to the measure of their deposits, at his disposal for the purpose of stopping any such inroad.

The requirement that the United States Government shall place its entire resources at the comptroller's disposal for the same purpose can not be justified on quite the same grounds. It is true, however, that it is almost impossible to conceive of too great expansion of the note issue, except through the purchase of United States bonds, and the saving of interest to the United States that results from these purchases calls for some return. Moreover, the fact that the general interest of the country demands a confidence that can be established only by such absolute guarantee of the stability of its standard of value is sufficient reason for granting him this sure resource to which, in all probability, he will never be compelled to resort. Do not these provisions enable us to say to the creditor: "In no country in the world is the standard of deferred payments so securely guarded against depreciation as in the United States."

3. While making these provisions for the debtor and creditor, has anything been accomplished for the interests of the country as a whole? It is hoped that a monetary policy has been proposed that will meet the demands of the gold man, the silver man, and the Government-currency man. This will mean a stable monetary policy, which will bring with it advantages to every class and every individual in the Nation. The fiscal administration of the Government will no longer attempt to do a banking business, and any one can tell when bonds are issued to make good a deficit and when to redeem Government currency. It is believed that the specter of inflation will be laid once for all. Could an emergency arise that would tempt Congress to an abnormal issue of paper money when it knows that the country is constantly using its demand credit as freely as the wisdom of the bankers will allow them to use theirs, and when it will have been educated by seeing the circulation contracted from time to time because of its depreciation through overissue? Nevertheless, the country as a whole will reap what profit arises from the economy of substituting a paper currency for one of metal. The advantages that will be derived from the increased mobility of capital can not be confined to any class. The device that enables the comptroller to relieve a financial pressure, or stop a panic at some particular point, and if such operation unduly expands his issues, to contract them by a draft upon the whole banking system, may seem local in its benefits, but the business life of the Nation is so organic in its nature that to cure a local ailment is to strengthen the whole system. The security that it would afford to the millions who must intrust their money to the care of others does not seem a small thing to one who has watched the suffering caused by bank failures. But the benefits derived from this security is not confined to the depositors. The hoards of the distrustful will become active capital. The fact that the failure of a bank can not lock up a dollar of capital will alone be a great benefit.

To sum up, in conclusion, a few of the reasons for expecting such a policy to receive popular support: It gives the creditor a greater measure of security than he has ever yet known; it does even more for the debtor than for the creditor; it provides for the unlimited use of both gold and silver as monetary metals; it gives to the country all the profit that can be derived from substituting a paper currency for one of metal; it insures for bank depositors the immediate availability, under any emergency, of every cent of their deposits; it frees our banking system from the constant fear of regulations enacted by men entirely ignorant of the banking business, and will undoubtedly increase very much the amount of their deposits and the limit to which they can safely carry their loans and discounts; it provides means for securing a note circulation for those sections of the country that are not able to make use of a deposit currency; it brings without delay the great financial resources of the Nation to the support of any section that is suffering from a monetary stringency, and in doing this renders the whole system so sensitive to credit excesses that it is hoped the worst effects of great crises may be altogether avoided.

WORTHY P. STERNS.

UNIVERSITY OF CHICAGO.

[9] The seignorage charge of $1 will prevent any sales of metal for export by the issue department, except when the demand notes are depreciated.

COIN MONEY? REGULATE THE VALUE THEREOF [1]

Has Congress ever obeyed this simply worded Constitutional order?

It was 157 years ago next July that we decided to manage our governments—we had 13 of them—without outside help. Five years later we decided that we would have to work together in matters of common interest. We put in the machinery for doing so, and put it in charge of our hired men. Six years of this federated effort showed us that we were not putting enough power into this machinery. So, after two years of preparation we set up our present Federal Government. We set down in black and white what we wanted it to do. Our courts have been explaining our wishes to Congress ever since. We pay in the money it costs to run this Government. For several years, we have been paying, or promising to pay, around five billion dollars a year. We pay the money. Doe we get back what we have a right to expect, what we desperately need? If we do not, it is our own fault.

In the Preamble of the Constitution we say that the new Government is set up to promote the general welfare. Can this be done; can people in general prosper, if they neither have nor are able to obtain a satisfactory medium of exchange. And what is a satisfactory medium of exchange? It is a means of payment which enables one to trade at as good advantage as citizens of any other country, in any place open to ordinary methods of carrying freight.

Has any Congress given us a money meeting these specifications? Far be it from me to say they have not tried to do it. Indeed, I question whether it could be proven, that any Congress has failed to do as much to carry out this provision of the Constitution, as could be expected from any group of men of equal numbers, under the circumstances and during the years through which they served.

Some may say, at first thought, that the Constitution does not specifically require Congress to furnish such a means of payment, to every citizen in every corner of the Republic, so far as it may be feasible to do so; and that whenever such means of payment become defective in quantity of quality, Congress is expected to remedy such defects by any means reasonably available. But a little further thought, and some consideration of the actual circumstances in 1787, will persuade them, that this was exactly what those quite wonderful men who wrote the Constitution in that year, did mean.

Most of these men had spent their entire lives in the United States. They had known the 13 colonies, and now knew the wilds of the West as no other men knew them. This territory already acquired, together with some only claimed now stretched (or soon would) north to the Lake of the Woods on the Canadian border, and south to the lower reaches of the Mississippi And they knew that gold was the only means of payment that one could expect to have accepted throughout that territory. Indeed, in many wild regions, the only trade was barter.

Furthermore, probably more than one of them knew the history of European chartered banks, from that of Barcelona, started in 1401, down through the great career of the Italian banks at Venice, Genoa, Milan, and other cities, for the two centuries in which they dominated the western world. In like manner they knew how the banks of Amsterdam and that of Hamburg ruled the western world during the next century. Of course best of all, they knew the work of the bank of England, chartered about the beginning of the eighteenth century.

These men knew that power and that unlimited, was the only thing that could give a country the ability, to regulate the value of its money. This they gave to Congress.

Under the practically perfect system of banking our bankers have developed, they, under our supervision, can give us a practically perfect medium of exchange, a practically perfect credit system. Give them the chance to do it. Then see that they do it.

A MONETARY SYSTEM

"The Congress shall have power * * * To coin money, regulate the value thereof * * *." This is simply said, but we have never done it. We have tried—have done something toward it. But, discouraged, we have let others, in their own interest, destroy the results of our efforts to promote the general welfare. It is in the interest of the common weal therefore, that I make the following suggestions as to the Government taking upon itself alone, the task of

[1] See sec. 8, par. 2, of the Constitution, and the fifth specific grant of power under that paragraph. A grant of power is construed by our courts, to be a specific direction to use such power to whatever extent the general welfare may require.

controlling the supply and regulating the value of money; and its giving to that task the organized effort which is needed to carry it through to success.

In the monetary system here suggested, there would be but one legal tender in payment of debts in the United States—the currency of the issue department of the United States, marked "A legal tender in payment of debts amounting to ---------- dollars, within United States territory." All money now legal tender, including gold and silver, would be demonetized. Holders of such legal tender would receive currency for it if presented before a set date. Rights of both creditor and debtor would be protected.

The issue department would be independent of the fiscal administration. The Treasury would turn over all its gold and silver, receiving the new currency for it. The Comptroller of Currency, head of the new department, would proceed to buy and sell gold certificates as soon as a gold exchange had been organized; its demand certificates approved by Supreme Court standards commissioners; and its ability to supply any demand for such certificates established.

The issue department would also buy and sell demand certificates for any other goods whenever the same conditions had been brought about for them.

As a part of this monetary system, the issue department would buy all these demand certificates in any quantity, from any one offering them at less than the regular price on their exchange, and it would sell in any quantity, to any one offering more than the regularly established exchange price (the world market price).

Whenever the standards commissioners add a new demand certificate to those which the issue department must hold, because of the requirements upon it given in the preceding paragraph, they determine anew, what proportion of the entire value of the issue department's reserve, shall be held in the different certificates. They will also have power to change such proportions at any time, on their own motion, or on approved petition of interested parties.

Few realize the extent to which the necessary standardization of commodities has already gone. Practically our whole supply of money consists of certificates (United States notes and bank notes) exchangeable for the standard gold unit of value. All of the enormous business done on our produce exchange rests upon the absolute assurance that produce received in exchange for certificates, will conform to standard specifications established by the Federal Department of Agriculture or other comparable authority. The Bureau of Standards is working in the same direction in its lists of manufacturers ready to certify to purchasers that products supplied by them comply with nationally established standards. The Federal Specifications Board has already established many thousand standards preparing the way for satisfactory trading in certificates representing thousands of commodities. Federal expenditures in this field of standardization amount annually to millions of dollars. And why not? However, effective mobilization of the country's resources can not be expected until all the Government's activities in this field are brought into systematic and effective relation to each other in a Federal standard trading units bureau.

But—a satisfactory legal tender does not, by itself, constitute a satisfactory monetary system. To properly supplement such a currency, every bank doing a demand-deposit business in the United States, will be required to honor checks drawn on every other demand-deposit bank, whether such bank is solvent or insolvent. All insolvent banks will be required to file balances of all depositors. Solvent banks will furnish balance of any depositor on proper official request for same. It follows that anyone having a balance in any demand-deposit bank in the United States (solvent or insolvent) has at his command an equal amount of legal tender. Above communications will all be by telegraph, at the new bank system's expense.

It is at once evident, that no demand-deposit bank could do business in the United States unless it was reorganized under the bank act here suggested.

Government control, subject to the act itself, would be through the issue department. Daily telegraphic clearings throughout the system, passing up through local, district, and regional clearing houses, would center in the issue department. New requirements as to reserve would go from it only to the regional clearing houses, but would radiate from them to the smallest bank in the country.

The check in question would pass from one clearing house to another and finally be settled by the distribution of the loss over the entire system, by the comptroller. Regulatory powers sufficient to protect themselves from dishonest and inefficient banking would be given to the bankers. Unfair regulations would be vetoed by the comptroller.

If United States legal tender should be worth less than gold in the markets of the world, any one could buy gold certificates at the issue department with such legal tender at world prices, so long as such inducements existed. The issue department would have to sell other certificates as fast proportionally, as the gold certificates, and the all around demand for currency resulting from this bargain sale, would soon reduce the supply so greatly as to restore a correct price relation between United States legal tender and gold in the markets of the world.

It is held that this banking system would give the creditor greater security than he has ever had in the past; that it would give him no unfair advantage over the debtor; that it would give practically legal tender power, at prevailing market prices to any potential purchasing power whose standardization had been officially recognized by the standards commissioners of the Supreme Court; that it would make bank checks practically as good as, indeed, sometimes better than legal tender in the payment of debts; that it would give men who know the banking business practically complete control in its fair regulation; that it would provide United States currency for sections unable to use bank checks to advantage; [1] and, finally, that it would bring the financial resources of the whole country to the rescue of any section suffering from reduced present purchasing power.

Senator HARRISON (presiding). The committee has received the following from Mr. Donald R. Richberg:

CHICAGO, *February 21, 1933.*

Hon. REED SMOOT,
*Chairman Committee on Finance,*
*United States Senate, Washington, D. C.*

DEAR SENATOR SMOOT: Since I understand it will be impossible for the committee to give me an opportunity to appear in a public hearing this week and since my engagements following this week make it difficult for me to be sure that I could meet the convenience of the committee, I have prepared and printed a summary of the testimony which I desire to give, in response to your invitation. I am enclosing herewith a copy of this printed summary, which I presume you may desire to incorporate in the record. I will furnish additional copies for any members of the committee who would be interested to have my testimony in this form.

While I should have enjoyed an opportunity to present my views orally with the opportunity of questioning and further discussion, I wish to express my appreciation of the invitation extended and the opportunity given to present my views in writing.

Very truly yours,

DONALD R. RICHBERG.

Senator HARRISON. The statement prepared by Mr. Richberg will be placed in the record at this point.

(Mr. Donald R. Richberg's statement is as follows:)

## DEPRESSION CAUSES AND REMEDIES

The principal cause of the present depression is the greedy and ignorant misuse of money power.

The only effective legislative remedies will be found in measures wisely designed to compel the operation of essential industries as institutions of public service and to prevent greedy and ignorant men from gambling with the natural and human resources of the Nation, in their selfish pursuit of power and wealth. These legislative remedies need not destroy capitalism or create State socialism. They can follow the course of evolutionary ideas and reject revolutionary programs. But no sound legislative remedy of permanent value can be based on an effort to preserve unchanged our present economic system and to preserve unreformed the present forces in control of that system.

### TESTIMONY OF DISQUALIFIED ADVISERS

Representatives of the influences now dominant in our great industrial and financial enterprises have disqualified themselves as competent advisers to the Congress, by their failure to prevent or to stop the destructive course of this depression. Either they do not know what to do, or they are unwilling to do

[1] The method for doing so is not given in the text.

what is necessary to operate the industries of the Nation so as to protect and to advance the general welfare. The first necessity for an honest and useful consideration of the problem before this committee is to eliminate the influence of the transient prestige and authority of those whose ghastly failures to measure up to their responsibilities have stamped them as unworthy of further public confidence.

Since the present depression is world-wide, it must also be realized that testimony from abroad may be tainted with the same incompetence; because in bringing about and continuing a world-wide failure of our economic system the industrial and financial leaders of America have found effective collaborators in their equally greedy and ignorant colleagues in other lands. This committee has been listening with great patience to testimony presented largely by, or in behalf of, those leaders whose working philosophy has been proved unsound, and who have proved their inability to operate successfully the political, economic mechanisms which they recommend. Therefore, perhaps the committee may be willing to hear even more patiently views which have not yet been proved unsound and to consider programs for economic recovery which have not yet been proved unworkable.

You may be doubtful of the value of remedies proposed by untried physicians. But—can you afford to experiment further with the remedies of sick physicians who are saving their own lives only by transfusions of blood from their dying patients?

You have listened to bankers who have saved their banks only by Government grants of hundreds of millions of dollars that should have been devoted to saving millions of human lives.

You have listened to railroad presidents who have saved their jobs, but not their railroads, by borrowing millions of dollars that should have been devoted to saving from privation and starvation several hundred thousand railroad workers, who are worth more to the Nation and are more indispensable than all the locomotives, cars, tracks, and other railroad facilities—which are not irretrievably impaired by undermaintenance, and which do not die when they are undernourished.

You have listened to manufacturers, who with mob panic have cut wages and thrown millions of men out of work, and have supported foolish programs that would destroy mass purchasing power and insure the destruction of their businesses, and also have steadfastly opposed efforts to increase mass purchasing power that might save their enterprises from ruin.

You have listened to economic and financial "experts", who babble about sound money and demand that we maintain the "integrity" of a financial system under which when a man borrows or lends a dollar he can not possibly tell whether it will take 50 cents or $2 to pay the debt.

You have listened to financiers who demand that a system of corporate organization and control be continued under which power and responsibility are so divorced that investors, workers and consumers can be systematically betrayed and robbed by "trustees" with little risk that any big thief will be sent to jail.

In a word, you have been deluged with the advice of those who have helped to develop and who have profited hugely out of a political economic system so viciously unjust as to be self-destructive. They have attempted to explain to you that this inevitable process of self-destruction is only the temporary result of exterior forces or of minor weaknesses of interior management. It is just as necessary to deflate this evidence of those who have been tried and have been found wanting as it is to avoid inflating the evidence of those who have not been tried and who may or may not be found wanting.

Although the conspicuous money-makers who presume to advise you have proved their ability to make themselves wealthy, it is far more important for this committee to realize that they have also proved their ability to make millions of people very poor. When they are credited with paying large dividends occasionally, they should be debited with paying low wages regularly. If they are to be applauded for producing brief eras of spotty prosperity, they should be denounced for producing long periods of general depression. The architects of our monumental skyscrapers are also the builders of our slimy slums. The profits that are frozen in marble and bronze were squeezed out of human beings who labored and suffered and made forced sacrifices of health and comfort and happiness in order that wealth might be accumulated in a few hands.

The testimony of those who have become trustees of the national wealth, and trustees of the general welfare, by exercising their acquisitive powers, should be weighed, not by the evidence of their success in self-service, but, by the proof of their failure in a public trusteeship. This proof is found in the fact that in this land of plenty we have to-day 12,000,000 unemployed workers and the whole

Nation suffering in the fourth year of the worst and most inexcusable economic depression in the history of the world.

The excuses offered for this failure are both uninteresting and untrue. The power to operate industries and to utilize credit so as to bring about the production, distribution, and exchange of products, rests in the controllers of industry and finance under the present system. If they fail to exercise this power, denying a market to agricultural products and denying employment to industrial labor, they must admit, either that they are personally incompetent to operate the existing system of production and exchange, or that the system is wrong.

When the dominant men of industry argue that the system is all right, and that they know how to operate it, but that some exterior force is preventing them, they are plainly presenting a false alibi. Along with all our other troubles we have an overproduction of alibis; and the alibis of our deflated "big business" men have become nauseating to the American people. Either these gentlemen do not know what to do, or they won't do it. In either event they should be denied the power which they are unable or unworthy to control. That should be the object of any effective legislation.

I submit that every conspicuous leader of affairs who has appeared before this committee and who has attempted to justify the continuance of the present political economic system unchanged, with its present control unreformed, is either too ignorant of facts, too stupid in comprehension, or too viciously selfish in his short-sighted philosophy, to be worthy of any attention in this time of bitter need for honest, intelligent, and public-spirited planning for the rehabilitation of our crumbling civilization.

### QUALIFICATIONS FOR TESTIMONY CONCERNING PUBLIC INTEREST

Since I have criticized the competence of other witnesses who have appeared before this committee, the question may be raised as to the possible value of any suggestions I may offer. To avoid any effort to qualify myself improperly, I will at once disavow any claim to speak with any authority save that of a life long advocate of public interests, who has been a consistent and conspicuous opponent of the influences that brought about this depression, and who long ago, in the years of delusive prosperity, repeatedly pointed out the crumbling and sinking foundations on which our huge enterprises were being built. I am entitled to claim that, following a respectable education, practically my entire professional experience of over 28 years has been that of a lawyer representing public interests or mass interests. I have represented many public officials, cities, and States, usually in contests with privately owned public utilities

For 12 years, as special counsel for the city of Chicago, I fought the power of Samuel Insull, now recognized throughout the Nation as one of the most malevolent influences in the development of present conditions, but probably no more harmful an influence in public affairs than some of the men whom committees of Congress still honor with invitations for advice as to legislation. For over 10 years, as counsel for the standard railway labor organizations, I have been fighting to maintain and to advance the standard of living of the wage earners. For a similar period, as general counsel for the National Conference on Valuation, I have fought against the excessive valuation of public utilities, particularly the railroads, with its inevitable consequence of high rates and low wages.

### SIGNIFICANCE OF THE O'FALLON CASE

Let me recall the attention of Senators to the fact that in the year 1928 the United States Senate by a vote of 46 to 31 requested the Supreme Court to permit me to appear and argue in the O'Fallon case, in order that the political economic views which I represented might be considered by the Supreme Court in dealing with the momentous problem of railroad valuation. I recall this to your attention because of the significant fact that the intervening years have proved that the policy advocated in that case by the dominant financial and industrial leadership of the nation was utterly unsound. And the intervening years have proved that the policy advocated in that case by those whom I represented was absolutely right.

The cause of the present depression was made clear in the O'Fallon case, because the railroads of the country there advocated the theories of the dominant money power in this country which, translated into the control of business, have brought about this depression. My arguments in the O'Fallon case opposed this suicidal policy and I ventured there to point out the far-reaching effect of giving judicial sanction to a social-economic philosophy which would destroy our democracy and the security and freedon of our people. There I quoted from Taussig's Principles of Economics this significant sentence:

"It is not too much to say that the future of democracy will depend on its success in dealing with the problems of public ownership and regulation."

The O'Fallon case brought to a head the long accumulating protest of sound economists against the current business fallacy of inflating property "values" above investment and deflating wages below a fair share of the labor product. In that case and in a series of wage arbitrations we repeatedly demonstrated that railroad securities would be alternately inflated and deflated by the prevailing policy of their control, which would produce alternately billions of unearned profits for gamblers and billions of undeserved losses for investors. We argued that reasonable rates, reasonable wages, and adequate public service would always be impossible under such a policy; and that periodic receiverships and demands for Government aid would be inevitable.

In the last three years these contentions have all been proved to be sound. We pointed out that, if monopolies were permitted to thrive and charge monopoly prices, the capital burden upon the worker would soon become unbearable. We presented evidence that from 1850 to 1920 the average burden of paying interest to property owners had increased from about $70 to $360 per year for each wage earner. We pointed out the impossibility of maintaining property values based on imposing such an increasing burden on labor. We sought to demonstrate that the wages of labor must be increased and the claims of capital must be reduced or our entire political economic system must collapse. Our system has collapsed. Ten thousand banks have failed. Our basic industries are prostrate. More than one-third of our population is suffering privation. A multitude of laws are neither respected nor obeyed. The authority of the courts is subjected to constant challenge. Billions of public money are being expended either to relieve individual distress or to support private enterprises and property values that are collapsing, because they are dependent upon the effective operation of a political economic system that is not permanently workable.

### PRIMITIVE CAPITALISM WILL NOT SERVE MODERN NEEDS

It is on the basis of a long experience in challenging the false prophets and the false creeds of commerce, which are now proved to be false, that I venture now to sum up the causes of the depression. The political economic system which we may call "primitive capitalism" was probably well adapted to serve a transitional period during the development of man from the status of a producing, distributing machine to the status of a master of producing and distributing machinery. Capitalism, as a system under which the selfish individualist by ruthless competition might reap huge rewards of power and self-satisfaction, has undoubtedly encouraged the constant extension of individual control over natural resources and forces. Scientific investigation and the application of scientific discoveries to enrich life have been persistently stimulated by the desire to acquire wealth and individual power, which would be insured by the political protection of private property.

I am not one of those who believe that the great human motives, the individualistic ambitions which have been developing through uncounted generations, can be transformed rapidly by any new system, which might be either enforced by legislation or voluntarily undertaken by a frustrated and bewildered community. I do not believe that in a short period of time the prevailing individual objectives can be replaced by social objectives, or that an altruistic desire to advance the general welfare can be substituted for individual ambition, as the motive power of human activity. Therefore, I do not believe that the logical or probable successor of capitalism is Marxian socialism. But it should be apparent that we have reached a stage in the development of human affairs where it has become intolerable to have our primitive capitalistic system operated by selfish individualists engaged in ruthless competition.

Scientific knowledge has given us mass production. Mass production has brought monopoly. Machine production and distribution have brought labor specialization. Labor specialization has increased the interdependence of man upon man which all the developments of modern industry have promoted. We can no longer permit the great public services, upon which we all depend for the necessities and ordinary comforts of life, to be operated for the primary purpose of satisfying individual ambition or greed. We can not tolerate an uncontrolled competition in acquiring money or power, whereby the balance of production and consumption and the steady flow of currency and credit may be destroyed, so that food may rot in the fields, and factories may stand idle, while agricultural and industrial workers suffer privation because they can not exchange their products. On the other hand, we can not tolerate the control of all our lives by private monopolies of essential services, whereby a ruling class can subject the masses of the people to practical slavery and can dictate when and where they shall work and how they shall live.

THE FUNDAMENTAL NEED—A PLANNED CONTROL OF ESSENTIAL INDUSTRIES

The fundamental need, in order to give security and freedom to the multitude, is plain. No man with sufficient intelligence to be worthy of any attention can deny that a planned control of the great essential industries is absolutely essential; and this involves a planned control of mediums of exchange, an articulated production and distribution of currency and credit. The state socialist would seek this planned control through direct governmental operation of industries. The reactionary individualist would withdraw political prohibitions against monopoly and leave the primary planning and control to be carried on by the owners and privately selected managers of private properties, subject only to some limited regulation by government to compel a certain amount of publicity and reliable accounting and to prevent a too remorseless exploitation of the common people.

If this reactionary individualist had his way, he would undoubtedly lay the foundations of state socialism, which in its first phase would probably be fascism; that is, a political control of industry for the primary benefit of the property owning and managing class. In the long run this would probably result, as indicated by historical parallels, in the eventual confiscation of minority privileges by a revolutionary majority of the dispossessed. No ruling minority has yet appeared in history capable of resisting the temptation of oppressing the majority and sitting on the safety valve until the inevitable day of explosion.

PROGRAM OF A RECONSTRUCTED INDIVIDUALIST

There remains for consideration the program of the reconstructed individualist. I seek to represent him, as a man still living in the tradition of American liberty, still seeking to be let alone, to be free from governmental orders and restraints so far as possible, a man even willing to work for a living as a mere cog in a vast industrial machine, if unable to find independent, profitable labor, but insistent that his daily work shall produce sufficient leisure, security and freedom for himself and his dependents so that they may employ the unregulated hours of the day so as to realize all the self-satisfactions of which they are capable.

This reconstructed individualist knows that the production and distribution of the necessities and common comforts of life must be planned and regulated so that a certain minimum standard of living can be obtained by all. He has learned that gambling and profiteering in these commodities and services have become crimes against his fellow men; and that, if he seeks to make a living or to acquire wealth out of such operations, he is a public enemy who deserves the same restraint and punishment as that meted out to embezzlers, forgers, and counterfeiters. He has learned that the preferred racketeer, who makes a fortune out of manipulating huge corporations, upon whose services and products communities depend, is just as much an enemy of society as the common racketeer who organizes criminal gangs, or piratical labor organizations.

The reconstructed individualist may still aspire to serve as the well-paid officer of a large corporation. He may hope to get a salary of $100,000 a year or more, if the stockholders think he is worth it. The services of responsible heads and subheads of large organizations are undoubtedly worth so much money to investors and to the public that they can properly aim at moderate wealth as the reward of their labors. But no man, except a reactionary individualist (who, if not the brother of a racketeer, will be at least a first cousin), will claim the right to profit out of manipulating securities and properties over which he has been given control as a trustee for those who are dependent upon them. It is respectfully submitted that when such reactionary individualists testify before congressional committees their advice should receive exactly the same consideration as would be given to that of full-blooded racketeers and public enemies.

### THE PERMANENT REMEDY

The permanent remedy for this depression is to enact the laws necessary to reorganize our political economic system, so that our industries must be operated for the primary purpose of employing as many workers as possible at the highest possible wages, while paying the lowest possible compensation for the use of money and property that will induce all necessary investment.

We have been viewing industry upside down throughout the era of capitalism. The only object of primitive industry was to furnish a livelihood to the worker. That should be the primary object and obligation of all industries to-day. If the welfare of those employed were the supreme object of the management of every enterprise, the highest possible wages would be paid and the purchasing power of the masses, upon which all large enterprises depend, would be maintained. We should not have sudden collapses of purchasing power under such conditions. Markets would be maintained. Consumption and production would be naturally related. If we had a planned production, excessive production followed by excessive unemployment would not periodically wipe out capital accumulations. Therefore, money could be more safely invested; and investors, feeling more secure, would be satisfied with lower rates of interest and their purchasing power would be more constant.

### HOW CAN PRODUCTION BE CONTROLLED

Still we face the problem: How are we to regulate industrial production without either accepting private monopoly, or conferring governmental control? The answer might be a simple one; but one which would never occur to the ruthless individualists who have controlled our industries as the means of accumulating wealth beyond their capacity for intelligent enjoyment, and power beyond their capacity for wise exercise. Since, however, this simple answer, which I will first suggest, would probably be intolerable to the present masters of industry, the necessity for legislative action is made more clear and a method of exerting governmental coercion must be devised. But I present the suggestion in order to show what a ruling class could do to avoid political control if it possessed the necessary intelligence, free from the bias of insensate greed.

### THE SIMPLE ANSWER—SELF-GOVERNMENT IN INDUSTRY

If industrial workers were adequately organized, it would be entirely practical to create industrial councils composed of representatives of managers, investors and workers and then to create a national council composed of similar representatives of all essential industries. The council of a single industry would have in its worker delegates the representatives of a large consuming interest. This interest would act as a brake upon any effort of one industry to profit unduly at the expense of another. Ultimately, in the national council, all producing and consuming interests would be so represented that one group could hardly obtain sanction for a policy clearly contrary to the general welfare.

Of course, certain groups of interest under the present system must be eliminated from power in the proposed system, such as the gamblers, the profiteers, and the money-mad megalomaniacs who werck communities and nations of the present day in their pursuit of anti-social aims and insane ambitions. There would be no room in such a reformed system for commercial "Napoleons" who are willing to ruin nations to gratify their appetites and to inflate their vanity. But there would be room for great public servants entitled to wealth and power suited to their demonstrated capacity to serve their country. That should offer a reward sufficient for any decently ambitious man. The gamblers and profiteers should be relegated to the development of new enterprises and those not yet essential to the prevailing standard of living.

It must be evident that this elimination of the most undesirable, but, at present, dominant element in our industrial system could only be brought about by a legal limitation upon profit-making in the essential industries. That is one governmental regulation which would be a necessary factor in any reformation of our political economic system. Such a law would involve only a natural extension of the principle of public utility rate regulation; but improved methods of applying this principle should be devised.

### METHODS OF PROFIT LIMITATION

One method for the accomplishment of this purpose might be a corporation tax which would automatically absorb excessive earnings on investment. Appropriately designed rates for individual income taxes and progressive inheritance taxes would prevent excessive individual profits from being retained. Thus the main incentives for depressing wages and elevating prices would be curbed. Thereby the principal self-destructive influences in the present system would be eliminated. Eventually the widom of a constitutional amendment might become apparent in order to make universally effective the ancient and wise doctrine that usurious gains should be outlawed.

In the near future, however, it would be possible to go a long way in the reformation of the capitalistic system through Federal control of currency, credit, taxation, and interstate commerce. Little legislation would be needed if the present controllers of commerce and finance had the desire and the intelligence to organize and operate industries so as to promote the general welfare. Unfortunately, there is overwhelming evidence that both the desire and the intelligence are lacking. Not only has this evidence been piled up mountain high during the depression, but it was accumulating in great quantity during the previous years. No persons are better acquainted with this evidence than those who have been fighting the battles of organized labor.

### WHY LEGISLATION IS NECESSARY

It should be evident that the business of the production and distribution of services and commodities is essentially the business of organizing workers so so that they may labor and exchange labor products. But, effective labor organization has been, not only neglected, but opposed by large employers The masters of industry, being primarily interested in exploiting their workers and their customers, have persistently sought to keep the workers and consumers disorganized, voiceless and collectively impotent. Therefore, the necessary task of organizing the workers has been partly performed by labor leaders; and the task or organizing consumers has been partly performed by politicians. Since both groups of organizations are constant impediments to profit making, the rulers of commerce and finance have waged constant war on all labor organizations and all political organizations, which they could not control. Thus, the spokesmen and writers representing "big business" are perennially engaged in attacking and misrepresenting labor leaders who are loyal to the workers and public officials who are loyal to their constituents.

No one familiar with the increasing opposition, of those who control the money power of America, to any effective organization of either workers or consumers can indulge in any hope that the present masters of industry will undertake voluntarily their legitimate function of organizing the worker-consumers, so that through accurate registration of consumer needs, and constant adjustments of productive and consumptive power, industrial operations might be conducted for the greatest good of the greatest number. Therefore it is quite evident that through political action a new leadership must be placed in power which will owe its allegiance to the masses of the people; a leadership in which individual ambition and success will depend upon the good faith and ability with which the interests of the masses are promoted and the average standard of living is maintained and advanced.

It follows inevitably that we must undertake political action definitely designed to bring about this transfer of economic power, from those who are now responsible only to an organized money interest, to those who will be made responsible to an organized citizenship. We have universal suffrage. We do not need to resort to violence—unless the freedom of the people to speak, to assemble peaceably, and to organize for collective action is denied by those wrongfully exercising political or economic power. Of course, if those possessed of such power attempt to starve or otherwise compel wrongfully millions of men and women to submit to despotism they will reap the whirlwind they have sown. But when we seek legislative action, we at least can not be accused of advocating revolutionary violence.

### PRACTICAL LIMITATIONS UPON EARLY LEGISLATIVE ACTION

It should not be expected that the incoming Congress will respond fully to the needs of the present time. The organization of industrial and agricultural workers is as yet inadequate to place in both Houses of Congress a working majority of representatives of the worker-consumer interests. Neither the farmers, nor the industrial workers have been adequately organized. Indeed, one of the great tragedies of recent years has been the failure of many labor leaders to measure up to their opportunities.

### INADEQUATE LABOR ORGANIZATION

The labor leadership of America has developed many sound ideas and useful programs. It has accomplished a great deal in defense of labor interests. It has failed to develop a constructive program of attack. Therefore, let me quote a phrase of Brooks Adams which met the approval of Theodore Roosevelt: "The progress of civilization and centralization has depended largely upon the growing mastery of the attack over the defense." The progress of labor has been halted because of a declining mastery of the attack. This has been peculiarly evident since 1929. Organized labor, with an adequate program and a developed technique, would have seized its great opportunity to organize the unemployed, ignoring the hampering traditions of craft unionism and the theories of industrial unionism, organizing the unemployed as citizens, organizing the irresistible force of millions of voters. They would have been organized as men and women denied their inherent right to work. They would have been organized as citizens to demand that their Government destroy any legal barriers that bar willing workers from opportunities to earn a livelihood; to demand that their Government should no longer be controlled by rulers of commerce and finance who have utterly failed to meet their obligations to this Government and to its citizens from whom all their power is derived.

Such a great labor organization, if it existed to-day, would voice its demands in such terms as these:

> We, the people of the United States, are the Government. We support in power every captain of industry and finance. We permit the bankers to control billions of dollars. We permit the industrial managers to control billions of property values and to employ millions of men. We permit individuals to become multimillionaires. And, to our shame, we have permitted millions of our fellow men and women to suffer intolerable privation.
>
> All individual power and wealth rests finally on the permission, on the sanction, of the people—on the consent of millions of human beings. They have the inherent right to withdraw their consent. They have the undoubted power to tear down with their naked hands the supports they are maintaining, upon which all individual power or wealth now rests, because it all rests on the daily labor of those who do the world's work and produce the necessities of human existence.

If the organized labor movement had organized the unemployed millions and given them one mighty arm and voice, this committee would not now be asking the advice of those responsible for the calamity of this depression; nor would this committee be listening skeptically or impatiently to my argument. This entire Congress of the United States would be listening most attentively to the demands of the dispossessed people of the United States telling their Congress to take control of the resources of the Nation and to compel those who may be temporarily authorized to manage the enterprises of the Nation, either to provide a livelihood for every willing worker in the land, or to stand aside in favor of managers who would be zealous and competent to fulfill the obligations of those who are the trustees of the commonwealth and the guardians of the commonweal.

### PRACTICAL SUGGESTIONS CONCERNING LEGISLATIVE POLICE

Since, however, it appears that the workers of the United States are still too inadequately organized to compel adequate legislation to end this depression and to prevent its recurrence, I am constrained, as a practical-minded person, to submit only the following suggestions:

First. Let me warn those who desire to preserve the existing order, but intend to do nothing to reform it, that if this depression continues much longer the unemployed will be organized and action of a revolutionary character will be demanded and will be compelled.

Second. The fatuous argument that the depression will cure itself was answered by the blizzard which recently swept across the Nation. Did we leave the highways blocked with snow? Did we let stranded people die unaided on drifted roads and in isolated homes? Did we close the schools until spring? Did we leave trains stalled in their terminals while commerce halted and cities starved? Did we shut down public offices and suspend the mail service so as to reduce taxes and balance the Budget by matching zero in receipts with zero in expenditures? Did we follow any one of the insane, cowardly, defeatist programs that incompetent, discredited business leaders are now trying to force upon national and State legislatures? Why did we not? We knew that in the procession of the seasons, spring must come and snows would melt and that natural forces would eventually reopen the roads—so that commercial intercourse might be resumed by those who had managed to survive the winter storms. Why did we not let nature take its course?

The answer is obvious. We built the cities and the highways of concrete and steel. We established community living and the interdependence of town and town, of city and countryside. This is the system of modern life which we have constructed. We must keep it operating at any cost. A railroad in receivership must clear its tracks and run its trains. A city unable to pay its policemen, its firemen, and its teachers, must clear its streets.

Does not the same answer apply to our economic system? It is man made. We have constructed it. We must keep it operating at any cost. Even if we are going to rebuild it, or build another system, we must keep it going in the meantime. We can not tolerate further increasing, or even continuing, unemployment on a large scale. We can not carry indefinitely the load of supporting one-third of the workers and their dependents in idleness. We can not meet that steadily mounting cost. We can not wait for spring. We must fight the blizzard. We must clear the roads. We must stop wholesale starvation. We must put people back to work at any cost. We must increase substantially the mass purchasing power. We must use our resources of capital, income or credit to increase consumption, to reduce surplus supplies, by satisfying the needs of suffering millions, and thereby bring about a new cycle of productive activity and increasing employment.

The needs of this emergency demand a fundamental reversal of the hitherto prevailing policy of national legislation. Of course, many States with reduced sources of income and limited credit must reduce public expenditures. Taxes can not be levied to a normal amount on citizens with subnormal incomes. It is a good time to eliminate waste and extravagance in State or national government; because the people will support a sound program of economy. But this is the worst possible time for the Federal Government to reduce salaries, or to reduce employment in useful public work. This is the time when the Federal Government with its vast reservoir of credit should spend every dollar that is needed to bring about vast increases in employment of men and women either in public or private work, which will increase mass purchasing power and start an upward spiral of increasing production and consumption.

### PRACTICAL SUGGESTIONS OF LEGISLATIVE ACTION

National legislative action should proceed along three lines:

1. There should be adequate appropriations for direct relief to support and to supplement the work of State agencies. This relief should be on the basis, not of furnishing bare subsistence but of providing nourishing food, decent clothing and shelter, and the essential comforts for those who are now in want. A $500,000,000 appropriation (S. 5125) is all too little for this purpose.

2. There should be a courageous program to create an immediate mass purchasing power, to bring about a large increase in the demand for necessaries, with the resulting heavy increase of employment to satisfy this demand. Such a program may well provide for extensions of credit to unemployed heads of families (S. 4947) and credits to industrial enterprises to bring about the resumption of operations, which will employ large numbers of adult workers. Such a program, if articulated with a program for increasing the prices of agricultural commodities and reducing or absorbing present surplus production, should have the early effect of increasing the national income and lightening the burden of taxation.

3. There should be a civil mobilization of national resources, through the immediate creation of a national planning council, composed of representatives of major economic interests who recognize the necessity of a planned economy, who are intolerant of gambling in essential industries and who will firmly decline the advice of those who are opposed to coupling the power to serve the needs of the Nation with the obligation to serve those needs. Out of the early deliberations of this council should be developed emergency measures as the experimental steps in a program of permanent economic recovery. These should be made effective promptly by legislation. It would be of little value for anyone to prepare a blue print of such legislation in advance of the organization of the national planning council. But, under the direction of a competnnt, sincere membership, emergency measures could be developed and presented for action by the Congress long before the driving needs of another winter are upon us.

In conclusion, may I submit that there are no insuperable obstacles in the way of economic recovery. There is only the stubborn resistance of men entrenched in power, fearful of the loss of the securities, the privileges, and the satisfactions they have found in the existing system. Supporting this resistance is the inertia and timidity of the myriads who will always prefer to "bear those ills we have than fly to others that we know not of." Against this resistance and inertia and timidity can be mobilized to-day the support of millions who have lost so much that they have little fear of further losses; and the support of those men and women of vision and courage who have always risen in unexpected numbers in great crises to support a leadership that was intelligent, public spirited, and unafraid.

DONALD R. RICHBERG,
*333 North Michigan Avenue, Chicago, Ill.*

FEBRUARY 23, 1933.

Senator HARRISON. The committee has also received the following letter from Mr. James H. Rand, jr.:

REMINGTON RAND (INC.),
*New York City, February 17, 1933.*

Hon. REED SMOOT,
*Senate Office Building, Washington, D. C.*

MY DEAR SENATOR: I would like to submit a plan for concerted reemployment which time would not permit me to explain when I appeared before your committee on Tuesday. I would like to have this added to my remarks.

On this subject I would also like to say that one of the points which should have been emphasized is that American industrial employers must foot 70 per cent of the cost of relief through taxation, with nothing to show in return for the money; or a plan of this kind must be undertaken whereby we will get a big upward push in business activity, at the same time getting work done for the money paid out.

With kind regards, I am faithfully yours,

J. H. RAND, Jr.

(The reemployment plan presented by Mr. James H. Rand, jr., for the record, is here printed in full, as follows:)

REEMPLOYMENT CORPORATION

This corporation is to be organized with a nominal capital, to be subscribed by at least 100 leading business men.

The charter is to provide that any earnings in excess of 3 per cent per annum should be paid over to the Reconstruction Finance Corporation.

The corporation shall be so constituted as to be self-liquidating at the end of five years from the date of organization and such as to qualify for a loan from the Reconstruction Finance Corporation.

The corporation shall undertake only self-liquidating loans and shall devote itself exclusively to financing where the proceeds will result in the reemployment of additional workers through the normal channels of business.

The corporation shall negotiate a 5-year credit from the Reconstruction Finance Corporation in the amount of $500,000,000 at a nominal interest rate not exceeding one-half per cent the first year, 1 per cent the second year, 2 per cent the third year, and 3 per cent the fourth year; and the rate of interest to be charged by the Reemployment Corporation to borrowers shall not be more than one-half per cent in excess of the interest paid by the Reemployment Corporation to the Reconstruction Finance Corporation.

The Reemployment Corporation will loan funds to employers for two years with the privilege of an extension for two additional years at the prescribed rates of interest to any individual, firm, or corporation engaged in an established, going business, provided applicants for such loans fulfill the following requirements:

1. The applicant must have demonstrated the ability to manufacture and sell through continuous, solvent operation throughout the five yearss prior to date of application.

2. The average number of persons employed throughout this period must equal or exceed 20 employees.

3. Applicant must have demonstrated ability to operate at a profit during at least two years out of the last five years.

4. The maximum amount of any or all loans applied for by one applicant shall not exceed $10 per week to be paid out during a 13-week period for each additional employee which applicant agrees to employ, not exceeding the maximum number employed by applicant during any single 3-month period in the year 1930.

5. Applicant must furnish together with his application a sworn statement of assets and liabilities as of the close of the latest fiscal year, certified by any reputable firm of independent auditors, together with a sworn operating statement for five years, showing profit or loss for each year and the amount of Federal income tax paid during each of the five last years.

6. Applicant must furnish a statement of employment, showing average number, maximum and minimum number of workers employed and total pay rolls paid during each of the last five years, and also average number of male and female workers employed and total pay roll for the calendar month preceding date of application.

7. Applicants must agree to the deposit of loan proceeds in a special pay roll bank account, from which funds will be withdrawn only for the purpose of meeting pay rolls and no withdrawals to be made for any other purpose while the loan remains unpaid.

8. Applicants must agree to render to the local member bank (through which the loan has been procured) a monthly report showing the average number of workers employed during the month and total pay roll for the month.

Each Federal reserve member bank throughout the country will be appointed and constituted as an agency of the Reemployment Corporation, authorized to receive and pass upon applications for loans under this plan.

All approved applications will be forwarded to the Federal reserve headquarters in the district where final approval or disapproval will be given.

Proceeds of each approved loan will be forwarded from the nearest Federal reserve bank to the member bank to be deposited to the credit of the borrowing employer in a special pay roll account.

## A Reemployment Plan for Putting 3,000,000 People Back To Work

### THE NECESSITY OF A PLAN

There are 10,000,000 men out of employment to-day. During 1930 the average wage of these men was about $20 per week, or roughly $1,000 per year.

Thus unemployment has destroyed $10,000,000,000 worth of purchasing power annually.

We can only revive this purchasing power by reemploying these men in normal business channels.

The plan proposed below is a simple, practicable method of accomplishing this.

It has been edited and amended by many business and Government leaders.

It is a dramatic, almost war-time measure, with an emotional appeal which can go far toward leading this nation out of the slough of despair into which we have fallen.

Will you take 15 minutes to read and consider it carefully; then give it your indorsement?

The time for action is now, when we can plan to take advantage of the natural momentum of the coming spring season.

### THE PLAN

Explained by a message which in substance would be the introductory proclamation by the Chief Executive of the United States.

### THE SUGGESTED MESSAGE

In time of war it is customary for the initiative to be taken by the President of the United States. We have passed through three years of a great depression and a great emergency. We have battled with forces over which we have had no control. We have reached the place now where we feel that the turn in the affairs of business has arrived.

The business situation at this time is one in which the buying power of 10,000,000 workers has been completely cut off, thus reducing the purchasing power of the country by $10,000,000,000 per annum. Everyone knows that the backbone of the buying power of our industries is the buying by the very employees of industries themselves.

The total buying power has sunk so low that it can not be restored by waiting for business gradually to improve. It can only be restored through a collective, concerted drive for reemployment.

Every employer of labor in this land would be eager to increase the number of his employees immediately if only he could be assured of the restoration of the buying power of the present unemployed workers on June 1.

I am so thoroughly convinced of the truth of this statement that I propose to use all the powers of my office to that end, and I hereby call upon every employer of labor in the United States to volunteer to perform a definite part in a nation-wide program of concerted reemployment. I am asking every division of industry to show its courage and belief in the future of our country by volunteering to assume the responsibilities of employing (to the limit of its ability) starting June 1 all additional workers possible in a united nation-wide program to reestablish buying power and therefore in that way to revive business in all lines.

This program is to be made effective only providing a total of 3,000,000 men are pledged to be put back to work on June 1.

Upon that condition I call upon you to telegraph me your pledge, stating the number of additional workers you will agree to reemploy starting on or about June 1, and carrying through a period of 90 days thereafter, on condition that the entire plan shall be fully subscribed to with an aggregate of reemployment of 3,000,000 workers who are not now employed either full or part time. Furthermore, I ask that your pledge shall be to provide employment for the said employees for at least three days of each week throughout this 90-day period.

Upon receipt of pledges aggregating three million additional workers to be reemployed, I shall at once deliver a proclamation declaring this plan operative. Then, and then only, will the pledges of volunteer employers become binding.

By these pledges about $400,000,000 of buying power will be liberated through the increased pay rolls of the Nation during June, July, and August, and that in itself will guarantee adequate impulse to business activity so that prior to the expiration of the 90-day campaign the increased volume of business throughout the land should require not only the continuance of employment but, in my opinion, a further increase in the workers required—with $1,600,000,000 per year added to purchasing power.

I believe that to-day just this sort of stimulus is necessary to turn the economic trend.

I propose to ask for the approval of a reemployment corporation, self-liquidating and nonprofit making, to be organized by a group of 100 leading business men and so constituted as to qualify to borrow $500,000,000 from the R. F. C.

These funds will then be made available to industry through local banks for the specific and exclusive purpose of expanding pay rolls, the loans to be secured by warehouse receipts on goods manufactured and (or) pledges of accounts receivable when such goods are converted from merchandise into sales. In other words, instead of the R. F. C. advancing money to States, who cill spend it for relief and tax the citizens for payment thereof, under this plan the R. F. C. money would flow directly into the hands of employees, and in return for productive work.

A "back-to-work" committee will be established in each community, to see that any established qualified business enterprise is offered the credit necessary to join in this program.

I believe that the question of the welfare and self-respect of the people of this country demands the substitution of honorable employment for charity. By this program we will immediately relieve the separate communities of the necessity of providing charity for 3,000,000 families. This will greatly reduce the "charity" burden on taxpayers.

The newspapers of the country will give full publicity to the progress being made during the campaign for industrial volunteers by publishing the names of those who have volunteered, and by giving full information as to the employment progress from day to day, both local and national.

Our country is of such vast size and of such great resources that we can, by means of reemployment of 3,000,000 men, accomplish an upturn in widespread business activity, which should carry through the present economic cycle.

### HOW MEN WILL BE REEMPLOYED

A conservative estimate of possible reemployment under this plan, is shown below.

| Occupation | Employed, April, 1930 | Estimate of number now employed | Increase suggested | Increase number employees |
|---|---|---|---|---|
| | | | *Per cent* | |
| Mining | 984,000 | 300,000 | | |
| Manufacturing | 14,110,000 | 8,400,000 | 30 | 2,520,000 |
| Transportation | 3,480,000 | 2,500,000 | 10 | 250,000 |
| Wholesale and retail trade | 6,080,000 | 4,000,000 | 10 | 400,000 |
| Public service | 856,000 | 856,000 | | |
| Professional | 3,250,000 | 2,000,000 | | |
| Domestic and personal service | 4,950,000 | 3,000,000 | 5 | 150,000 |
| Clerical | 4,025,000 | 3,200,000 | 10 | 320,000 |
| Total | 37,735,000 | 24,256,000 | | 3,640,000 |

Employers now employing full force on the basis of less than three days a week would be asked to volunteer to increase the working hours to three full days per week, rather than to add additional men. Where work is now at the rate of a 3-day week or better, employers would be asked to add workers.

### TYPICAL COMMENTS OF EMPLOYERS ON THIS PLAN

1. Something must be done. Ten million unemployed can not be permitted to starve. They must be fed, either by charity or by wages. This plan provides a full return for money invested, with the major risk absorbed by the R. F. C. Since the job of feeding these people is a governmental responsibility, anyhow, this risk must be taken by government in some form or other. This plan insures a good possibility of full return for money invested as well as an immediate upturn in business conditions.

2. The economics of the plan are sound. Of all classes, manufacturers and merchants alone have the money available (or can get the money) to make immediate expenditures. Employees can not buy without pay roll money.

3. Manufacturers and merchants who put money into this plan will get their investment back, because working employees are their customers. The pay-roll money which they pay will return through increased purchases of finished goods.

4. Manufacturers and retailers have been reducing inventories for two and one-half years, so that 90 day production stepped up 15 per cent, can not possibly create an unwarranted surplus of finished goods. Earlier, the plan might have failed. To-day there is an actual shortage in many lines of finished goods.

5. The time of year is right—employment by retailers is showing a seasonal increase; figures from 162 cities show the upward curve has started in all employment; the holiday season is coming as a preliminary stimulus to consumer buying.

6. The plan forms one more link in the chain of reconstruction plans—a farm plan is in preparation; the construction industry is being stimulated; this plan would stimulate employment in general industry and in mercantile establishments.

7. The plan has a reasonable objective—it contemplates only a 3-day week—it aims to reemploy only one-third the people now out of work, yet enough to give a definite impetus to the upward trend.

8. The plan goes hand in hand with the community-chest drives, making it possible for employers to give jobs, while employees who are now employed, give money—for this winter's relief.

Finally, this represents the first definite plan to end the depression by a war-time mobilization of forces. It is a plan with emotional appeal and high publicity value. It has every chance of winning popular approval. It is simple, and can be understood by every unemployed man and every laborer in the United States.

### DETAILS OF THE PLAN

1. It is proposed that a national "back-to-work" committee be appointed immediately consisting of 100 industrial leaders, representatives of all lines of industry and strictly nonpartisan.

2. In addition to this national committee, it is proposed that regional committees of the same characteristics be appointed to carry on the work in each locality, under the supervision of the national committee.

3. The President would next send a telegram to 10,000 of the larger employers of the country, urging them to volunteer to put back to work a definite number of workers on June 1 on three days a week.

4. At the same time, the President would release to the press and over the radio a message to all employers in the United States somewhat as previously given in this paper, calling upon them to volunteer to reemploy workers—with the distinct understanding that each pledge becomes operative only when total pledges aggregate 3,000,000 reemployed workers.

5. The national and regional committees would then take up the work, calling on all employers of labor in every section of the United States and securing from each the number of additional workers or added working hours which each would pledge himself to put into effect.

6. These pledges would be given to local papers and wired daily to Washington, where they would be compiled and published as part of the daily national report. Each local committee would follow through to see that pledges were put into effect on June 1.

7. In order to avoid individual risk, it would be distinctly understood that all above commitments would become effective only when the total pledged employees reach 3,000,000 men. No employer pledging assistance would be obligated unless this goal were reached.

8. As an additional insurance of benefits to employers who volunteered, a "back-to-work" purchase order is suggested. The interchange of these orders between volunteers would stimulate purchasing from the firms who had pledged assistance, and as a result, tend to bring backward firms into the fold.

9. Similarly, posters and window stickers, buttons and emblems would be provided to identify volunteer employers.

10. To provide adequate financing the R. F. C. should make available to a reemployment corporation (self-liquidating and nonprofit making) $500,000,000 to be loaned for 5 years at one-half of 1 per cent. These funds to be made available in limited amounts at low interest rates to qualified employers who are unable to secure local accommodation, but only on condition that the proceeds are to be used to pay wages to additional employees and on condition that loans are secured by warehouse receipts or an assignment of accounts receivable.

Each Federal reserve member bank throughout the country will be appointed and constituted as an agency of the Reemployment Corporation, authorized to receive and pass upon applications for loans under this plan.

All approved applications will be forwarded to the Federal reserve headquarters in the district where final approval or disapproval will be given.

Proceeds of each approved loan will be forwarded from the nearest Federal eserve bank to the member bank to be deposited to the credit of the borrowing employer, in a payroll account.

11. Wholesale and retail outlets, who may not be in position to employ additional people, could become "volunteers" by increasing inventories at least 10 per cent during the 3-month period, any such pledge to become binding only when the reemployment plan is declared operative.

12. After the plan has been declared operative, beginning with the month of June each volunteer employer will be called upon to make a monthly report showing the average number employed during the month and the total dollar pay roll for the month.

## WHAT WE WANT YOU TO DO

This plan has been indorsed by several of the country's representative industrial leaders. However, to succeed it must be sponsored and pushed by an aggressive committee of business men.

You have been selected as a logical member for such a group. If you feel that this plan has a reasonable chance of success (on the condition that it is approved by President Roosevelt) will you help the movement by wiring me somewhat as follows:

> I am favorable to the plan you propose and will endeavor to attend a meeting in Washington within the next two weeks to inaugurate a campaign along these lines.

Obviously, such a reply does not represent a definite commitment on the part of you or your company—it merely expresses your own interest.

James H. Rand, Jr.,
*205 East Forty-second Street, New York City.*

December 7, 1932.

Senator HARRISON. We will hear Mr. Edward J. Grimes, of Minneapolis, Minn.

## STATEMENT OF EDWARD J. GRIMES, VICE PRESIDENT CARGILL ELEVATOR CO., MINNEAPOLIS, MINN.

Senator HARRISON. Mr. Grimes, give your address and business for the record, and then proceed.

Mr. GRIMES. My name is Edward J. Grimes. I am the vice president of the Cargill Elevator Co., Minneapolis, Minn., and also vice chairman of the grain committee on national affairs.

In analyzing the present economic situation we must first of all understand that what we are now experiencing is not a depression in the sense that we are all familiar with the word, but an extraordinary depression due, for the most part, to a radical change in price level from the inflated war-time levels to lower levels normally incidental to times of peace. In the deflationary process some factors in the economic structure have shown more resistance to decline than others. The deflation in grains and most other raw materials has been severe and it appears to be about completed. The conclusion is inescapable that further deflation is inevitable in other factors, particularly manufacturing and distributing costs, and the best interests of all require that the deflation of these factors be permitted to proceed to completion as rapidly as possible. It is my belief that not until this is accomplished can we have a return of employment and prosperity. By "prosperity" is meant a high standard of living, and a high standard of living is quite independent of price levels. Obviously, a high standard of living means that the entire Nation must be producing and high production and unemployment can not go together.

It is obvious that a large percentage of the world debts can not be paid with the present price level. It is also obvious that a determined effort will be made to effect reduction in debts by currency inflation. The unfairness of such a course is apparent and it is hoped that there is sufficient moral courage on the part of our legislators to resist pressure for inflation, although it is, in my opinion, far better to default openly through sheer inability to pay than to face the consequences of concealed default through inflation, for inflation takes the savings of the thrifty, which are urgently needed for rehabilitation, and uses them to retire the debts of others, thereby causing untold suffering without learning anything in the process except to show how easy it is to violate that fundamental principle of civilization, namely, the property right of the individual.

Had it not been for the world wide development of a political philosophy which called for an ever-increasing growth of political authority and control over economic functions, it is my belief that this decline would have been orderly and of nothing like the violence or depth of decline of price levels which we have actually experienced. I ascribe to these ill-advised political attempts most of the stagnation existing to-day in domestic trade, with the attendant circumstances of heavy, wide-spread unemployment and suffering and distress among our farm population; in fact, nearly all the maladjustments in the factors that constitute our economic structure.

Yielding to the insistent demands of special groups and factions, Government through legislation has progressively undertaken to prescribe formulæ for the conduct and direction of industry and commerce. In many fields legislative restriction and regulation have been the chief causes of tremendous shrinkage in the volume of trade.

In general, the effort of Government to control economic behavior has produced disastrous results. This legislation has injured those it intended to help. Economic ills can not be cured by formula, as it is quite impossible to throw a formula across a living flow; the flow goes on and the formula remains behind to hinder and impede. The futility of formula legislation can be observed in the failure of our tariff policies to provide anything but temporary relief.

A fair and impartial analysis of the causes of present conditions undoubtedly will show our tariff policy is partly responsible for the spread of nationalism throughout the world, a situation that has played havoc with international trade. Nationalism, intensified also by formula legislation, such as the agricultural marketing act, has prostrated a large part of our agriculture. Formula legislation has institutionalized our railroads, freezing their freight rate schedules high above levels needed to promote free interchange of goods. Legislation of this type spawned the agricultural marketing act. The paralyzing effect on our agriculture of that tragic experiment can now be observed on every farm. Indirectly, legislation has written unnecessary inflexibility into the wage schedules of many of our important industries. It is now proposed to apply restrictive legislation to agriculture by governmental control and limitation of acreage and production. Because of the enormous costs of administration and the inadequacy of the relief offered to agriculture, all of these plans and schemes are foredoomed to failure. Farmers, and other citizens as well, are demanding real relief by the drastic reduction of taxation, and taxes can not be reduced if governmental activities and expenses are increased.

Government has also heavily invaded the field of private business, spreading hesitancy and fear. The destruction in our business and social life created by formula legislation is only part of the picture. Coincident with the development of this theory of government, the expenditures of government have been so heavily increased that public and private credit has been seriously impaired and excessive taxation threatens property confiscation.

It appears plain that much of our present distress is traceable to political influence upon the economic order.

The possibilities for improvement in conditions are almost unbounded if political and economic factors can be brought into fair and proper equilibrium. The forces of recovery are forces of correction and adjustment. Taxes, freight rates, rents, labor, power, and finished goods must be brought into alignment with the levels of basic raw materials in order that free interchange of commodities and services may be facilitated. Employment will increase and goods will start moving as the exchangeability of goods and services is adjusted to an equitable and balanced basis.

This adjustment process is slowly moving forward and conditions will improve rapidly as soon as the adjustment is completed. Every artificial restraint imposed to aid any special group serves as a deterrent in accomplishing what must eventually take place in the course of time. This means adjustment in the unit cost of some classifications of labor, but labor as a group will immensely profit by the elimination of unemployment and the increased purchasing power of the wage scale of laboring men and the income of the farmer. Failure to adapt in any field to the changed order only fosters and promotes the growth of competitive enterprises in that field. Observe that this is now developing rapidly in the transportation field. The extensive growth and popularity of bartering societies is another indication of the trend in that direction.

As these adjustments are consummated, our industries will be able to compete in the world market on finished goods. Tariffs can then be safely lowered and should be reduced to restore international trade volume. It is not possible to suppose with the modern rapid means of communication that America can long pursue an isolationist policy, and the quicker we adapt ourselves to the world outlook the better for all concerned. Because of America's commercial supremacy, it is advisable for this country to assume leadership in removing the barriers that impede the flow of the world's commerce.

The alternative to this policy is American isolation and the extension of the spirit of intense nationalism, the devastating effects of which can now be observed throughout the world. Artificial barriers to international trade are responsible for much of the present world distress.

The irrational extension of the spirit of nationalism not only provides an excellent background for the breeding of international discord but it, necessarily, compels the adoption by every nation of policies of government that restrict and imperil the freedom of the individual. Dictatorships are already common in Europe. Americans are not ready to accept a theory of government that curtails freedom. A liberty-loving people, they have already grown restive under the yoke of too many regulatory laws and are demanding less interference by Government with their personal freedom.

The following measures are suggested to hasten business recovery:

First: Drastic economies in Federal, State, and local government expenditures, so that public and private credit may be restored.

Second: Drastic reduction in all taxes. The blight of heavy taxation today threatens property confiscation and has practically destroyed values.

Third. Reduction in railroad rates. This would provide a tremendous impetus to trade revival, and furnish conspicuous relief to agriculture. Railroad rates are approximately 50 per cent higher than 1916 levels, in terms of money and much higher in terms of the present value of deflated farm commodities. Railroads are the victims of inflexible wage schedules, heavy taxation, and are entangled in the complexities of regulation, but they can not be excused for failing to make reductions in their freight rate schedules. Since 1929 they have effected great economies by laying off men and reducing pay rolls, but their financial positions have grown steadily worse because patronage has declined in even greater ratio. It is obvious that tonnage can be attracted to the railroads only by reduction of the rate level, which is far out of line with the current price levels of the staple commodities transported. Railroad management, ownership, and labor, in their own interest and in the public interest, must combine and provide the country with a rate level adapted to the changed conditions of to-day. Then railroad employment will increase and local and sectional interchange of goods will be stimulated.

Fourth. Drastic curtailment of bureaucracy, which is a stifling competition and destroying the freedom of the individual.

Fifth. End enactment of class legislation. Activities of organized minorities should be discouraged and effectively suppressed.

Sixth. Repeal uneconomic legislation and remove restrictions that interfere with exchangeability of goods and reserves, so that markets both at home and abroad may be opened to farmers and laboring men.

As a business man engaged in handling the products of farmers, I thoroughly agree with the policies expressed by a hundred farmers near Wanamingo, Goodhue County, Minn., in the following petition recently signed and forwarded to the President, President elect, and Congressman A. H. Andresen:

> We, the undersigned dirt farmers, demand the immediate repeal of the marketing act, disposal of the Farm Board and liquidation of its affairs as quickly as possible, and cancellation of all activities now being considered for farm relief. We want only drastic reductions in our Government expenditures, so our taxes will be reduced 50 per cent, and lower interest rates on our present indebtedness and our just dues in tariff protection. And, last but not least, when this is accomplished, leave us alone.

Senator SHORTRIDGE. Mr. Grimes, you are engaged in just what line of enterprise?

Mr. GRIMES. I am in the grain-elevator business. We buy the grain from the farmer in the country, we also buy it in the terminal markets of the country, Minneapolis, Chicago, Milwaukee, Omaha, and we handle it and then ship it both into interstate commerce, that is throughout the eastern United States, and also abroad.

Senator SHORTRIDGE. In the course of your very thoughtful statement I was attracted by your views or as to what you said concerning tariffs, and, as you said, perhaps the development of the national spirit among the different peoples of the world. There are, of course, many nations, and each nation, of course, is striving to develop itself and benefit its own people.

Mr. GRIMES. Yes.

Senator SHORTRIDGE. You suggest that we might lead the world in striking down what you say are barriers—reducing the tariff duties upon the various articles of import into the United States?

Mr. GRIMES. Yes, sir. It is my belief that this nationalistic spirit abroad has been engendered and built up by retaliation against the United States for the very high tariffs that we have in this country against the imports from abroad. It has also been an outgrowth of the policies such as our agricultural marketing act where an attempt was made to force Europeans to come in and pay what might be called a much higher price for grain than would be justified probably by actual supply and demand conditions. In other words, they put on the tariff in order to stimulate the production of grain at home because they had no assurance that they would be able to buy grain from the United States on a basis that might be considered to be fair and equitable. In other words, I think that the spirit of nationalism throughout the world is due in great part to policies that have come from ourselves and from our Government.

Senator SHORTRIDGE. Well, may we not agree that practically all the nations of the earth had what may be called protective tariffs before we increased ours here recently? In other words, put it this way:

It is not a fact, is it, that the other nations have raised their tariff duties because of our increase in certain items?

Mr. GRIMES. That is my understanding, that we have been the leaders in tariff.

Senator SHORTRIDGE. All right. Of course you have in mind the purposes of the tariff?

Mr. GRIMES. Yes.

Senator SHORTRIDGE. First, it is to raise revenue. I merely want to get your view. The second bill that was passed here by our Government way back yonder, signed by Washington, was avowedly a protective tariff bill. And the purpose of the bill was set forth as being, first, to raise revenue. Second, in order to pay the national debt. For we commenced, you know, with a national debt. We have always had one save once in a little period when it is claimed we owed nothing. And, third, to encourage American industries. Well, you remember that England had laws preventing the Colonies from manufacturing. We had to buy from England. Therefore, to raise revenue in order to pay the expenses of government and pay the national debt and encourage American industries—those are the words in the act—that law, the second one ever passed, was enacted. Now are not those the purposes to-day of a wisely constructed tariff bill, to raise revenue and to encourage, let us say, American manufacture and business?

Mr. GRIMES. In my opinion they are probably wise purposes. But it is also my opinion, and carefully considered, too, that it has far exceeded the basis of revenue. It has become, in my opinion, merely a subterfuge for industries to come down to Washington and ask for a basis by which they may be able to purchase goods behind a high tariff wall. In my opinion that has brought about a good deal of this stagnation.

Senator SHORTRIDGE. Well, it may be. There is a constituent of mine, Mr. Hearst, who publishes many newspapers, who is urging in America to buy American produced goods. "Buy in America." What have you to say about that slogan?

Mr. GRIMES. I do not subscribe to it at all.

Senator SHORTRIDGE. You do not?

Mr. GRIMES. I do not.

Senator SHORTRIDGE. Take newspaper print paper. There is a mill up in the State of Washington manufacturing newspaper print paper. Do you think it is the better policy to close down that mill and buy all our newspaper print paper from Sweden, for example, or develop our home industry?

Mr. GRIMES. Well, in the first place let me say this, that since the days of Washington, and since the days even of a very recent period, we have changed from a debtor Nation to a creditor Nation, and of course the philosophy of tariff legislation is entirely different to-day than it was even 25 years ago. Now when it comes down to the protection of an industry such as the mill that you named, it seems to me that that is just incidental to what is best for the majority of the people in the country.

As I see it your tariff legislation has been a colossal failure, because notwithstanding that we have raised the tariff four or five times in the last 10 years, each time we found it was not sufficient, and that we have had to go ahead and a few years hence make another change. And to-day we find ourselves prostrate and it is not sufficient to-day.

Senator SHORTRIDGE. All right. I merely mentioned that one as illustrative of a doctrine. Take the poultry industry—and I have in mind the far-away Pacific coast. Take the poultry industry. Those engaged in that industry can not compete with China. Why? Because they can ship that product in here and sell it at such figures as would put out of business the poultry industry. You might say that is all right, but if that be a fact as to the paper manufacture and as to the poultry industry—and I am citing these two as illustrative of the doctrine—do you think it desirable for us to rely upon the foreigner for our products, or to manufacture them ourselves, giving employment to our own capital and to our own people?

Mr. GRIMES. My recommendation in there does not mention that the tariff that has been built up through all these years should be torn down completely and at once. I make the suggestion that reciprocal relations might be made with foreign countries whereby the interchangeability of goods and services between these countries could be helped along.

Now, as far as poultry or any of the agricultural products are concerned, it is my opinion, and in fact I think that any fair-minded person will agree, that the farmer in the United States has borne the brunt of the deflation. There is practically nothing that he raises that is not right down to almost an absolute bottom. And I would say this, that if you are going to make tariff restrictions, or tariff changes, they should be made on such articles where there is exaggerated protection given to industry. That is my point.

And I say this. I believe very thoroughly in this, that unless we do adopt a spirit, a philosophy of government, where there is going to be interchange between nations, that we have got to go into our shell, we have got to reconcile ourselves to a pattern of life where what a man may do will be prescribed by government. Now that is socialism. Nationalism is only another name for socialism. And I say that my own idea is that I believe that it is un-American; the curtailment of the freedom of the individual is something that does not go along with our ideas of life.

And I think this, regardless, Senator, whether we like it or not we are coming to a period when we are going to be forced into international trade in some form or other. For instance, we have ten or twelve million men out of employment in this country—men who probably are out because of the tariff—many other causes, perhaps, but the tariff is one of them unquestionably. Now what is going to happen? You are going to find that the laboring man who to-day is protected by a tariff wall—of course if his employer is protected by a tariff it just means that he is going to be held up by labor, which of course, is fair—it means this, that the people who are out of work to-day will do, just like they are doing now—you will find, as I say in my statement, that barter societies are springing up. We have one in Minneapolis where the people who are unemployed are getting together with the group system and they are exchanging goods for services. Now how long is it going to be before the ten or twelve million people in this country get together and start undermining the very job that the high wage man has to-day?

Now when we flatten out here to a world basis where the trade commences again, why, as I see it, reemployment is inescapable. And as I say—maybe there is some fault, maybe there is some flaw in what I said, but it seems to me not only inescapable but it also seems to me that it is the logical thing to do.

Senator SHORTRIDGE. Of course, you agree with some of us that these foreign nations should pay us what they owe us?

Mr. GRIMES. I listened this morning to a very scholarly statement on international debts, and I must say that I am not qualified to say how that ought to be settled. It is far beyond my power to say how it should be done.

Senator SHORTRIDGE. What does your corporation do with its debts?

Mr. GRIMES. We pay them, I know that.

Senator SHORTRIDGE. Why certainly. When you enter into a valid agreement to pay certain sums at a certain time you endeavor to observe and carry out the contract.

Mr. GRIMES. Yes.

Senator SHORTRIDGE. Well, now, Great Britain is a sovereign, independent kingdom. Italy is a sovereign, independent kingdom. So is Latvia, so is Esthonia, so is Czechoslovakia. And when they entered into a specific, plain, clear, understandable contract, voluntarily entering into it without coercion, without threats, without duress, I would be glad to have you tell me why those nations severally should not observe their contract even as two honorable business men or two corporations are expected to observe their contracts?

Mr. GRIMES. There is no question but what they should be made to pay everything that they can be made to pay. Of course, sometimes there arises a situation where sheer inability controls the situation.

Senator SHORTRIDGE. Well, of course, there is no international court into which a nation may go and plead insolvency. And I undertake to say, and I want to get your view, that if there were an international court into which a given nation could go and plead insolvency or bankruptcy, thereby to escape the payment of its obligations, I undertake to say there is not one nation in Europe that would dare to go into such a court and make such a plea.

Mr. GRIMES. That ought to be a fair test, it seems to me.

Senator SHORTRIDGE. I thank you for your views.

Senator HARRISON. Thank you very much.

Mr. GRIMES. I thank you for the opportunity of appearing.

Senator HARRISON. We will next hear Mr. Davis.

## STATEMENT OF GEORGE H. DAVIS, PRESIDENT, DAVIS-NOLAND-MERRILL GRAIN CO., KANSAS CITY, MO.

Senator HARRISON. Mr. Davis, will you give your name, your business, and your address for the record.

Mr. DAVIS. George H. Davis. President, Davis-Noland-Merrill Grain Co., Kansas City, Mo. We operate a 10,000,000 bushel grain elevator. We are grain merchants and grain exporters.

On the day that I received the request from this committee to appear there was an item in the Kansas City Star of 40 years ago. It is just a small item, and with your permission, I will read it:

> The much debated antioption bill, designed to close up all the grain exchanges in the country, passed the Senate 40 to 29, yesterday. It already had passed the

House. Its proponents are jubilant. When the bill finally becomes a law, in a few weeks, there will be no more grain speculation in this country, so they say.

Fortunately for the farmers of the country that bill was vetoed, and the grain exchanges were not closed up.

Senator HARRISON. Who vetoed that?

Mr. DAVIS. I think President Harrison. Cleveland was inducted into office in 1893. So it must have been President Harrison.

Senator SHORTRIDGE. Forty years ago?

Mr. DAVIS. Forty years ago.

Senator SHORTRIDGE. What was the purpose of that act, did you say? To do away with grain exchanges?

Mr. DAVIS. To do away with grain exchanges. That was in the panic of 1893 when we had low prices corresponding to present low prices. Whenever prices are low we naturally endeavor to do something about it. And the favorite attack has been on the method of handling grain in vogue at the time. I was in the grain business at that time, keeping books, and I remember that we figured we would be out of business. Now since that time wheat has sold as high as $3.65 a bushel, and it never sold as low as 40 cents until the past year.

Senator SHORTRIDGE. What is it to-day?

Mr. DAVIS. Around 48 cents basis Chicago. Using that as a basis.

Now there are barriers that have brought about our recent troubles. For years we got along in the grain business. We had our ups and downs. The farmer did not get as much as he wanted at times. At other times he was satisfied. Those conditions are like all other conditions—supply and demand ultimately reign. Beginning our barriers, we started out in our sister country up here to run a grain pool. They tried to hold up wheat to $2 a bushel, and their avowed purpose was to starve the foreigner unless he paid that. They met the usual fate of the artificial means of sustaining prices.

And then we came along with our Farm Board act—our agricultural marketing act. Wheat at that time, as you remember, was about $1.25 a bushel. For three years we have had nothing but uncertainty. We have driven the people who usually hold up prices out of business to a large extent. We have passed artificial rulings until a miller is afraid to have any quantity of wheat on hand—the small millers scattered over the country. The speculator who usually buys grain, when movement is very heavy, has been frightened into staying out of the market because he knew that the Government had accumulated a vast amount of grain that would be dumped some time. He did not want to be long in grain when it was dumped, so natuarlly he stayed out of the market.

Now the grain exchanges usually get the credit for any decline in prices. The grain exchanges have nothing to gain by low prices. In our own business as handlers of grain, if wheat is a dollar a bushel we do not have any trouble at all getting 1 or 2 cents profit. It is practically impossible at present prices to get a half a cent a bushel handling grain through an elevator. That means taking the carload of grain in and possibly cleaning it, and mixing it, and loading it out in the car again and giving the miller the exact kind of grain, special protein, and so forth, that he desires.

Senator HARRISON. So the better the price the more profit you make?

Mr. DAVIS. The better the price the more reason there is for more profit. So there is not any reason under heaven why the grain man desires the price to be low. I say that as a grain man. I am a farmer. I raise livestock and I grow grains of various kinds. And I know what the problems of the farmer are. And, of course, it is terrible. But it does not help him any to be constantly restricting the grain exchanges who handle this grain.

As an illustration, there are times in Kansas City when we get 2,000 cars of wheat in a day. That is practically 3,000,000 bushels of wheat. Now, as an elevator, we have bought as high as 500,000 and 600,000 bushels of that grain—my own firm. Now we can only buy it at what we can hedge it. That is our insurance just the same as any insurance.

Senator HARRISON. As soon as you buy you sell?

Mr. DAVIS. Yes; we sell. Now there must be some one to float that wheat along until it is needed. There is not a demand for 3,000,000 bushels of wheat in Kansas City on one day. And as long as the farmer is compelled in a good many instances to sell the bulk of his wheat in the first 60 days, why he must have a market for it. And we supply that market.

Now the speculator looks forward—he can not influence the price, but the speculator can look forward to the prospects of a short crop in our Northwest or in Canada, or a short crop in any part of the world, and he can see that later on there is going to be a good demand for wheat. So the speculator buys the future. We buy the cash wheat and put it in the elevator and sell it in the future. We do the financing; we do the insuring. And it is an economical method of handling grain. It is the best method that has been developed from the best brains in the grain business.

Now what has caused our trouble has been the restrictions that have been put on that speculator, as you call him. As was stated here this morning, you might call a spade a spade. Now our interest in the price of this grain if anything is to see it go up, because we can get a fair profit out of dollar wheat where we can not out of 40 cent wheat. But if you destroy our hedging facilities this wheat sinks to the bottom, because there is no water in the river to float it along.

Senator GORE. All the risks are shifted back on the farmer, is that the idea?

Mr. DAVIS. No, the farmer, Senator, has carried the risk up to the time that we buy his wheat. Then the speculator takes the farmer's risk.

Senator GORE. I understand. But now suppose that when you buy the spot wheat or the cash wheat you can not sell futures against it.

Mr. DAVIS. That is the point.

Senator GORE. Then you can not re-insure against the fluctuations of the market?

Mr. DAVIS. Then instead of handling wheat for one-half to 1 cent per bushel we would be compelled to get 5 or 10 cents a bushel to insure us against decline in the market.

Senator GORE. And who would pay that insurance?

Mr. DAVIS. The farmer would pay it.

Senator GORE. That is the point I was trying to make, that the risk of the added uncertainty would be shifted back to the farmer.

Mr. DAVIS. Absolutely.

Senator SHORTRIDGE. When you buy the wheat the wheat is yours is it not?

Mr. DAVIS. Yes, sir. We pay for it.

Senator SHORTRIDGE. You pay for it?

Mr. DAVIS. Yes.

Senator SHORTRIDGE. You either sell it or you hold it for future sale, do you not?

Mr. DAVIS. Yes. But in the meantime incidentally we sell a future contract against it called hedging, which protects us against loss coming down. Of course if the market goes up we get that much more for our wheat in our elevator.

Senator SHORTRIDGE. Who are they with whom you contract to sell it?

Mr. DAVIS. Those are speculators, or possibly a miller who has made a foreign sale abroad for deferred shipment. You can not sell grain abroad when you want to sell it. You must sell grain abroad when they want to buy it.

Senator GORE. Mr. Davis, as a grain man, when you buy cash wheat could you afford to buy cash wheat and hold it unless you could hedge against it?

Mr. DAVIS. Not unless we had 5 or 10 cents a bushel margin. We could not do it on the economical basis that we handle it now.

Senator GORE. When you sell your future contract against your cash wheat you do not know whether it is being bought by a speculator or whether it is being bought by a miller who wants to demand delivery on it in the future?

Mr. DAVIS. No. And we do not care.

Senator GORE. Suppose we passed a law here that when you want to sell a future contract to hedge your wheat you must look around and find somebody that wants to buy futures with a view of demanding delivery on it when the time comes, that would break down the system, would it?

Mr. DAVIS. It would destroy the market. Because you must have buyers and sellers, and you must have a continuous marker to be of any value.

Senator GORE. You have to sell now. When you buy you have got to sell.

Mr. DAVIS. Yes.

Senator GORE. You can not take the chance?

Mr. DAVIS. And we have to maybe buy back to-morrow if we sell that wheat to a miller.

Senator GORE. Then you cover your hedge?

Mr. DAVIS. We cover our hedge.

Senator THOMAS of Idaho. Your contention is that the legislation of the Farm Board had a tendency to destroy speculation?

Mr. DAVIS. It drove the speculators out of the market, because the Farm Board became the big speculator, and when a speculator tries to make water run uphill every one knows that he has just one end. That he will have to liquidate that wheat at a loss.

Senator THOMAS of Idaho. I understand. Now, Mr. Davis—and maybe I am disturbing your line of thought?

Mr. DAVIS. That is perfectly all right.

Senator THOMAS of Idaho. There is pending now before the Congress the farm allotment bill. I assume you know about that?

Mr. DAVIS. Yes.

Senator THOMAS of Idaho. I would like to have you comment on what you think of the advisability of enacting the allotment bill so far as wheat is concerned.

Senator GORE. Senator, might I ask him one question in connection with this other matter? It will avoid reverting back.

Senator THOMAS of Idaho. Yes, Senator, go right ahead.

Senator GORE. Mr. Davis, I have heard it stated that the laws passed by Congress and the regulations of the departments have driven some of the largest speculators out of the wheat market, and that that is one reason why we have had a sagging wheat market. That that is one of the contributing causes. Do you think that is true?

Mr. DAVIS. Yes; I don't think there is any question about it, Senator. It has not only driven large speculators but it has driven small speculators out.

Senator GORE. Mr. Cutten in his articles in the Saturday Evening Post said that he, himself, was out until the Government stopped too much regulation.

Mr. DAVIS. To get the price of wheat up—can I finish that, and then answer your question, Senator?

Senator THOMAS of Idaho. Certainly. Go ahead.

Mr. DAVIS. We have got to get the Government out of the grain business if we are ever going to get the price of wheat up.

Senator GORE. Another question on that point. Of course everybody knows that there are enough uncertainties in the wheat market as in every other market at best. Now is it your idea that the Farm Board added to those uncertainties?

Mr. DAVIS. Absolutely. Anything that is artificial immediately stops the natural flow of grain because it frightens the legitimate trader out of the market.

Senator GORE. You mean the grain merchant could not tell when the Farm Board might unload its wheat?

Mr. DAVIS. The grain merchant could not tell when the Farm Board might unload its wheat, or what they were going to do next. I will give you an illustration. You remember in 1930 the stabilization was supposed to be over. And the southwestern farms proceeded to buy wheat and put it down at the Gulf. We were doing a regular export business. We had bought several million bushels ourselves. We were selling that wheat abroad. The prices were in the 70's—somewhere between 70 and 80 cents, probably in the 70's, as I remember. Then without much warning you will remember in October or November, on account of the banking situation in Virginia and Kentucky—I am using the words that were quoted—they suddenly started to stabilize grain again. Immediately it killed off our export demand and stopped that flow of that surplus grain. If they had not done that we would probably never have had within fifty to seventy-five million bushels as much grain stored up as they finally landed with.

Senator HARRISON. How much have they got stored up now?

Mr. DAVIS. They have practically no cash grain.

Senator GORE. How much futures?

Mr. DAVIS. The last official report showed that they had about 36,000,000 bushels of futures. But the general opinion is that they have sold about half their future holdings. That is what keeps the market from going up. Every time it has started up recently they have started to sell some more of that wheat. And conditions are very bullish on wheat at present. The prospects out in the Senator's country (Oklahoma) and where I come from and west of Kansas City are the worst I have seen in years. And if we had a normal speculative market my judgment is that wheat would be 10 or 15 cents a bushel higher.

Senator HARRISON. What was the largest amount the Farm Board had on hand?

Mr. DAVIS. As I remember it, about 256,000,000 bushels.

Senator GORE. I have been told that every time wheat tried to rise, so-to-speak, the Farm Board would push it back in the water, either by dumping cash wheat when they had it, or by selling their futures.

Senator SHORTRIDGE. What was the reason for that? Have they assigned any economic reason for doing just what Senator Gore suggests they did do?

Mr. DAVIS. Why, it is fear. After you make one mistake you usually continue to make mistakes. When you start in on an artificial campaign you never know when to stop. It is just like when you start telling a lie, you have to keep on telling lies to make it good.

Senator HARRISON. That is merely because when it goes up 2 or 3 points they think they had better go out and sell, and that shoves it down.

Mr. DAVIS. Yes.

Senator HARRISON. And then they wait awhile and it goes up two or three points and they get out a little more.

Mr. DAVIS. Yes.

Senator GORE. And you people can not tell how much more they will unload. That is the point I was trying to make.

Senator THOMAS of Idaho. As a matter of fact, some time last year they had disposed of practically all of their cash wheat, had they not?

Mr. DAVIS. After the two Red Cross donations.

Senator THOMAS of Idaho. Yes; that is what I mean.

Mr. DAVIS. That fairly well cleaned them up.

Senator THOMAS of Idaho. But in the meantime they had accumulated futures.

Mr. DAVIS. Yes; they had.

Senator THOMAS of Idaho. Did they not make an announcement to the public as to the policy of their handling of those futures at that time?

Mr. DAVIS. Yes. They said they would not sell them until after the 1st of January. Now, normally we would believe that. But they also made the statement that there would be no more stabilization after July 1, 1931. And within six months they were at it stronger than ever. So the trade naturally said, "Well, we will stay out of the wheat market until they get through."

You can not put restrictions on indefinitely, keep one restriction after another on trade and expect the trade to go along and function under them.

Senator SHORTRIDGE. You are opposed to the Government going into the wheat business?

Mr. DAVIS. Absolutely.

Senator GORE. When they were pegging wheat in 1931 was not May wheat around 80 and 81 and July wheat around 60?

Mr. DAVIS. Yes.

Senator GORE. Due to this artificial pegging?

Mr. DAVIS. Yes. Now, if that had been a normal condition foreigners would have bought cash wheat. If the grain trader in this country had known the conditions were to be normal we would probably have sold a large volume of wheat for forward shipment and bought the July against it. But we did not know whether we would be permitted to export any wheat, so of course that business went by the board.

Senator SHORTRIDGE. What nations are our foreign purchases of wheat?

Mr. DAVIS. Well, that fluctuates from month to month practically. For instance, Germany as a sample: Germany raises a large volume of soft wheat. Germany has a tariff of $1.62 against our wheat. But Germany can permit them to export some of their soft wheat and buy our hard wheat without that duty. Export conditions change from time to time.

Senator SHORTRIDGE. Certainly. Does England buy wheat?

Mr. DAVIS. England buys wheat.

Senator SHORTRIDGE. Does Italy buy our wheat?

Mr. DAVIS. Yes.

Senator SHORTRIDGE. And France?

Mr. DAVIS. Italy buys what we call durum wheat, what we call macaroni wheat. And France is a soft-wheat country and buys soft wheat. But those conditions change from time to time.

Now, the reason that those barriers originally were put up was to encourage home production, because Canada announced they were going to charge them $2 a bushel—they started it, and then we came along with the Farm Board and announced that we were going to charge them $1.50 or $2.

Senator GORE. Canadian pools made that announcement about five or six years ago, did they not?

Mr. DAVIS. Yes.

Senator GORE. That they were going to raise the price of wheat to $2 and keep it there?

Mr. DAVIS. Yes.

Senator GORE. Was not there immediately following that both in the Argentine and Australia a large increase in the wheat acreage?

Mr. DAVIS. I can not give you the figures, but there was an increase.

Senator GORE. Naturally.

Mr. DAVIS. It was pretty substantial. Because it would be very profitable for them to raise wheat at any such price as that.

Senator GORE. They increased their acreage to get the benefit of those $2?

Mr. DAVIS. Yes. And they immediately increased their acreage in the countries that were to be starved out. So that was just one of the barriers.

Now getting back to answer your question, Senator Thomas.

Senator THOMAS of Idaho. Yes; I will be glad to have you answer that question.

Mr. DAVIS. I will start out in this way. Wheat has sold 30 cents a bushel lower than it ever would have sold, due first to the restrictions put on speculation by the Capper-Tincher "snooper" act, we call it.

Senator Harrison. What act?

Mr. Davis. The Capper-Tincher.

Senator HARRISON. What else did you call it?

Mr. DAVIS. "Snooper" act.

Senator SHORTRIDGE. Why do you use that word?

Mr. DAVIS. Because when you have agents in the different markets that have authority to go around and ask how much wheat you were long on my books, and whether it was a sale against future or whether it was speculation, or what it was, you must get down and explain to them. For instance, we are in the elevator business. We have on hand now about 9,900,000 bushels of wheat hedged. They do not pay any attention to us; they say that is perfectly all right. But that man can come in and look at our books at any time and see whether you happen to be long on wheat or William Allen White or some one else that happened to think that he could sell his crop of wheat. I have sold wheat on my farms frequently and bought futures because I was not satisfied with the price. Sometimes I wished I hadn't. But it certainly ought to be my privilege to do that. But you would not like to have it brought out that you were long 25,000,000 bushels of wheat, probably. So I call it a "snooper" act. It has certainly done no good, and it has done lots of harm.

Senator GORE. Have they not got a regulation or gentlemen's agreement that they shall not carry more than a certain number of bushels at any one time?

Mr. DAVIS. Well, there was an agreement made by the bureau with the Business Conduct Committee of the Chicago Board that the Business Conduct Committee would sit in judgment on a trader as to whether he should have more than 5,000,000 bushels of wheat long. Right now if some of them had 25,000,000 millions bushels it certainly would be a godsend, because cash wheat would likely go up; if we had these restrictions off and would allow it so that some one would carry the load until the time when the cash wheat demand would come for export.

Senator GORE. But if Cutten wanted to buy 25,000,000 bushels of wheat he could not do it under that arrangement?

Mr. DAVIS. No, he could not do it. Because he knows that they have authority to come around and under this "snooper" act expose his business relations to the public gaze, which, of course, probably would defeat his plans, because he probably bought that wheat considering that there would be a short crop next July or August or September. He does not expect it to go up at the moment.

Senator GORE. In that connection, Mr. Davis, will you explain the effect of the tax that we placed in the revenue bill last year on these transactions on the board of trade?

Mr. DAVIS. Well, we have the equivalent of a 5-cent per $100 sales tax on all future trades in grain. Naturally that decreases the volume of trade. In a time like this when we need every encouragement to hold prices up it decreases the volume of trade that is necessary to hold these prices up until we absorb this surplus that we have. Now if that volume were larger we would not have any trouble carrying this surplus, because with the present crop prospects in my judgment we will need all of this wheat inside of the next year, and we certainly could afford to pay 20 cents a bushel more than it is selling for to-day. That is the reason why the tax cuts down the volume. We need the volume to carry the hedges against this grain in our elevator, and others.

Senator GORE. In the last analysis who do you think bears that tax?

Mr. DAVIS. The farmer. We are down to a point where we are handling grain for practically nothing.

Senator GORE. One man told me that his tax in a day was $32. He said that on a good day he made a little profit, but then with two or three bad days it washed out.

Mr. DAVIS. And he is out of the market. And therefore you have the man who would help hold up this load, without being paid for it, eliminated from the market. You have eliminated him from the market. You have the tax, and the Capper-Tincher Act, and the agricultural marketing act all interfering with this trade. I have not forgotten your question, Senator Thomas. Now you are getting around and proposing that you put on some more artificial measures, see?

Senator THOMAS of Idaho. Another tax.

Mr. DAVIS. Another tax. Any way you want it. The position that we take is that any artificial restriction on the free and open movement of grain is bound to depress the price ultimately and therefore hurt the farmer.

Senator THOMAS of Idaho. Do you think this additional tax proposed by the allotment plan would have a tendency to retard the orderly marketing of the product?

Mr. DAVIS. It certainly would cut down, in my judgment, the consumption of flour about 25 per cent. Which would far offset anything that you could possibly move out of the country.

Senator GORE. Mr. Davis, the trouble with the farmer to-day is that there are not consumers enough in this country with purchasing power enough to absorb the large production of wheat—is that not true? Even at prevailing low prices?

Mr. DAVIS. I would not agree to that, Senator, for this reason. We had in Kansas the year before last 240,000,000 bushels of wheat. One State. Last year, 106,000,000 bushels of wheat. This year probably less than 75,000,000 bushels. In a country the size of this we should carry over, in my judgment, at least 200,000,000 bushels of wheat to be on the safe side.

Senator GORE. What is the carry-over now?

Mr. DAVIS. Well, no one knows. We talk about the enormous surplus there is in the Northwest. No one knows what it is, because there had been feeding that has not been officially estimated.

Senator GORE. Feeding wheat to livestock?

Mr. DAVIS. Feeding wheat to livestock. There has been the question of the mortgaged crop. The farmer takes the crop to market and he gets nothing out of it. It is absorbed by the mortgage. And under those conditions my judgment tells me that there is not the invisible supply that they talk about. And your visible supply is 57,000,000 bushels less than it was a year ago.

Senator GORE. Notwithstanding all that, if the consumers of this country, including the 12,000,000 unemployed and the others who are under-fed had more purchasing power would they not buy more flour to-day at the prevailing low prices?

Mr. DAVIS. Well, of course—you remember I am a grain man—I think they would.

Senator GORE. Now then, if you add 25 per cent to these low prices, will that increase consumption or decrease consumption?

Mr. DAVIS. Why, there is not any question but what it would show a marked decrease in the consumption of flour, because here is corn down to the lowest price ever known, and there are plenty of substitutes. No one is going to buy flour when you raise the price—that is, I say no one—I mean the people to whom a dollar a day makes a vast difference, they are not going to buy flour when they can buy substitutes.

Senator GORE. That has been my principle about this farm legislation; that if you can not absorb the wheat you have now, if you raise the price you will cut down consumption.

Senator SHORTRIDGE. What is the price of corn?

Mr. DAVIS. Corn is selling about 25 cents a bushel, in the Chicago market; around 10 cents a bushel to the farmers in the country.

Senator HARRISON. How does the price of American wheat compare with the world price of wheat?

Mr. DAVIS. Well, you get in, Senator, to various grades of wheat. Take, for instance, Argentine's wheat, and Australian wheat. Our wheat is probably at the moment cheaper than Australian wheat and a little higher than Argentine wheat. And compares favorably with Canadian prices. It depends on the ocean tonnage that you could get at a particular port. And of course it depends on the variety of wheat that you are talking about.

Senator HARRISON. I got the impression that generally speaking American wheat was being quoted at a higher price in the world markets than other wheat.

Mr. DAVIS. That changes, you know, with the market and with other markets. Two months ago the Chicago price of wheat was five cents a bushel over the Canadian price. The last quotation I saw Canada was a half a cent over the Chicago price. Now that fluctuates from day to day. I have seen them buy wheat at a higher price in this country on the same day. They need different varieties of wheat, you know. It takes different strengths of wheat abroad to make flour. They can maybe get some cheap wheat from one place and then they could get wheat from another to blend with it and make an average flour. But generally speaking we are not far from the world market.

Senator GORE. What is the price at Liverpool now?

Mr. DAVIS. I have not gotten that, Senator. I have been down South for a month, and I have not been checking up. Do you know the Liverpool price [addressing Mr. Grimes]?

Mr. GRIMES. No; I do not.

Senator SHORTRIDGE. What are the varieties of wheat? For my own information, what are the varieties of wheat?

Mr. DAVIS. Hard wheat. Are you from California, Senator?

Senator SHORTRIDGE. Yes.

Mr. DAVIS. Your wheat is soft wheat. And then red soft wheat in the Ohio Valley and Missouri, through there. In the plain States, of Senator Gore, and Kansas and Nebraska, hard winter wheat, which we think is the best in the world. And in the Northwest they have spring wheat that Mr. Grimes would tell you is the best in the world.

Senator SHORTRIDGE. So that there are 3 or 4 or 5 varieties of wheat?

Mr. DAVIS. Yes.

Senator GORE. And a great many grades of those.

Mr. DAVIS. And there are very many grades of those.

Senator SHORTRIDGE. Yes; of course.

Senator HARRISON. And it is only certain kinds of wheat that the Canadian wheat comes into competition with?

Mr. DAVIS. Yes. That is a spring wheat.

Senator HARRISON. Spring wheat, hard wheat?

Mr. DAVIS. Yes; such as our Northwest.

Senator HARRISON. It does not come in competition with the soft wheat?

Mr. DAVIS. No. But there is not a large amount of soft wheat exported. You have some garlicky wheat here in Maryland and in this eastern section that sometimes goes for export.

Senator HARRISON. You call that garlicky?

Mr. DAVIS. Garlicky.

Senator SHORTRIDGE. Why is that?

Mr. DAVIS. A little garlic mixed in with it. A little garlic comes along with it. It sells at a discount on that account.

Senator GORE. Mr. Davis, a good deal of the time in the last year or so our prices have been above Liverpool prices.

Mr. DAVIS. Yes.

Senator GORE. Was that on the same grade and character of wheat?

Mr. DAVIS. Well, Liverpool price means wheat that sometimes costs 2 to 4 cents a bushel to get around to a mill. And the Liverpool price means the price on the lowest grade of grain that can be delivered, whether it happens to come from India or Argentine or Australia or where. Frequently we have sold hard wheat at 6 and 7 cents a bushel higher than the Liverpool price.

Senator GORE. They do not have a fixed contract price like we have?

Mr. DAVIS. Well, their contract calls for delivery of the lowest grade of wheat. Now, hard wheat might be scarce and they might need some hard wheat to bring up some soft wheat that they got cheaply, from Germany on a change of soft for hard wheat. Under those circumstances you see they would pay a premium for this hard wheat out of the Gulf. Then frequently they will pay more for hard wheat at the Gulf than they will out of Montreal. It depends on what they happen to need that day, Senator.

Senator GORE. Yes. I have not been able to get a satisfactory explanation as to why it is their wheat has been selling so much lower than ours a good deal of the time.

Mr. DAVIS. Well, that is part of it; you can always figure two or three cents a bushel unless there is a very heavy surplus of hard wheat.

Senator GORE. The freight from Kansas City to Liverpool is how much?

Mr. DAVIS. Well, that varies on the ocean tonnage. It has gotten down as low as 6 cents from Galveston to Liverpool. Our freight from Kansas City down would average about 14 cents.

Senator GORE. So that would be about 20 cents?

Mr. DAVIS. About 20 cents.

Senator GORE. Here is the thing that puzzles me now: Why it is that a given grade of wheat of a certain quality at Kansas City ought not to be selling at 20 cents less than Liverpool if Liverpool is the world market?

Mr. DAVIS. Well, it does not always regulate the price. It only regulates the price when we have a surplus that we must send abroad. We have such a large percentage of our crop used at home that frequently we are off the export basis.

Senator GORE. Has this Ottawa agreement giving the Dominions a 6-cent differential reacted much on the market, and if so, how?

Mr. DAVIS. It has not been so noticeable as yet because we have not been exporting any wheat.

Senator GORE. Because the river has been frozen?

Mr. DAVIS. The river has been frozen. You see, there is no use talking about its effect when the Farm Board has the wheat tied up. That is the real trouble.

Senator GORE. And they have had trouble because they could not bring it through Buffalo and to New York?

Mr. DAVIS. Yes.

Senator GORE. And get the benefit of the reduced rate differential?

Mr. DAVIS. Yes.

In summing up the things that can be done to help the price of wheat. I see my time is going here. We should get the Government out of the grain business. By that I not only mean the Grain Stabilization Corporation, but stop loaning money at one-eighth of 1 per cent to so-called cooperatives when a regular dealer must pay 5 or 6 per cent for his money. Especially when you read articles such as these in the Kansas City Star of February 17:

> A wheat-pool receiver.
> Friendly suit in U. S. court against Kansas cooperative.
> Division of assets after sale to Farmers' National will be expedited.
>
> * * * * * * *
>
> The Kansas Cooperative Wheat Marketing Association was organized in 1924 by merging the Kansas Wheat Growers' Association and the Farmers' Union Wheat Pool.

That is only one of a large number of cooperatives that have gone by the board, and nobody knows how many hundreds of thousands of dollars they owe the Government.

Now the grain trade have no objection whatever to cooperatives who have some of their own money in their business. If they have a better system or a more economical system of handling grain than the regular grain trade, the regular grain trade should go out of business. But we feel that it is not fair to loan them money at one-eighth of 1 per cent when a regular dealer must pay anywhere from 4 to 6 per cent for his money. Especially in view of the fact that very few of those loans are ever collected.

Senator GORE. You do not mean to imply that the Government taxes your 6 per cent earnings in order to get the money to lend this money at one-eighth of 1 per cent, do you?

Mr. DAVIS. That is exactly what I mean, Senator.

Senator GORE. I had my suspicions.

Mr. DAVIS. That we are perfectly willing to run our business on an equal basis with any one else, whether it is a grain competitor or cooperative competitor, but——

Senator GORE. Now Mr. Davis, you may not have an opinion on this point, and you need not answer unless you like to. Do you think that the Farm Board's activities and the subsidies it has granted to these various cooperatives has helped or hurt the cooperatives, by and large?

Mr. DAVIS. I will answer that, Senator, by saying that if you had a boy and you raised him as a pet do you think he would ever amount to anything?

Senator GORE. I am afraid not.

Mr. DAVIS. I do not believe cooperatives raised as a pet will ever amount to anything. I think that the head of every business must sweat to make that a success, whether he is a cooperative or a regular business man, regardless of his line of business.

Senator SHORTRIDGE. So you think it has not helped the individual grower of wheat?

Mr. DAVIS. Absolutely not. I think that the well-organized country cooperative elevator has been as much of a success as general business, but when they have gotten out into Government money they have practically all proved a failure.

The repeal of the Capper-Tincher "snooper" act, as I call it, and the repeal of the sales tax, in addition to getting the Government out of business, will give the farmer a chance for a better price for his wheat.

Senator GORE. I figure, Mr. Davis, what the farmer needs worse than anything else is a wider and better market for his products.

Mr. DAVIS. An absolutely free and open market, where supply and demand will be the regulating factors.

Senator GORE. You do not think a subsidy is a substitute for a good market?

Mr. DAVIS. It has one end, just as they have all had.

Senator SHORTRIDGE. And what is that? You say it has one end.

Mr. DAVIS. One end; failure. They have had fifty wheat pools in this country, and they have all failed.

Senator SHORTRIDGE. May I sum up the matter by this question? Having regard, now, to the individual farmer, the sower and the reaper of wheat, having regard to your own individual business, and having regard to the various laws, some of which you had mentioned, what would you do if you had the absolute power, now?

Mr. DAVIS. I would wipe the slate clean of the restrictions on the grain trade.

Senator SHORTRIDGE. That would mean the repeal of these several laws you have mentioned.

Mr. DAVIS. Yes; and I do not think there is any doubt that the farmer would get a better price for his grain than he has in the last year. In other words, I think that wheat never would have been within 20 cents a bushel as low as it has gone, if it had not been for these restrictions on the grain trade. For instance, when there is grain legislation up here, they do not call in the men who have made a success of the grain business in handling grain economically. They call in the so-called leaders of the farmers, who, six or seven years ago, represented 4,000,000 farmers, but today- represent less than 400,000. They certainly have not made any progress under this system of restricting the economical handling of grain.

We feel that in case an economical system of handling grain that has been in vogue for 75 years or more is going to be changed, the people who have developed that system should be consulted, rather than untried men in that particular line of business. The farmer certainly is our best freind. He is our customer. Only as he prospers, can we prosper.

Senator GORE. You have no way of knowing their attitude towards this domestic allotment plan, have you?

Mr. DAVIS. The farmers?

Senator GORE. Yes, sir.

Mr. DAVIS. I can speak from personal experience, that eight out of ten of them are against any artificial action by the Government. What they want is to be let alone, and allow natural conditions to apply again, as they did prior to the start of these-agricultural regulations. You remember they got $1.25 for their wheat when it started.

Senator GORE. I was told that Mr. Shannon conducted hearings at Kansas City, and had the farmers before him in regard to governmental activities and relations, and that a good many actual farmers were asked what they wanted at the hands of the Government, and made answer that they wanted to be let alone. Do you have any means of knowing whether that is true, or not?

Mr. DAVIS. I could bring you farmers down here, representing thousands of acres of wheat land, that would tell you the same thing. Every one had a chance to appear before the Kansas City hearing of the Shannon committee, and when that statement was made, as was made down here the other day, that they did not have a fair hearing, Mr. Shannon held another hearing and invited them all in; and there was no change in that testimony.

Senator GORE. For 10 years Congress has been discussing, round and round—a weary round, more or less—the debenture plan, the equalization plan, and now the domestic allotment plan. Is it your point of view that that has kept a condition of agitation in the country that has disturbed rather than composed business?

Mr. DAVIS. And resulted in lower prices to the farmer every time there is an agitation started. There is no question about it.

Senator HARRISON. Mr. Davis, have you finished your statement?

Mr. DAVIS. Yes, sir.

Senator HARRISON. If there are no other questions, we thank you very much.

Senator GORE. Senator, may I ask Mr. Davis one more question?

Senator HARRISON. Yes.

Senator GORE. Mr. Davis, one of the chief complaints we hear about the future market is that future contracts many, many times as large as the total cash wheat crop, or the total spot cotton crop, take place on these exchanges, through these exchanges. Of course, that is true.

Mr. DAVIS. That is what makes a continuous market, just the same as the clearing house for your checks every day.

Senator GORE. Do these heavy transactions according to your experience and observation, take place on a larger scale when prices are high, or increasing, or when prices are low or decreasing?

Mr. DAVIS. Usually when prices are higher.

Senator GORE. Let me ask you this: Suppose I bought 10,000 bushels of May wheat, and you sold it. Could not that 10,000 bushels of wheat, going through various transactions, show up in the total as 100,000 bushels, with only 10,000 bushels actually involved?

Mr. DAVIS. It would show up——

Senator GORE. Suppose May came, and I did not want to close out, and I transferred it and took another position in July. It is the same transaction.

Mr. DAVIS. Yes; but it would be counted again in July, and again in September, and again in December, if you carried the wheat along.

Senator GORE. That is the point I make. While I had only one contract, I was just transferring it to future months to get a better position to close out finally. So that it would multiply, and might show 100,000 bushels, when only 10,000 bushels are involved.

Mr. DAVIS. Before you got through with the transaction.

Senator GORE. Yes.

Mr. DAVIS. Yes; that is correct.

(At this point the subcommittee went into executive session for the purpose of hearing another witness.

At the conclusion of the executive session, the subcommittee adjourned until to-morrow, Friday, February 24, 1933, at 10 o'clock, a. m.)

# INVESTIGATION OF ECONOMIC PROBLEMS

**Friday, February 24, 1933**

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
*Washington, D. C.*

The committee met at 10 o'clock a. m., pursuant to adjournment on Thursday, February 23, 1933, in room 335 Senate Office Building, Senator Reed Smoot presiding.

Present: Senators Smooth (chairman), Shortridge, La Follette, Thomas of Idaho, Metcalf, Harrison, King, Walsh of Massachusetts, Barkley, and Gore.

The CHAIRMAN. The committee will be in order. Mr. James F. Bell, of Minneapolis, Minn., advised the committee that he can not be here, but he has presented a brief, and I shall ask that this brief be made a part of the record.

(The brief presented by James F. Bell, of Minneapolis, Minn., is here printed in the record in full, as follows:)

While I hesitate to engage your time in discussion of the broader phases of the general situation, nevertheless, since they form a necessary prelude to any comprehensive discussion, I will make reference to them, but only in general terms.

The world to-day, including ourselves, stands the victim of two great and overwhelming wars, the one military, the other economic. One ended in November, 1918, the other began with that date. One brought destruction of men and property; this world economic warfare has erected vast involvements of restraint upon the normal conduct of business, with prohibitions, quotas, clearing agreements, exchange restrictions, and many others, which form a complete barrier to international trade and enterprise.

We must not permit the immediate effects of disablement to erect a permanent program unbecoming to our position as a great Nation or one which violates our historical traditions or which drives us into the abhorrent circumstances of isolation.

To accept the condition of an imposed isolation, to lessen our productivity, although this is in excess of our domestic demand, permanently is unthinkable. These surpluses require a place in international trade and our future course must direct itself toward a participation in that flow. This can be accomplished only, when, as, and if the processes of betterment which we entertain for ourselves are extended to others.

Proper consideration of any great problem should involve much more than a study of that particular segment of the problem that is close at hand or of personal concern. In the present instance our national problem is merely a segment of the world problem and therefore makes necessary the consideration of world conditions.

Debt rests heavy upon the world, as it does upon us. The present debt of the world is largely the result of three waves of inflation, in 1914–1918, 1919–20, and 1925–1929. We seek ways and means of alleviating this situation. By the same token and on the same principles, the help in this direction for ourselves must extend itself to others.

We have yet to adjust our economic thinking to the change from a debtor to a creditor Nation and to appreciate the responsibilities and obligations that this imposes upon us.

The question of economic disarmanent and the solution of international problems are therefore of major importance and should be engaged in a broad attitude of mediation, conciliation, and adjustment.

This does not mean that either domestic plans or progress must wait upon the complete solution of the world problem. Certainly we in the United States can proceed in the adjustment of our own affairs, always keeping in mind the thought that these processes must adjust themselves with conditions of world betterment.

The entire functioning of our social, political, and economic structure rests upon the foundation stone of confidence, and until this is revived and evidenced, no plan of human devising can be made effective.

The first prerequisite of any sound government is its credit. It must live within the limits of its income in whatever form this takes, and it must fulfill its obligations in whatever terms these are contracted. The expenses of government must be held within the limits of its income, and this income can not be conceived in terms that impose a destructive burden upon the creative and productive elements of the people.

We can not escape the fact that the average general property tax in the United States is now the sum of $32 per capita as compared with $9 in 1902, whereas the commodity price level is about as low as that of 1902 and individual income and earning prospects are reduced to a present-day minimum.

I do not know of any course of action that is so essential to bring public confidence as the balancing of the national Budget. Whether a nation be fortunate enough to be on the gold standard, as in our own case, is not so much a matter of concern provided the national expenditures are in conformity and in balance with the government income, in whatever terms it is devised.

The soundness of our currency is of paramount importance. Sound money is the basis of the confidence which permits the wheels of industry and enterprise to function, and is also the basis of our social reactions. Destroy belief in the soundness of our money and you strike terror into the hearts of all and bring panic and paralysis.

The methods of credit inflation which we already possess, and have already exercised to finance the Budget deficit, and the further potentiality they possess are even larger than those which could be conceived under any artificial plan; and so far as adequate money and its employment, which is more important, are concerned, once you have balanced the Budget and given assurance of sound currency, there will be unlocked a hoard of sound money that will exceed in quantity and in value anything that you could hope to obtain through artificial tinkering. So long as there is possibility of the latter, confidence will not exist.

## BANKING

The pitiful spectacle of bank failures, with their aftermath of ruin and disaster, wiping out lifetime savings and sacrifices and casting many of its victims into the lap of charity, is enough to strike terror into any nation. How can we hope for public confidence on which to build so long as we see a continuance of this condition? Ten thousand bank faiiures in a little more than 10 years is proof enough that something is wrong with the present system. Four thousand five hundred bank failures in the last three years is proof enough that the condition continues and grows worse, not better.

It is now three years that this disability has been before the Nation, with power to effect correction, and yet nothing has been done. Without attempting to defend, support, or advocate any system of banking, nevertheless the contrast of no bank failures in England and but one in Canada during the last 10 years is proof enough that adequate measures within ourselves can be found and utilized.

Bank legislation can not prove a panacea for all banking evils, neither can it make good bankers out of poor bankers; but it can create those conditions which will attract capital and sound management and make such capital and management available in districts where they are urgently needed.

The distressing experience of the past brought into existence the reserve banking system. Is it consistent to deny to individual banks the same elasticity of utility and operation that was conceived as the essential requirement to success in Federal reserve banks? To do so is to deny the soundness of the premise upon which the previous action was based. To enforce a rigidity of capital structure and reserves in the individual national banks is to defeat the very objectives through which correction is sought. The pressing requirement now, as in all sound banking, is for release of the surplus funds of one community to another where they may be needed and where they can be safely used, and extension of banking service to districts that have been deprived of such facilities.

So long as the public is denied the provilege of finding in its individual depositories that elasticity which will bring security to its commercial and savings deposits, so long shall we see a lack of that confidence on which trade and industrial activities are based.

AGRICULTURE

Measured in terms of purchasing power of industrial goods or with the income of industrial employees, either salaries or wage earners, agriculture rests under a heavy and continued disablement. This is in a large measure the result of an inconsequent and inconsistent national policy which, in closing the export doors, has at the same time pursued methods that have led to increased production and enforced export. No effort has been made to balance supply to the effective demand at home or abroad, despite the self-evident proofs of oversupply and lessened demand even before the particularly lessened demand of the depression. It has encouraged by numerous devices and incentives the increase of agricultural acreage and the intensity of production, heedless of the relation which these must have upon the supply in its relation to effective demand. The Government has pumped hundreds of millions of dollars of public treasure into selected commodities, not to market goods or to increase the markets for goods, but for the express purpose of withholding these from the markets on the theory that if held long enough it would force prices to advance.

The effect has been the exact opposite and prices have fallen to a basis where they can no longer sustain the burden of taxes and interest. Under this policy we merely converted short-time debts into long-time obligations and altered the relation between debtors and creditors from one of private to one of public character. The policy created both debt and surplus.

In the vain effort to avoid these adverse effects the Government threw into the normal processes of trade artificial restraints and disablements, driving out or limiting the effective action of those marketing agencies that for a long period of years had effectively sustained the normal movements and values of farm products. The same amount of money intelligently expended in an endeavor to bring a balance between production and effective demand would have contributed both income and an advance in the basic price.

We have had enough of legislative palliatives which have brought only an increasing measure of disaster. I do not lean to the defeatist policy that envisions complete deflation. I do not believe in the laissez faire attitude with respect to agriculture or any other problem. I think that we have it within ourselves to help ourselves. I am not adverse to legislation that tends to accelerate economic processes, but I am opposed to such palliatives as contravene established and proven experience.

However, in this respect, I think we labor under the delusions of both previous thinking and previous action. The theory that the recent high values and prices will soon be restored is erroneous and efforts based upon an erroneous theory are in themselves destructive. It is the height of folly to believe that the present condition is temporary and that the conditions of 1928 and 1929 can soon reappear. Yet all the artifices are based upon a belief that farm land values, commodity prices, and purchasing power in dollars will shortly be restored to that level. To adhere to this theory is to deny the self-evident truth.

We are in a new level of prices. Historical experiences denote its continuance for some years. The restoration of prosperity is not a matter of restoring the old levels of values but a readjustment to the present or nearby levels. What matters the price provided values are equalized? Instead of spending our time on artificial devices designed to tide over depression, let us address ourselves to restoring an equitable basis of exchange in the present. Prosperity is merely the widespread distribution of commodities, products, and services. It rests on continuous exchange between producers. It is necessary only that exchange be equitable to both, thereafter the dollars involved are not important.

We have had prosperity on levels lower than the present one, but with this essential difference—that the exchange of commodities, products, and services at that time were mutually profitable and mutually equitable. We can restore business or exchange activity on one basis as well as another provided the exchange is equitable. The price level is not particularly important but rather that the basis of exchange be equitable, whether price levels be high or low.

An equality can not be obtained if our production is in excess of effective demand in prosperity or in depression, for the equalities of value are dependent upon the relation of supply to effective demand.

We need not be afraid if by error in judgment or natural causes a shortage should develop. Even though we are obliged to go out and temporarily supplement the domestic supply with importation, that should not be a cause of concern. These circumstances connote a satisfactory domestic price and the full operation of the tariffs on agricultural products which have been devised for their benefit and which are now inoperative because of the surplus.

The public at large forgets that tariffs are negative forces that protest; they do not create and they are inoperative in the presence of a surplus. Reduce production to effective demand and you will give to your agricultural interests that measure of tariff benefit which is conceived in their behalf.

Regardless of what views we may entertain as to the merits or demerits of a policy of isolation, nevertheless we can not escape the fact that we are at least temporarily faced with such actual conditions, and so long as these maintain they impose disablements which we must move to meet.

We must not overlook the fact that the processes of economic nationalism were advancing rapidly prior to the war; they were not halted but modified by that catastrophe and have taken up their course again with increasing rapidily. Policies of national self-sufficiency are not necessarily the retaliatory expressions of nations or policies arising from the trade barriers we have erected, but are for the most part necessitous requirements in balancing international accounts. It is obvious that these adverse balances can be accommodated only through economies, reduction of imports, increase of exports, or all of these. That these restrictions have for the moment shut the door to a considerable portion of our surplus which previously found outlets in export is certain.

Our international merchandise account, which embraces imports and exports of merchandising, payments for and receipts from ocean freight services, and tourist expenditures, is and has been in fair balance for a considerable period of years. It is obvious under the present conditions that the necessary dollar exchange to conduct increased business does not exist. It does not now exist even for the payment of present private and governmental debts, and these can be discharged only at the expense of our merchandising volume or by payment in gold or goods. Gold we can not expect, nor is it desirable that we should demand it and thereby weaken the financial structures of our national debtors. Goods we apparently will not accept because of their adverse effect upon the commodities of which we already have an excess.

I do not hold to an isolation policy; it is abhorrent and un-American; but since there is temporary cessation in the free exchange of goods and services in open markets, until such time as the barriers are broken and trade released to take its normal course, while this lasts we are forced to some extent to its imposition. We must therefore conceive effective demand as that amount inherent in the volume of trade now existing in the export and domestic fields.

Under these circumstances price betterment can not be anticipated until production is related to the foreign situation. It may be argued that production is not too large but consumption too small. This is all too true in a depression. Restored confidence, expressed in greater consumption and utilization, may move to alleviate the necessities of decreased production and thus enlarge the effective demand, but this does not change the necessity of the relation, since "effective demand" conceives the accommodation of these factors.

With such a program it seems only fair that our producers should be given assurance of a full enjoyment of American markets on a basis of competitive parity with all goods of American origin. If you are unwilling to effect this adjustment through the exercise of ample tariffs, then production must be curtailed by a program that brings rewards to those who are thus deprived of their usual opportunities and markets. To what extent this can be safely accomplished at the public expense and without further drains upon public credit, is a matter of serious consideration.

We must bear in mind, however, that it takes very little surplus to cause a lowering of prices and, per contrary, a very small amount of shortage to bring an advance after the upturn of depression. It is possible that this balance can be obtained within reasonable limits of expenditure, but certainly it can not be obtained so long as public funds are voted for projects of reclamation and irrigation and for other activities that have as their sole aim and attainment a greater amount of productive land and greater production from existing lands.

I repeat my opposition to a permanent policy of isolation, but I say if necessity forces it upon us temporarily then let us be consistent and follow it through. To further it by trade barriers which reduce effective demand on the one hand and to encourage greater production on the other, is the height of folly and wastefulness.

I consider that the proposals made by Mr. Baruch to your committee to reward reduced production by rental and lease of present cultivated land for fallow are of a most constructive character, proposals in which both agricultural and industrial interests could meet.

If I could add anything to his valuable suggestions it would be that the program to accommodate a temporary situation by supplemented by one of permanent character through which we should consistently and persistently move to stabilize the volume and value of our agricultural lands, to contract and expand it according to the necessities of effective demand, to plan for the diversion of the present surplus lands into commodities which are now imported, and further to develop new utilization of existing lands and products. I believe that we should set up under a separate corporate structure a Federal Farm Reserve responsible for the contraction or expansion of both volume and values of the agricultural lands through open market transaction therein. I conceive in this an operation similar to that inherent in the Federal reserve system with respect to credit.

Artificial processes that aim to compensate producers for the difference between existing and equitable prices can be effective only through the use of public credit or through the transfer of the existing meager funds from one portion of our population to another. In one case it would impair our credit, in the other it would increase our fear of further drains upon our slender individual resources.

In the consideration of these processes and the finances necessary to conduct them much thought has centered in the use of excise taxes in the belief that the commodities themselves should bear the burden of paying for the benefit devised in their behalf. This is a very difficult and dangerous procedure.

We must not overlook the fact that the process of commodity exchange is a very delicate and sensitive piece of machinery and that the existing competitive parities are the outcome of long years of adjustment. They are very sensitive in response to all influences. Over a period of time they have formed adaptations to the change of natural conditions and work most effectively.

To change this natural order by the interjection of any artificial processes would bring inescapable disablements between commodities, substitutes, and replacements and in the course of time inevitably divert the direction of the tax from the consumer to the producer.

Competitive parity as between commodities before the consumer is the essential of price economics. It can not be maintained in the presence of an excise which can not be applied with fairness to all. It can not be applied to all. In many instances utilization, marketing, and distribution make it impossible, and in those circumstances some disparity is inevitable. Again, commodities differ among themselves vastly as to what proportion must bear the entire excise tax, and thus the tax tends to be multiplied to a point that destroys their place in the general order of commodity relationship.

### DEBT SITUATION

Much attention concentrates upon the agricultural debt situation. To be sure, to a portion of farm owners the absolute burden is heavy, but with respect to other forms of private debt its volume and involvement are comparatively low. It is more a matter of income, or exchange equality, than the debt itself.

The conscientious agricultural debtor is more interested in his ability to discharge his debt than in its refunding and realizes that were the exchange value of his products on an equitable basis he would possess the ability either to discharge the debt in time or to refund the debt himself if necessary. Again, the solution of the problem is to balance agricultural production with effective demand and thus bring about the enhancement of the price of agricultural products necessary to place their exchangeability on an equitable basis.

Serious consideration should be given to the plan which Mr. Baruch has advanced for redemption of farm mortgages on a discount basis through issue of low interest bearing sinking fund bonds with interest guaranteed by the Federal Government; but I see also the needs for alleviation in other fields.

### ANTITRUST LAWS

The restraints upon modern industry by reason of our archaic and antiquated laws are both unnecessary and destructive. They should be revised to conform with modern requirements and necessities. Any dangers of monopolistic control, if they exist, can be combated without retaining the destructive forces of overcompetition and unethical business practice which these present laws impose.

We have taken away from industry even the power of regulated discipline, which is the first and necessary accompaniment of every human effort. The continual pressure for existence under the forces of unrestrained overcompetition makes each individual the victim of every new device or nefarious practice on the part of his competitor.

The welfare of the worker, as social unit and consumer, is recognized as a necessary and vital contribution to the financial success of industry, and yet the processes now imposed by the existence of these laws make labor sustain burdens for the benefits that accrue to others. We do not wish to hamper progress or advancement under which costs and prices are reduced and distribution made more effective, but at the same time there are possible measures of industrial rationalization that can bring to the worker a larger measure of reward and elimination of the hazards to which he is exposed through the varying degrees of industrial activity.

My observations lead me to suggest concentration of legislative effort upon a limited program of fundamentals aimed to restore public confidence. They embody:

1. World economic disarmament, to the end that international trade may be restored, with the normal exchange of goods in the open markets of the world.
2. Balancing of the national budget and international account on a basis that is not destructive to enterprise and individual initiative.
3. The maintenance of a sound currency on the gold standard.
4. A sound banking system.
5. A comprehensive agricultural program to meet both temporary emergencies and permanent situations.
6. The removal of unwholesome restraints upon industry through adaptations of the Sherman-Clayton Act in conformity with existing needs and conditions, and rationalization of industry under proper safeguards, with relief to labor from the increasing burdens which the present laws impose.

We have arrived at a time in our great national needs when political affiliations, self-interest, and all other considerations must give way to the national interest. The new administration should ask for and receive without stint unrestricted support, cooperation, and services from members of all parties and from leaders of agriculture, labor, finance, and industry, and from all loyal citizens that may be called upon for service. To permit any interference from whatever cause that may arise to impede the progress of restoration is unthinkable. It is a question now of the nation, first and last.

The CHAIRMAN. Mr. J. D. Stern.

## STATEMENT OF J. DAVID STERN, EDITOR AND PUBLISHER PHILADELPHIA RECORD AND CAMDEN (N. J.) COURIER-POST

The CHAIRMAN. Give your full name and address for the record.

Mr. STERN. J. David Stern, Philadelphia Record, Philadelphia, Pa.

In appearing before your committee I think it is usual for a man to qualify as an expert. While I am a student of money I am not an expert. I want to explain to you that the views that I wish to express to this committee I have expressed in my newspapers published in the most conservative cities in the United States for the past year and a half, and I have not expressed them just on the editorial page but on the front page with as much emphasis as I could place on them.

The CHAIRMAN. What papers?

Mr. STERN. Philadelphia Record and Camden Courier and Camden Post. And I can tell you, gentlemen, that the reaction to these views has been most remarkable and surprising even to myself. After a year and a half I have found a very favorable reaction. As a newspaper man of 30 years I can talk with certainty of the reaction of the public to what appears in my paper continuously over a year or more. And not only among the general public, but among the business men of Philadelphia I have found a growing response to and understanding of these views, which leads me to believe that the general public are ahead of the bankers who have been dominating the fiscal policy of this country.

I believe the average business man of to-day has a clearer and more intelligent understanding of what is wrong with our monetary system than have the bankers or the so-called financial advisers of the Government. And I am just explaining to you that these views have been tried out on the public of Philadelphia and have not been found wanting over a year and a half.

My paper has advocated: Fight the depression as we fought the war.

That is what I have come to urge upon your committee, as I have advocated it in my newspapers for the past year and a half.

The present economic crisis is as dangerous as any war-time crisis. It is causing more human misery than did the World War. Therefore, our Government is justified in resorting to war-time measures.

I believe I am paraphrasing the first witness before this committee, the Hon. Bernard M. Baruch, but Mr. Baruch did not follow through. He talked of a war-time emergency and then offered weak peace-time remedies.

We did not talk of balancing the Budget during the World War. We spent $45,000,000,000 in three years and went in debt $26,000,000,000. We were prepared to spend double and treble that amount if needed to win.

This Nation must fight depression with the same spirit and high purpose that made it victorious in every war.

It is as wicked and silly for us to talk about balancing the Budget in such a crisis as for the head of a family to talk about budgeting his household expenses when his wife and children are in dire need of medical attention.

Balancing the Budget is a bookkeeper's phrase. This Nation can not afford to be ruled by bookkeepers.

The national Government is a parasite upon national business. It is in the position of a commission merchant who prospers as his principals prosper. A commission merchant can not make business better for himself by raising his commission rate when business is on the decline. No more can the Government make itself whole by raising its taxes or commission on business when the general business of the Nation is on the decline.

Any attempt to balance the Budget by raising taxes during a period of extreme deflation is the worst possible policy that the Nation can pursue to aggravate its misery. It is like giving whisky to a victim of sunstroke.

Overemphasis of the phrase "balancing the Budget" indicates that the fiscal policy of this great Nation has been dominated by bookkeepers rather than by statesmen.

I have had two great disillusionments in my life. The first when, as a little boy I took a girl to a baseball game—a very pretty little girl whom I admired and respected. I was shocked when she asked, "Why are the men running around the bases?" It had not occurred to me that anybody, let alone a very pretty girl, could be so ignorant of the rules of baseball.

The second great disillusionment was when I found that bankers, whom I had always looked up to as supermen of business, were as ignorant of the laws of money as the little girl of the rules of baseball.

I respect Mr. Baruch as an able and practical man of affairs, but he is typical of New York financiers in his disregard of scientific knowledge of the main thing he has been after—money.

In that disregard of the science of money by our leading New York bankers lies the key to the present depression. These bankers who made bad loans to Germany and worse loans to South America, who backed Insull and fell for Kreuger, and who, with colossal egotism have taken upon themselves the management of great mergers, gave the President bad technical advice, not from selfishness or malintent, because they have been sufferers in the depression, but from ignorance of the science of money.

We endow great universities and then fail to use the technical knowledge they have developed.

There is a famous passage by Walter Bagehot, English economist and publicist, where, after complaining that the directors of the Bank of England were not acquainted with right principles, he continues:

> They could not be expected themselves to discover such principles. The abstract thinking of the world is never to be expected from persons in high places; the administration of first-rate current transactions is a most engrossing business, and those charged with them are usually but little inclined to think on points of theory, even when such thinking most nearly concerns those transactions.

"Fight the depression as we fought the war," is more than a mere slogan or phrase. Specifically, we recommend that the President immediately declare a gold embargo and that in the enforcement thereof the Treasury Department temporarily suspend gold payment. Such action would follow the precedent of President Wilson, who, on September 8, 1917, pursuant to the power granted him by the act of June 15, 1917, declared a gold embargo. This action was taken the morning after the House of Representatives had unanimously voted a $11,000,000,000 war credit. President Wilson did not even wait for the Senate to concur, as it did on the following day.

If you turn to the newspaper files of September, 1917, you will be interested to note that the declaration of this gold embargo was news of secondary importance. Our people were occupied with the war. They gave scant attention to this technical ruling. I believe that the average man doesn't even know to-day that for four years, during and following the World War, we were practically, if not technically, off the gold standard. From 1917 to 1921 any one who demanded gold of his bank was referred to the United States Treasury. As far as I have been able to learn no one had the nerve to take any gold from the Treasury but "Ma" Bergdoll, the mother of the notorious Grover, who came down to Washington with a little black bag and browbeat the Treasury officials out of some.

Did this suspension of gold payment affect the credit of the Government? It did not. During the four years when you couldn't get gold for your money we floated twenty-five billion of Liberty and Victory bonds.

If you gentlemen want to interrupt me at any time do not hesitate to do so.

The CHAIRMAN. You may proceed.

Mr. STERN. I have advocated a gold embargo for a year and a half so that the Government should be free to issue major credits to arrest the ever-increasing momentum of a self-accelerating deflation. If this deflation be allowed to continue to its ultimate conclusion, it must inevitably result in the wiping out of all credit, so that nothing will be left as a medium of exchange but actual cash currency. This would mean that the dollar would be worth twenty times as much as it was in 1926; the nickel of 1933 would equal a normal dollar. Before you had arrived at that point, if you allow this deflation to continue, you would have destroyed every financial institution in the country, insurance companies and banks, wiped out every debt, mortgages on homes and railroad bonds. That will be the result of following Wall Street's advice to let deflation take its course.

The men who oppose fighting the depression as we fought the war indulge in the most damnable demagogy to hamstring this Nation.

They talk about starting the printing presses as though credit inflation means the printing of more paper currency. They must know that nothing is further from the truth. To-day our main medium of exchange is credit or bank deposits.

Economists and financiers who discuss quantity of currency as an essential price factor don't know the Civil War is over. There was a time in the history of this country when its only medium of exchange was cash currency. The interchange of bank deposits by check is a modern invention, not over 40 years old to any great extent, which has so far displaced actual currency that 90 per cent of our business transactions are through the exchange of credits. Currency has become merely a supplementary and relatively unimportant medium of exchange.

In normal times we have more than $55,000,000,000 of bank deposits and less than five billion of currency in circulation. What is more important, the velocity of these bank deposits or bank clearings reached the astounding total in 1929 of $720,000,000,000. It is this figure which regulates the value of the dollar—the velocity of bank deposits.

The amount of currency in circulation, or the amount of gold behind it, has little or no bearing on the value of the dollar.

Strange as it may seem, the more prosperous the country, the less currency in circulation, because more persons have bank accounts, use checks for trivial household transactions, and there is little or no hoarding.

Instead of gold regulating the value of the dollar, the quantity and velocity of credit regulates the value of gold. It is necessary to recognize these facts to appreciate that the present deflation is self-accelerating.

When a man borrows $1,000 from a bank, the bank puts $1,000 to his credit on its books, and thereby creates $1,000 of credit currency.

When the man pays off the note, $1,000 of credit currency is wiped out. Normally as people pay off their notes the bank creates new credit currency by making new loans to others.

But for the last few years the process has been one-sided. Old loans are being paid off, but very few, if any, new loans are being made, with the result that the quantity of bank deposits has dropped to $40,000,000,000, and the velocity of these credit dollars has dropped to less than $300,000,000,000 per annum.

The less credit dollars and the slower they move, the higher the value of the dollar. The higher the value of the dollar, the lower the dollar value of the collateral against which the bank has issued credit. As the dollar value of collateral goes down banks are compelled to reduce their loans against collateral and thereby further enhance the dollar, and further depress the collateral.

Thus deflation is a self-accelerating process which can have no other outcome than the complete destruction of our entire credit structure.

I hold no thesis for inflation, any more than Senator Carter Glass is for deflation. Every sensible citizen is for the stabilization of the value of the dollar. The one thing that is to be avoided is too great variation in our unit of value. Such great variations are bound to disrupt our whole economic structure, as a variation in the length of the standard foot would disrupt our deeds and boundaries of real estate.

The present administration has relied on the assumption that while the deflation is self-accelerating, it will reach a certain point at which it is self-arresting. I asked a high official of the present administration last spring, "What will arrest the deflation?" He said, "When the shelves of the stores become empty of 'soft' merchandise—merchandise that wears out, like clothing and shoes."

He was partially right, because last summer we did have an upturn in the textile and shoe industries, just as he had predicted. But this arresting force was not of sufficient strength to stem the main tide. The slight upturn last summer was soon offset and the inexorable mathematical law of deflation again asserted itself.

### DOUBLE PURPOSE OF A GOLD EMBARGO

I recommend an immediate gold embargo for a double purpose.

First, to place the Government in a position to issue such credit as is necessary to win the fight against the depression by distributing purchasing power among consumers.

Second, to reduce the swollen value of the dollar to its commodity index value of 1926, or the average for the years 1921 to 1929, inclusive.

Thus far we have attacked this great emergency in a weak and faltering way. If we used only one-tenth of the resources we did in the war, the back of the depression would have been broken long ago.

New credit should be issued to the consumer. All Government effort has been to stimulate production. We have been attacking the wrong side of the economic equation. Stimulate consumption by giving the people credit to spend, and producers will meet the demand.

There are a hundred ways in which credit can be distributed among consumers. I do not wish to enter into a discussion of their relative merits, but will simply name a few to give concrete illustrations of what I have in mind.

1. Advance by the Government of 50 per cent of the face value of certificates of deposits in closed banks on their assignment to the Government or its agent.

Senator HARRISON. Would you do that through the Reconstruction Finance Corporation?

Mr. STERN. No, I would not. I mean I would not suggest it being done that way.

Senator HARRISON. How would you?

Mr. STERN. Through the Federal reserve banks.

Secretary of the Treasury Mills recommended an advance of 35 per cent at a hearing before a congressional committee a year or more ago. I do not know whether it was before this committee or some other committee.

Senator HARRISON. No; it was not before this committee.

Mr. STERN. He recommended 35 per cent at that time.

2. Government construction and advance to municipalities for slum rehabilitation to the extent of $5,000,000,000.

3. Advance of 50 per cent on the nine billion dollars of farm mortgages.

4. Amending of the home loan bank bill so that the loans can be made directly and immediately, instead of surrounding the process with the red tape which now encumbers it.

5. Enlargement of unemployment relief.

I hold no special brief for these points of distributing credit among consumers. The only point is that the new credit should go to consumers rather than to industries, railroads, and banks.

Let us be frank. The situation is so acute that it demands immediate positive action.

The President still has the power to declare a gold embargo.

The CHAIRMAN. Before you leave the other. Have you in mind how we are going to raise this $13,000,000,000 which you have outlined in that last statement that you made?

Mr. STERN. Yes; by issuing notes or bonds directly, to be taken up by the Federal reserve banks.

The CHAIRMAN. How can we take them up? Do you mean to say that the Government is to issue that much paper money with nothing back of it?

Mr. STERN. No; not paper money, because it would be merely credit to the Government against which the Government would check.

The CHAIRMAN. Yes; but where would they get the money?

Mr. STERN. The Federal reserve would simply place on its books to the credit of the Government as much as the Government wanted.

The CHAIRMAN. But then where would the Federal reserve get this money?

Mr. STERN. Well, it does not need money. All it needs is credit. Because we do not use money in this country. For instance, Senator, I can explain that in a word if you want me to.

Senator KING. You would want credit based upon debts? That is what you mean?

Mr. STERN. On the notes of the Government.

Senator KING. That is the Government going into debt by issuing its bonds, and then those bonds would go into the Federal reserve banks and become the basis of credit?

Mr. STERN. Yes.

The CHAIRMAN. You have got to issue some kind of money in order to circulate that money to take care of these $13,000,000,000 that you speak of. You have not got the gold in the country to do it. There is only one way, and that is to issue paper money. And now what are you going to have back of it?

Mr. STERN. Well, Senator, the point I wish to make is that the actual currency would not be needed. And I can explain that to you in a moment if you wish me to.

Senator KING. Your theory, in brief, is this: The Government would issue its bonds, those bonds would be taken over by the Federal reserve, and supposing the Federal Reserve Bank in Philadelphia would buy $1,000,000 worth of bonds; on its books it would extend credit to the Government for a million dollars, and the Government could draw its drafts or its checks or obligations and pay its debts, or make loans through the Reconstructions Finance Corporation, or otherwise, and draw its draft upon the Federal Reserve Bank for that million dollars.

Mr. STERN. That is what you are doing to-day.

The CHAIRMAN. Why stop at $13,000,000,000? Let us have one hundred billion. Then there will not be any question about it at all, if that can be done.

Mr. STERN. Well, that is exactly what happens when an individual goes into a bank. He does not get a roll of bills. He gets a credit put on his account in the bank.

The CHAIRMAN. Yes; but the bank has to report that they have money enough on hand, under the law.

Mr. STERN. Yes.

The CHAIRMAN. And if it falls below that, then the bank is violating the law.

Mr. STERN. Well, it is possible, Senator, that a certain amount of new currency would be required, but it would not be over 5 per cent of the amount of credit issued.

Senator HARRISON. Mr. Stern, why is it, in your opinion, that not more of the banks have taken advantage of the so-called Glass-Steagall provision for issuing notes against Federal securities? At the time it was proposed they said that would be a large measure of inflation, where we could inflate upwards of more than a billion of dollars. I believe it was stated a billion and one-half. And there has been a very small per cent of banks taking advantage of that. Have you any reason to state why they have not?

Mr. STERN. My explanation is that the businesses that are entitled to credit do not want credit. As business goes down, we require less and less money in our business, because our accounts receivable and our inventories go down. So that the average business that has still got its neck above water requires less and less credit at the bank. The banks have nobody to lend to because nobody needs credit now, because the consumers make no demand upon them. The average business to-day which is still going has more money in its coffers than it usually has, or in its bank account—more credit in its bank account, I should say, to keep the distinction. So that the banks have no use for this extra credit. They keep the Government security on which they get a small return, even if it is only 1 per cent, rather than discount that in order to get new credit.

Senator HARRISON. It is not your view, then, that any influence from higher up, either the Federal Reserve Board or the officials of the Treasury, have discouraged banks from taking advantage of that provision?

Mr. STERN. No.

Senator HARRISON. You do not think that they have done that?

Mr. STERN. No. I do not believe there is any malintent on anybody's part. I think that there is stupid selfishness, and all the Government can expect from any of its citizens is enlightened selfishness. Now I believe that these bankers have been under such a strain that they can not see this thing clearly. And they are running around in a circle, and it is a descending spiral of deflation.

Do you want me to continue with this?

Senator HARRISON. Yes.

Mr. STERN. The President still has the power to declare a gold embargo. If he did so to-norrow, the Treasury would have the right to question anyone who demanded gold, and if the officials were in the least suspicious of the applicant's intent to export it, they would be justified in demanding a heavy bond and frequent inspections to be sure the gold had not been taken from the country.

Senator HARRISON. Of course, Mr. Stern, that is a very close question, as to whether or not the President has that right. Personally, I think he should have the right.

Mr. STERN. Well, it could be enacted.

Senator HARRISON. Well, it takes some time, when you discuss the proposition, to do the thing.

Mr. STERN. Such methods would discourage any demand for gold as effectively as it did during the war.

Let us take the specific instance of a man with coupons of a gold bond. Instead of pursuing the usual business procedure of depositing the coupons with his bank, to be collected and placed to the credit of his account, he demands gold coin from the company issuing the bond. The company obtains an order on the Treasury for the required amount of gold. The gold seeker goes to Washington to be questioned as to his intent. He is required to give bond for his hoarding of the so-called precious metal. It is inconceivable that, in such a case, the courts would entertain a suit against the company which had issued the gold bond because the Government took proper steps to enforce a presidential decree.

The war-time procedure of gold embargo and temporary suspension of gold payment is preferable to reducing the gold content of the dollar, as proposed in the Goldsborough bill and in other bills, because so many of our contracts provide for payment in gold dollars of the same weight and fineness as the present coinage of the United States.

The gold-embargo method has been tried and used without any friction during war time. The only possible objection that could be raised to the use of the same method at this time is that the Government is not justified in taking the same action in time of peace as in time of war. My recommendation rests on the contention that the present emergency is as great as that of war, and therefore justifies our fighting the depression as we fought the war.

The fear of going off the gold standard has paralyzed the present administration in fighting the depression. The more credit issued against a given gold reserve, the more tendency there is for the gold to be taken from the Federal reserve or the United States Treasury. And it is being taken now.

Europe is in a position to take $2,000,000,000 in gold from this country within a fortnight. Any issuance of major credit by the Government, financed by the Federal reserve banks, which would reduce the percentage of gold reserve to the 40 per cent limit, would be enough to start a gold run. The President was right when he said that we were at one time within two weeks of suspending gold payment. It is this fear more than anything else which has interfered with the proper meeting of the present situation.

A gold embargo and temporary suspension of gold payment is the one certain, immediate way of meeting the present emergency. It is equivalent to the Columbus method of making an egg stand on end, and should be the precursor to the discovery of a new era of prosperity and progress in the Western Hemisphere, if not in the world at large.

This is the zero hour. It demands action now. The alternative is complete destruction of our economic structure, if not of our civilization.

Senator La Follette. Mr. Stern, I noticed in the opening part of your statement that you took some exception to the advice that has been given to this committee by so many witnesses, that if we just balance the Budget everything would be all right. One thing that has interested me is this, and I would like to get your view about it: How can you balance the Budget while conditions are continually getting worse? Assume now that we agreed with these witnesses that have been before this committee that balancing the Budget was all we had to do to restore prosperity. As long as conditions are getting worse how can you balance the Budget?

Mr. Stern. My answer is: You can not. And if you could you should not. In fact the word "balancing" the Budget is merely a bookkeeper's phrase, and when you analyze it it has no application to a sovereign power. I am quoting from John Maynard Keynes, the greatest economist living to-day.

Senator Barkley. There might be some dispute about that last statement.

Mr. Stern. Of course that is only an opinion. But a good many men in this country, I think, agree with me. And a good many men in any country.

The Chairman. If you are through and have nothing more we will excuse you.

Senator King. Thank you very much.

The Chairman. Mr. W. Mont Ferry.

## STATEMENT OF W. MONT FERRY, VICE PRESIDENT AND MANAGING DIRECTOR OF THE SILVER KING COALITION MINES CO., SALT LAKE CITY, UTAH

The Chairman. Give your full name and address for the record.

Mr. Ferry. W. Mont Ferry, Salt Lake City.

The Chairman. You may proceed, Mr. Ferry.

Mr. Ferry. Mr. Chairman and members of the committee, I have been a resident of Utah since my early manhood, and have been associated with various private and public activities in the western Mountain States during my entire active life; chiefly with the mining industry. I am, and have been for more than 15 years, vice president and managing director of the Silver King Coalition Mines Co., of Utah, a large producer of ores containing gold, silver, copper, lead, and zinc. I am, and have been since its organization, president of the

American Silver Producers Association, the membership of which represents about two-fifths of the total world's mine production of silver. I am also associated with other mining, industrial, and financial enterprises, and have held electric and appointive positions within the State of Utah on several occasions within recent years. I am a director of the Intermountain Economic Conference, which includes within its membership the States of Utah, Arizona, New Mexico, Montana, Idaho, Nevada, Wyoming, and Colorado.

I am grateful for the opportunity which the Senate Finance Committee invitation affords me to express publicly the considered opinions of many thoughtful men of the intermountain area.

The region for which I speak is one which produces raw materials almost exclusively, and our industrial and financial fabric is closely knit to this fact. There is little accumulated wealth, substantially all of which is invested in enterprises directly founded upon the basic commodities which we produced. These commodities are metalliferous ores, coal, beet sugar, wool, livestock, forage crops, grain, and fruit. Our agricultural production is sold largely in local markets. A substantial part of the portion disposed of elsewhere finds its outlet through channels intimately connected with trans-Pacific trade.

Because we have little accumulated wealth, and because this area is in the development stage, we depend largely upon borrowed capital not only to initiate enterprises but to carry them to the point of production. The service on these debts, as well as the payment of the debts themselves are, of course, dependent upon the ability of the debtor to market his products at a profit. This brings us directly to a consideration of the commodity price level. It may be stated definitely that productive endeavor within the area of which I speak is not profitable.

I now direct your attention to the following figures which present an accurate and startling picture of the market conditions which confront producers of silver, copper, lead, and zinc.

The average price of silver for 1932 was 27.9 cents per ounce, which is 42.6 per cent of the average price of the white metal for the last 25 years.

The average price of copper for 1932 was 5.6 cents per pound, which is 35.9 per cent of the average price of copper for the past 25 years.

The average price of lead for 1932 was 3.2 cents per pound, which is 53.9 per cent of the average price of lead for the past 25 years.

The average price of zinc for 1932 was 2.9 cents per pound, which is 43.4 per cent of the average price of zinc for the past 25 years.

The composite average price for 1932 of the four metals named was only 43.95 per cent of the average price of those metals for the past 25 years.

I have called your attention to these particular commodity prices for the reason that I am directly associated with the metal-mining industry and am, therefore, especially familiar with the problems of that industry; and for the further reason that the condition of metal mining has special significance in the Western States. A competent survey recently made in the State of Utah discloses that 47 per cent of the State's population is directly dependent upon the metal-mining industry. The condition in Utah is typical of conditions in other States of the region, and the ratio given applies approximately to these other States. It should be borne in mind, moreover, that mining is a devastating industry. A continuation of unprofitable operation in this industry means extinction of the capital represented.

The disastrous effect of the low commodity price level has made itself manifest throughout our land. The discrepancy between the comparative value of the American dollar, on the one hand, and the value of things and human service, on the other, has brought stagnation to all forms of productive endeavor. Furthermore, it has paralyzed the initiative of producers and is destroying hope and confidence in the minds of men. The vast debt and credit structure which has been built up in this country, especially since the war period, is in grave danger of complete collapse. Debtors, of course, must meet their obligations by exchanging the things they produce for the dollars necessary to meet interest and principal. It is obvious that unless the growing discrepancy between dollars and things is corrected and stabilized at a point of reasonable equity between creditor and debtor, general bankruptcy and repudiation must result. This situation which now exists throughout our country, affects not only individual and corporate debtors and creditors, but also affects municipal, State, and National financial affairs. The unemployment, the dependence, and the despair affecting not less than 25 per cent of our population, present a condition which is of the utmost importance if our institutions are to stand. The immediate relief for acute distress which is being so generously and properly furnished from National, State, and other public sources is primarily extended from tax money. Now, sources of taxation are drying up, and it is becoming more and more difficult to meet the increasing demand for relief.

When we realize that these conditions are not confined to our own country, but are in varying degrees of intensity apparent throughout the world, we must look for a world cause and a world remedy. It is the considered opinion of competent authority that there has been a break-down in the money structure which has disarranged credits and exchange, and has destroyed confidence.

From time immemorial the world has used silver and gold for money; the eastern world preferring silver, and the western world gradually coming to the use of gold alone as a basis for money. The destruction within recent years of the comparative value of the money and hoardings of silver-using peoples who constitute more than one-half of the world's population, has had a serious effect not only upon these peoples in trading with so-called gold countries, but also upon the well-being of the peoples of the gold-using countries. It has resulted in cheap money, cheap labor, and cheap costs, forming a competitive set-up which tends to destroy the stability of the commodity price level in gold-standard countries where the low cost products inevitably find a market. Our own countrymen are now feeling the effects of this, and if the situation is not corrected and these peoples become thoroughly industrialized, a home market for our own people will be a remembrance and not a reality.

Senator KING. Is it not quite obvious, Mr. Ferry, that with the low price of silver in the Orient, which results in cheap labor and cheap production, that we will suffer more from the yellow peril industrially in the future than in the past, and that the Orient will produce commodities cheaper than the Occident, and therefore will be able to undersell not only the United States, but other occidental nations in manufactured commodities?

Mr. FERRY. You have stated an incontrovertible fact, Senator, which has ample authority to justify it. And there is every evidence to-day that that is going on. I observed yesterday that a very distinguished witness called attention to the fact that our trade with China held up better than with other countries. Those things are said sincerely, of course. But information is lacking to justify such a statement. An analysis of our trade with China indicates that tobacco and cotton have increased tremendously because gold has gone into China, is building cigarette factories and cotton mills, manufacturing those, and are shipping those to all high exchange countries.

Senator KING. That is particularly true in Shanghai where the textile mills are being erected and they are pouring out very large quantities of commodities.

Mr. FERRY. That is true.

Senator HARRISON. By what people are they being erected? Chinese?

Mr. FERRY. Some Chinese, and some Germans.

Senator HARRISON. Any American interests there?

Mr. FERRY. I think so. I am not advised about that, Senator Harrison.

The CHAIRMAN. The same thing applies to Japan.

Mr. FERRY. Yes.

Senator KING. Not to the extent that it does in China.

The CHAIRMAN. I think the importations are more, in proportion to the amount of trade in Japan than they are in China.

Senator KING. I am speaking of the investment, Senator.

Senator HARRISON. Then what they have done is to take the gold dollar, convert it into cheap silver, and buy their plant over there on the silver basis and then start the wheels going?

Mr. FERRY. Surely. Employ local labor, buy local supplies, and import nothing but machinery.

Senator KING. Of course it is to be expected with the war conditions in the Orient and China attempting to meet the assaults, as she contends, of Japan, there would be rather an increased market for our commodities during the past few months and possibly during the next few months.

Mr. FERRY. Undoubtedly.

Senator KING. And that might account for the increase in the purchase of foreign commodities by the Japanese as well as by the Chinese.

Mr. FERRY. Surely.

Senator KING. But generally speaking your thesis is, as I understand you, that with silver down so low and the silver standard there prevailing to the exclusion of the gold standard, prices are built upon the level of silver, and therefore with those cheap prices there will be cheap labor and cheap commodities, and that those commodities will find their way into the markets of the world and undersell the nations which rest upon the gold standard or upon the gold exchange standard?

Mr. FERRY. They not only will do it, but they are doing it now. Senator.

The CHAIRMAN. Take the statistics of the exportations from Japan. That is enough to show you what they are doing, not only to this country but to other countries of the world.

Mr. FERRY. Gold is too dear and things are too cheap. Our Department of Labor states that within the last five years, gold has appreciated about 60 per cent above par. Recognized authority has reported that the annual mine production of gold has reached its apex; that within two or three years the annual production will start to decline, and by 1945 the annual production from the gold mines of the world will have declined as much as 45 per cent. My authority for the foregoing statement is Lord Bradbourne, chairman of the South Africa Consolidated Gold Fields Co.; the 1931 report of the joint committee of the Federation of British Industries and the Empire Economic Union on Empire Monetary and Financial Policy; the report of the financial committee of the League of Nations under the chairmanship of Prof. Gustav Cassel of Stockholm University; the 1930 report of Mr. H. A. fursell, an eminent American mining engineer; and the report of Sir Robert Kotze, engineer for the South African Government. These reports and opinions are based upon the expressed belief that there is no probability of any new and large gold fields remaining in the world.

Senator HARRISON. There is nothing to this report that we get occasionally that they have struck another gold bonanza out in California?

Mr. FERRY. Undoubtedly, Senator, there are new mines coming in all the time.

Senator HARRISON. I notice my mail is filled with statements of that kind now. I wondered what there was to it. I don't know whether it is propaganda or not.

Mr. FERRY. It does not change the facts as found by these eminent economists and engineers who have gone so much into detail that they have figured the tonnage available, the average content of the ore, the average cost of producing those ores. Much of the stuff coming from California is due to the fact that there are many, many thousands of men otherwise out of employment who are panning for gold.

Senator KING. And they are working the old tailings and the old dumps.

Mr. FERRY. Getting anywhere from 50 cents to 75 cents a day.

Senator HARRISON. There are no new discoveries being made?

Mr. FERRY. None.

Senator HARRISON. Have you got there the figures representing the production of gold in the various countries?

Mr. FERRY. The production?

Senator HARRISON. Yes.

Mr. FERRY. They are available from government sources and I will file them with the committee if you wish.

Senator HARRISON. Yes.

Senator KING. South Africa produces about 70 per cent?

Mr. FERRIS. No, South Africa produces 54 per cent. Within the British confines 74 per cent of the gold of the world is produced.

Senator HARRISON. What per cent do we produce?

Mr. FERRY. We produce about 9 or 10 per cent.

Senator KING. And the South African mines will be exhausted, as Lord Bradbourne says, by 1945 or 1946. And they are now working at levels so deep that it is almost impossible for human beings to remain in that fetid and heated atmosphere. So that with the exhaustion of the mines in South Africa the greater part of the gold supply of the world will be cut off.

Mr. FERRY. 54 per cent.

Senator KING. Yes. One other observation, if I may interrupt you there, Mr. Ferry. Is it not a fact that the economists figure that the increase in population and the normal increase in commodities—say 2 or 3 per cent per annum—would require an accretion to the gold reserve of the world of about 2 per cent anuallly in order to maintain a sort of equilibrium if we are to have the gold standard?

Mr. FERRY. I am touching on that in my next paragraph. A part of it, at least, Senator.

Senator KING. Very well.

Senator BARKLEY. While we are discussing this, and before you go on. I do not want to interrupt you again. Is there an increased activity now in the attempt to discover gold and mine gold in mines that have been more or less sluggish?

Mr. FERRY. Yes.

Senator BARKLEY. What is the result?

Mr. FERRY. The result is a temporary sporadic increase of gold production due to low costs, you see. Compared with the value of gold. But it is an exhaustion of old and known ore bodies and not any new discoveries. The nearest to that I think is some recent discoveries in Canada, in the northern area of Canada, where it looks very well for some substantial gold production. But in a large way, as Professor Cassel has said in his report, there is no reasonable expectation—always the possibility—but no reasonable expectation that new and large gold fields remain undiscovered. And he adds that the greatest problem before statesmenship and finance is to increase the metallic base for money.

There are between eleven and twelve billion dollars of gold in the money scheme of the world. If gold is to remain the basis of the money and credit structure, and if this metallic base is not be to strengthened, supplemented, and stabilized by the use of silver, it seems inevitable that the discrepancy between the comparative values of gold and commodities is bound to increase. This means disaster.

Normally, money and credit requirements increase about 3½ per cent per year, which fact considered in connection with a decreasing gold supply for metallic base and international trade settlements points to the results indicated.

The Macmillan committee in its recent report to the British Parliament, after a learned discussion of economic conditions throughout the world, and especially throughout the British Empire, asserts that the use of silver as a primary money to supplement the gold standard, should receive immediate and favorable consideration.

In our own country much study has been given to this matter. Trade organizations on the Pacific coast have realized the disastrous effect upon their export trade with oriental countries that has been caused by the low price of silver. The executive committee of the American Federation of Labor and the three largest national agricultural organizations have studied and reported upon the disastrous effect to their membership and to the country of the high price of gold. The United States Chamber of Commerce, at its annual meeting in 1932 asserted the importance of the use of silver as money.

As you are aware, two committees of Congress, one from each of its branches, have recently studied the effect of low silver or high gold upon money, exchange, credit, and home and foreign trade.

You, Senators, have doubtless studied the testimony in the records of these committee hearings, and have been impressed not only with the character and testimony of the witnesses, but also with the intelligent discrimination of the committee's findings.

The best opinion of government and business in our own country is against inflation. Too often the word is misused and misunderstood. Fiat money, and the unrestrained activities of the printing press, are not indicated or suggested by what I say. Nor do I at this time ask you to consider the merits of bimetallism. I do most earnestly urge upon you to favorably consider the sound and simple plan of strengthening and stabilizing the gold standard by adding silver to the metallic base. Such a plan is not inflation. On the contrary, if properly worked out, it will insure the maintenance of an adequate metallic base for money and credit, and will stay the urge for unlimited credit money, which after all adds to the burden on gold. This suggestion is not unique or revolutionary. The London Financial Times through its special Canadian representatives, stated specifically that the Ottawa conference which was held last July expected to consider the use of silver as a basic money, and the Times published the exact program which it stated was a part of the agenda to be considered. For reasons which were sufficient to the authority controlling this conference, the subjects of silver, money, and exchange were not presented. It is, however, entirely safe to say that the use of silver as an additional metallic reserve is favorably reviewed by many British statesmen and financiers.

From the foregoing brief outline of this general idea to utilize silver to help the world, and from your knowledge that many far-sighted and intelligent representatives of business and finance favorably consider the idea, we may conclude that a sympathetic consideration of this question is probable. It appears to me that the real question for your committee to consider is whether or not the United States of America should promptly assert the leadership which its position among nations justifies, and enact the suggested legislation without awaiting the formalities, delays, and uncertainties of an international conference. The need and justification for such action are clear when it is realized how disastrous to our own people and to our home and foreign markets is the destructive competition of countries with depreciated currency and exchange.

The plan is not fantastic nor dangerous. It is simple and easily controlled. Its operation will strongly tend to stabilize exchange, to restore the dollar to parity, to elevate and stabilize the commodity price level at a point where productive industry can again become profitable. It will tend to make possible the repayment of borrowed money and of taxes without devastating liquidation. It will stimulate employment and will encourage our citizens to again engage in the production and exchange of goods.

The CHAIRMAN. That is a very good statement.

Senator KING. Yes. Mr. Ferry, if there should be international bimetallism that would be a desideratum which we all require.

Mr. FERRY. There is no question about that.

Senator KING. If England, the British Dominions and the principal commercial nations of the world should agree upon a bimetallic standard, double standard, fixing a ratio of 20 to 1, or 15 or 16 to 1, giving to silver the same validity, the same purchasing power as to gold at that ratio, then that would increase the metallic base upon which rest currencies and credit and tend to increase prices and remove the tremendous tension and pressure upon gold which the world is now experiencing?

Mr. FERRY. Undoubtedly.

Senator KING. So you would not object to—indeed you would favor an international agreement for the rehabilitation of silver?

Mr. FERRY. I would.

Senator BARKLEY. Do you think it can be brought about without an international agreement?

Mr. FERRY. Bimetallism?

Senator BARKLEY. Well, yes. The remonetization of silver, so called? Of course that is a misnomer. That term is not correct, because it is still money. But the process which is commonly described as remonetization of silver, can we do that by ourselves, or will it be necessary to have an international agreement?

Mr. FERRY. If I understand your question, Senator, my answer is that I gravely doubt it. If I understand your question to mean a free and unlimited coinage of silver at a certain fixed ratio by the United States alone.

Senator BARKLEY. Yes.

Mr. FERRY. I should say that it is doubtful if that can be done, in my judgment.

The CHAIRMAN. With safety.

Senator HARRISON. You do not advocate that?

Mr. FERRY. No.

Senator HARRISON. But you do advocate the purchase of silver?

Mr. FERRY. I advocate the use of silver, Senator, as an additional metallic base by accepting it and paying for it with silver certificates.

Senator HARRISON. How much would you buy?

Mr. FERRY. That I do not know. That is a matter for experts to determine.

Senator BARKLEY. Some witness the other day suggested $200,000,000 worth.

Senator KING. Yes.

The CHAIRMAN. $200,000,000.

Senator BARKLEY. $200,000,000 worth of silver. That the purchase of $200,000,000 worth of silver would raise the price of silver, and he suggested the sale of a certain amount of gold that is now used as the basis for money; that by the sale of gold and the purchase of silver on the part of the Government that the chasm between the two would be to some extent bridged. That they would be brought nearer to a parity. What do you think about that?

Mr. FERRY. I think there is some force in it. I confine myself, Senator, to what I deem to be a basic economic truth. While I have not any claims as an expert on economics or upon anything else—economics must be based upon common sense and the lessons that history teaches us. My thought is very definitely that the maldistribution, plus the demonstrated fact, in so far as it is physically possible to make a demonstration, that gold production had reached its apex and will start to decline very soon, plus the known or admitted fact that our ordinary business activities normally increase 3 or 3.5 per cent, while even at best gold increases 1.7 per cent, but has now started to decline, and plus the assumption that we are going to remain upon a metallic credit basis, it seems to me inevitable that we must find some additional metal to supplement the gold reserve. The scramble, of course, for gold is beyond words to describe, as you know much better than I do.

Senator BARKLEY. I know that my scramble for it is beyond words to describe.

Mr. FERRY. And as far as a particular plan or detailed plan, I am not prepared to recommend or suggest any. I am sure that the studies which are being made with the expert advice that is being employed to reach conclusions will bring the right detail out.

Senator KING. Mr. Ferry, your position is that silver should be made to help the world. You are more concerned in helping the world and raising prices to the proper level than you are to aid the silver producer? That is a secondary consideration?

Mr. FERRY. Yes, Senator. The producers of silver who are intelligent—and most of them are—have long since reached the conclusion that silver per se was of no importance. That as a means to an end it might be used very advantageously. And purely from a selfish standpoint a silver producer is not especially interested in an increased price of silver. That sounds strange, does it not?

Senator HARRISON. That is a very startling statement to me.

Senator SHORTRIDGE. I do not understand it.

Mr. FERRY. I will explain it to you very definitely. Eighty per cent of silver production in the world comes as a by-product. There is not more than 20 or 21 per cent which comes from purely silver mines. The rest of it comes as a by-product of copper and lead and zinc and the combinations of those ores. The price of silver governs its production less than does the price of any other thing. The silver mines depend for their prosperity more upon the commodity price level than they do upon the price of silver. So that if silver should be artificially and arbitrarily stimulated in price, and that should result, which it would, in a certain amount of increased production, it would also mean an increased production of lead, copper, and zinc, and upon an already unwilling market with the commodity price level so disastrously low as it now is, the prices of those metals would necessarily go down and our last condition would be worse than our first. That is from a very narrow and very selfish standpoint.

Senator HARRISON. What is the proportion of the content of silver in copper?

Mr. FERRY. Do you mean totally?

Senator HARRISON. No; I mean do you get a larger percentage of silver out of copper ore than you do out of lead?

Mr. FERRY. No.

Senator HARRISON. Or out of zinc? That is what I am trying to get at.

Mr. FERRY. No. The lead and the lead-zinc group furnish a larger proportion than do the copper ores. The copper ores, by reason of their quantity production produce in the total a very substantial amount of silver. But it is very, very low per ton.

The CHAIRMAN. What is the average amount of production of silver as compared with gold in the world?

Mr. FERRY. Fourteen and a half to one. There are about 1,100,000,000 ounces of gold that have been produced since any records have been kept. There are about 15,000,000,000 ounces of silver since records have been kept.

The CHAIRMAN. A little less than that, is it not? I thought it was between eleven and twelve billion ounces of silver.

Mr. FERRY. No. About 15,000,000,000. A little less, perhaps.

Senator BARKLEY. Of course a great deal of that is lost, Senator, so that the quantity of silver in the world to-day would be less.

The CHAIRMAN. I said production.

Mr. FERRY. Yes, you said production.

The CHAIRMAN. I think it is 11,000,000,000 ounces or so.

Senator BARKLEY. How much silver and how much gold is there at the present time that is available for any purpose? A considerable proportion of that which has been produced I guess has been lost and destroyed or something happened to it. How much is there in existence now?

Mr. FERRY. The best information—and there is much information on the subject—much of it is based on a Senate inquiry which took place in 1922 or 1923 inquiring into the production of gold and silver in the world. That is a very illuminating report, carefully gotten out, and a great deal of investigation made prior to its compilation. That and other admitted authorities indicate that 59 per cent of gold is used for money purposes and the balance for the arts and objects of art, and so on. That 75 per cent of silver is used for money even now, and 25 per cent in the arts. So that silver is still money. Was that your question, or did you mean the total?

Senator BARKLEY. I was speaking of the total.

Mr. FERRY. It is believed that after accounting for coinage losses, the sinking of treasure ships and so on, that there are still in hoarding in oriental countries about 7,000,000,000 ounces of silver. That is the accumulation of ages. That, of course, is the savings banks for the ordinary laborer and small farmer, as you well know. And the destruction of the silver price has been a crime against almost half of humanity by destroying the value of savings of generations, as well as the buying power of their real money.

But of course that is in no wise a factor in the silver market, as is well illustrated by what took place during the war period when, because of the necessity which arose for the use of silver coin in payment of work troops, Indian and Chinese work troops, and for the further purpose of settling with India and with Indian merchants, silver coin was needed. There was not any to be had anywhere in the world—silver bullion. And the price of silver went up over night almost. In San Francisco it once touched for a few days \$1.41½ an ounce. In London it touched \$1.72 an ounce. It did not seem possible to get it. And Lord Reading, as you men are well aware, came over here and negotiated with our Government so that England might use the only known reserve, the only reserve that could be handled, and it was so arranged, and in spite of the price we let the Allies have about 200,000,000 ounces of silver at a dollar an ounce.

Senator HARRISON. And the price at that time was what?

Mr. FERRY. In London, was \$1.72 and in our own country from \$1.38 to \$1.41½.

Senator HARRISON. We were quite generous.

Mr. FERRY. Very. Very generous. And the point of the thing is, there wasn't any came out. The higher the silver went the tighter it was held by those who through generations have had faith in silver. And, incidentally, it is a very serious question as to whether—well, there can not be any question—it is a very serious phase of the question, which is, after all, a gold question, that the destruction of faith in silver in these oriental people is going to turn their hoarding proclivities toward gold, and when that gold is hoarded, why of course it is out of circulation.

Senator BARKLEY. How are they going to get very much of it?

Mr. FERRY. They will have to sell some stuff to get it, of course.

Senator KING. By unloading upon the world their commodities at prices that are devastating. They are determined to get gold for hoarding purposes. So it is to our advantage to raise the price of silver through the use of silver as a basic money, thus preventing this hoarding of gold and denuding the Occident of what little gold they have, and increasing the basic structure upon which credit and currency rest.

Mr. FERRY. Exactly so.

Senator HARRISON. You said, though, that that had to be done through international cooperation, and the more nations you get in that cooperation the more effective will be the plan and the better it will work?

Mr. FERRY. I am glad you asked that question, Senator. In so far as the complete installation of the bi-metallic system, which I think is inevitable, if we are going to remain upon a metallic basis, yes. But in so far as a declaration asserting faith and confidence in the use of silver as a basic money I am of the opinion that the United States not only could, but should take that position.

Senator HARRISON. Separate and alone?

Mr. FERRY. Separate and alone. And there is no danger connected with it at all. No danger of any flood. There is no danger of any lack of control. And I really believe that it will tend strongly to avert whatever danger may exist of unrestricted printing-press inflation.

Senator HARRISON. But suppose this country would say: We are going to buy \$500,000,000 worth of silver, without any restriction as to where the silver shall come from, you have no doubt that it will pour in here to that amount?

Mr. FERRY. Without any restriction, yes. But I would make restriction, Senator.

Senator HARRISON. If we said we were going to stabilize it at a certain price, and this Government would pay, say 60 cents for it, is there anything then that would keep other countries from hammering down the price of it and making this country hold the bag?

Mr. FERRY. May I answer that question without being categorical in my reply?

Senator HARRISON. Yes. I just want the facts. I want your opinion about the thing.

Mr. FERRY. The maximum mine production reached 260,000,000 ounces per year. A curious thing about the silver market is that there is no substantial surplus of mine production ever. It is sold whatever the price is. It finds its way somewhere. There is an accumulation of silver for sale purposes, particularly in the Indian Treasury, of perhaps 250,000,000 or 300,000,000 ounces—nobody knows how much quite—which they have used to keep the market between 25 and 30 cents, it is believed, and with the gold reserve—the equalization fund in Great Britain for the so-called purpose of stabilizing the pound, silver in the East, gold in the West, the commodity price level of gold countries has been manipulated and kept low. That 250,000,000 or 300,000,000 ounces should be excluded from the market.

Senator HARRISON. You mean that that is in the equalization fund?

Mr. FERRY. No, in India.

Senator KING. The Indian mint.

Senator HARRISON. In India. I understood you to say about 250,000,000 ounces?

Mr. FERRY. Well, from 250,000,000 to 300,000,000. No one knows quite what it is.

Senator HARRISON. That is the only particular silver that you would exclude?

Mr. FERRY. I would exclude all silver coming from melted-up and debased currency.

Senator HARRISON. China has some?

Mr. FERRY. China has quite an accumulation of silver at Shanghai, but it is driven there from the interior for safe-keeping. And according to the evidence in the Pittman committee report, which still stands good, they had not enough silver to do their business back in the interior. It has come in to the important cities and been put in the banks and vaults, and so on. Mr. Brownell of the American Smelting & Refining Co., one of the largest handlers of silver in the world, is of the opinion that not more than 30,000,000 or 40,000,000 ounces are loose on the market anywhere. There probably would be some speculative silver. He estimates less than 100,000,000 ounces coming from China—oriental countries. So that I am perfectly willing to give as my judgment that not more than 200,000,00 ounces are available at the maximum.

Senator KING. The annual production of silver has been reduced materially so that now the production is substantially 150,000,000 ounces, is it not?

Mr. FERRY. Yes.

Senator HARRISON. You think then, if this country, either by itself or with France and England, should purchase $500,000,000 worth of silver, and the only exception in the matter of purchase would be India, that in itself would have a tendency to inflate prices?

Mr. FERRY. Undoubtedly. It would deflate the comparative value of the gold dollar, in my judgment, providing the money which was issued upon the matellic base so purchased were made legal tender, except as otherwise indicated in the contracts.

The CHAIRMAN. You would have to make it legal tender.

Mr. FERRY. I know. But I mean not merely as token money. As long as silver was used as basic money, I think that is precisely what would occur.

The CHAIRMAN. Is there anything else?

Senator SHORTRIDGE. I would like to ask one or two questions. Can you give us in a few words your definition of money? What is money? You see what I am leading up to?

Mr. FERRY. Yes. Money is a medium of exchange.

Senator KING. Really purchasing power.

Senator SHORTRIDGE. The base of our money structure is gold.

Mr. FERRY. Yes.

Senator SHORTRIDGE. Well, the metal, gold, in the ledge, in the mine, is not money, is it?

Mr. FERRY. No.

Senator SHORTRIDGE. As I understand it, then, it takes some act of government to make that metal money?

Mr. FERRY. That is my belief.

Senator SHORTRIDGE. If that be so, why could not the United States fix a ratio as between the two metals, contemplating the coinage or the issue of a token representing the money supported by the metal base—why could not the United States fix the ratio and proceed upon that theory?

Mr. FERRY. I have no strong conviction that it could not.

Senator SHORTRIDGE. Putting it in a sort of a leading form: Do you not think that if the United States now, a great creditor Nation, should do that, take the affirmative, take the leadership, that certain other great commercial nations would follow suit?

Mr. FERRY. I think they not only would, but I think they would be obliged to.

Senator SHORTRIDGE. That is my thought on the matter. Wherefore, is it your mature conclusion that we, the United States, should wait for these other nations to take action?

Mr. FERRY. It is not. I think we should assert the leadership which the position of our country justifies us in asserting. I am in doubt, as I indicated earlier in the hearing, that the United States alone and unaided could open its mints to the free and unlimited coinage of silver. Although there is strong reason to believe that if that were done, or if it were seriously contemplated, the immediate agreement could be had of one or two other leading nations. But there can be no doubt in the minds of thoughtful men, it seems to me, that the international consideration of these things—silver, as well as international debts and tariffs—are pawns in a game. They are trading points.

Senator SHORTRIDGE. Well now, quite apart from the question as a purely monetary question, would not some legislation looking toward the remonetizing—to use that word—of silver be of benefit to the United States in view of our economic condition? Meaning, would it not put men to work?

Mr. FERRY. It would unquestionably do that.

Senator SHORTRIDGE. I noted, of course, in what you said, that in a sense silver was a by-product in mining. Nevertheless if silver took on a greater value it would encourage the development of our silver mines, would it not, and give employment to our people?

Mr. FERRY. Oh, yes. But silver per se is of comparatively no importance even in the great picture. It has no more importance, it seems to me, than its relative position to other lines of industry.

Senator SHORTRIDGE. Now the final question. Certain nations owe us money. And they have agreed to pay us. And the agreement is evidenced in writing, clear, definite, nothing uncertain as to time, nothing uncertain as to principal or interest or time of payment. And those several agreements provide that these moneys shall be paid in gold as of the then standard value. These agreements are in force. They are valid agreements, legal agreements as between, for example, France and the United States, Italy and the United States, Czechoslovakia and the United States. Now if called upon to pay the contracts provide they shall pay in gold, as I said. Is there any reason why they should pay in gold at an exaggerated or an appreciated value now as compared to what it was when the contracts were entered into? You grasp my meaning?

Mr. FERRY. I do.

Senator SHORTRIDGE. What is your judgment, if you will have the goodness to give me your views?

Mr. FERRY. My judgment of the matter is that the commodity price level or the relationship between dollars and things must be stabilized at a point where there is more equity between debtor and creditor before the consideration of ability to pay can be properly made.

Senator SHORTRIDGE. If I understand you that would hold good as between two individuals?

Mr. FERRY. Absolutely.

Senator SHORTRIDGE. That is to say, if I owed you $1,000 to be paid a year hence is it your view that we shall sit down together and a year hence consider whether I was to pay you $1,000 or $980?

Mr. FERRY. No; not that strong. My position is illustrated by the position on farm mortgages, where it takes 2 or 3 bushels of wheat to buy the dollar to pay the mortgage now, when it took 1 or 2 bushels, perhaps, to buy it when the dollar was borrowed; but now four or five years afterwards when that mortgage becomes due the farmer can not buy the dollar at the price he bought the dollar he borrowed. Of course there would be fluctuations, but not fluctuations to the extent of 60 per cent as our Commerce Department indicates in its reports.

Senator SHORTRIDGE. Then there is no such thing as certainty in the matter of contracts to pay money in the future?

Mr. FERRY. Oh, yes. I am not suggesting any violation of contracts, sir. I am suggesting the broad principle of reasonable stabilization between commodity price level and money.

Senator SHORTRIDGE. Thank you very much.

The CHAIRMAN. Mr. M. S. Eccles.

## STATEMENT OF M. S. ECCLES, PRESIDENT FIRST SECURITY CORPORATION, OGDEN, UTAH

The CHAIRMAN. Mr. Eccles, give your name and your address for the record.

Mr. ECCLES. M. S. Eccles, Ogden, Utah.

The CHAIRMAN. You are interested in banking institutions in not only Utah, but Idaho?

Mr. ECCLES. Yes.

The CHAIRMAN. You may proceed, Mr. Eccles.

Mr. Eccles. Let me say at the outset that I am not appearing here as a representative of any one class or section. Nor am I suggesting measures designed to help my section of the country at the expense of any other section. The ideas I shall present have not been gained through contact with or interests in any one line of private or public occupation. I happen to be interested in the following businesses:

President of First Security Corporation, owning and operating 26 banks and 1 trust company in the principal points of Utah and southern Idaho, all in the trade territory of the Salt Lake Federal reserve branch. Total resources of approximately $50,000,000. None of these banks are borrowing money from the Reconstruction Finance Corporation. The organization has been through the effects of numerous, important bank failures in the same communities in which it operates.

Vice president and treasurer of the Amalgamated Sugar Co., one of the large beet sugar companies of the United States, producing the past year 2,000,000 bags of sugar.

President of Sego Milk Products Co., engaged in the production of evaporated milk, butter, cheese, and ice cream with plants in the States of Utah, Idaho, and California.

President of the Utah Construction Co., largely engaged in railroad, highway, and dam construction, and one of the six companies building Boulder Dam.

President of the Stoddard Lumber Co., a pine lumber manufacturing concern in eastern Oregon, normally producing 30,000,000 feet per year.

Director of 2 chain retail concerns—the Anderson Lumber Co., owning and operating 14 retail lumber yards in northern Utah and southern Idaho; the Mountain States Implement Co., owning and operating a wholesale house in Ogden and 10 retail stores in northern Utah and southern Idaho.

Member of governor's executive relief committee.

Director of Salt Lake branch of Reconstruction Finance Corporation. I mention these contacts merely to rebut any assumption that my views are founded upon theory alone. I am, however, without political experience, having never held a political office. Nor are my politics entirely free from blemish, as I am one of the many who last fall wandered from the Republican fold, although with some misgivings, because I felt that Republican leadership had failed to act with sufficient understanding and courage to remedy the ills from which we now suffer.

The measures proposed by me, while more far-reaching than have been used to date, are predicated upon sound Government finance. Nor do they involve any measure of inflation of the popular brand. I believe the adoption of any or all of them would not in any degree weaken our gold standard or cheapen the gold content of our dollar. Now, I am not so sure, since I prepared this paper a week ago, due to the developments of the last few days. They, of course, are changing the situation relative to our gold standard, I think very, very rapidly. I think there is a good deal of gold hoarding. And, of course, with the increased hoarding of currency it means 40 per cent of that amount must be set aside in gold and becomes worthless in so far as its value in our money system is concerned.

The CHAIRMAN. *I suppose you know that there has been gold hoarding from your own experience.*

*Mr. ECCLES. Yes. But mostly from hearsay.*

On the contrary, I am firmly convinced that these measures would protect and strengthen the sound money of this country and its gold standard. The propositions I offer are all intended to bring about, by Government action, an increase of purchasing power on the part of all the people, resulting in an immediate and increasing volume in all lines of business with consequent diminution of unemployment and distress and gradual restoration of our national income. When this is accomplished, and not before, can the Government hope to balance its Budget and our people regain the standard of living to which the material wealth of this country entitles them.

Before effective action can be taken to stop the devastating effects of the depression, it must be recognized that the breakdown of our present economic system is due to the failure of our political and financial leadership to intelligently deal with the money problem. In the real world there is no cause nor reason for the unemployment with its resultant destitution and suffering of fully one-third of our entire population. We have all and more of the material wealth which we had at the peak of our prosperity in the year 1929. Our people need and want everything which our abundant facilities and resources are able to provide for them. The problem of production has been solved, and we need no further capital accumulation for the present, which could only be utilized in further increasing our productive facilities or extending further foreign credits. We have a complete economic plant able to supply a superabundance of not only all of the necessities of our people, but the comforts and luxuries as well. Our problem, then, becomes one purely of distribution. This can only be brought about by providing purchasing power sufficiently adequate to enable the people to obtain the consumption goods which we, as a nation, are able to produce. The economic system can serve no other purpose and expect to survive.

If our problem is then the result of the failure of our money system to properly function, which to-day is generally recognized, we then must turn to the consideration of the necessary corrective measures to be brought about in that field; otherwise, we can only expect to sink deeper in our dilemma and distress, with possible revolution, with social disintegration, with the world in ruins, the network of its financial obligations in shreds, with the very basis of law and order shattered. Under such a condition nothing but a primitive society is possible. Difficult and slow would then be the process of rebuilding and it could only then be brought about on a basis of a new political, economic, and social system. Why risk such a catastrophe when it can be averted by aggressive measures in the right direction on the part of the Government?

Our leadership has delayed far too long in attempting to deal intelligently with our problems, which can be met only by the bold and courageous action of government, coupled with the unselfish, intelligent, and cooperative support of our business and financial leadership, the whole effort designed in the interest of our entire people. In the mad confusion and fear brought about by our present disordered economy, we need bold and courageous leadership more than at any other time in our history for the reason that our industrial evolution has made necessary a new economic philosophy, a new business point of view and fundamental changes in our social system. The nineteenth century economics will no longer serve our purpose—an economic age 150 years old has come to an end. The orthodox capitalistic system of uncontrolled individualism, with its free competition, will no longer serve our purpose. We must think in terms of the scientific, technological, interdependent machine age, which can only survive and function under a modified capitalistic system controlled and regulated from the top by government.

What I have said could no doubt be considered academic unless the discussion of it reveals some specific constructive propositions for solution of our immediate problems, which now call for first-aid measures due to the failure of those in authority to act sooner. Before offering and considering in detail what I will term a "five-point program," it is pertinent to consider the operation of our money world, how it has failed to be a servant in our real world and instead is our tyrant and master.

Money has no utility or economic value except to serve as a medium of exchange. Inflation and deflation are expressed in the increased and decreased purchasing power of money, which we speak of as a cheap dollar or a dear dollar according to what it will buy. At present our dollar is too valuable measured in terms of goods and services, or, conversely, goods and services are too cheap measured in dollars. Were it not for our debt structure the fluctuating and unstable dollar would not raise such havoc with our economic system. Our debt and credit structure is the very foundation of our capitalistic society and our unstable dollar results in a large measure from the uncontrolled operation of this system.

We could do business on the basis of any dollar value as long as we have a reasonable balance between the value of all goods and services if it were not for the debt structure. The debt structure has obtained its present astronomical proportions due to an unbalanced distribution of wealth production as measured in buying power during our years of prosperity. Too much of the product of labor was diverted into capital goods, and as a result what seemed to be our prosperity was maintained on a basis of abnormal credit both at home and abroad. The time came when we seemed to reach a point of saturation in the credit structure where, generally speaking, additional credit was no longer available, with the result that debtors were forced to curtail their consumption in an effort to create a margin to apply on the reduction of debts. This naturally reduced the demand for goods of all kinds, bringing about what appeared to be overproduction, but what in reality was underconsumption measured in terms of the real world and not the money world. This naturally brought about a falling in prices and unemployment. Unemployment further decreased the consumption of goods, which further increased unemployment, thus bringing about a continuing decline in prices. Earnings began to disappear, requiring economies of all kinds—decreases in wages, salaries, and time of those employed.

And thus the vicious cycle of deflation was continued until after nearly the four years we find one-third of our entire working population unemployed, with prices of everything greatly reduced, raw products of all kinds selling at an unprecedentedly low level; our national income reduced by 50 per cent with the aggregate debt burden greater than ever before, not in dollars but measured by present values which represents the ability to pay; fixed charges, such as taxes, railroad and utility rates, insurance and interest charges close to the 1929 level and requiring such a portion of the national income to meet them that the amount left for consumption goods is not sufficient to support the population.

Senator WALSH of Massachusetts. That is a good statement.

Mr. ECCLES. As a result of this pressure we hear demands for increased economies in every field, both public and private, which can only make for further distress and unemployment and less buying power. The debt structure, in spite of the great amount of liquidation during the past three years, is rapidly becoming unsupportable, with the result that foreclosures, receiverships and bankruptcies are increasing in every field; delinquent taxes are mounting and forcing the closing of schools, thus breaking down our educational system, and moratoriums of all kinds are being resorted to—all this resulting in a steady and gradual breaking down of our entire credit structure, which can only bring additional distress, fear, rebellion, and chaos. Individuals, corporations, cities, and States can not, of themselves, do anything except play according to the rules of the present money system and make their outgo balance their income, or ultimately "go broke." Most of them are unable, much as they may desire, to give consideration to helping the general situation except as they may influence the action of the Federal Government, which is in an entirely different category, it being able to make and change the rules of the game.

The Government controls the gold reserve, the power to issue money and credit, thus largely regulating the price structure. Through its power of taxation it can control the accumulation and distribution of wealth production. It can mobilize the resources of the Nation for the benefit of its people. As an example of Government control and operation of the economic system look to the period of the war, at which time, under Government direction, we were able to produce enough and support not only our entire civilian population on a standard of living far higher than at present, but an immense army of our most productive workers engaged in the business of war parasites on the economic system, consuming and destroying vast quantities produced by our civilian population; we also provided the allies with an endless stream of war materials and consumption goods of all kinds. It seemed as though we were enriched by the waste and destruction of war. Certainly we were not impoverished, because we did not consume and waste except that which we produced. As a matter of fact we consumed and wasted less than we produced as evidenced by the additions to our plant and facilities during the war and the goods which we furnished to our allies. The debt incurred by the Government during the war represents the profit which accrued to certain portions of our population through the operation of our economic system. No Government debt would have been necessary and no great price inflation would have resulted if we had drawn back into the Federal Treasury through taxation all of the profits and savings accumulated during the war.

Senator WALSH of Massachusetts. Another good statement.

Mr. ECCLES. No government debt would have been necessary and no great price inflation would have resulted if we had drawn back into the Federal Treasury through taxation all of the profits and savings accumulated during the war; in which case, it would not have been necessary to use Government credit for the purpose of supplying our allies with the endless stream of goods which we furnished them and we now would not be concerned with the vexations interallied debt problem.

Why was it that during the war when there was no depression we did not insist upon balancing the Budget by sufficient taxation of our surplus income instead of using Government credit to the extent of $27,000,000,000? Why was it that we heard nothing of the necessity of balancing the Federal Budget in order to maintain the Government credit when we had a deficit of $9,000,000,000 in 1918 and $13,000,000,000 in 1919? Why was it that there was no unemployment at that time and an insufficient amount of money as a medium of exchange? How was it that with one billion less gold then than we now have we were not concerned about our gold standard?

Senator WALSH of Massachusetts. Because we drafted human lives and not money.

Mr. ECCLES. That is right. How was it that during the period of prosperity after the war we were able in spite of what is termed our extravagance—which was not extravagance at all; we saved too much and consumed too little—how was it we were able to balance a $4,000,000,000 annual Budget, to pay off ten billion of the Government debt, to make four major reductions in our income tax rates (otherwise all of the Government debt would have been paid), to extend $10,000,000,000 credit to foreign countries represented by our surplus production which we shipped abroad, and add approximately $100,000,000,000 by capital accumulation to our national wealth, represented by plants, equipment, buildings, and construction of all kinds? In the light of this record, is it consistent for our political and financial leadership to demand at this time a balanced Budget by the inauguration of a general sales tax, further reducing the buying power of our people? Is it necessary to conserve Government credit to the point of providing a starvation existence for millions of our people in a land of superabundance? Is the universal demand for Government economy consistent at this time? Is the present lack of confidence due to an unbalanced Budget?

What the public and the business men of this country are interested in is a revival of employment and purchasing power. This would automatically restore confidence and increase profits to a point where the Budget would automatically be balanced in just the same manner as the individual, corporation, State, and city budget would be balanced.

Senator WALSH of Massachusetts. It would not be balanced immediately; it would be balanced in the future.

Mr. ECCLES. I am saying that when that is done it would automatically balance as with an individual or corporation, because you create the source of wealth by labor and employment, which is the only source of wealth.

Senator WALSH of Massachusetts. Would you increase the taxes or borrow the money necessary to cover the deficit now between the income and expenditures?

Mr. ECCLES. I answer that later.

Senator WALSH of Massachusetts. Thank you.

Mr. ECCLES. We must correct the causes of the depression rather than deal with the effects of it, if we expect recovery with its attendant confidence and budget balancing. This can only be accomplished by government action tending to raise the price level of raw products and increasing employment, thus bringing about an increased demand for consumers' goods.

Senator SHORTRIDGE. That is just the point that I would like you to get to.

Mr. ECCLES. I will get to that later.

Senator SHORTRIDGE. Very well.

Mr. ECCLES. Every effort has been used to bring this about by the Reconstruction Finance Corporation and the Federal reserve banks without result, demonstrating that extension of credit alone is not the solution. Credit is the secondary offensive when there is a basis of credit through the raising of the price level and an increase in the demand for goods requiring credit. Nor is the correction of our present difficulties to be found in a general scaling down of debts in an effort to bring them in relation to the present price levels. During the past three years there has been such tremendous liquidation and scaling down of debts that extraordinary measures have had to be taken to prevent a general collapse of the credit structure. If such a policy is continued what assurance is there that the influences radiating from a marking down of the claims of creditors will not result in a further decline of prices? In other words, after we have reduced all debts through a basis of scaling down 25 per cent to 50 per cent, what reason have we to expect that prices will not have a further decline by like amount? And then again, the practical difficulties of bringing about such an adjustment on a broad scale seem to be insurmountable.

The time element required would indefinitely prolong the depression; such a policy would necessitate the further liquidation of banks, insurance companies, and all credit institutions, for if the obligations of public bodies, corporations, and individuals were appreciably reduced the assets of such institutions would diminish correspondingly, forcing their liquidation on a large scale. Nothing would so hinder any possibility of recovery. Bank and insurance failures destroy confidence and spread disaster and fear throughout the economic world. The present volume of money would diminish with increased hoarding and decreased credit and velocity, making for further deflation and requiring increased Government support without beneficial results until we would be forced from the gold standard in spite of our 40 per cent of the world's gold, and, at that point, an undesirable and possibly an uncontrolled inflation with all its attendant evils would likely result, and thus the very action designed to preserve the gold standard and reestablish confidence would destroy both.

In my opinion, we can bring about and support a price level which will reestablish employment and credit on a sound money basis if action is not too long delayed on the part of our Government. The last 10 days have changed the thing. I am not as certain as I was a week or two ago whether we can do it on the gold basis or not.

Senator SHORTRIDGE. You say the action of Government. You will come to it, I suppose?

Mr. ECCLES. Yes. I have got the five points here.

Senator SHORTRIDGE. Of just what you would do?

Mr. ECCLES. Yes, sir.

Present low prices are not justified by the volume of our currency in circulation and bank deposits, the aggregate of the two making up our total volume of money. It is because of hoarding by both individuals and banks that there is an apparent shortage of money and consequently there is a great demand for the inflation of our currency, the remonetization of silver, or the reduction of the gold content of the dollar——

Senator WALSH of Massachusetts. Those are the two methods of deflation you suggest?

The CHAIRMAN. Yes; but he has reference to hoarding by the banks and individuals.

Mr. ECCLES. It is because of hoarding by both individuals and banks that there is an apparent shortage of money and consequently there is a great demand for the inflation of our currency, the remonetization of silver, or the reduction of the gold content of the dollar, with the idea that any one of the three methods would increase our volume of money and thus raise prices, relieving debtors and bringing about prosperity. None of these three, in my opinion, would accomplish the results desired unless a method would be provided for getting the increased supply of money to the ultimate consumer.

It does not make any difference what kind of inflation, if the inflation is adopted—you can print money, you can remonetize silver, you can reduce the gold content of the dollar and it is not going to raise your price level unless you start the purchasing power at the source with the consumer.

Senator WALSH of Massachusetts. Unless it is widely scattered and moves with rapidity.

Mr. ECCLES. Yes.

Why resort to inflation of the sort referred to when prices can be increased and business revived on the basis of our present money system? We have nearly one and a half billion currency more in circulation at the present time than we had at the peak of 1929, and under our present money system we are able to increase this by several billion more without resorting to any of the three inflationary measures popularly advocated. There is sufficient money available in our present system to adequately adjust our present price structure. Our price structure depends more upon the velocity of money than it does upon the volume. The velocity is measured by the annual turnover of bank deposits or what is termed "bank debits," representing checks issued. Ninety per cent of our business is done by the bank check; currency, augmented by silver, normally is largely used as pocket money and represents 10 per cent; gold is held in reserve banks to support our currency.

In 1929 the high level of prices was supported by a corresponding velocity of credit. The last Federal Reserve Bulletin gives an illuminating picture of this relationship as shown by figures of all member banks. From 1923 to 1925 the turnover of deposits fluctuated from 26 to 32 times per year. From the autumn of 1925 to 1929 the turnover rose to 45 times per year. In 1930, with deposits still increasing, the turnover declined at the year end to 26 times. During the last quarter of 1932 the turnover dropped to 16 times per year. Note that from the high price level of 1929 to the low level of the present this turnover has declined from 45 to 16, or 64 per cent. And, mind you, 90 per cent of all business is done on bank checks, so that that represents your velocity.

Senator WALSH of Massachusetts. And the figures, if we could get them, for January and February would show a further decline.

Mr. ECCLES. Yes; would show a much further decline.

Senator GORE. And in 1929 the turnover was 45 times?

Mr. ECCLES. Yes.

Senator GORE. But in New York City the turnover was over 150 times.

Mr. ECCLES. I am taking the country as a whole. It varies with different parts of the country.

Senator GORE. Yes.

Mr. ECCLES. While during the same period the volume of money represented by total bank deposits and currency has declined approximately 22 per cent. It is clear, therefore, that the velocity, rather than the quantity of money, supports the price structure and that our problem to-day is not one of increasing the volume of money but its velocity.

Senator WALSH of Massachusetts. But, as a matter of fact, we have increased the volume or currency.

Mr. ECCLES. Yes; currency, but the total of currency and bank deposits is 22 per cent less than in 1929.

Senator GORE. But currency alone is about 25 or 30 per cent more.

Mr. ECCLES. Yes; but it is not working. Some of it is in hoarding.

Senator WALSH of Massachusetts. What figure did you give, Senator?

Senator GORE. Twenty-five per cent.

Mr. ECCLES. No; currency is more than that to-day. Currency to-day is close to 30 per cent more.

The CHAIRMAN. Then the bank deposits must be less.

Mr. ECCLES. The bank deposits are possibly 30 per cent less, or between 25 and 30 per cent. The 22 per cent represents the combination of the volume of currency and bank deposits. The deposits are more than 22 per cent less.

The CHAIRMAN. That is what I said.

Mr. ECCLES. And currency is 30 per cent more. Making the average 22 per cent.

Several factors to-day stand in the way of increasing our money velocity.

I repeat there is plenty of money to-day to bring about a restoration of prices, but the chief trouble is that it is in the wrong place; it is concentrated in the larger financial centers of the country, the creditor sections, leaving a great portion of the back country, or the debtor sections, drained dry and making it appear that there is a great shortage of money and that it is, therefor, necessary for the Government to print more. This maldistribution of our money supply is the result of the relationship between debtor and creditor sections—just the same as the relation between this as a creditor nation and another nation as a debtor nation—and the development of our industries into vast systems concentrated in the larger centers. During the period of the depression the creditor sections have acted on our system like a great suction pump, drawing a large portion of the available income and deposits in payment of interest, debts, insurance and dividends as well as in the transfer of balances by the larger corporations normally carried throughout the country. This makes for a shortage of funds in the agricultural areas and an excess of funds in the cities.

During our period of prosperity funds were flowing from the creditor sections into the debtor sections in the extension of new credits and capital expansion as fast or faster than they were flowing out. There is no way of reviving the return flow through the operation of credit or investment until there is a basis for credit brought about through an increased price level and until there is an opportunity of profit through further investment of capital. The agricultural areas during the periods of prosperity did not share in their portion of the national income and this made for further concentration of money in the creditor sections, with too large a portion of our aggregate debts in the agricultural areas. This explains the reason for a greater financial collapse as shown by the bank failure record throughout the entire back country, represented largely in the agricultural areas.

The maladjustment referred to must be corrected before there can be the necessary velocity of money. I see no way of correcting this situation except through Government action.

It is estimated that one-third of our population is dependent upon agriculture in its varied forms and it is recognized that prosperity is impossible without a revival of the purchasing power of our agricultural population. To bring about the restoration of business to the average of the postwar period I have to suggest five points as first-aid measures designed to bring about recovery. Action with reference to these should be taken immediately. They are as follows:

First. Make available as gift to the States on a per capita basis $500,000,000 to be used during the balance of this year in assisting to adequately take care of the destitute and unemployed, pending a revival in business which should result from the following program.

Senator WALSH of Massachusetts. Is that a gift or a loan?

Mr. ECCLES. I am covering it here. I am first outlining them and then I cover each point individually in detail.

Senator GORE. We passed a law the other day in which among other things we gave the District of Columbia $600,000. Now they are asking for $200,000 more. I was talking to the head of the community chest of this city and he said that the representatives who distribute this fund came here to Congress and lobbied and got that $600,000 without ever asking him about it; without even getting an estimate from him. Yesterday two Senators advised the District Commissioners to turn in a request for $250,000 more. And they will do it, and they will get it. There is not any end to that business.

Senator SHORTRIDGE. Did you suggest a fund of $500,000,000?

Senator WALSH of Massachusetts. I wish you would read that first suggestion again.

Mr. ECCLES. First. Make available as gift to the States on a per capita basis $500,000,000 to be used during the balance of this year in assisting to adequately take care of the destitute and unemployed, pending a revival in business which should result from the following program.

Second. Increase the amount of Government funds——

Senator WALSH of Massachusetts. You are coming back to a discussion of that first point when you finish giving the five points you referred to?

Mr. Eccles. Yes.

Second. Increase the amount of Government funds to two and a half billion dollars, and more if necessary, for self-liquidating projects and loans to cities, counties, and States for public works on a liberal basis at a low rate of interest.

Senator Walsh of Massachusetts. How large is that amount?

Mr. Eccles. Two and one-half billion dollars.

Senator Gore. We passed a bill the other day doing away with the self-liquidating feature. You know as you start this you do not stop. It gets worse and worse.

Mr. Eccles. Third. The adoption of the domestic allotment plan, or a similar plan, designed to regulate production and raise prices.

Fourth. Refinancing farm mortgages on a long term basis at a low rate of interest.

Fifth. A permanent settlement of the interallied debts on a sound economic basis, cancellation being preferable.

Senator Shortridge. What! Cancel all those debts?

Mr. Eccles. I will get to that in just a minute.

Senator Shortridge. Well, go on.

Mr. Eccles. I will cover those points.

Point No. 1. Unemployment relief. Without going into any detail or figures, it is recognized by everyone that our most urgent and acute problem to-day is to immediately provide adequate relief to the millions of our people who are destitute and unemployed in every corner of our Nation. It is national disgrace that such suffering should be permitted in this, the wealthiest country in the world. The present condition is not the fault of the unemployed, but that of our business, financial, and political leadership. It is incomprehensible that the people of this country should very much longer stupidly continue to suffer the wastes, the bread lines, the suicides, and the despair, and be forced to die, steal, or accept a miserable pittance in the form of charity which they resent, and properly resent. We shall either adopt a plan which will meet this situation under capitalism, or a plan will be adopted for us which will operate without capitalism.

Private charity is almost entirely exhausted. It is impossible for most of our political subdivisions to provide additional funds through borrowing or taxation. Many of them are in default at the present time in the meeting of their obligations and are unable to provide funds necessary to pay the expense of their schools and local government. I am on the Governor's Executive Unemployment Relief Committee of my State and although I am sure the unemployed receive as much or more than in many sections of the country, available funds are entirely inadequate to meet the situation, which is daily becoming more difficult to control.

I advocate that the Government make available, as the most urgent of all emergency measures, at least $500,000,000 to be distributed to the States as required, as a gift and not as a loan, on a per capita basis in such amounts as will enable the relief organizations of each State to take care of the needs of the unemployed in a more adequate manner than has heretofore been possible. For this reason, that when it is made as a loan there is a resistance to borrowing. There is a cutting down to a point of starvation. When a State has to borrow the money that is the attitude of the public officials of the State as a result of the demands of business leaders and taxpayers generally for economy.

Senator WALSH of Massachusetts. When it is a gift the lid is off?

Senator GORE. Where does the Federal Government get this money to give to the States?

Mr. ECCLES. Where did it get $27,000,000,000 during the war to waste?

Senator GORE. A very different situation.

Senator WALSH of Massachusetts. Let him finish his two sentences under No. 1 and then we will ask him some questions.

Mr. ECCLES. To do less would be to fail in the first duty of government, the protection of the lives of its citizens. This support of the unemployed by Government should rapidly decrease as appropriate action is taken by the Government to restore the proper functioning of our economic system.

Senator WALSH of Massachusetts. Now may I ask you a few questions?

Mr. ECCLES. I am just wondering if it is all right to continue with my statement, Senator. Maybe the questions will be answered during the course of my statement.

Senator WALSH of Massachusetts. I would like to discuss this thing with you.

Mr. ECCLES. Yes.

Senator WALSH of Massachusetts. Is it a fact that the greatest distress in this country to-day is in the large centers of population?

Mr. ECCLES. Well, I am not in a position to say what the distress is in the larger cities.

Senator WALSH of Massachusetts. Are there not many more million people in need and distress in the large centers of population rather than in the farming districts?

Mr. ECCLES. I believe that is true.

Senator WALSH of Massachusetts. You are asking the Federal Government to give money to New York State in large volume, to Massachusetts in large volume, to Ohio in large volume, and to Illinois in large volume, on the theory that they, the richest States in the Union, from whom the Federal Government must get it money, can not support this situation. How can you justify that?

Mr. ECCLES. On this ground——

Senator WALSH of Massachusetts. How can you justify giving money out of the Federal Treasury to the State of New York, whose per capita indebtedness is insignificant compared to the Federal Government, who is the great treasure house for the Federal Government to go to for its money, on the theory that it is so bankrupt, it is so helpless that it can not take care of its poor and starving people? We might as well confess bankruptcy if we ever reach that situation.

Mr. ECCLES. Well, there is this difference. A State, of course, is in the same financial category as corporations and individuals in that they do not have the power of issuing money or credit. The Federal Government is entirely in a different category because it controls the money system. It is true that the State of New York and the State of Pennsylvania and these other States are creditor sections, not debtor States. In other words, the wealth of the State is less than the wealth of the people living in the State.

Senator WALSH of Massachusetts. I do not follow you. The State has the same power of taxation as the Federal Government.

Mr. ECCLES. That is true. But to-day you have not the basis of taxation, for the reason that the production of wealth has largely stopped through unemployment. Now the credit of the Federal Government is in relation to the national income. If the national income is cut in two, then it goes a long way to destroying the credit of the Federal Government on a gold basis.

Senator GORE. You do not think there is any way to destroy the credit of the Federal Government, do you?

Senator WALSH of Massachusetts. Senator Gore, may I finish my inquiry?

Senator GORE. Senator, he said it might destroy the credit of the Federal Government. I did not think that it was possible to destroy the credit of the Federal Government; that it was just inexhaustible and infinite. Pardon me for interrupting, Senator.

Mr. ECCLES. The more unemployment there is the less production of wealth there is and the less ability to pay taxes and support Federal credit unless inflation without regard to the gold standard is resorted to.

Senator GORE. Is Congress going to tax somebody that these States can not tax? What is the resource, what is the reservoir that the Federal Government can tap except the pocketbooks of the people in Utah and New York?

Mr. ECCLES. Wealth is not distributed and ability to pay is not distributed according to population.

Senator GORE. Not entirely.

Mr. ECCLES. No. There is a great difference. In other words, the income tax paid by certain States is a far greater percentage of the total national income tax collected than their population.

Senator GORE. Yes; there is about half a dozen or such a matter. And yet they are coming here asking the Federal Government to supply them funds to feed the hungry, notwithstanding that when that money is repaid they will have to pay a disproportionate share of it.

Senator WALSH of Massachusetts. Exactly. I can understand, young man, and I will vote for any amount of money that is necessary for any State that confesses its inability to borrow money to take care of its poor, Utah, or whatever State—all that it needs. But I can not vote to give money to the State of Massachusetts and the State of New York and the State of Pennsylvania and the State of Ohio, which are the chief sources of wealth in this country, from which the wealth must come, when they have a credit equally as good as the Federal Government.

Mr. ECCLES. Well, their credit can not be as good as that of the Federal Government, for this reason. In the first place, Government bonds are eligible for rediscount with the Federal reserve banks, and that in itself creates the ability with which to get credit.

Senator WALSH of Massachusetts. Very well. Let us issue Government bonds and have the State at the same rate give the Federal Treasury its bonds in return, so that the interest rate in these rich States will be reduced to what the Government will borrow. That is a proposition that might well be given consideration.

Mr. ECCLES. You provide the means with the Government bonds of credit. A State in order to get credit must, of course, be able to sell its securities; and the market for its securities is not the same market, not as good a market, by any means, as the market for Federal Government securities for the reason that, of course, the Federal Government has all the resources of the Nation from which to draw, and, secondly, that the Federal Government bonds are eligible for rediscount, eligible to secure Government postal savings and all public deposits, and they always have a ready and favorable market, which, of course, makes them more desirable.

Senator WALSH of Massachusetts. Do you know any governor in the United States of America who is willing to make a public statement that he is not providing sufficient relief for those in want and need in his State?

Mr. ECCLES. Well, I think a governor would hesitate to do that.

Senator WALSH of Massachusetts. But you are indicting the governor and the legislature of your State and in my State in saying they have failed to appropriate the necessary money. Why, they ought to close schools rather than let people suffer. They ought to shut down the schools and save that money and turn it in to feed starving people. But to come in here and say that the local governments have allowed starvation to go on without taking care of it and the legislatures have failed to meet this emergency, but that the Federal Government, having more heart, having more soul, having more agencies than the local people, being more interested in these local people, must give them the money and send agents in there to take care of this problem seems to me to be preposterous.

Mr. ECCLES. I do not think agents should be sent in.

Senator WALSH of Massachusetts. Are you going to give Tammany Hall $5,000,000 more to spend? How do you know it is going to the needy?

Mr. ECCLES. I do not think that actual starving has occurred. I mean there is a lot of suffering because the amount that these people get is entirely inadequate.

Senator WALSH of Massachusetts. And then after we give $500,000,000 it will be inadequate upon the standards of some people, so you will be coming on and on indefinitely. It seems to me, young man, that what we have got to adhere to is the local authority, the local agents who know these people, who live with them, whose sympathies are with them, whose hearts are with them; they have got to take care of them and distribute these charities; and if the State has not got enough money to take care of them, then it is a confession that it is not solvent. It is a confession that it becomes a dependent of the Federal Government, and the Federal Government has to take care of it.

Mr. ECCLES. There is no question about that. The State has no power to make money. It is not a sovereign power It can not call men to war and provide billions for that purpose. It can not end the depression all of which the Federal Government can do.

Senator WALSH of Massachusetts. Those States are to give up their statehood, and the Federal Government take over the management of their affairs, because once the State welfare is undertaken by the Federal Government for the feeding of its people the Federal Government should take over everything, schools, churches, and everything, in my judgment.

Mr. ECCLES. I think that is largely what you may have to do. Unless the Government soon recognizes its position as the only stabilizer of our economic system and acts accordingly, unemployment relief required is due to Government failure to act sooner.

Senator SHORTRIDGE. Let me ask you this, and then I will not interrupt you until you finish your statement. Take Utah. Its credit is good, is it not?

Mr. ECCLES. Well, I think so. I do not think that a State should be required to——

Senator SHORTRIDGE. That is not the question.

Mr. ECCLES. I think its credit is good, yes.

Senator SHORTRIDGE. If there be suffering in Salt Lake City or in any of the cities of that fine State the credit of Utah, you tell me, is good?

Mr. ECCLES. Yes.

Senator SHORTRIDGE. Utah, as a State then, could raise money, could it not?

Mr. ECCLES. Yes; a limited amount.

Senator SHORTRIDGE. And with that money it could, through its proper agencies, relieve any present suffering of the people, could it not?

Mr. ECCLES. I think so.

Senator WALSH of Massachusetts. Why does it not do it?

Senator SHORTRIDGE. That would be my final question.

Senator WALSH of Massachusetts. Why does it not do it? Feeding the hungry is primary to everything else. They ought to close up even the health department, they ought to close up the schools, they ought to abandon their police force rather than let people be hungry.

Mr. ECCLES. States must preserve their credit so that will not be necessary. That is why unemployment relief is the responsibility of the Government. I do not think people are hungry, except people that do not report. I do not think generally people are hungry, but I do think that people are not being taken care of in anywhere near the relation or the ability that this country and the resources of this country enables them to be taken care of.

Senator SHORTRIDGE. Well, if they have enough to eat and a fair suit of clothes and can read the newspapers they are happy, are they not? That is all they want nowadays.

Senator GORE. If Utah raised money for this purpose through borrowing and taxation there would be some little sense of economy in administering it, would there not? You think too much economy?

Mr. ECCLES. I think if they had to borrow the money there would be.

Senator GORE. Yes; there would be too much economy. But if Uncle Sam will give them the money, then there will not be too much economy, will there?

Mr. ECCLES. No, I would hope not, but I think they should be limited to certain disbursements, and I think even under those circumstances there would be reasonable economy.

Senator GORE. I think you made the point a while ago that where the money was loaned to the State there would be too much economy, and if it were given there would not be too much. That is the point.

Senator KING. I suggest that Mr. Eccles be permitted to complete his statement so that we will get the continuity of it, and then we can question him as we desire.

Mr. ECCLES. 2. Financing of self-liquidating projects and public works.

I quote from Dr. W. T. Foster:

> This much, in fairness, we must say for the Russian plan. If anywhere in Russia they had as many available trained carpenters and masons and bricklayers and engineers and architects and all the rest, and as much available steel and lumber and brick and all the other building materials as we have here, they would not sit around and stupidly hand out charity to the unemployed. They would use the surplus men and the surplus materials, and they would clean out these festering sores, and make decent dwelling placed for the people. Incidentally, there would be no unemployment. Now, what can be done under communism or socialism, can be done under capitalism in the United States, if we have sense enough to set up an adequate flow of currency and credit in the right channels.

Senator WALSH of Massachusetts. What public works are there in Utah that can be undertaken?

Mr. ECCLES. Ogden needs a new water system and a high school.

Senator WALSH of Massachusetts. Are there any more highways you need, considering now the conditions in this country, considering that there is no man to-day can predict they will be any better 10 years from now? It is all in the hands of the gods. Considering the conditions in this country, considering that the money borrowed has to be paid for in taxation, what more public works are needed in your State than are there now?

Mr. ECCLES. Of course, the way I look at this matter is that we have the power to produce, just as in the period of prosperity after the war demonstrated when we had a standard of living for a period from 1921 to 1929 which, of course, was far in excess of what it is now. Yet in spite of that standard of living we saved too much as I have previously tried to show.

Senator GORE. You have got Foster in the back of your head?

Mr. ECCLES. I only wish there were more who had. We saved too much in this regard, that we added too much to our capital equipment. Creating overproduction in one case and underconsumption in the other because of an uneconomic distribution of wealth production.

Senator WALSH of Massachusetts. We can go to extremes of waste in the matter of public works if we are not very careful.

Mr. ECCLES. Of course we are losing $2,000,000,000 per month in unemployment. I can conceive of no greater waste than the waste of reducing our national income about half of what it was. I can not conceive of any waste as great as that. Labor, after all, is our only source of wealth.

Senator WALSH of Massachusetts. Your suggestion is that we meet it by borrowing large sums of money in performing works. That the people have got to pay for it in taxation, and that in a time of distress like the present are not needed?

Mr. ECCLES. No; they would not pay for it now. There are times to borrow and there are times to pay. The Government borrowed during the war $27,000,000,000. They did not collect the profits that were made during the war to pay for the war. They could have done it, but they did not. They borrowed $27,000,000,000, and we got prosperity even though all they borrowed was wasted, every dollar of it. There could be no waste in post offices or in roads or in schools. You would have something to show for it. With war all you have left is the expense of taking care of maimed and crippled and sick veterans. That is what is left from war. And it is all wastage.

Senator GORE. You have touched the point. The real cause of the existing trouble was the war, with destruction of over 300 billion dollars of wealth in four years. We are paying the price now. The boys paid the price in blood on the field. We are paying the economic price to-day. And you may just as well pass a resolution to raise the dead that fell in France as to try to pass laws to avert the inevitable consequences of that war.

Mr. ECCLES. It is true we are suffering the consequences of the war, but there is no reason why we should be suffering from the consequences of the war if it had not been for the international or the interallied debt that resulted from it. We are suffering from a debt structure. We are not suffering from the waste, because after all, we know to-day that we have the power and the facilities to produce certainly all that the people of this country need and want.

Senator GORE. You think you can destroy $300,000,000,000 of wealth and its represented accumulation of centuries without disastrous economic consequences?

Mr. ECCLES. Senator Gore, in the United States we added $100,000,000,000 to our capital accumulations since the war.

Senator GORE. A great deal of it paper additions.

Mr. ECCLES. No; buildings and factories and roads and actual physical wealth. Wealth in the real world and not the money world.

Senator GORE. On borrowed money credit, largely.

Mr. ECCLES. Well, it was the product of labor.

Senator GORE. On borrowed money, and we strained our credit to the snapping point and had this crash.

Senator SHORTRIDGE. Are you dealing with the second point?

Mr. ECCLES. Yes. Let me finish this, if I may.

Senator GORE. Yes. Pardon me.

We now see, after nearly four years of depression, that private capital will not go into public works or self-liquidating projects except through government and that if we leave our "rugged individual" to follow his own interest under these conditions he does precisely the wrong thing. Each corporation for its own protection discharges men, reduces pay rolls, curtails its orders for raw materials, postpones construction of new plants and pays off bank loans, adding to the surplus of unusable funds. Every single thing it does to reduce the flow of money makes the situation worse for business as a whole. The production of wealth and the consumer's ability to buy starts with the pay roll and the individual producers of raw material, the agriculturalist. To-day we are losing close to two billions per month of national income due to unemployment, resulting in the inability of our people to purchase the goods necessary to sustain our production. Is there any program of economy and Budget balancing on the part of our Government as important as to stop this great loss and all the attendant human suffering, devastation, and destruction?

I believe that an essential part of the program to end the cycle of deflation is by the Government supplying the credit for self-liquidating

159450—33—PT 6——4

projects and loans to the State for public works. I have the following program to propose:

Senator SHORTRIDGE. That is under your No. 2?

Mr. ECCLES. Yes.

That the Government make available $1,000,000,000 to be added to the $1,500,000,000 already made available through the Reconstruction Finance Corporation for self-liquidating projects, making a total of $2,500,000,000. A separate agency should be set up to take over this division from the Reconstruction Finance Corporation and administer these funds. Emergency speed, such as was resorted to during the time of war, is necessary for the success of this plan. The self-liquidating plan to date has been utterly ineffective due to the failure to get the funds out; this is largely due to limitations of the law and red tape of administration. And, I might say, the high interest rates.

Senator SHORTRIDGE. What is the rate?

Mr. ECCLES. It is 5½ and 6 per cent on self-liquidating projects. Those are the rates that I have been familiar with or heard.

In order to obtain speed, I would recommend the appointment of a civilian nonpolitical commission of not to exceed five representative leaders in each State, to serve without compensation, whose duty it would be to encourage development of public works and liquidating projects in their respective States as rapidly as possible. Loans should be made on a very liberal basis as to terms of payment and security. The interest rate should not exceed the amount which the Government is required to pay for its funds, as the purpose is not to discourage the use of these funds and make a profit for the Government.

The Federal Government, as well as the financial and business leadership of this country, should get back of this program with the same enthusiasm and patriotic zeal as was developed during the war. The entire public psychology must be changed through the propaganda of the press. Every city, county, and State in the Union should be urged, as a patriotic duty, to avail itself of the Government credit with which to construct such projects as they would normally require during the next five years, thus putting men to work instead of providing them with charity.

In order to speed up this program a limit of three months from the time of the appointment of the commission in each State should be given in which to file and complete applications; this period of time to be extended, if necessary, by the approval of the President of the United States.

This plan would have the advantage of securing for each State and community public and self-liquidating works which will be necessary in the immediate future at an unprecedentedly low interest rate and construction cost, while at the same time providing emergency employment and stimulating business generally at a time when such expenditures render the greatest service to our entire people.

This program can be financed in one of two ways—either through a Government bond issue, or through the issuance of currency by the Treasury which would be put into circulation through the Federal reserve banks in payment of the projects proposed. This currency should be retired as fast as the income of the Federal Treasury permits.

Senator KING. Would that currency rest on bonds?

Mr. ECCLES. It would be a promise to pay on the part of the Government. It would be a noninterest paying obligation.

The Treasury, of course, would hold in lieu of this currency the obligations of the various States, counties, cities, and private corporations using these funds. I do not believe this currency could be kept in circulation, for with the restoration of confidence the present outstanding currency would likely be reduced by at least one and one-half billion dollars, the estimated amount now in hoarding.

Senator WALSH of Massachusetts. When do you think prosperity will come back?

Mr. ECCLES. It depends entirely on what the Government does. It will not come back unless action is taken by the Federal Government, in my judgment.

Senator WALSH of Massachusetts. Do you think there is anything to the claim that this period now is more or less a period of nomalcy?

Mr. ECCLES. No; we can not stay at this level. If you can not raise the price structure you will go into a condition of collapse and you will get into a chaotic condition far worse than we are in to-day.

Senator WALSH of Massachusetts. We have been slipping for three and a half years. When is the slipping going to stop?

Mr. ECCLES. I have said when the Government takes the necessary action to stop it.

Senator WALSH of Massachusetts. In other words we have done nothing in the last three and a half years to stop this?

Mr. ECCLES. I think not.

Senator GORE. All our efforts have come to naught?

Mr. ECCLES. That is what I think. I think nothing has been done except to extend credit, and credit is the second line of defense and not a primary line of defense.

Senator GORE. Are you not relying upon that line of defense there pretty liberally, or do you distinguish Treasury notes from credit?

Mr. ECCLES. I am talking about private credit. If it is credit we need why do not say 200 of our great corporations controlling 40 per cent of our industrial output that are in such shape that they do not need credit—they have great amounts of surplus funds—if it is credit that is needed why do they not put men to work? Why do not those great institutions put men to work? For the very reason that there is not a demand for goods, that we have destroyed the ability to buy at the source through the operation of our capitalistic system, which has brought about such a maldistribution of wealth production that it has gravitated and gravitated into the hands of—well, comparatively few. Maybe several millions of people. We have still got the unemployment and have got no buying power as a result.

Senator GORE. The only thing not unemployed in the country, after all, is the printing press.

Senator SHORTRIDGE. You are still dealing with self-liquidating projects?

Senator KING. And governmental.

Senator WALSH of Massachusetts. We are interfering with the witness.

The CHAIRMAN. Yes; I think so too. Let us have the whole picture presented.

Mr. ECCLES. This new currency issue, plus the one and one-half billion dollars of hoarded currency, which is largely Federal reserve notes, would automatically find its way into the banks and from there into the Federal reserve banks where the Federal reserve currency unnecessary for circulation would be retired and the new, or Treasury, currency would be held until the Treasury Department is able to retire it out of the payments received from borrowers or from other sources.

Senator SHORTRIDGE. You mean these self-liquidating projects?

Mr. ECCLES. Yes; would pay themselves.

Senator SHORTRIDGE. Some of them, though, look forward 25 or 30 years before they willl ever be able to start to repay.

Mr. ECCLES. Then I would not support such a project if it looks forward such a length of time.

Senator SHORTRIDGE. What is the self-liquidating project? Is the big bridge we are building across the Golden Gate? We term that a self-liquidating project. The bringing of water from the Colorado River into our metropolitan districts the center of which is Los Angeles calls for a vast sum. We term it a self-liquidating project. But manifestly it will be many, many years before it will be able to begin to repay the money to the Government, assuming that the Government loans us the money.

The CHAIRMAN. Let us get the whole picture and then we will discuss the question.

Senator SHORTRIDGE. Yes.

Mr. ECCLES. It would likely be necessary to pay to the Federal reserve banks such portion of interest collected by the Treasury on the money loaned as would enable the Federal reserve banks to carry the noninterest bearing currency, otherwise it may result in an operating loss to the Federal reserve bank.

The latter plan would have the advantage of protecting the bond market from the pressure of new Government bond offerings at a time when it is desirable to preserve that market for the necessary Government financing required to meet its present operating deficit and provide for unemployment belief until the beneficial effects of the proposed emergency measures are realized.

As an alternate to the proposed self-liquidating public-works program that would more quickly meet the emergency, I offer for consideration, without recommendation, the suggestion of Mr. J. M. Daiger, appearing in the February issue of Harper's Magazine under the title of "Confidence, Credit and Cash." Quoting from his article, he says—

> We should be prepared to pay a political price for prompt action in order to restore cash, credit, and confidence in our banks. The suggestion is that we offer an inducement that banking politics could not successfully resist; namely, that the Federal Government pay the "trifling price" of all the bank failures, State and National, of this last 13-year epidemic—pay to the depositors of the chartered banks that failed the net amount of the deposits they last, and thus restore this money to active circulation. The total amount of deposits involved in the failures was approximately $5,000,000,000. The recovery by depositors has been, or will be, probably half this sum. Most of this they have already received, either through the receivers of the closed banks, or through advances from other banks, or, more recently, through the Reconstruction Finance Corporation. We should require, then, a bond issue of approximately two and a half billion dollars to cover the net losses.

This plan could be financed by an issue of currency as above suggested as an alternative to a bond issue, any loss to the Federal reserve banks while holding this currency to be made up by the Treasury Department.

The plan of Mr. Daiger referred to I would amend to cover only those losses covered by bank failures during the depression, that is, during the years 1930, 1931, and 1932 and the necessary part of 1933, until this legislation is effective, which would substantially reduce the cost to the government. If such a plan is adopted, the liquidation of all assets, including claims against officers, directors, and stockholders, of closed banks should be turned over to the Comptroller of the Currency for liquidation through a special department set up for this purpose.

The plan would have the merit of being politically popular. It would very quickly get a large sum of money out into circulation and into the hands of those people and communities which are, generally speaking, the greater sufferers from the effects of bank failures. It would completely establish confidence, bring money out of hoarding, tend to raise prices and thus start the necessary flow of credit. All this in turn would greatly increase the value of the assets taken over from the closed banks and facilitate their liquidation, thus reducing the loss in such a venture.

A bank deposit guaranty law would likely have to be incorporated in such a bill, and such a law would have to be made to cover all banks for the reason that if any were excluded because of inability to meet certain requirements they would have to close. The stronger banks of the country, which do not need the benefit of such a law but which get the benefit of the wealth production from the country as a whole, should be required to share their proportionate cost, thus tending to equalize the burden of loss due to bank failures over the entire financial structure. Each bank should be assessed a necessary percentage of its deposits to provide and maintain an adequate fund to meet losses to depositors. In order not to put a premium on bad banking practice, rules and regulations required for the continuation of the benefits of the fund should be gradually promulgated and enforced over the next few years as business recovers, so that in time a stronger banking structure would be developed as a bulwark in future depressions. If banks failed to meet the requirements of eligibility after six months notice they would be suspended, which would mean their liquidation and the fund being drawn on to prevent any loss to depositors. In this connection it is my opinion that the banking structure would be greatly strengthened with the passage of the Glass bill providing for branch banking, thus reducing the cost on the banking structure of maintaining the deposit guaranty fund.

An important advantage of the banking legislation proposed, besides preventing hoarding and the maldistribution of deposits with the larger banks, would be the elimination of the cost of surety bonds now required to secure various forms of public funds and the release of Government bonds, municipal securities, and land-bank bonds, which are now used to secure postal savings and Government funds. The release of these securities would be helpful to many banks; postal savings would disappear and these funds would return to the banks where they are most needed to support the financial requirements of the various communities. The Postal Savings have been increasing at an astonishing rate, this increase being largely in the sections of the country having the greatest banking difficulties, which in most cases are those sections least able to lose deposits to the Postal Savings System.

Senator KING. Does your bank plan guarantee all the bank deposits, which to-day are $45,000,000,000?

Mr. ECCLES. Under certain conditions only. If a bank guarantee of deposits, is used—and it may be that we will be forced to it whether we like it or not the way things have developed, in order to save the situation——

Senator SHORTRIDGE. That is, the Federal Government guaranteeing deposits?

Mr. ECCLES. Or sponsor a law that would create an agency for that purpose. However, there is always this danger about that class of thing. It encourages bad practices and bad management. It may put a premium on them, which of course we do not want to do, and if it is done there must be rules and regulations for the proper conduct of banks requiring eligibility, and if they fail to meet the eligibility they would be suspended after so much notice, and the fund would be drawn upon to take care of any loss.

Senator GORE. Do you think that any member bank could be excluded from a guaranty system?

Mr. ECCLES. No; I do not. I do not think any State or national bank should be excluded because if you exclude any you bring their collapse.

Senator GORE. You have made a point there, and the point that always puzzles me is how to distinguish and treat honest and competent bankers in one fashion and dishonest and incompetent bankers in another. It seems to me that any scheme to guarantee deposits ignores that difference, and that is a fundamental and vital error. You just can not get around it.

Senator SHORTRIDGE. Is it one of the functions of the Federal Government to do that thing?

The CHAIRMAN. I would like the witness to finish his statement. The witness should be permitted to give the whole picture so that we will have it before us, and that we then ask any questions we wish to ask him.

Mr. ECCLES. No. 3 is the allotment plan.

The allotment plan, at least for the present, should be confined to our three major crops—wheat, cotton, and hogs. Now, I would like to eliminate hogs. I am not clear in my mind of the practicability of it. I think it involves complications in carrying it out that may defeat the whole plan. So I would suggest the wheat and the cotton as being far more practicable. Its purpose would be to raise the prices of these products by the amount of the tariff, which at present is ineffective due to the exportable surplus, the domestic price being, therefore, determined by the world price. To accomplish this, Government control, regulation, and sponsorship is necessary. However, the operation of the plan should be decentralized as much as possible, working through the State farm organizations which in turn would work through the county farm organizations, thus placing the responsibility of the success of the plan as much as possible on the local units, which are better able to control the determined reduction in acreage and production. This plan in no way would put a financial burden on the Government except the comparatively small cost required for a proper central regulation and control. And I believe that there is already plenty being spent by the Government through its Department of Agriculture and other agencies to take care of the necessary supervision by some sort of a reorganization.

The increase in prices brought about by this plan would, of course, be paid for by the consumers, but in this respect it would be no different than the effect of the tariff on the prices of those manufactured and agricultural products where the tariff is now effective in maintaining a domestic price higher than the world price. In other words, the domestic allotment plan, in its operation, might be termed an inverted tariff. If the domestic price level is going to be maintained by a tariff on some of our agricultural products and most of our manufactured products, then the prices of our major agricultural products must be raised to a domestic level by making a tariff effective through an allotment or similar plan; otherwise, the balance and equilibrium necessary to the operation of our economic system and, I might say, the velocity of our money can not be maintained, and the whole price structure will be kept out of adjustment as a result.

Objection is raised to the allotment plan on the ground that it will increase the cost of those products covered by it to the consumer, whose purchasing power is already close to the vanishing point. It will not only do that, but it will tend to increase the price structure generally, if it accomplishes the results desired.

An increase in the price of cotton will cause some increase in the price of wool, silk and rayon; an increase in the price of hogs—and of course I am eliminating hogs here—will tend to increase the price of all other meat products; and likewise, an increase in the price of wheat will tend to increase the price of other grain products, as all competitive products are influenced by the price of the product which is the cheapest.

Senator GORE. Any increased purchasing power that you gave the farmer through this would be taken away in taxes, would it not?

Mr. ECCLES. No. Through velocity a billion dollars increase in the price of cotton and wheat at the source would amount to from ten to at least fifteen billion dollars in purchasing power.

Senator GORE. If it did.

Mr. ECCLES. Well it would, based upon the record of your turnover.

Senator GORE. But that is in different times than these.

Mr. ECCLES. Well, of course, but you put this money into the hands of the farmer through this increased purchasing power, and you are getting at the source of wealth production where buying power and where consumer demand starts. And with that consumer demand started you get your velocity, you raise your prices, you start the creating of income which will balance your Government Budget through creating of income on the part of corporations and individuals.

Senator GORE. It is estimated this domestic plan will take a billion dollars out of the pockets of the consumer and turn them over to the farmer. You have already proposed to give a half a billion dollars to the cities to buy that with. I can follow you if you raise the price of cotton cloth and food and then tax the people and give money to the people to buy it with; I can see how you can get things going that way.

Mr. ECCLES. That is right.

Senator SHORTRIDGE. Let me interrupt to ask a question, Mr. Chairman.

The CHAIRMAN. Yes.

Senator SHORTRIDGE. When you speak of the farmer, you seem to limit the word "farmer" to the raiser of two products—what and cotton?

Senator KING. No; only for the allotment plan, but not for the benefits to be derived from this increased productivity and the circulation of money, and purchasing power.

Mr. ECCLES. I cover that here.

The effect of raising agricultural prices generally will bring about an increased purchasing power to those engaged in agriculture, which would serve to increase the demand for all kinds of manufactured products, thus increasing employment, wages, and general income to a far greater degree than the increased cost of the agricultural products consumed. And I just explained the velocity. Dairy, and poultry products, fruits, rice, vegetables, and all other agricultural products, which it would be impractical to cover by the allotment plan, would increase in price with the increase in consumption brought about through the improved buying power of our entire agricultural, as well as our industrial population.

Senator SHORTRIDGE. I see the theory.

Mr. ECCLES. The cost of manufactured goods at present is slightly above the 4-year pre-war average, while the cost of all agricultural products is approximately one-half of the 4-year pre-war average. The domestic allotment plan would tend to bring these two important economic factors in balance. Which is absolutely necessary to have prosperity.

Senator SHORTRIDGE. No government on earth though, has ever undertaken any such a plan, has it? No recognized government from Pharoah's time?

Mr. ECCLES. The small countries of Europe, Denmark, Holland, I think Belgium—they operate on a similar plan.

Senator SHORTRIDGE. On an allotment plan?

Mr. ECCLES. Yes.

Senator SHORTRIDGE. All right, if you say so.

Mr. ECCLES. The allotment plan may be a long way from a perfect solution of the farm problem, but something must be tried. Our progress up to date in every field is the result of experimentation, trial, and error. The allotment plan may need to be changed or modified from time to time, but that can be done as experience determines. I believe that some form of the allotment plan is necessary as a permanent measure as long as a tariff policy is in effect in this country. The allotment plan is no more artificial than the tariff, the money system and all the regulatory operations of the Government. Our whole economic system, in the same sense, is artificial and must of nececessity continue so unless we revert to a primitive society.

### 4. REFINANCING FARM MORTGAGES

The allotment plan, to be effective, should be followed immediately by a refunding of farm mortgages on an immense scale and on a long-term basis at a low rate of interest. The seriousness of the farm-mortgage problem is evidenced by the farm strike in all parts of the country, the moratoriums being forcibly granted and the legislation designed to relieve debtors being proposed in every agricultural State. As a means of meeting this problem, I have the following to suggest:

Enlarge the scope and size of the Federal land banks so as to enable them to take over mortgages up to an amount of, say, $5,000,000,000; this amount can be increased if conditions warrant.

Senator SHORTRIDGE. Do you mean refinancing existing mortgages, or making new loans?

Mr. ECCLES. Existing mortgages only.

I understand that at present the total farm mortgage debt of the United States is somewhere between $8,000,000,000 and $9,000,000,000; of this amount approximately one and a half billion dollars is now held by the Federal land banks, one-half billion dollars by the joint stock land banks, one and three-fourths billion dollars by the insurance companies, and the balance by private mortgage companies, banks, and individuals.

The present mortgages held by the land banks should be refunded on an amortized basis over a period of 40 years. An annual payment of 5 per cent of the principal amount of the refunded mortgage would allow 3 per cent for interest, seven-tenths of 1 per cent for expenses and losses, and would retire the mortgage in 40 years. In order to accomplish this, existing Federal land bank bonds, which now bear an interest rate of from 4 to 5 per cent, should be refunded on a basis of a 3 per cent bond and, as a consideration of the reduced interest rate, these bonds should be guaranteed by the Federal Government and should be made eligible on a bills payable basis at the Federal reserve banks.

Mortgages held outside of the Federal land banks by other agencies should be taken over in exchange for Federal land bank bonds as above described. In taking over these mortgages, all delinquent interest should be waived up to and including the time when this proposed legislation could be made operative, which I would suggest be July 1, 1933. It would also be necessary for the present mortgage holders to write down the principal amount of their mortgages in those cases where the amount is excessive based upon a normal agricultural commodity price structure, or where it is on marginal land which can not be operated profitably. In the latter case the loan should not be taken over at all, but such property should be leased by some agency of the Federal Government and taken out of production.

Present prices of agricultural commodities should not be a basis for refunding farm mortgages because on such a basis the entire scheme would fail to give either the desired relief to the farmers or those holding the mortgages. The aggregate discount taken on existing mortgages must be limited, otherwise financial institutions now holding them could not absorb the loss without disaster and consequently would not make the exchange for Federal land bank bonds, in which case the agricultural borrowers would not receive the necessary relief and the entire plan would fail to accomplish the results desired.

In the proposed refunding operation by the Federal land bank, all delinquent taxes and delinquent principal payments should be included in the principal amount of the refunded mortgage, the first payment to be made in the fall of 1934. This is very necessary in order that the agricultural interests may have the benefits from the proceeds of their 1933 production with which to purchase the vast amount of consumers goods of all kinds which they so desperately need. With the increase in prices through the effects of the allotment plan, this buying power would be a tremendous factor in reviving every type of industry and would go a long way toward restoring business in general and increasing employment in every field.

Farm mortgages at present are possibly the most undesirable and frozen of all loans, and frozen loans are preventing, to some extent, the necessary expansion of credit. The plan I have proposed will very effectively and immediately make liquid billions of dollars of assets for which there is no market to-day, while at the same time it will bring about a reduction of at least one-third of the average annual payments on the farm debt now required to be made by farm mortgage debtors without requiring any financing or loss by the Federal Government, thus bringing about the necessary relief in the farm-mortgage field. This plan has the advantage, as a result of the Government guarantee of the Federal land bank bonds, of diverting surplus funds carried in the great creditor sections into the indirect financing of farm mortgages where it is impossible even at a high rate of interest, which farmers can not pay, to attract those funds directly.

The combination of the allotment plan and the farm mortgage refinancing plan will provide, in an effective manner, a sound farm relief program, thus saving our entire agricultural industry from what otherwise would likely be a general collapse, and at the same time greatly expanding the purchasing power of our entire agricultural population, thus helping to bring about a revival of industry.

### 5. INTERALLIE DEBTS

No program designed to bring this country out of the depression can be considered apart from the relations of this country to the rest of the world unless a policy of complete isolation is adopted and an embargo put on gold exports and our domestic economy adjusted to meet such a condition.

Our international problems are far more difficult and will be slower to work out because of our inability to control the action of other nations. These problems can be met only through international conferences over a period of time. The most important of these problems and the one which must be settled before any progress can be made in the meeting of our domestic or other foreign problems is the problem of interallied debts.

There is a great demand on the part of the public and most of the press of this country that these debts be paid. It seems to me that our political leaders have lacked the courage to face this problem in a realistic manner. This has greatly contributed to prolonging the depression. The public, generally speaking, is not fully informed as to the impossibility of our foreign debtors complying with these demands, which can only be complied with at the expense of our own people.

Senator SHORTRIDGE. Right there. I know of one country that defaulted in a certain payment and the very day, almost, that it defaulted it loaned an equal amount to another country.

Mr. ECCLES. That is true.

Senator KING. May I say right there, Senator, that the League of Nations urged that country to which you referred, France, and

Great Britain, and several other countries, in order to save the other country from bankruptcy and from chaos which would have spread to other countries, to extend credit to save not only the country in question, but really to aid Europe, and France patriotically and, I think, properly, joined in the consortium and made her part of the loan. We do not talk about the other nations that joined in making the loan.

Senator SHORTRIDGE. Well then I could cite another nation that defrauded and expended a sum far in excess of the amount due us as of a certain date—expended it unnecessarily on war preparations.

Senator KING. There will be a difference of opinion there, and it will do no good for us to discuss it now, at this point.

Mr. ECCLES. I cover it in the next point I am making.

Senator GORE. There was another country ready to pay and it was discouraged from paying, and the representatives that signified willingness to pay was recalled. They did not want it to pay because it set a bad precedent for these other countries.

Senator SHORTRIDGE. They did not want to pay.

Mr. ECCLES. It is elementary that debts between nations can ultimately be paid only in goods, gold, or services, or a combination of the three. We already have over 40 per cent of the gold supply of the world—that is not true; it is between 35 and 40 per cent—and as a result most of the former gold standard countries have been forced to leave that standard and currency inflation has been the result. This has greatly reduced the cost of producing foreign goods in terms of our dollar and has made it almost impossible for foreign countries to buy American goods because of the high price of our dollar measured in the depreciated value of their money. This naturally has resulted in debtors trying to meet their obligations by producing and selling more than they buy, thus enabling them to have a favorable balance of trade necessary to meet their obligations to us. If this country is to receive payment of foreign debts, it must buy and consume more than it produces, thus creating a trade balance favorable to our debtors.

In order to prevent this and reduce the pressure of foreign goods on the American market a high tariff wall has been built and we now hear demands on all sides for a further increase in this tariff due to the effects of depreciated currencies on our price structure. It is, therefore, evident that this pressure on our markets by goods from foreign countries would be greatly reduced if the burden of debt were lifted from our foreign debtors, thus allowing our prices, as well as their own, to rise.

We must either choose between accepting sufficient foreign goods to pay the foreign debts owing to this country, or cancel the debts. This is not a moral problem, but a mathematical one. Foreign debtors, no doubt, would be delighted to pay their debts to this country if we would make it possible for them to do so by reducing our tariff and accepting the goods which they have to offer.

No one would be as greatly benefited by the cancellation of these foreign debts owing to our Government as American agriculture and American labor. A comparatively small portion of our population would make up this loss to the Treasury through the payment of income and inheritance tax which would be made productive by the revival of business.

Cancellation, or a settlement of the debts on a basis which would practically amount to cancellation, in exchange for stabilization of the currency of the debtors, together with certain trade concessions and an agreement to reduce armaments would be a small price for this country to pay as compared with the great benefits which the entire world, including ourselves, would derive therefrom. Without a stabilization of foreign currencies it will be difficult, if not impossible, in my opinion, to substantially raise the price level in this country as long as we stay on a gold basis. Our debtors will default and we will likely be forced to abandon gold and depreciate our currency in relation to that of other countries in order to raise our price level in this country and to meet foreign competition unless we are instrumental in inducing foreign countries to stabilize their currencies on a gold basis, or gold and silver basis if action is taken internationally to remonetize silver. I am not in disagreement with Mr. Ferry there.

Senator SHORTRIDGE. Permit me to interrupt there. We have outstanding obligations, interest bearing obligations amounting to about how much now?

Senator KING. About $21,000,000,000.

Senator SHORTRIDGE. Do you know of any way in which we can cancel or get rid of paying what we owe?

Mr. ECCLES. Well, how are you going to collect what the foreign countries owe?

Senator SHORTRIDGE. Oh, I grant you that we have no police force.

Mr. ECCLES. They are willing to pay if we take goods.

Senator KING. And services.

Mr. ECCLES. Goods or services are the way you can get your debts paid.

Senator SHORTRIDGE. Then I take it you would have the tariffs reduced?

Mr. ECCLES. No. Debts canceled. Then I think with the prosperity that you would get in this country you can collect more than that in income and inheritance taxes when you stop this loss of $2,000,000,000 a month through unemployment. You start the process of wealth, and even a capitalist is far better off. I am a capitalist.

Senator SHORTRIDGE. Well, I am a capitalist. But I am on the gold basis.

Mr. ECCLES. We could, as an alternative, further raise our tariff wall, put an embargo on gold and live entirely within ourselves.

The program which I have proposed is largely of an emergency nature designed to bring rapid economic recovery. However, when recovery is restored, I believe that in order to avoid future disastrous depressions and sustain a balanced prosperity, it will be necessary during the next few years for the Government to assume a greater control and regulation of our entire economic system. There must be a more equitable distribution of wealth production in order to keep purchasing power in a more even balance with production.

If this is to be accomplished there should be a unification of our banking system under the supervision of the Federal reserve bank in order to more effectively control our entire money and credit system; a high income and inheritance tax is essential in order to control capital accumulations (this division of taxes should be left solely to the central government—the real property and sales tax left to the States); there should be national child labor, minimum wage, unemployment insurance and old age pension laws (such laws left up to the States only create confusion and can not meet the situation nationally unless similar and uniform laws are passed by all States at the same time, which is improbable); all new capital issues offered to the public and all foreign financing should receive the approval of an agency of the Federal Government; this control should also extend to all means of transportation and communication so as to insure their operation in the public interest. A national planning board, similar to the industries board during the war, is necessary to the proper coordination of public and private activities of the economic world.

Such measures as I have proposed may frighten those of our people who possess wealth. However, they should feel reassured in reflecting upon the following quotation from one of our leading economists:

> It is utterly impossible, as this country has demonstrated again and again, for the rich to save as much as they have been trying to save, and save anything that is worth saving. They can save idle factories and useless railroad coaches; they can save empty office buildings and closed banks; they can save paper evidences of foreign loans; but as a class they can not save anything that is worth saving, above and beyond the amount that is made profitable by the increase of consumer buying. It is for the interests of the well to do—to protect them from the results of their own folly—that we should take from them a sufficient amount of their surplus to enable consumers to consume and business to operate at a profit.

I am speaking of business during normal times.

Senator SHORTRIDGE. Who said that?

Mr. ECCLES. Stuart Chase, I think. He is an economist. Or Foster. I am not sure which.

> This is not "soaking the rich"; it is saving the rich. Incidentally, it is the only way to assure them the serenity and security which they do not have at the present moment.

Senator KING. That is a fine statement.

Senator SHORTRIDGE. I would like to ask one question, Mr. Chairman, for my own information, and that is in respect of the so-called allotment plan. Does that contemplate retiring all arable wheat land from cultivation?

Mr. ECCLES. The allotment plan, as I understand it, is to do two things: Control acreage which controls production and establish a price on the basis of a domestic level rather than on the basis of a foreign level.

Senator SHORTRIDGE. This allotment plan contemplates the retiring from cultivation of arable wheat land? That is so, is it not?

Mr. ECCLES. I do not think so. At least that is not what I had in mind here.

Senator SHORTRIDGE. The miners, the blacksmiths, the carpenters, the painters, the gas fitters, the skilled labor in a hundred branches have organized into unions and their purpose is altogether worthy. They seek to control their wages and the hours of labor. Query: Has there been any effort made among the wheat men of a given State to organize and to regulate, and, if it be so, retire arable wheat land from cultivation, reducing thereby the output with the end in view of preventing a surplus of wheat, and hence a better price for that which is raised and put into the market? I am wondering whether the wheat farmers or the cotton raisers themselves have not organized along the line, if you please, similarly?

The CHAIRMAN. It has been talked of for 50 years, and they have never been able to do it, so I do not know whether they can do it now or not.

Senator GORE. I read a poem not long ago written in the early seventies on that point.

Senator KING. Thank you very much for your statement.

Senator GORE. I want to ask you a question or two for the record, which illustrates my view and I think illustrates the tendency of your philosophy. You say that you think the domestic allotment plan ought to be limited to wheat and cotton?

Mr. ECCLES. Because of the difficulty of making it practically apply to vegetables, we will say, and fruits and the like.

Senator GORE. You would take account of practical difficulties?

Mr. ECCLES. Yes.

Senator GORE. Wheat and cotton are the pillars of our whole agricultural structure; that is the reason, is it not?

Mr. ECCLES. That is one of the reasons. Of course, livestock is a very important factor.

Senator GORE. As the bill was originally projected in the House it was limited to wheat and cotton, but when they came to consider it they needed votes. And other interests brought pressure to bear on the committee. They added, I believe, in the committee tobacco. They added in the committee butterfat, because the dairy industry in this country is strongly organized among the farmers. They had to yield to that whether it was practical to yield or not. They took the bill to the House and peanuts went in by 1 majority in the House. These peanut fellows want peanuts in that scheme. They do not want to be left out.

You say that our best efforts to relieve have been a failure, and I think you are right. But has it ever occurred to you that in view of these past failures and in line with that, that perhaps all these governmental schemes are narcotic and that the more you take the more you have got to take in the future to get the same reaction and the same results?

Mr. ECCLES. I feel that one of two things is inevitable: That either we have got to take a chance on meeting this unemployment problem and this low-price problem or we are going to get a collapse of our credit structure, which means a collapse of our capitalistic system, and we will then start over. And I therefore would like to see us attempt to regulate and operate our economy which to-day requires more action from the top due to our entire interdependency than it did in our earlier days. We have drifted in this country into a form of collectivism in many lines of business, when you consider our great corporations and farm organizations.

Senator GORE. Let me ask you this. I do not mean for you to dilate on it. But you say our credit structure is in danger. And I think it is. I think our mischief results largely from overstraining of credit. Your proposal seems to be that for the excessive use of credit we use more credit. Is that not true?

Mr. ECCLES. No; that is not true.

Senator GORE. It seems like every scheme you suggested was for the Government to advance money to somebody.

Mr. ECCLES. You have got to take care of the unemployed or you are going to have revolution in this country. Out in Salt Lake City the other day you had an illustration of what occurs.

Senator GORE. You noticed that out in Seattle the boys struck and they wanted gasoline. They need gasoline.

Mr. ECCLES. When you get enough unemployed they will control the Government and change our present political, social, and economic system.

Senator GORE. There is the trouble. And that is the danger here. They brought pressure to bear in the House to get tobacco, butter-fat, and goobers included in this domestic allotment. You get enough unemployed in this country organized and there are no brakes you can put on your scheme. That is the history of Rome. The dole destroyed Rome. It is going to destroy England and France and Germany and this country.

The CHAIRMAN. We thank you for your statement, Mr. Eccles.

The committee will stand in adjournment until 2 o'clock, when we will meet in executive session, after which we will have an open session.

(Thereupon, at 1.20 o'clock p. m., the committee adjourned to meet in open session at 3 o'clock p. m. the same day, Friday, February 24, 1933.)

AFTER RECESS

The subcommittee resumed the hearing of witnesses in public session at 3 o'clock p. m.

## STATEMENT OF LAWRENCE DENNIS, NEW YORK CITY

The CHAIRMAN. Will you give your name and address to the reporter?

Mr. DENNIS. Lawrence Dennis, 27 West Forty-fourth Street, New York.

The CHAIRMAN. What is your business?

Mr. DENNIS. I am an independent financial writer.

The CHAIRMAN. For any particular publication?

Mr. DENNIS. No; independent.

The CHAIRMAN. You may proceed. Have you a copy of your statement?

Mr. DENNIS. I have two articles which I intend to use as a basis for what I have to say.

The CHAIRMAN. You may proceed.

Mr. DENNIS. There are two theories about the present depression, and I think that practically everyone holds, in some form, one of those two theories.

The one is that this is another of a series of seven or eight cyclical depressions which have occurred in the history of the modern industrial-capitalist system; and the second theory is that this depression is or may be, very likely, a phase of transition from the existing system of private capitalism, to some form of economic organization which we can not definitely foretell at the present time.

Those two theories do not classify people into socialists or capitalists. A great many socialists and communists think the present system will survive many of these depressions before it ultimately is changed by revolution or otherwise.

On the other hand, a great many conservative capitalists, or people who are not, at least, socialists or communists, or even fascists, feel that there are many considerations in the present situation which indicate that this may not be an ordinary cyclical depression, but that it may be a phase which marks the nearing of the end of an organization, economic and political, which has existed for about a hundred and fifty years the world over.

I am inclined to take the view that it is extremely probable that this depression may be a phase of transition from the present system of private ownership, private initiative and a free market, to some form of economic organization which we can not foretell.

I think, at least, that that idea should be entertained in studying the present depression, and I want, in the course of my remarks, to develop a certain line of analysis of this situation which differs from that of those who assume that this is only a cyclical depression from which we will recover.

I shall try to talk in terms, largely, of the financial and economic behavior of the present factors.

The ordinary way out of depressions in the past has been through a revival of new investment. The cycles of depression and boom have followed each other from about the time of the Napoleonic wars up to the World War, in sequence. During periods of boom, there was excessive investment. Investment outran savings, and then there was inflation of credit. There were a great many unwise investments, and then there would be a crash, and a long period of falling prices and depression, and gradually, as prices and wages fell, investment would start up again. People to-day assume that that must repeat itself, and most of the people who advocate being quiet and waiting, assume that the financial processes will take us out of the depression in that way.

Here, for the purpose of brevity, I shall read somewhat from an article I have just written, for the purpose of condensing what I have to say.

The question is whether the banks or the financial institutions can generate enough investment to take us out of the depression. While our leaders prophesy the early and spontaneous generation of prosperity through finance and financiers, our banks hold half a billion dollars of surplus cash reserves and over a third of the world's monetary gold. It is about 37 per cent at present.

With a capacity for almost unlimited credit expansion, our financial institutions continue the contraction of credit. Current new investment is rapidly approaching zero. The financial fuel is piled up. The State and not the bankers must light the match. Motives of public welfare must lead us out of the present depression, as greed and war have led us out of past depressions, to be followed, of course, by other depressions.

The profits resulting from a rapid opening up of new continents by European immigrants and capital constituted a dynamic factor in past recoveries. Another factor was the then incompleted transition from feudal and agricultural economy to modern industrialism. To-day these dynamos are lacking. There is no more migration of capital or of peoples.

You will remember, of course, that for the first time in the history of this Republic, the tide of immigration is flowing against the United States. There has been a retardation in population growth from about 2 per cent per annum before the war, to 1 and a fraction per cent per annum since 1920. The consequence of that is that there are no more fields for large-scale profit-yielding investment. This assertion can best be verified by making a considerable investment in any new productive venture, and then waiting to see what happens to it. That is a very significant fact, that most of the people who believe in automatic or spontaneous recovery overlook. Their assumption is that investment will start up again, because it started up in the past—and it did—that is, from the Napoleonic wars, down to the present date; but, according to the analysis I am advancing, which is not an original one, naturally, there is no investment to-day because there are no fields inviting investment as there were in that time.

After the Napoleonic wars, there were railroads to be built. England first started building railroads. From about 1820 to 1845, France was building railroads with British capital. Then railroad building began in this country, and in Australia and in other parts of Europe, all between 1840 and 1870. After 1870, from 1870 down to 1890, railroad building was carried on at a very rapid rate in this country. So, during these depressions, when capital accumulated, reserves or savings accumulated in Europe, and there were not profitable fields found for their employment there, they flowed out to these new countries of Australia, the United States, and South America, to be invested profitably. It was the expectation of profit in those fields which induced Europeans to send their capital here; and, going along concurrently with that process of investment, was the constant migration of Europeans to those new countries. That migration is not in course now. It simply is not a factor.

And, at the same time that there was that migration and investment in progress, there was a rapid rise in the industrial populations of England and Germany—later in Germany. England started right after the Napoleonic wars, and Germany got in the game of industrialization after the Civil War. During that time, the industrial populations of those countries were increasing, creating a market for raw foodstuffs and raw materials. So, there developed a natural basis for investment in exchange. England sent rails and locomotives to the new countries, built railroads, built factories, developed plants and mines for producing copper, wheat, sugar, and all sorts of products, and their growing populations at home consumed those, and there developed a natural exchange between the old countries of industry and the new fields of producing raw materials. Investment was then justified, but if you look the world over to-day, you can not find any such reason for investment, because all the world is glutted with raw materials and the prices are such that there is no profit in increasing the production of raw materials anywhere. In fact, the raw material producing centers in South America, Australia, and in Asia are unable to operate at a profit in the present state of supply and demand.

To be sure, certain undeveloped countries, like Russia and China, remain unmodernized. Given radically different world conditions, they might provide inviting fields for new investment. But the lure of profit can not beckon capital or migration to lands rules by anarchy, the case of China, or communism, the case of Russia. There may be good reasons to give away American money to the Chinese and Russians, instead of hungry Americans, but there can be no sound reason for investing capital in lands ruled by principles avowedly opposed to capitalism and profits. If further creation of capital must be justified by the expectation of a fair return, an indefinite scrapping of productive plant and a steady fall in the standard of living of the people are indicated. What is more, they have been in course since 1929.

Now, I am coming to a vital point in the analysis I make. The assumption of spontaneous revival through new investment has always rested on the fallacious postulate that people and banks will not indefinitely hoard money. The postulate is historically and theoretically untrue. Rich princes and merchants in the East and Europe have for thousands of years done just what the classical economists have said could not go on indefinitely. They have hoarded gold, silver, and other forms of wealth, usually obtained from wars and looting. They did not seek the Calvinistic or kosher 6 per cent in investment, for the good reason that investments of this type were not to be found in considerable quantity in times of no industrial expansion. What has happened for centuries is happening to-day everywhere. We are getting back to a course of conduct, in respect of wealth, normal for thousands of years.

The question in finance is not how might the banks contribute to recovery, for that we know already, but why they should do it so long as new investment offers no profit? Since the creation of the Federal reserve system by the act of 1913, our banking system has met satisfactorily all demands including that of contracting credit to correspond to a practice of economy. Before 1913 we had occasional money panics, due to the inelasticity of our then available supply of paper currency. The Federal reserve act of 1913 gave us an elastic currency and banking system which has avoided a recurrence of the monetary panic of 1907 and which has conducted for us, according to sound financial theories, a war, a boom, and a depression—each the biggest in history. What more could be asked of a banking system?

Our banking system adapts itself to the conditions of our economic life, and it must do that. If we want a war our banks give us the money for it. If we want a speculative boom our banks create credit and money for that. If we decide further investment is not profitable our banks must conform to that decision.

Let the following figures of new capital issues tell the story how the American people for a time willed prosperity and then, in 1929, began willing depression, without of course, realizing in 1929 that a decision to curtail new investment for profit at a moment when money income and profits were highest amounted to a definite decision to have a depression. I just quote figures of new capital invested in new issues of corporate, foreign government, farm loan, State and municipal bonds, and stocks of all sorts. They are the figures of the Commercial and Financial Chronicle. In the year 1924, $5,593,000,000; 1925, $6,220,000,000; 1926, $6,344,000,000; 1927, $7,791,000,000; 1928, $8,114,000,000; 1929, $10,183,000,000;

1930, $7,023,000,000; 1931, $3,108,000,000; 1932, $1,190,000,000; and in January, 1933, $64,000,000, as compared with $184,000,000 in 1932.

That is one measure of the decrease in new investment. Briefly stated, it is a very adequate index, I think, of the decline in new investments, the amount put into new corporate and public bond issues.

Briefly stated, the American people, from 1924 through the middle of 1929, wanted to invest heavily in the expansion of their own and foreign countries. They were motivated by a desire for gain and not for public welfare. The banks facilitated such profit-seeking investment. About the middle of 1929, the American people decided that a further increase in the Nation's productive capital would not be profitable. The decision was probably correct. They, therefore, decided to curtail the building of new capital plant. This decision started the depression and brought new investment in America to the lowest point in this century by the end of 1932.

In other words, new investment started declining in June, 1929, roughly, and it was about that time that the total amount of wage payments started their decline. The decision to invest less in new profit-seeking properties was a logical and necessary one if profits had to be the only motive for new investment.

A dictator, fascist, communist or king by divine right, could have prevented in 1929 the start of the present decline in spending and investment. He could have continued investment without regard for profit, as in better homes for the poor, museums, churches, etc. He could have kept up spending or production and consumption with regard only for the willingness and capacity of the people to produce.

You know that in the thirteenth century in France, $1,000,000,000 were invested in 100 years in building churches and cathedrals. In medieval times the State created work for people and activity in the building of churches, convents, monasteries, palaces, art galleries, pyramids, and great irrigation systems, none of which were motivated by profits.

The decision of American capitalists in 1929 to decrease further building of capital plant was dictated by the prospect of declining profits, due to the inevitable working of the capitalist system. The decision of the American people to spend less was imposed by a reduction toward the middle of 1929 of total wage payments. These two decisions, the results of the inevitable play of the system, willed the depression and forced the banks to start a contraction of credit, amounting to some sixteen billions in the past four years. The decline in the circulation of what bank money there is has been no less than the shrinkage in its absolute quantity. The activity of banking accounts or the circulation of bank money is best indicated by figures of what are called debits to individual accounts. During 1925–1928 such debits averaged about $50,000,000,000 a month. In 1929 they rose to over $70,000,000,000 a month. At present they are running about $25,000,000,000 a month.

The people have about fifteen billions less money in the banks. though they have over a billion more in currency, due to hoarding. People are spending bank money, or drawing checks, about a third as fast as in 1928–29. Yet we have as much gold to support bank credit and deposits. There are as many people to spend. They have as many wants. There is a larger equipment of productive capital with which to supply things on which people might spend money.

Here it may be objected to my exculpation of the bankers that they might, in spite of present trends, increase investments and loans in order to help us out of the depression. The answer to this objection is that banks can not finance the building of more factories, radio cities, or renting properties when half of our productive plant is idle for want of consumption and a large percentage of housing properties are vacant for want of paying tenants. Banks can not give money away to relieve the depression. The State, however, can give away money, because the State, unlike the banks, has the power of taxation.

Were the bankers to go temporarily insane, as they not infrequently do, and if they were to start making large investments and loans on the basis of their idle reserves, contrary to the obvious indications of commercial supply and demand, it would happen that depositors would at once make a run on such banks and thus defeat these well-intentioned but unsound attempts to save the country from the depression.

The banks to-day have about $500,000,000 surplus reserves, but they can not use them for investment when such investment promises results as we see in Radio City. If this analysis is correct, the State must save what we have of a price and profit system, a credit system. Under a price system—and this goes for communism or socialism or any ism—as long as you have prices under the price system, the only escape from a depression must be increased spending. In the absence of profitable new fields for investment, in a world already glutted with unsalable products, the only way to increase spending is for the State to do it for nonprofit yielding public works, social service or war. Japan has chosen war, and that is certainly the worst way to do it. The State can maintain adequate consumption. To say that the State can not do it is to deny history, because they did it for thousands of years. This is really an exercise in government and taxation; and we must remember, gentlemen, that a government which fails to govern must fall. A people who will not allow a government adequate to their needs must come to grief. State expenditures would probably have to be financed, in the beginning, with fiat creations of credit and money. I think we ought to be perfectly honest about this part of the problem.

All money, bank money and paper currency, except gold and a negligible quantity of silver coinage, is fiat money. All money except coins is created by a turn of a printing press or a stroke of a banker's pen. It is fiat money because it can be created without any other limit than the fiat of State authorization. Bankers make 90 per cent of our money by setting up on their books deposit credit and borrower debt.

No one has a valid standard for determining the future value of currency, bank money, gold, or bonds. Sound money theorists define fiat money as any money issued in excess of what they consider enough. Sound money is merely their definition of money issued within their limit. And every believer in sound money has a different idea as to what is enough money at a given time.

In fact, sound or good money is merely money that maintains or increases its purchasing power. Unsound or bad money is money that declines in purchasing power. The degree of goodness or badness is the extent of appreciation or depreciation after issue. Sound money theorists believe they have quantitative formulas for determining the future value of money and credit, much as physicists have for calculating the impact of falling bodies.

Simple minded advocates of what they piously call sound money suppose at times that some money is better than other money because expressly issued against goods already produced or in course of production and marketing. Such money, they imagine, is different from fiat money. It is, however, merely money issued within their limit and subject to their approval. As a matter of fact, money issued against unsalable goods is no different from money issued against the ice at the North Pole. Twelve million bags of coffee were burned last year in Brazil. We may see the same disposition made of our wheat and cotton surpluses. Yet the banker who issues credit or money can rarely tell whether goods will be sold at a price to cover costs, or even sold at all. The only security of any issue of money is a certain right course of future events. Believers in sound money are deluded with the notion that they have ways of foretelling the future.

The dollar is now painfully sound. It is getting sounder every week as prices continue their fall and unemployment continues its rise of the past four years. If present trends continue, it will soon be so sound that all our banks will be closed and most of us will be starving or living by moneyless barter, which many people are already extolling.

A sound bond pays the expected return. An unsound bond does not; and we never know at the time we create bonds what they are going to do, because of changes in future economic conditions.

When I was a boy 20 years ago or a little more, most European Governments' bonds were sound. After the war they have been unsound. Twenty years ago the watered stock of the United States Steel Corporation was unsound. Since 1915 or 1916 the watered stock of the United States Steel Corporation has been very sound. Even the securities of Insull and Kreuger, and the 1929 investment trusts, and of the South American Governments, might all be sound to-day had another course of events ensued comparable to those which followed the California gold rush or which followed the period of about 1870 to 1900.

The fact is, then, that there is no rule for determining whether money is going to be sound or unsound. The soundness of money or of credit depends upon the total production and consumption and the state of trade that follows. You can not fix those conditions when you create money.

I am not advocating what I would call unsound money. I am merely trying to clear the field of these invalid objections to what is called unsound money. I am making the point that no one has a standard for pronouncing money sound. We issue money against the production of goods. That is not valid, at all, because the goods may have the value of wheat or coffee 10 or 2 years or 6 months hence. The soundness of money depends upon the state of the exchanges; and that you can not determine when you issue money.

Let us look at the facts to-day. We have in 1933 more wealth in the United States for use than we had in 1929, and probably half as much value in exchange. Much of that wealth for use to-day has no exchange value because it can not be used under our price system. The reason it is not being used is that potential users do not receive the money income to buy the products of idle factories and prostrate farms. The need is not for more money primarily, but for more spending; and the reason that there is no more spending—the reasons why are not simple; they are somewhat complex. But the need is, I repeat, more spending, more investment, more consumptive spending.

Our sound money friends are terrified lest the inflationists give the shivering and under-nourished millions of unemployed unsound money in return for productive labor, so that quantities of now unsalable goods and housing might be bought.

The sound money people say that credit to build factories, which are now idle, was sound a few years ago, but credit, for instance, to clear away slumps would not be sound, because not profit yielding.

What does this inflation case really come down to? It comes down very largely to this, that the people who cry inflation against those who advocate State generation of activity make the great error of associating with inflation many of the unhappy things that have gone with inflation in the past.

Here you can state somewhat dogmatically that by inflation is meant the increase in consumption such as accompanies war, or the payment of reparations, which is a consumption in replacement of what was consumed in war, or else the inflation corresponding to an expansion of new country.

In the three great periods in our history before the Revolutionary War, the Civil War, and the World War, the people who criticize inflation are really criticizing those wars. The criticisms that they apply to inflation apply to the war. No country ever said, "Let us inflate," and then decided to have a war so that they could inflate. Countries have been driven to the decision to make war by considerations that they thought sufficient, and when they made the decision to go to war they had to inflate as a means of carrying out that decision.

In other words, what is called inflation and expansion of credit and money and more spending has always been an accompanying means for the accomplishment of something that the people as a whole wanted very much to do, such as fighting a war or developing a new country.

It does not follow that the only use that inflation can be put to is war. We did inflate in America in the past century in the opening up of the West. They inflated in Australia; they inflated in South America. The people who denounce inflation do not denounce the development of this country, which was accomplished by the increase of credit and investment. They confine their criticisms of inflation to what took place in Germany, to what took place in this country and in Europe as a result of the war. The evil of inflation is not the increase in money or spending, but it is the things that go with war.

We have in America to-day a real struggle, not between the proletariat and the bourgeoisie, because we do not have classes that answer to those terms. We have a struggle between the people who really believe in what they call sound money and the people who believe in the right to eat and the right to work.

Sound money arguments are appealing to those who have money and feel sure of getting more while millions grow poorer. They are not valid for a Government employee thrown out of work to balance the Budget and keep the dollar sound. There can be no valid sound money argument for the man who is denied by the exigencies of sound money the right to earn a living. This is a talking matter for the embattled bondholders and the cold-blooded theorists. But it will become a killing matter for the moneyless and hungry. Security for the working or declining years must be found in steady production, fair distribution, and a responsible, humane state. There can be no security for the thrifty or the worker in a state that allows production to become paralyzed and millions of men to go without work. In such a state, a sound currency is a travesty on words. Even if we grant that a sound dollar comes ahead of welfare or that a sound dollar is the best way to assure welfare, there is no evidence that any one can tell us how to maintain a sound dollar or that the recommendations of the sound dollar devotees can be carried out.

As we have seen in the present depression, the sound-dollar people really wish to reduce costs, reduce expenses; and the savings of the people who have money will eventually be turned into new investment. But we have seen that the process is not going to happen.

Now, how can government meet this situation? The first condition to be recognized is the need for more spending. What is the amount of additional spending needed? I am not going to be restrained by considerations of conservatism or by the fear of not being taken seriously. I am going to speak logically, even if my statements seem extreme.

We have in this country to-day about 12,000,000 unemployed, let us say. It is necessary to create enough additional consumption to provide work for those people. Suppose it is necessary to create $15,000,000,000 of additional consumption to provide work for these people. You will remember that only about 70 per cent of the amount spent will be applied to wages alone. Thirty per cent will go in remuneration of property owners in interest and profits.

Suppose it is necessary to spend fifteen billions a year additional to employ those 12,000,000 people. How shall that money be spent?

The first consideration there is that the money must be spent consumptively; the money must not be invested with a view to netting a profit. There has to be a definite increase in consumption. Can the State do it, and how?

Let us assume that there is a will to increase consumption by $15,000,000,000 a year by the action of the State. What could be done? The President of the United States could, in a message, set forth the nature of the present situation and invite the governors of the States and the mayors of the largest cities which are able to direct large scale expenditures of money, to send representatives to a conference to study this problem. The first question would be determining the total amouut to be spent, which, we will say, might be fifteen billions in a year. Then the allocation of those expenditures. What would the money be spent on? Not on reproductive works. The money would be spent on works which would create a better standard of living and which would not be expected to yield a net profit return to the State.

I think the largest field for investment there is in housing—housing for the poor; slum clearance. You will say right away, "There are plenty of houses." That is true—there are plenty of houses and plenty of housing for people who have the price; but the housing scheme that the country needs is one which will not compete with existing houses, but a housing scheme which will clear large areas of houses now occupied and build in their place better houses which will accommodate fewer people, but give them better quarters and, at the same time, for prices which they are now paying; the cost of that to be borne by the State.

The result of that operation will be a transfer of the ownership of that property to the State and the reimbursement of the owners with very low interest rate bonds. A part of the cost of the better housing for the same rental rates will go on the National Budget or on the State budgets. The property rights of landlords will not be injured by that, because you will not compete with existing houses, but you will create a demand for additional houses.

There is naturally a great deal of work to be done on the improvement of the esthetic approaches to the cities. There are unlimited fields for expenditure—nonprofit yielding expenditure—and that expenditure can be kept up indefinitely. With a preliminary issue of credit by means of taxation, the result of the spending will be to generate new purchasing power, to employ factories that are now idle, to create values which are now nonexistent because of the inactivity of these productive plants.

The principle of all this is a recognition of the fact that investment for profit is not the solution, but that by State action we have to increase consumption and we have to finance that increased consumption subsequently by levies on our national income in the form of taxation.

I do not think that such a program—certainly not for a long time—would amount to anything approaching a complete state of socialism. It would allow the entire management of industry and production by private producers, and it would permit a levy which would have very important effects on the distribution of wealth and income, but it would not be confiscatory. On the contrary, the effect of putting 12,000,000 men to work producing better houses to be rented without profit would be to enhance the capital values of investment in our steel mills and our cement mills and in all forms of property.

The question arises, can that be kept up? I see no reason why it can not, just as it was kept up for centuries before the rise of industrial expansion. Taxation and government administration are the bases of doing it.

In closing I want to say a few words about the alternative suggestions of a small issue of credit and a small expenditure to stimulate what is called a revival. Most of those suggestions suppose that this depression is a sort of psychological affair which is due to a lack of confidence, and that if you start the ball rolling it will then go of its own weight and momentum, and that spending a few billion dollars, two or three billions one year, will start the thing off and it will go by itself.

I believe that if you make a thorough analysis of all the factors in this situation you will be forced to the conclusion that there is no reason to suppose that a few billion dollars spent this year in any form will generate of itself processes that will take care of adequate activities for the next 10 or 15 years.

If you had a big war and spent several billions and destroyed a lot of property, then you would take care of this for several years, because you would have a period of replacement, and that would take care of it. But if you are not going to choose the war way, which has been taken by Japan for just this reason, you have got to recognize the necessity for the State to supplement private initiative to whatever extent is necessary; and I fix no limits. The State must supplement private initiative to whatever extent may be necessary to maintain an adequate level of activities for the whole country.

When I say "adequate" I mean adequate to have only one or two millions or two or three millions unemployed; but I do not believe any one can say that there is adequate activity in the country with 12,000,000 unemployed; and if none of our bankers and none of our financial advisers can tell us how or why anybody with money should invest it, then surely they have no reason to say that the State must not spend so as to create activity for those people.

The CHAIRMAN. There are many States now that have borrowed to their limit under their constitutions. What would you suggest in cases of that kind?

Mr. DENNIS. That I was going to come to, but I will be glad to take it up at this particular moment.

In regard to the question of financing these increased expenditures, assuming that the President's conference of governors and mayors should decide that this increase in expenditure is necessary and that the States must do it, the first problem is one of financing—how are you going to finance it? Assuming that taxation afterwards will take care of replacement, you must create money of some kind, bank money or currency. I do not think that you can go in the market to-day and sell five or ten billion dollars of Government bonds without breaking the Government bond market and thereby creating a great dislocation of our financial institutions. You have got to create for the initial year of spending a sheer increase of bank money through appropriate measures in the reserve banks or by a mere issue of currency. I do not think that your cities and States can borrow the money on their credit. I think that has to be recognized. I think you must make the direct creation of the money——

The CHAIRMAN. You mean, that the Government will have to supply the money to the States?

Mr. DENNIS. Yes; that is right.

The next question you will probably ask me is this: "Well, won't we have inflation and a terrible rise of prices"? If you spend the money so created to create new production you will not have it. You will have some rise in prices, but no dangerous rise in prices, the evils that the inflationist predicts would occur if this happened.

If the Government furnished $15,000,000,000 of money and just spent that and at the same time made a law and enforced it prohibiting any factory from increasing its production and preventing anybody from renting a house that is now empty, then the result of throwing out $15,000,000,000 of Government money to buy that much more goods in addition to the normal demand, with no increase in supply, would give you a fantastic rise of prices; and it is inconceivable to suppose that if the Government ordered $15,000,000,000 worth of some goods and services the idle factories would not immediately start turning them out. If they raised their production proportionately to the increase in spending, you would not have any rise in price. What gave you a rise in price when inflation started during the war was this, that during the war you took out of industry a large number of men to fight. At the same time you built up your consumption by a fantastic amount. The Government then comes into the market and throws money in the market for more goods, but it can not increase production as much as it increases demand. The result is the fantastic rise in prices.

In Germany eventually what happened? The Allies demanded exorbitant reparations of Germany. The Germans were required to make deliveries in goods. They were required to have large quantities of currency. How did they get it? They had to buy it. So the Germans began printing money in impossible amounts—that is, impossible to obtain without inflicting tremendous sacrifice on the population. That caused a rise in prices.

In other words, the evils of inflation only begin when your increase of money outruns your possibilities of increased production.

You would not have any extensive inflation until you reached the point where you got everybody at work, every factory turning out its full output, every house rented, and then have speculators operating, and you would get a rise of prices. That raises the question, can you control them? I do not think any one can say that it can be wholly controlled. We can not control our children, our wives, our husbands, our employees, entirely. There is no such thing as perfect control. You have to have a sufficient amount of control to make life possible. You have to assume that after the State has increased consumption by a sufficient amount to absorb our necessary output—and when I say "necessary" I mean enough to keep most of our people employed—you have to assume, then, that the State will not increase its spending beyond the capacity of our productive plant to supply.

If that is done, there is no reason why prices should become excessive or why they should become very unstable. There will be some instability, of course; but there you have a problem of government. First, the problem of creating the money for the initial expenditure; second, the problem of getting the money back by taxation and spending it again; third, the problem of keeping your spending in relation to your capacity of production; and there you can have a fairly normal equilibrium which can be maintained indefinitely without going to the extremes of socialism or communism.

That is an adequate plan, and I do not think that the spending of a few millions here and a few millions there is the adequate or correct approach to the problem. You can not stabilize prices and you can not generate a force which will of itself restore prosperity.

The CHAIRMAN. You will have to excuse me. I have to go to a conference.

(Senator Smoot withdrew from the hearing room, and Senator Shortridge took the chair and presided during the remainder of the session.)

Mr. DENNIS. Another question that I would like to discuss in connection with some logical plan of Government spending, to supplement any deficiency of consumption, is the question of a fair return to the investor, a fair return to the capitalist. A great many people believe that they can conserve their capital rights and receive a fair return on bonds and interest-bearing obligations without regard for production. I think it is one of the main errors of the current economic thought in this depression. The return to the capitalist must be considered purely as a part, a percentage of what is produced. The investor can only receive in the long run a part of what is produced.

I do not need to give figures to this committee on production. Every one knows that production to-day is about half of normal. Take the index to production of the Federal reserve bank, or any of the indices of production and distribution, and you will find by any of those indices that production is about one-half of normal. The capitalist's return can not be maintained in view of the situation. Half of the credit rights of this country, half of the mortgages, half of the rights to money payment have got to be canceled sooner or later in this depression if production is kept at 50 per cent of what it was four or five years ago. There is no escape from the logic of that proposition, as I see it. You reduce production to half, and you have got to cut the capitalist's return in half. If you by State action increase production a hundred per cent or put it back approximately to where it was, even though that production is used to give poor people better homes or to build beautiful buildings or whatever you increase that production for, on that production the investors will receive or be able to receive a larger return—not a larger percentage of return, but a larger gross return.

In other words, my argument is that you can not maintain your credit right good in this country unless you bring your production back; but if you can not bring your production back by getting the rich to spend more money, you have got to bring it back by getting the State to spend more money.

Senator SHORTRIDGE. What do you include within the word "production?"

Mr. DENNIS. I include the sum total of goods and services which are sold. The housewife's services for her husband would not be included, but the servant's service for her master or a farmer's wage or a manufacturer's production would be included. That is production which is paid for in money. The farmers, of course, are producing a great deal nowadays which is not being paid for in money, for their own consumption; but we can not go back to a primitive economy in which everybody makes his own shoes and weaves his own cloth. We have got to continue on a price economy, which means that we must sell and buy; and there are 12,000,000 people who can sell and buy very little, because no one will buy their labor. They can not sell their labor, so they are practically living on charity or on their rapidly dwindling savings.

The bondholders and conservative people, it seems to me, in this crisis, are making a great mistake in denouncing what they call inflation, which is but another word for increased activity. I do not call myself an inflationist any more than I think George Washington would call himself an inflationist, or Woodrow Wilson or Abraham Lincoln would call themselves inflationists. The Revolutionary War was fought with inflation; the Civil War was fought with inflation, and the World War was fought with inflation; but none of the leaders of the people who were responsible for those wars were inflationists as such. What is called inflation is merely the means of meeting a situation; and it is my argument that unless production is increased by the action of the State, the credit values of the country will be worthless.

The thought that I want to leave in connection with this general thesis is that our credit values and our property rights are only worth as much as our production; and any person who argues against increased spending on the ground that he is protecting his property or his credit is really deceiving himself unless he can show how his course of action is going to lead to increased production.

The time has come when the burden of proof is on the banker, on the bondholder, on the conservative who says, "We will stand still and wait until investment starts up." The burden of proof is on the man that takes that position; and I find in my reading and in my going about and in my connections in the financial world that none of the people who hold that view have any constructive suggestion for starting up new production or additional production and additional consumption.

Senator LA FOLLETTE. Most of the gentlemen who have been before this committee have indicated that if we would just balance the Budget everything would be all right.

Mr. DENNIS. Senator La Follette, I believe in balancing the Budget; and however radical, however extravagant the program of public expenditures, I would also advocate that that be covered promptly thereafter by taxation. A balanced Budget alone in this crisis will not get us out of the depression. The Government can not balance the Budget because the people's incomes have been decreased.

Senator LA FOLLETTE. That is the point that I wanted to get your reaction upon. Most of these men who have been before the committee thus far have indicated that if we would just balance the Budget, confidence would return and we would begin to have increased production and would get out of the depression.

Mr. DENNIS. I anticipated that very point in my somewhat lengthy development of the idea that there is no field for new investment. The plea for measures which will increase confidence presuppose a state of world demand and supply in which it may be profitable to invest money if you have confidence. Mr. Rockefeller had confidence. He invested $225,000,000 in Radio City. But confidence would not make the investment profitable if there is not sufficient demand.

So I do not think that this is a crisis of confidence, although I think a lack of confidence may be directly responsible for a run on the bank. A lack of confidence usually has some foundation. While it is always desirable to encourage people to have confidence, you can never expect people to have confidence in an essentially false state of affairs; and it seems to me that the confidence preachers to-day are not asking people to be calm; they are really asking people to believe bedtime stories. They are asking people to believe that if they invest money they will be able to get a return on it. Anybody who has any common sense knows that if he builds a new factory or produces more minerals or more wheat he will not get more profits. There are a few minor exceptions, possibly.

Therefore, the balance the Budget argument is really to enable people to save more money. It is not to balance the Budget. They want to reduce Government expenditures and make economies for taxpayers, so the taxpayer will have more savings, and that presupposes that the taxpayer will go out and invest that money. But that is just what he will not do; he will hoard the money.

Senator SHORTRIDGE. But that would be a desirable thing, would it not, to so reduce the cost of Government and, if necessary, increase the revenues of the Government, as to pay expenses? Would not that be desirable and helpful in many, many directions?

Mr. DENNIS. If I understand your question, Senator Shortridge, it is whether it would be desirable for the Government to reduce expenditures?

Senator SHORTRIDGE. Yes; to the end that the cost of government could be borne and we could balance the books. Balancing the Budget merely means that the income of the Government shall be ample to pay the current expenses of the Government.

Mr. DENNIS. My answer to that would be this. The unbalanced state of the Budget in the last two years, which is almost 50 per cent of the ordinary Budget, has not been due to an increase in budgetary expenditures so much as to a decline in revenue.

Senator SHORTRIDGE. Certainly that is true.

Mr. DENNIS. That is the first point. The second point is this, that as the Government reduces its expenditures in order to bring them down to its income, its income will go on declining too. You will not stop the decline in revenue by stopping expenditures, because your revenue will shrink as fast from other factors, from other causes, as your expenditures. That is what is happening. You throw a man out of a Government job. Where does he get a job? You throw a man out of any job to-day, and where does he get a job? The Government might solve this problem—I don't think it can at the present time—by reducing employment in Government service; but it might reduce its expenditures by four hundred or five hundred millions a year by just abandoning certain types of public service, because, as you know, about 30 per cent of the Government Budget is fixed charges, and if you reduce public expenditures you reduce the incomes of people, and your income from revenue is being reduced by factors which are wholly outside of the power of budgetary economy to control. You can not increase people's revenues by reducing the Budget. You will also increase your indigent class which is getting support already. If you throw a man out of a Government job who was getting $1,200 a year, the community will incur a charge of $400 to $500 a year for his support, sooner or later.

I do not think solution is to be sought at all along the line of contraction or economy. To my mind we are facing a situation exactly like war. We have an enemy. It is the depression. It is inactivity, unemployment. When you set out to take an enemy you must employ all your resources to beat that enemy. You must not try to conserve your resources. You would not make war by trying to conserve men or money. You make war by trying to beat the enemy. In think government economies can not increase revenues and that you can not contract expenditures as fast as your revenues will contract in the present state of affairs.

Senator LA FOLLETTE. In other words, you can not balance the Budget while you are sliding down hill?

Mr. DENNIS. No; you can not do it. You can not reduce expenditures fast enough.

Senator SHORTRIDGE. You have used the word "production." We have heard a great deal about overproduction, as in the case of many of our agricultural products. There is overproduction to-day, is there not?

Mr. DENNIS. There is overproduction in the sense that many things can not be sold at a profitable price. Strangely enough, the farmers are selling their output better than anybody, though they are making less and are suffering more in a reduced standard of living. The total farm output of the country has declined less in physical volume than the output of any other major branch of industry.

There is a potential market for all our potential output. There is overproduction if you are to earn interest charges and a profitable return; but the assumption of my whole case is that you have got to create demand by the act of the state to supply the deficiency, because, as you say, there is overproduction, just as there is overproduction for profitable demand. There is more produced than people will buy at a price which yields a profit; but the conclusion that we draw from that fact is not that you must further cut production, but that you must increase consumption, because under a price system people can only consume if they produce. In order to increase consumption you must increase production to some extent, because 12,000,000 unemployed should not be given doles so as to increase consumption. They should be given an opportunity to add to the overproduction; but in so doing, to increase that consumption to such an extent that the whole output would be absorbed.

Senator LA FOLLETTE. At the peak of prosperity there were 20,000,000 people in this country living below the minimum standard set by the Labor Department as necessary to sustain life on an adequate basis. Therefore we can hardly say that even at the peak of prosperity, with that potential market, there was any actual overproduction; it was an inability to consume. And it is to-day?

Mr. DENNIS. Yes. Everything depends upon the point of view from which you view production. If it has to be production for a profitable price, then you are definitely limited. The State is the great consumer in any society; and I think the great lesson of this depression that is missed by most people is that historically the State has been the great consumer. It is only during the period from about the time of Adam Smith or the American Revolution down to the World War, or even a little before that, that society could rely on the profit motive in opening up new fields of investment to supply an adequate amount of consumption to take care of the output. In the medieval days they built cathedrals, monasteries, churches, and great public works to keep the people employed; and there is nothing radical or abnormal about that idea. It just so happens that some of our bankers have a notion that it is a historic and inherent law that the State must only spend enough to keep the peace, and that individuals can be relied upon in the play of the free market to do enough spending to absorb the necessary output.

The fact is historically that since the dawn of history the State has seen that the people have enough work and enough activity. I do not say that it has always been of a desirable quality; but you must take into account the results of invention to increase productivity in the last 120 years. The rise of the standard of living during the industrial revolution was due to increased technological efficiency. During that heyday of the recent industrialism the State did not need to do much but just keep the peace and act as policeman.

In the meantime the people who were in search of profit went to America and opened up new fields of production. But now we are at the end of that period, it seems to me, and I think history will bear me out in this. I can not assert this dogmatically, because my statement might be belied by some utterly unforeseeable combination of events, or, of course, by a great war, which is a consumption process.

But the thought that I want to stress again and again is that there is nothing radical, there is nothing revolutionary in the concept that the State has to provide activities. It just so happens to be a fixed notion of the bankers and so-called conservative people in this country that State consumption is a radical, unsound, unprecedented thing, just because it has so happened during the 150 years of expanding industrialism that society could rely on private profit seeking initiative to supply a market, and not on the State.

The last World War, which some people often refer to as the cause of our present depression, in my opinion really saved us from this depression—it postponed it. I think that it might very well have happened that the world would have sunk into a very deep depression, perhaps worse than this, more slowly, had the war not come. Indeed I will say that the tendency toward depression was one of the causes of the World War. That is seen in the competition and threat of competition between England and Germany. The war came between England and Germany primarily because of economic rivalry. Markets were becoming limited. I do not say that they just made that analysis of the situation and said, "Now, let us have a war." It did not happen that simply; but the war saved us from the continuation of the depression that followed the panic of 1907, by creating a great demand for consumers' goods. It is unfortunate to have to kill people in order to spend enough, and the extremity of spending excessively during a brief period and having a period of prosperity in replacing what may have been destroyed, most naturally, under a profit system, may rise to a severe depression when the credit expansion has become so great that it has to be deflated.

But the argument there is not against consumption; it is against the bad type of consumption which is constituted by war, and it is in favor of a type of social consumption which has not the disadvantages of war, because, as I have said, the great objection to inflation which the anti-inflationists always use is the objection to what has always gone with inflation, in the Revolutionary War, the Civil War, and the World War. We have used inflation in connection with the war, and the anti-inflationists always denounce the process of events which gave rise to inflation; and there they are quite right. We must use credit to promote human welfare.

Senator SHORTRIDGE. Do you not think that the great World War was a net loss to every nation engaged in it?

Mr. DENNIS. On the human factor side I would say, yes. On the economic factors I would say, no.

Senator GORE. Economists estimate that one hundred and eighty-six billions of actual wealth was destroyed during the war and one hundred and fifty-one billions of potential wealth and two hundred billions of indebtedness was written on the books of a crippled and blasted world. Are you able to figure out any economic consequences from the destruction of three hundred and thirty-seven billions of wealth and the loading of two hundred billions of indebtedness in as short a time as four years on as small a planet as this globe, and with as small a population as that, and expect anything but the most terrific economic consequences from it?

Mr. DENNIS. Senator Gore, I think if the nations of the world following the World War had had an attack of comon sense and applied their productive faculties to social programs, and had they extinguished their war debt by direct capital levies, within a few years, I think we could have entirely eliminated the consequences that we have in the present depression. I do not blame the World War for this depression, sir. I think that the World War really gave a boom, and that the misfortune of the world is that we were not able to keep up the boom.

But the war certainly did not prevent us from keeping up the boom. What prevented us from keeping up the boom was that we relied on the use of consumptive credit directly or indirectly to finance consumption; and you can not go on financing consumption by the use of credit. You must finance consumption by some means of distributing income as it is produced and consumed. It is the scheme of distributing national income which is responsible for the depression, and not the breakdown of our productive processes; because if you will stop to think, Senator, we have all the factories that we had in 1929. We have every productive factory to-day that we had in 1929, and we have a far bigger productive factory, about a hundred billion dollars more of productive capital now than we had in 1914. That is true of France; that is true of Germany. All the European countries have a greatly enlarged productive plant, and the South American countries and Australia all have a greatly enlarged productive plant.

Senator GORE. I think you are right; but during the war I think the world's productive capacity was developed to a point beyond the world's requirements The war created. seven new nations with 12,400 miles of additional international boundaries. Each of those little dinky States trying to become economically self sufficient was adding to their own productive capacity regardless of the fact that it was being added to a productive capacity of the world at large which was already excessive. Is not that true?

Mr. DENNIS. I would say, Senator, that the human race has a capacity for consumption; that the only limit to the production of a people should be their willingness to work and their natural resources, to some extent, and I believe we can use up all this production if we have the right system of distribution.

Senator GORE. I agree with you entirely about that. We have got to cut down production or cut down the days of the week or the hours in each day until everybody has got all they need, at least, and perhaps more than they want.

Mr. DENNIS. That is my view.

Senator GORE. I do not have any sympathy with this other plan at all; I think it is ruinous. But after the war was over we lent money to the peoples of Europe for rehabilitation purposes, and they used that money to buy our goods that were produced in this country.

Mr. DENNIS. I made an analysis of our capital exports from 1919 to 1931, taken from the reports of the international balance of payments, of the Department of Commerce, and in my analysis I found that the amounts we loaned to the European peoples, to foreigners, were almost exactly equal to what we received or were due to receive and did receive in interest and dividends. So I say that our loans were just about equal to our capital income from abroad. So we did not by our loans really increase their purchasing power for American goods.

Senator GORE. Do you think they could and would have bought as much in the United States if they had not borrowed as much from us?

Mr. DENNIS. The answer is that they would not have bought as much in the United States if they had not borrowed from us and if they had paid their interest. If they had not paid any interest to us, when they would have bought just the same amount.

Senator GORE. I saw a statement not long ago—I have forgotten the figures, but from 1922 to 1929 we loaned them eight billions.

Mr. DENNIS. I think that is about right.

Senator GORE. During that time our favorable balance of trade was eight billions or approximately so. There was a singular correspondence between our balance of trade and what we loaned them. The author may have been right or wrong.

Mr. DENNIS. He was right.

Senator GORE. He was drawing the inference that this money that we loaned them had been used to buy goods from us.

Mr. DENNIS. It so happens that the figure you refer to as the favorable balance of trade is the favorable balance of our commodity exports. The invisibles you see are just about equal to our capital exports. So you can see that the invisible imports of the United States are just about offset by the capital exports.

Senator GORE. In any event, whether they borrowed money from us or not, they bought enormously from us?

Mr. DENNIS. That is true.

Senator GORE. Which stimulated production in this country, did it not?

Mr. DENNIS. It was a contributory factor, about 7 per cent.

Senator GORE. It did contribute to mass production, did it not?

Mr. DENNIS. Somewhat; yes.

Senator GORE. When mass production began in this country, the increased output and the increased sales abroad began to show pretty good earnings for the factories, did they not?

Mr. DENNIS. Yes; only I would say, Senator, that the construction of new buildings in this country during that period was a far bigger factor in creating our prosperity than our foreign exports.

Senator GORE. There is no doubt about that, because during the war we suspended. The Government requested people not to put capital into buildings, and they obeyed the request. Not only that, but two or three million farmers came to town. They did not have any homes because the building had not kept pace with the ordinary demand. So when the war was over there was a demand for buildings in the cities to accommodate the newcomers, and for business purposes as well. That caused a sort of artificial stimulus to domestic industry, and everybody that was producing building materials or engaged in the building trades became prosperous. On the other hand, it stimulated our factories to mass production and started factories earning profits and profit taking advanced and prices increased and did not that help to start this wild stock speculation?

Mr. DENNIS. It was a contributory factor indeed. I think, however, that if the United States at the conference of Versailles, or shortly after, had canceled all the war debts, the foreign trade of the United States would have been about evenly balanced since the war, and our capital exports would not have figured since the war as a contributory factor towards our prosperity. As it was, I am inclined to think that they were not so important as a contributory facotr as was the construction of better homes and the rise of the standard of living and a great many technological advantages in industry which gave rise to a great deal of new investment, and all of that, connected with a spirit of enterprise, of profit seeking which had been greatly stimulated by the war, and the people had a little of the spirit of the 70's and 80's, the pioneer spirit. The war gave them a great spiritual impulse. Everybody thought, having made barrels of money in war orders, that they could go on doing that, and there was a great impulse, a spiritual, psychological impulse to investors.

Senator GORE. I want to come back to that, but I want to ask you two preliminary questions. In the war our bank deposits increased five and a half billion?

Mr. DENNIS. Yes.

Senator GORE. Loans and investments of the banks increased seven billions?

Mr. DENNIS. Yes, sir.

Senator GORE. From 1922 to 1929 bank deposits increased thirteen billions, twice as much. During the same period, 1922 to 1929, loans and investments increase fourteen and a half billions. The volume of money during those seven years declined. I agree with you so far as this credit inflation being responsible for this panic is concerned. I understood that to be your theory—I do not want to misstate your views.

Reverting to the proposition you spoke of a minute ago, there is no doubt, whether you call it spiritual or material, that there was a great buying campaign in this country; and is it not true that during that buying campaign a great many of our people spent all their earnings, all their income? Is not that true?

Mr. DENNIS. I think so; yes. Some of them spent more by instalment buying.

Senator GORE. Do you not think they invaded their savings to buy?

Mr. DENNIS. I think probably they did.

Senator GORE. Do you not think that some of them invaded their capital to buy?

Mr. DENNIS. Yes, sir; I think so.

Senator GORE. Do you not think that some of them resorted to their credit to buy?

Mr. DENNIS. Yes, sir.

Senator GORE. And, as you say, bought consumption goods?

Mr. DENNIS. On credit.

Senator GORE. Instalment buying?

Mr. DENNIS. Yes.

Senator GORE. I have the authority of an eminent economist to the effect that the people of this country were buying, when the panic came, at the rate of $15,000,000,000 worth more goods a year than the national income amounted to, and they made up the difference and acquired their purchasing power from the invasion of their savings, from capital, and credit. The people borrowed all they could borrow to buy, and the day came when they could not borrow any more to buy with. Mass production lost its market. The factories sensed the chill in the air that indicated that they might not be able to sell. Demand slackened. When people use up all their resources and credit and everything else, they quit buying. The factories slackened their output because of slackening demand, and they turned off employees, and that dininished the purchasing power, and that cut down production, and that put us into a vicious spiral. But the point I am getting at is this. Is it your view that this expansion of credit, the use or misuse of credit, is largely responsible for the crash?

Mr. DENNIS. I agree with you entirely that the use of credit for consumption is unsound and undesirable and should be avoided. I think that one of the greatest dangers in our economic structure is the use of credit. Fixed interest bearing credit is what I mean.

Senator GORE. We have had some eight or nine major depressions in our history. The combination of causes differs in each case. One set of causes produced one panic; one another. You might say one set of causes precipitated another. But in every panic we have had major or minor, there has been a credit crisis, has there not?

Mr. DENNIS. Yes.

Senator GORE. The people used their credit and strained it until it flew into flinders, so to speak, and then they came down to earth.

In 1927, you know, there was quite a controversy in this country about the rediscount rate, and it was made very low. One school said it was too low and another said it was not, and it was made in order to help England get on or stay on the gold standard. The rediscount rate for money was lower than the market rate. Of course that encouraged banks to rediscount with the Federal reserve, and loan it and get the difference. Is not that true?

Mr. DENNIS. I do not think it is quite as simple as that. My opinion would be that the rediscount rate of the Federal reserve bank was a negligible factor in the credit situation from 1927 to 1929. The rediscount rate might have become a factor had it been raised to 10 or 12 per cent; but inasmuch as that was not done, I do not think its influence——

Senator GORE. It therefore tended to arrest the business in the runaway, and they put it down 3½ per cent, if I remember correctly.

Mr. DENNIS. I do not think that was a factor, for this reason, that the banks did not make any considerable use of reserve bank credit during that period. Their use of reserve bank credit was not an important factor. The figures show that there was very little or comparatively little use made of it. I heard Mr. Mitchell testify the other day before another committee that his bank, which was the object of considerable criticism during that period for an excessive use of credit and the encouragement of speculation, had not borrowed, was not borrowing at all from the reserve bank.

Senator GORE. When was that?

Mr. DENNIS. In 1929. The City Bank was not in debt to the reserve bank at all; and the major New York bankers who were pouring great barrels of oil on the flames of speculation were not borrowing at all from the reserve banks. The banks that were borrowing or leaning most heavily on the Federal reserve system were in the agricultural districts where there was not very much speculation going on.

Senator GORE. But the point I was making was that the low interest rate encouraged borrowing and the use of credit.

Mr. DENNIS. It was not used very much in the fields of speculation.

Senator GORE. They were borrowing from the banks.

Mr. DENNIS. The banks were charging a pretty fat rate of interest. They were charging 6 per cent on any commercial loans at that period, and charging up to 15 per cent on call money loans at times in the New York market.

Senator GORE. Yes; and draining the whole country of money and credit both to concentrate in New York.

Mr. DENNIS. Yes; but they were not drawing on the reserve banks' credit.

Senator GORE. I was not making that point.

Mr. DENNIS. I think that credit was abused, but I think that the real evil is assuming an obligation to pay an interest rate which can not be earned; when people are optimistic and borrow large amounts of money to speculate, to invest, on the assumption of earning a high rate of interest, and when the state of supply and demand and exchanges does not make it possible to earn those interest rates, you have, sooner or later, got to have a readjustment. Credit is a necessary institution under any price system, but interest is not a necessary institution. You could have the ownership of property in the form of common stocks and real estate and property rights rather than fixed interest rights. It is all a question of what you mean by credit. The evils of to-day, I should say, are the evils of having promised to pay a rate of interest which can not be earned.

Senator SHORTRIDGE. Are we to understand from your statement that you think it would be economically wise for the United States to cancel the debts due us from foreign nations?

Mr. DENNIS. I had not referred specifically to that, sir, but I think, as a matter of fact, that the United States has either to cancel the debts due us from foreign nations or accept an import surplus; that is, lower our tariffs and take more foreign goods than we export.

Senator SHORTRIDGE. To put it simply, I wanted to get your conclusion rather than your reasons for it. There are certain written agreements, obligations of those European nations. We set up a commission here to adjust and settle the debts, a funding commission. These several nations, through authorized agents, came here to Washington and we took into consideration all the facts, their capacity to pay, and we gave to them severally some 62 years within which to pay at certain rates of interest. Those agreements were then ratified by the several governments and by ourselves, and those contracts are now valid and existing. The simple question is, if you can answer it just by yes or no, Shall we cancel them? Shall we give further time? Shall we waive interest, or, upon the other hand, shall we stand upon the agreements and insist that the agreements be performed by these several debtor nations?

Mr. DENNIS. I favor cancellation, sir.

Senator SHORTRIDGE. I merely wanted to know that.

Mr. DENNIS. I favor cancellation, and I add that if we do not want to cancel them, I would favor maintaining the debts and offering to accept in a quota the amount of goods at a tariff rate which would be competitive and permit their entry, to pay the amount of the interest.

Senator SHORTRIDGE. Take Italy, for example. Would you favor the reduction or the wiping out of any tariff duties on Italian imports into the United States, those imports coming necessarily into competition with like products of our own country?

Mr. DENNIS. That is a little difficult, Senator, to answer a question of that sort yes or no, without stating one's position. I believe in a closed economy. I believe it is inevitable at the present time.

Senator SHORTRIDGE. What to you mean by that?

Mr. DENNIS. I do not believe in lowering the tariff at the present time. I do not think it is possible. Although I am in favor of debt cancellation, I think it is eigher lower the tariff and demand debt payment, or cancel the debts and maintain the tariff.

Senator SHORTRIDGE. Putting a leading question to you, do you not think that France, for example, could have paid the installment due on December 15 if she had wanted to do it? Don't you think she had the money?

Mr. DENNIS. She could have shipped gold; yes.

Senator SHORTRIDGE. And could have paid it?

Mr. DENNIS. She could have shipped gold to pay it.

Senator SHORTRIDGE. Don't you think that little Latvia on the Baltic could have done likewise?

Mr. DENNIS. I would have some doubts about the ease with which it could do so; and I would say that the shipment of gold is one means of payment which we could insist on over a long period of time——

Senator SHORTRIDGE. They have the option of paying us by way of our bonds.

Mr. DENNIS. But they have to ship gold to buy our bonds.

Senator SHORTRIDGE. Do you have any figures showing what our outstanding bonds are held at abroad?

Mr. DENNIS. I have not, but our bonds have to be bought by foreign governments, and they probably could not be bought except with gold or at a price which would mean a premium in the moneys of the debtor countries.

Senator SHORTRIDGE. We all understand that these agreements provide that we shall be paid in gold of a standard weight and value or in United States bonds.

Mr. DENNIS. Yes, sir.

Senator SHORTRIDGE. So I was little curious to know, if the figures are available, what total amount of our outstanding bonds are held abroad by those nations.

Mr. DENNIS. I assume there are some good estimates on that. I doubt that there are adequate figures, because most Government bonds are usually passed on delivery, and a great many foreign-owned Government bonds are held in this country, and even held in street names and held in accounts of brokers, so that it would be a little difficult to get an accurate figure. I assume, however, that there is a considerable amount of United States Government bonds held by citizens of foreign countries and not by the Governments, and the Governments would probably have to pay for those bonds in gold. So that the problem of paying the debt to us would still be the problem of transmitting the gold to this country, unless gold exchange, the dollar exchange, could be bought in those countries without lowering the rate of exchange below the gold point.

Senator SHORTRIDGE. Are there any further quesions?

Senator LA FOLLETTE. I would like to ask one question of Mr. Dennis. Most of these witnesses that I have been able to hear, in boiling down their recommendations to a brief statement it is that the Government should batten down the hatches and take in sail and ride out the storm. What do you envision as the potentialities of taking that course?

Mr. DENNIS. A constant deepening of the depression, because we are in a spiral circle—contracting consumption, which distates curtailed investment, which results in less consumption which justifies curtailed investment, and so on. So that the end of the process would be balancing the Budget at zero and everybody being without work and money income, if it were carried to its logical extreme, assuming that nothing unexpected happens, such as the discovery of great quantities of gold, or some motive to go to Alaska or Mexico by the hundreds of thousands and invest millions and millions of dollars in some new field. I do not think we can expect to get out of this depression by waiting for new fields of investment to start up. We can not balance the Budget while revenues are declining, because expenditures can not be reduced as fast as the money income of the Nation is declining. If you read the figures of the Federal reserve member banks, the reporting member banks, each week, you will notice that practically every week there is a contraction of credit. The banks are calling commercial loans and buying few Government bonds. They call about \$3 of commercial loans and buy about \$1 of Government bonds. That is about the ratio for the past four years. Sixteen billion dollars contraction of commercial credit in the banks of the United States, and an increase of Government debt of about four and a half to five billion dollars which the reserve banks have taken about \$200,000,000 of, and the commercial banks and insurance companies have taken the rest.

Senator COSTIGAN. Without asking you to repeat any statement made in my absence, have you made concrete suggestions of activities that the Government might stimulate?

Mr. DENNIS. Yes, sir.

Senator SHORTRIDGE. If there are no further questions, we thank you very much, Mr. Dennis. The committee will stand in recess until to-morrow morning at 10 o'clock.

(Whereupon, at 5 o'clock p. m., a recess was taken until to-morrow, Saturday, February 25, 1933, at 10 o'clock a. m.)

# INVESTIGATION OF ECONOMIC PROBLEMS

**SATURDAY, FEBRUARY 25, 1933**

United States Senate,
Committee on Finance,
*Washington, D. C.*

The committee met at 10 o'clock a. m., pursuant to adjournment on Friday, February 24, 1933, in room 335, Senate Office Building, Senator Reed Smoot presiding.

Present: Senators Smoot (chairman), Watson, Metcalf, Harrison, King, Barkley, and Gore.

The Chairman. The committee will come to order. Mr. Atterbury.

## STATEMENT OF W. W. ATTERBURY, PRESIDENT OF THE PENNSYLVANIA RAILROAD, PHILADEPHPIA, PA.

The Chairman. Give your full name and address for the record.

General Atterbury. W. W. Atterbury. Broad Street Station, Philadelphia, Pa., president of the Pennsylvania Railroad.

The Chairman. Mr. Atterbury, we would be very pleased, indeed, to hear from you anything that you desire to say. And we may ask you a number of questions before you get through.

General Atterbury. My statement will be a very brief one, expecting probably that some questions will follow.

I am appearing before this committee at its request and would like to have it understood that my appearance is in a purely personal capacity, my observations and opinions being given as an individual citizen, entirely apart from my business-world connections.

First, in my judgment, one of the most important matters we have to consider is the reduction of governmental expenditures—National, State, and municipal—and the real balancing of their respective budgets. Taxation has become an overwhelming burden on everyone, corporation and individuals alike. The income tax on individuals and corporations should be materially reduced and an ultimate sales tax applied to everyone, graded proproportionately upon necessities, subnecessities, and luxuries. The capital-gains tax, which in my judgment contributed so largely to the pyramiding of speculative accounts in 1928 and 1929, should be wiped out, as should also the ruling which permits a percentage of capital losses to be applied as a deduction in the income-tax return. It prevented the digestion of securities in 1928 and 1929, and also forced the sale of stable securities in 1931, 1932, and 1933.

Budgets should be really balanced. The National Government and its component units should stop making capital expenditures of any kind except those which show a reasonable return on the investment. I can see no reason why Government should not conduct its business during these times in exactly the same way as the individual or corporation would do. There is no panacea for a resumption of prosperity except the slow, painful one of hitting the bottom, and then slowly building up with a sane and economical foundation on which to build.

Second, with respect to our international debts, I can see no reason why our country should not consider the treatment of a debtor country as would an individual treat his debtor; that is, sit down around the table and make the best possible settlement that can be arrived at, so as to get the debtor back on a sound financial basis and then resume business relations with him as a customer.

From my standpoint, disarmament has absolutely no place in such a discussion; nor should a settlment with one country affect settlement with other countries where conditions are essentially dissimilar.

The question of tariffs, however, is an important phase in such settlements. Our exportable surplusage enables us to benefit our own nationals as well as to manufacture and sell more economically in the world's markets. Further, the only practicable way in which our debtors can pay their debts is through importation of their manufactures and raw materials; consequently, I am of the feeling that adjustment of tariffs is essentially an element to be considered in the settlement of the international-debt question.

Third, the antitrust laws should be materially modified. Competition which for so long has been a fetish in this country, is now working industry's own destruction. The same rights extended to agriculture and to labor should be accorded to industry. Conspiracy in an unreasonable restraint of trade can be established and punished; but reasonable agreements should be permitted which would prevent the sale of commodities below their costs of production.

Our system of National and State regulation of transportation should be restored to its original purpose, which was to secure just and reasonable charges for transportation and to prevent special rates, rebates, and so forth, the primary object being to avoid unjust discriminations in the rendition of like service under similar circumstances and conditions.

The public interest should at all times be fully protected, but there ought to be a minimum of regulatory interference with the discretion of management.

The same form and measure of regulation should be applied to all other forms of transportation, not because of the railroad situation, but to protect the public. This having been done, the railroads will then be in a position to coordinate their services and by such coordination the public will be served by the form of transportation best suited to its convenience and necessity. If, under those conditions, the railroads can not survive, they will have to suffer as have all other obsolete methods in our advancing civilization.

My prophesy is that much branch line railroad mileage will be abandoned and that the truck and bus will find their useful places, as will also aviation, and that after that has been done the railroads will themselves be in a far healthier position and the public will be profiting by having at its command the best form of transportation service.

That, Mr. Chairman, is my statement.

Senator HARRISON. You think the railroads ought to be permitted to own the air lines and busses and trucks?

General ATTERBURY. Senator Harrison, my judgment is that trucks, busses, and aviation are all a part of our transportation system in this country. We on the Pennsylvania are using them to-day. We are interested in the Transcontinental and Western Air Express. We are interested in bus companies that control about 500 busses and in truck companies that control about 2,000 trucks.

The CHAIRMAN. Do you have your busses or trucks across the continent, or just locally?

General ATTERBURY. We are interested in the Greyhound Line, of which we own about 10 per cent of the stock. They control the Pennsylvania-Greyhound line which parallels our line all over our system, of which we own 50 per cent of the stock. That particular company, the Pennsylvania-Greyhound, has been a very successful company, and we use it to coordinate our service. We use it to tie in between local stations where it does not pay us to run local trains. And in another way it is really an integral part of our system.

Senator HARRISON. Are the rates about the same as the rates of the railroads?

General ATTERBURY. In most cases they are quite a little lower, but only low enough so as to induce travel that way as against a railroad service that might be more expensive for us. In other words if we can cut off railroad service by using a bus that can be more economically used than the railroad service, we do it.

The CHAIRMAN. Is there much through travel by bus?

General ATTERBURY. Yes; there is, Senator. There is quite a little through travel. I remember one day the Greyhound bus coming in from Chicago that had 18 through passengers on it.

Senator HARRISON. Has the Greyhound bus line shown a profit?

General ATTERBURY. The Pennsylvania-Greyhound has shown quite a comfortable profit. The Greyhound (Inc.), the holding company, however, which has a lot of attenuated lines that we are not interested in, has not shown as much profit.

The CHAIRMAN. The local company runs in the heavily populated districts?

General ATTERBURY. Yes.

Now, I might say in connection with the control of these other forms of transportation that the responsible truck and bus companies are as eager for the regulation of trucks and bus business as are the railroads. That is, they are suffering from irresponsible competition.

Senator HARRISON. Have you many competing lines in Pennsylvania, for instance, competing with the Greyhound line?

General ATTERBURY. We have got a line between New York and Washington. I think there are three other lines there. We have got a line from Philadelphia to Atlantic City. I think there are four other lines there. Those are all engaged in interstate traffic, and there is absolutely no control of those busses whatever.

Senator HARRISON. Do they charge the same rate?

General ATTERBURY. They are forced to. The result is that the rates from Philadelphia to Atlantic City are cut to a minimum, and the rates between Washington and New York are materially less than our railroad rates. And those lines, instead of being self-supporting, are becoming liabilities. That is why it is essential that there shall be interstate and State regulation of busses and trucks.

The CHAIRMAN. In regards to intrastate business, is there any regulation of it at all in any of the States?

General ATTERBURY. Many of the States that we run through require a certificate of convenience, and that is used as a measure of controlling that. The question of rates in some cases has been established by the State commissions, but not in all cases.

The CHAIRMAN. Was there anything else, that you desired to say, Mr. Atterbury?

General ATTERBURY. No; nothing.

Senator WATSON. That is a very good statement.

The CHAIRMAN. We thank you for your statement.

We will next hear Mr. Glenn Frank.

## STATEMENT OF GLENN FRANK, PRESIDENT OF THE UNIVERSITY OF WISCONSON, MADISON, WIS.

The CHAIRMAN. Give your full name, your address, and your position for the record, Mr. Frank.

Mr. FRANK. Glenn Frank, president of the University of Wisconsin, Madison, Wis.

The CHAIRMAN. You may proceed.

Mr. FRANK. Mr. Chairman and gentlemen of the Finance Committee, there are two sorts of counsellors the Nation can ill afford to follow in its search for the ways and means of national recovery. These are, I think: (1) the dogmatic business man and (2) the dogmatic economist. There are business men and there are economists to whom the Nation can well afford to listen, but the ranks of both are well stocked with representatives who have fallen victim to the sin of oversimplification.

The dogmatic business man has the narrowness of the "practical" man who has not related his daybook-and-ledger considerations to the innumerable social consideration which the forward leap of science and the machine and the fatal lag of economic policy have brought to harass the inarticulate millions.

The dogmatic economist has the narrowness of the "impractical" scholar who makes his diagnoses and compounds his remedies in a world of theory insulated from the swirl of practical affairs in which his remedies be put to clinical test.

Both are dangerous oversimplifiers.

The dogmatic business man, who has done so much to unbalance the Nation's life, thinks all we need do is to balance the Nation's Budget and the tides of enterprise will again run full of their own accord. Obviously a government can not, any more than an individual, find economic security and stability by aping the spendthrift and allowing itself to drift into bankruptcy. But to suggest that the economic impasse of the Nation can be broken by the single device of balancing the Federal Budget, regardless of what it does to the basic services of Government, is, in my judgment, the economics of infantilism.

The dogmatic economist thinks to resuscitate the Nation's prostrate enterprise by some single trick of artificial respiration, as witness the varied forms of monetary sleight-of-hand which are, for the moment, popular among dogmatic economists. Obviously the character and conduct of the Nation's credit and currency system are vitally related to the phases of health and disease that come to the Nation's economic enterprise. Realistic statesmanship will look upon the credit and currency system, not as an idol to be worshipped, but as a tool with which to get the Nation's work done, and will see to it that the Nation's credit and currency system is the servant of the Nation's enterprise instead of permitting the Nation's enterprise to become victim of the Nation's credit and currency system. But to suggest, as some economists have, that we can unlock the door to economic recovery with the single key of currency readjustment is, in my judgment, a delusive oversimplification.

I raise, at the outset, this warning against oversimplification because, to a degree I dislike to admit, we are a patent-medicine-minded people. When our minds are baffled by the complexities of a situation, such as now confronts us, we listen too readily to the man with a single remedy confidently advertised. The human hunger for miracles is strongest in times of dire difficulty. In times of prosperity men are willing to rest content with gradual progress, but in times of urgent need they want an apocalypse, some dramatic happening in which the old fades quickly away and a new heaven and a new earth appear, as if some conjurer had called them out, like rabbits from a hat. We are in such a time now. It is important to remember that the conjurer is a showman, not a statesman. And the United States needs just now statesmen, not showmen.

We shall find solution to our difficulties only through leadership in which theory and practice have come to fruitful union. We need the ministry of creative theory in determining long-time policies and a sturdy horse sense, at once cautious and courageous, in drafting emergency measures.

We are in very much the position of the woodsman obliged to journey by canoe down a river rendered dangerous by a succession of difficult rapids that must be shot before he can land in calmer water below. The economic river down which the Nation must now be piloted has many rapids in its course. And, in consequence, it presents two problems to the statesman-navigator, namely:

The first, the immediate, problem is to help the nation shoot these rapids successfully and to get as quickly as possible into calmer economic water.

The larger task, the task that will test our capacity for statesman ship and call for the best we can muster of mind and moral courage, is the task of removing the menace of the rapids from the course of the economic river for the future.

In shooting the rapids immediately before us, we may have to resort to not a little of emergency politics and emergency economics. The Nation has been passing through the valley of the shadow of economic death. We dare not neglect the patient perfection of long-time policies. We must not permit the fears and hysterias generated in this phase of profound depression to lead us now into political, social, and economic policies that may plague us for a generation to come. But we are in a phase of national emergency in which long time planning alone is not enough. We must evolve and execute emergency policies rooted in the twin soils of sanity and courage.

We must not be afraid of intelligently formulated emergency politics and emergency economics. And emergencies may justify measures for the moment that could not be justified as long-time policies. I doubt, for instance, the wisdom and workability of a Federal guaranty of bank deposits under anything approaching normal conditions. It would, I think, be the essence of folly to use the power of the National Government to underwrite and subsidize inadequate organization and incompetent management anywhere in the economic order, certainly in a banking system not under complete Federal control. But I can conceive an emergency critical enough to make the Federal guaranty of bank deposits throughout the Nation the essence of statesmanship.

It is of critical importance to keep the distinction clear between quack remedies and soundly conceived emergency measures.

I shall not, in the statement I am presenting, undertake any meticulous division of my suggestions into emergency measures and long-time policies because most of the policies and points of view I shall discuss are, as I see them, vital not only for ultimate reconstruction but for immediate recovery as well.

Broadly considered, national economic recovery seems to me to involve three intimately interlocked problems: (1) The financial problem of credit and currency, (2) the psychological problem of confidence, and (3) the economic problem of effective enterprise. I want now to consider in turn, the nature and interrelation of these three problems.

The financial problem of credit and currency. One of the cornerstones of a sound national life is a stable credit and currency system. The stability of a credit and currency system is not necessarily assured by the preservation of the gold standard and a standing pat on traditional credit policy. To be truly stable, a credit and currency system must be marked by three things: (1) It must be quantitatively adequate, (2) it must be technically sensitive, and (3) it must be socially responsible.

If, at any time, the volume of credit and currency is inadequate to finance the volume of business waiting to be done, the stability of the credit and currency system is threatened.

If, at any time, credit and currency lag in responding or fail to respond to the changing needs of the Nation's enterprise, the stability of the credit and currency system is threatened.

If, at any time, credit and currency are diverted into antisocial channels, as in the late orgy of speculation, the stability of the credit and currency system is threatened.

An economic system that is developing and expanding swiftly must be served by a credit and currency system capable of developing and expanding at a comparable rate. Otherwise the health of the economic system is undermined and its growth impeded. For some three hundred years the problem of keeping the expansion of credit and currency decently in step with the expansion of economic enterprise has been eased by the fact of periodic discoveries of new supplies of such monetary metals as gold and silver which provided the credit and currency system with the necessary margin for expansion. If, as some contend, although I think they contend wrongly, we are well toward the end of that rope, and if, in the future, the new needs of this new age of science and the machine necessitate any marked expansion of credit and currency, we shall have to find that expansion in what we think and do about our credit and currency system. The statesman's intelligence must take up the job where the miner's pick leaves it.

But whenever statesmanship sets out to deal with the credit and currency system it is obligated to play for three results: (1) quantitative adequacy, (2) technical sensitivity, and (3) social responsibility.

So much for the spirit and objectives in terms of which I think the problem of credit and currency should be approached. What about the present relation of credit and currency to the problem of economic relapse and recovery now confronting the United States?

Respecting the second and third essentials of a stable credit and currency system, I shall say only this: We could, in my judgment, greatly increase both the technical sensitivity and the social responsibility of our credit and currency system by placing all banking institutions in the United States under legal compulsion to join the Federal reserve system. In this, as in so many other matters, if we want to escape chaos, we must function responsibly as a Nation, not as an irresponsible congeries of communities.

Senator HARRISON. Do you suggest that as a permanent or as an emergency proposition?

Mr. FRANK. I suggest that as permanent. Frankly, I am not prepared to discuss in detail. From what little I know I would suspect that the development of a truly national banking system in that sense would involve changes and readjustment and alterations in the Federal reserve system as it exists, but I am making now only the observation that in my judgment we can do this by pooling our banking system together nationally.

It is with the first essential of a stable credit and currency system that I want to deal more directly, namely, its quantitative adequacy, for it is upon the assumption that we are now facing an inadequate supply of credit and currency that most of the current proposals for monetary reform are based.

Senator WATSON. Let me ask you this, Doctor Frank. On the question of all banks being compelled to join the Federal reserve system: Do you think there ought to be changes and alterations made in the Federal reserve system, or do you regard that during the present emergency it has functioned efficiently and needs no changes?

MR. FRANK. I doubt that I am equipped to discuss with you in detail in any authoritative way the detailed operations of the Federal reserve system.

Senator WATSON. That is all right.

Mr. FRANK. I am making this observation as a lay observer that in my judgment the elements of irresponsibility in the American banking system in a time like this can be overcome by greater national integration.

Senator WATSON. Very well.

Mr. FRANK. We are not, in my judgment, suffering from a shortage either of credit or of currency. By which I mean that, quantitatively considered, there is now in the United States plenty of credit and plenty of currency to finance and facilitate a sweeping economic revival if other factors, psychological and economic, made such revival feasible. It is not a shortage either of credit or of currency from which we are suffering but a shortage of borrowers willing to borrow and of lenders willing to lend under existing circumstances. If we could thaw out the frozen confidence alike of borrower and of lender, the flow of credit and currency would quickly fertilize the filed of national enterprise.

There is as much money, in fact more money, in the United States to-day as there was in 1929. The gold reserves, upon which currency issues and bank credit are based, are larger than in 1929. The provisions controlling the credit and currency issues of the Federal reserve banks have been enlarged within the last year and, under this liberalized authority, more than $1,110,000,000 of Government securities have been bought in the public market and paid for through the issuance of reserve credit. All this reserve credit went directly into the banks to which the day-to-day enterprise of the Nation must look for financing.

In less than a year the Reconstruction Finance Corporation has made loans of more than $1,600,000,000. Additional national bank notes to the total of $144,000,000 have been issued by authority of the Borah amendment to the national bank act. And more than $600,000,000 of gold has come into the country since June 15, last. All these acts have added to the available supply of credit and currency with which business may be done if business is being done.

I am quite aware that existing money is not effective money unless it is in circulation—that is, not effective in raising the level of prices. On December 31, 1931, there was $5,646,772,888 of money in circulation, $5,676,183,214 on December 31, 1932, and $5,602,000,000 on January 18, 1933.

Senator GORE. That is between December 31, 1931, and December 31, 1932, what was the situation? I did not get it. Is it more or less?

Mr. FRANK. There was about $30,000,000 more in circulation at the end of 1932 than at the end of 1931.

Senator HARRISON. There is not any marked difference, though?

Mr. FRANK. No marked difference; no.

Senator GORE. But it is substantial in amount above the circulation in October, 1929?

Mr. FRANK. Yes.

Currency in circulation is not, of course, as important a part of currently used means of payment as the tens of billions of active bank deposits upon which checks are daily drawn in the execution of business enterprises. The point I am making is that in any quantitative comparison with the money in circulation in economically more active times these figures certainly do not suggest an adequate supply of currency.

I am aware, of course, that all of the money that is technically in circulation is not actually in circulation, in the sense of being used in day-to-day business transactions, but may be hoarded, and thus sterilized as far as any effect on the price level is concerned.

Senator GORE. There is no way to put a speedometer on it and see how fast it is going, is there?

Mr. FRANK. No. The economists talk about velocity, but it is difficult to measure. I suggest that whatever part of the money technically in circulation has been sterilized by hoarding has been sterilized not because of any shortage of currency but because the hoarders have lacked that confidence in the economic situation that would normally thrust their money into actual circulation.

Competent analyists ascribe the drop of some $74,000,000 in money in circulation between the end of last December and the middle of January to the normal drop in trade from the abnormal trade of the holidays. This illustrates what seems to me an inescapable fact, namely, that the volume of money in active circulation is more dependent upon the volume of business than the volume of business is dependent upon the volume of money in technical circulation.

The CHAIRMAN. That is under conditions existing to-day?

Mr. FRANK. Any condition, in my judgment. Maybe not.

The CHAIRMAN. There is a question about that.

Mr. FRANK. I am quite willing to defer to the experts.

About the only ways in which fresh supplies of currency can be got into the hands of the unemployed or of those whose purchasing power has drastically declined are through doles, direct loans, and public works. I do not believe that the Federal Government has yet faced fully its responsibility for relief to the unemployed. I think there is room for a statesmanlike reconsideration of the leading program of the Federal Government that will point this lending program less in the direction of subsidizing obsolete organization and incompetent management and more in the direction of priming the pump of productive enterprise. And I am convinced that a wisely planned and properly financed program of public works has a very real rôle to play in national recovery. But, unless and until popular confidence in the economic future is restored, any currency forced out through even these valid channels of relief, Federal loans, and public works will take its one whirl of spending and then find its way into and freeze in the banks, in socks, and behind loose bricks in the chimney until a restoration of confidence sets it active again.

The CHAIRMAN. You could not make a more positive or better statement than that.

Senator WATSON. No doubt about it.

Mr. FRANK. All of which leads me to this position respecting the problem of credit and currency: I do not regard the credit and currency system as sacrosanct, as something statesmanship must approach with hushed voice and cushioned footstep. The credit and currency system is, as I suggested earlier, not an idol to be worshipped, but simply a tool with which to get the Nation's work done. If a quantitative inadequacy of credit and currency clearly existed, I should not shudder at the suggestion of currency readjustment and credit reform. Just because an inadequately planned and ineffectively controlled inflation has, here and there, left nations with a sick headache is no reason why realistic statesmanship can not, through sound planning and strong control, adjust the nature of its credit and currency system to the needs of its economic system. But I do not believe there is any inadequacy either of credit or of currency in the United States to-day. There is a vast amount of inactive credit and sterilized currency, but the thing that has paralyzed this credit and sterilized this currency is the epidemic of fear respecting economic future.

Senator WATSON. In other words, credit is based on confidence.

Mr. FRANK. Yes; that is the key to it.

Senator WATSON. Yes.

Mr. FRANK. The imperative first step toward national recovery is not, therefore, in my judgment, inflation of the currency but restoration of the national confidence. And this leads me to the second of the three major problems underlying national recovery.

The psychological problem of confidence. I have called the problem of confidence a psychological problem, but it is not a problem that can be solved by psychological treatment. Confidence in the economic future can not be restored by mere cheer-leading tactics on the part of presidents, congressmen, and captains of industry. Confidence has been lost because certain very real obstacles have been permitted to block the path to effective enterprise. Confidence will return when these obstacles to enterprise have been removed. And not until then. Which leads me to the third of the three major problems underlying national recovery.

The economic problem of effective enterprise. The task of restoring effective enterprise—which will automatically restore confidence, which will in turn restore to productive use the credit that is now inactive and the currency that is now sterilized—is a task that will take statesmen to every sector of the political, social, and economic fronts. Manifestly I could not, even if I were qualified, survey, within the time limits of this hearing, all these sectors. I choose, therefore, for summary discusson two fields in which, it seems to me, we may most seriously hinder or most successfully hasten national recovery—first, the field of foreign relations, and second, the field of domestic industry. Let me discuss, with such brevity and directness as I can command, these two fields in turn.

I turn first to the field of foreign relations. I am convinced that a realistic foreign policy is of crucial importance to the restoration of our domestic well-being. Regardless of the intelligence we bring to our domestic difficulties, our domestic program will, in my judgment, end in futility unless we bring a bold and realistic spirit to bear upon the present unrealistic foreign policy of the United States.

We went into depression under the aegis of three postwar policies which had, unless I am far afield in judgment, a direct causative relation to the near collapse to which our economic machine has come. These three policies were our tariff policy, our war debts policy, and our foreign policy. We can not, in my judgment, beat our way back to prosperity under the policies that were in force in these fields before the onset of depression.

One stubborn notion has stood in the background of our tariff, debt, and foreign policies, namely, the notion that the United States can, if necessary, operate a satisfactory economic life apart from the rest of the world. I challenge that notion. It is true that we have within our borders most, but by no means all, of the essentials of economic life, but this does not make us a self-contained nation, for the simple reason that, wisely or unwisely, on the foundations of our admittedly magnificient resources, we have so organized, so capitalized, and so set the production programs of most of our major industries that these industries can not produce successfully for our domestic market unless concurrently they can sell successfully in foreign markets such surplus as they are geared to produce.

It may be said that this can hardly be true when, from 1900 to our peak year of 1929, we never sold abroad more than about 10 per cent of our total production. Some put it around 6 per cent as an average. But unless we burrow under these production and export totals and break them down into their several elements, we do not get a true picture. It is true that for the last 30 years, through all the rise and fall of foreign trade, our exports have held about the same relation—6 to 10 per cent—to out total production. Now if it were true that every American product found 90 per cent of its market in the United States, we could build a wall around ourselves, let the rest of the world stew in its own juice, and build within our own borders a satisfactory and viable economic life. But this is not the case.

In 1929 more than 54 per cent of American cotton was sold abroad. More than 41 per cent of American leaf tobacco. Nearly 40 per cent of American kerosene. Over 40 per cent of American typewriters. About 36 per cent of American copper. Nearly 34 per cent of American lard. About 31 per cent of American lubricating oil. Over 29 per cent of American printing machinery. About 28 per cent of American sewing machines. And more than 23 per cent of American farm machinery was sold abroad. I need not extend this list which is familiar to you who have dealt at first hand with these facts during this phase of depression.

Senator HARRISON. Have you got the percentage of automobiles?

Mr. FRANK. No, I haven't in this list. But these do suggest, I submit, that a drop in our foreign trade is made up of many impacts that are far more serious than a 10 per cent aggregate of our total production would suggest.

The fact is that we are seriously dependent upon world markets, and, because of this fact, two courses are clearly open to us: First, we can play for a general reopening of world markets by sponsoring—in the fields of tariffs, war debts, and foreign relations generally—whatever policies may be necessary to stimulate a world-wide interchange of goods and services, or, second, we must, if we do not follow this first course, frankly dismantle such parts of our industrial and agricultural enterprise as produce surpluses in excess of domestic demand. We should, I suggest, think twice before we take the second course, for such dismantling—make no mistake—will mean far more than a simple mathematical reduction of the scale of American enterprise. It will mean drastic and radical readjustments in the organization, the capitalization, and the operation of our major industries and of our farms, and will inevitably involve a serious slump in the American standard of living.

The supreme test of our statesmanship, in the months immediately ahead, will be our capacity to relate American policy to world facts and world forces. And this test will be severest as we tackle war debts, tariffs, and the plight of the farmer. Let me speak briefly of the way in which, in these three problems, the question of foreign policy is intimately related to the question of domestic economic recovery.

I turn first to the issue of war debts. The issue of war debts is not primarily a question of the techinal or moral soundness of our claims upon Europe, nor should their collection be considered apart from its impact upon the economic life of Europe as well as upon the economic life of the United States. The problem is to find the war-debts policy that will best hasten the economic recovery of the world. All other considerations are secondary. For a recovered Europe would mean more to the United States in dollars and cents than all the war debts owed us.

The fear, the despair, the world-wide dislocation that have resulted from these war debts and related economic factors have caused the American taxpayers to lose far more through narrowing markets, shrinking business, collapsing capital values, and an epidemic of unemployment than the American taxpayers could possibly realize from their full payment. Quite apart from whether a wholesale cancellation of intergovernmental debts due to the war proves an imperative preliminary to world recovery—and I am not arguing that it will—there is, in my judgment, justification for thinking that the world at large ourselves, included, might very well gain in cold cash by a complete wiping out by all nations of these stale obligations that to-day tend further to chill and to chain the economic enterprise of the world.

It is regrettable that we must still be harassed by having these debts, like a body of economic death, bound to the body of the world's living enterprise. I think statesmanship might have saved the world much that it has gone through if greater wisdom had been used in this matter a dozen years ago. But, even at this late date, I am not sure but that a constructive initiative by the United States might lead the nations of the world into an intelligent reduction of armaments and a rational program of world tariffs as a corollary to the complete elimination of these obligations the world around. And the rationalization of world tariffs is in my judgment more important to the peace of the world than even reduction of armaments.

It is easy to stir popular emotion with the assertion that every dollar of war debts owned to the United States that is written down or written off the books will have to be paid out of the pockets of the already overburdened American taxpayers. Is this true? In a technical bookkeeping sense, yes. In the realistic sense of the ultimate effect on the economic well-being of the American taxpayers, the answer may be "No."

I do not suggest that we should, out of hand and without regard to European policies, cancel the debts due us. The war debts constitute a world problem that can finally be solved only by cooperative world action. I mean effectively. We shall get exactly nowhere by standing in the circle of nations and shouting "put up an shut up" across the diameter of the circle. We shall best serve our own interests—in my judgment we will—by standing ready to go any part or all of the way from the existing debt status to complete cancellation if, as a result of our going part way or all the way, there can be effected a rationalization of world economic relations that will, with some degree of certainty, hasten world recovery. For promptness of economic recovery is more important than the payment of reparations or the collection of war debts.

I am quite aware that this is not a politically popular position. But it is, in my judgment, the conclusion to which a realistic facing of the facts drives us. And, after all, it is the business of statesmanship to change rather than capitulate to a popular opinion that has been played upon by the jingoism and demagogy alike of press and of politics. One of the supreme tests of the statesmanship of the forthcoming Congress will be whether it brings a world-minded realism to this issue of war debts or permits crossroads thinking to tie it to the parish pump.

I turn second to the issue of tariffs. Here, again, we are challenged to relate American policy to world facts and world forces.

Senator GORE. Before you pass on, Doctor, I would like to throw in that some statesmen who have tried this education of public opinion have not fared very well.

Mr. FRANK. I have heard that.

Senator GORE. I took a vacation of 10 years putting myself in that splendid category.

Mr. FRANK. Well, much of the progress of the world, of course, has come because the soil has been fertilized by that sort of martyrdom, Senator Gore.

Senator GORE. You see what happened while I was out, too. Pardon me for interrupting.

Mr. FRANK. I turn second to the issue of tariffs. Here, again, we are challenged to relate American policy to world facts and world forces. Whether we are Republicans or Democrats, it must be obvious to most of us by now that the current orgy of high tariffs throughout the world, for which we are by no means guiltless, is one of the major factors now freezing the fountains of economic enterprise throughout the world. And I say this, gentlemen, not as a free-trade Democrat, but as a Republican who is convinced that free trade is wild, but that protective tariffs have run wild and are to-day out of all rational relation to the economic functioning of the modern world.

Senator GORE. Do you not think that protectiveness is almost committing suicide?

Mr. FRANK. I think unintelligently administered it is.

There is, I suggest, one test that every American tariff proposal should pass before being accepted, namely: Does it, along with related foreign policies, tend to build up the buying power of the rest of the world? It is a truism that it is to the selfish interest of the American manufacturer to establish wage, hour, and price policies that will build buying power among American workers who are industry's customers as well as its servants. In like manner, it is to the selfish interest of the United States as a whole to establish tariff policies that will tend to build rather than break the buying power of Europe and the rest of the world to the end that these nations shall be paying customers for the surplus output of American factories and American farms.

Tariff policy is one sort of problem for a debtor nation but quite another sort of problem for a creditor nation. When we were a debtor nation we used our tariffs to discourage imports. It was right for us, as a debtor nation, to play for an excess of exports over imports out of which to meet out obligations. Then, in the wake of the war, we found ourselves a creditor nation, money lender to the world, a rich nation with a world in debt to us. But from that day to this we have not readjusted our national policies to this change from debtor to creditor. We are still struggling to keep our imports as low as possible and to force our exports as high as possible. We still cling to tariffs that make it difficult if not impossible for the debtor nations to pay their debts to us in goods and services. The first law of the debtor-creditor relationship between nations is that the debtors must have exports in excess of imports and the creditors imports in excess of exports. This means far-reaching economic readjustments for us if we face it realistically, but it means chronic maladjustment for us if we ignore it.

Senator GORE. That is almost an iron law, is it not?

Mr. FRANK. I think so.

The forthcoming Congress can make one of its major bids for continued leadership and assure for itself a distinguished niche in national history by exercising a bold intelligence in the field of tariff policy. We have been all too guilty of making tariffs by the competing blackmail of special interests and the high-pressure tactics of local lobbies. Our own best interests demand that now we set seriously out, in concert with the rest of the world, to frame world tariff policies that shall be as low in rate, as nearly equal in impact, and as stable as the facts of divergent national economies will permit. In the forthcoming Congress fails to make progress in this direction, if it perpetuates and compounds the tariff blunders of the past, the whole world will be forced to follow to the bitter end the path of a world-wide tariff war.

And I say that for this reason: The United States, as the largest industrial nation in the world, holds the key to the rationalization of the tariff and trade relations of the world. If we take no steps towards readjusting our tariff policies to our new creditor status and to the changed circumstances of this changed time, and if we deliberately abstain from world counsel and world cooperation under the spell of the delusive dogma of isolation, I can see nothing ahead but a world-wide tariff war.

And if that takes place, every country, sooner or later, will decline to import anything it can possibly make at home. World trade will shrink to smaller and smaller dimensions. America will have to pull into her shell, abandon almost wholly her foreign investments, bid goodbye to her export trade, and go in for isolation in her trade as well as in her talk. It will no longer be possible, as heretofore, to talk about splendid isolation while clipping coupons on an economic relationship with the rest of the world that belies our talk. We shall have to be satisfied with a far lower level of living than we might otherwise achieve. The same developments will come the world around. England will move to higher and higher tariffs. And every nation in the world will suffer if England and the United States travel this suicide's road. The whole world will divide into competing tariff camps. And in these tariff camps the next world war will be born.

Further confirmation of the fact that far-sighted foreign policy has a direct bearing upon our domestic recovery is found when we examine the plight of the American farmer. With respect to agriculture, as with respect to our economic enterprise generally, I think we face two clear alternatives. We must either play for a reopening of world markets for American agricultural products or scale our whole system of farming down to a domestic basis. The latter, pushed to its logical conclusion, is, in my judgment, not statesmanship, but the counsel of despair. The experience of the next four years will, I confidently predict, make increasingly clear that far-sighted and world-minded foreign policy can mean more to the American farmer than all the specific farm legislation that can be conjured up to catch the votes of the hinterland.

Senator GORE. That is a world-wide market?

Mr. FRANK. Yes.

For more than 75 years we have been developing certain major branches of American agriculture for export as well as domestic trade. Last year in four such branches—cotton, wheat, tobacco, and pork products—the productive capacity in excess of domestic demand stood about as follows: Cotton, 50 per cent in excess of domestic demand; wheat, 20 per cent; tobacco, 35 per cent; and pork products, 10 per cent. These four branches of agriculture comprise about 85 per cent of our agricultural exports. We have suffered acutely in these four fields during the last three years as exports have dropped and surpluses piled up.

Senator BARKLEY. In that connection I might interject that there are some types of tobacco that depend on the foreign market for 85 per cent of their sales.

Mr. FRANK. Yes. Just as in pork products; lard runs up about 35 per cent dependence upon export markets. Prices in these fields are lower than prices in agricultural branches primarily domestic in outlet.

We shall not, in my judgment, find a satisfactory answer to this difficulty by schemes for the arbitrary reduction of acreage used in these branches of agriculture. To me it is incredible that, in a world of tragically unfilled human need, statesmanship must set out upon the quixotic attempt to increase wealth by destroying property or declining to create it. The domestic-allotment type of legislation, reduced to its essence, is an attempt to solve the agricultural problem by inducing a modified famine on the installment plan. Our ancestors have fought valiantly over the centuries to conquer famine. Are we now to say that the conquest has been too decisive? After the sweat of generations has brought us out of an economics of scarcity into an economics of plenty, are we to confess that we are incapable of managing plenty, and seek to relegislate scarcity? I think history will pass a bitter judgment upon us if, surrounded by a world of unfilled human need, we take this road in dealing with the difficulties now confronting our farms and our factories.

I am quite aware that human need is not effective economic demand unless it is equipped with purchasing power. But it is the first obligation of public leadership, under an economics of plenty, to refuse to consider reversion even to a modified scarcity, until it has exhausted its ingenuity in devising ways and means of translating existing human need into effective economic demand.

All of which means, I think, that we can not rescue the American farmer from his present plight by any specific farm legislation alone. What we do to effect a wider spread of buying power and what we do to clear the now clogged channels of world trade will be more important to the farmer than any direct farm legislation.

Senator GORE. I wish you could convince Congress of that, Doctor.

Mr. FRANK. Last year 205,000,000 acres were devoted to cotton, wheat, tobacco, and corn by American farmers. Suppose we venture upon legislation that would reduce this acreage by 20 per cent. This would throw some 40,000,000 acres out of their accustomed use. These 40,000,000 acres comprise an area larger than the State of Wisconsin, twice the area of Wisconsin farms, and four times the area in crops in Wisconsin. In other words, legislation reducing by 20 per cent the acreage used for cotton, wheat, tobacco, and corn would release from its accustomed use the equivalent of four States the size of Wisconsin.

Barring for the moment the doubtful wisdom of direct subsidy, what will the farmers do with these released acres? Taxes will still be levied upon them. They will not lie idle. They will, in the end, be put to uses that will compete with other acres now being used primarily for production for the domestic market. So that, while with one hand we shall be easing the problem of unsalable surpluses for foreign markets, with the other hand we shall further complicate the problem of production for the domestic market.

I am aware that such legislative proposals carry provision for Federal leasing for these withdrawn acres at a modest rental per acre. Such provision, in that it withdraws and sudsidizes good acres along with poor acres, is, in my judgment, not good planning. The selective leasing by the Government of marginal lands is a different and, I think, defensible matter. And as soon as the farmer is convinced he can put the withdrawn acres to an even slightly more profitable use than the Federal rental represents, pressure either to raise the rentals or renounce the plan will develop.

I can not avoid the conviction that the domestic allotment type of legislation, if enacted, will prove as great a folly of the Democratic Party as the stabilization operations of the Federal Farm Board were of the Republican Party.

The logic is, to me, inescapable. Any program of agricultural legislation that does not open world markets for American agricultural products is grossly inadequate. I am aware that there is no simple recipe for reopening world markets. But we should clear the decks promptly for a comprehensive attempt to effect reciprocal trade agreements wherever their feasibility is indicated. The time is ripe for such agreements with the countries of western Europe. If war debts concessions can hasten such trade agreements, we should muzzle our jingoes and go ahead and make such concessions as good judgment dictates.

I shall not enter into discussion of the varied proposals for farm relief that have been before you, save for one passing reference to the problem of the mortgage debts carried by the American farmers. The debt load generally, not among farmers alone, is straining the basic economic structure of the country. Much of the existing debt load was created on artificial values that never existed save on paper or in the minds of men hypnotized by the hastily improvised philosophy of the new era, which we now know was too old in character to be called new and too short in duration to be called an era. Much of the debt load was incurred on organizations and processes that are now obsolete. An extensive writing down of obligations is going on quietly and unofficially. We may find it necessary to do the job a bit more comprehensively. But we shall be well advised, I think, to move with the utmost care on proposals to scale down the obligations of any one class unless careful provision is made to anticipate and discount the ramifications of such scaling down in other sections of the economic order. I doubt that there is any justifiable halfway house between laissez-faire, supplemented by adequate mediation machinery to facilitate creditor-debtor negotiation, and a general scaling down of obligations for all classes and all enterprises.

Senator Gore. You would not include, though, public debts or obligations within your scaling-down operations?

Mr. Frank. I think not, no.

I turn now, in conclusion, to the second field of domestic industry. Any realistic analysis of the current depression must begin with the fact that it is the first general economic crisis that has befallen the whole western world since our machine economy has come to measurable maturity. It is not a matter of momentary maladjustment in any one section of the world. It is not a matter of momentary speculative mania having disrupted an otherwise statesmanlike and stable economic program. Momentary maladjustments, here and there and yonder, are in the picture. A mad speculation has done its deadly work. Many political and purely monetary factors are involved in the prevailing sickness of our society. Beneath and beyond all this, however, is the root fact that we have been so busy perfecting our technical processes for producing goods that we have neglected to perfect our economic policies for distributing wealth widely enough to create an adequate and assured outlet for the output of our machine economy with its ever-increasing rapidity and volume of production.

Tentative and insecure phases of recovery may be brought about by various devices of political stimulation and monetary legerdemain, but, until this basic problem of the relation of popular buying power to the rapidity and volume of production under a machine economy is seen and solved by politico-economic leadership generally, we must resign ourselves to an increasingly serious economic insecurity, unless we want to take the only alternative road, under our system of free capitalism and political liberty, to a balanced economy in a machine age and deliberately reduce the scale of our industrial and agricultural enterprise.

I do not want to join the oversimplifiers, and bring a false clarity to a situation that is admittedly complex. It is not a simple sickness that has fallen upon us, and it will not yield to any simple and single remedy. A lush variety of causes lies at the root of our economic crisis: Political unrest the world around; mounting armaments; speculative mania; abortive governmental attempts to stabilize certain commodity prices; the fall in the price of silver; provincialism of policy respecting foreign trade, tariffs, and the exploitation of the world's supply of natural resources; the direct impact of war-debt payments upon Europe and the indirect impact upon the United States; the gravitation of an undue amount of the world's gold supply into French and American hands; and so on to the end of a long list I need not rehearse. Even a casual diagnosis of this depression compels us to consider all of these factors in addition to the obvious issues of wages, hours, prices, profits, technology, and management, as well as the deeper issues of security, leisure, and self-respect for the toiling millions.

To all these issues, and more, we must bring a clear-headed and courageous statesmanship. I do not, let me repeat, want to join the oversimplifiers. But, in any situation, however complex, there may be one factor more fundamental than the rest, so fundamental, indeed, that the presence of all other factors can not compensate for its absence. Is there any single factor thus fundamental to economic recovery and stabilization? I think there is. And this is it: The leadership that has determined our policies for using goods and distributing wealth has proved inferior to the leadership that has developed our processes for making goods and producing wealth.

The production of goods has halted because the distribution of goods has halted. And the halt in the distribution of goods is due to a fault in the distribution of wealth. Our machine order is ready to produce goods. Our economic order is not ready to produce customers.

I am speaking here, let me make clear, not of any arbitrary and artificial redistribution of existing wealth. I am speaking, rather, of a functional distribution, through the normal processes of enterprise, of the national income as it is being currently created.

To-day events are proving that a wider distribution of the national income is essential to the solvency and success of capitalistic industrialism itself, on the simple grounds that it is obviously self-defeating for the industrial system to get itself in position to produce vast quantities of goods unless, at the same time, it sees to it that there are vast masses of potential customers ready with money with which to buy and leisure in which to enjoy the goods the high-powered industrial machine produces. Unless we can bring millions upon millions of men and women into position to buy the lavish output of our industrial system, even our existing investment in its marvelous productive facilities will become a permanently frozen asset.

A too great concentration of wealth means money in the hands of those who will invest it in producer goods. A wide distribution of wealth means money in the hands of those who will spend it for consumer goods. And it is the absence of an adequate and dependable market for consumer goods that is stalling our economic machine. This is not irresponsible soap-box doctrine. The plutocrat has an even greater stake than the proletarian in the widest feasible distribution of the national income as a result of a statesmanlike balancing of the factors of wages, hours, prices, profits, and so on, to the end that, in the very process of producing wealth, industry will be making its market while it is making its goods.

We have no right, gentlemen, to consider slowing down production until we have fully explored the possibilities of speeding up consumption. Until legitimate human need is served and saturated, a wholesale restriction of production is a confession that our capacity for economic statesmanship has gone bankrupt. What will be the judgment of the future upon our genius if, after elaborating a machine economy capable of putting an end to drudgery, poverty, and insecurity, we say, "Now that we have sharpened this tool, we must dull its edge; now that we have perfected this swift inefficiency, we must throw on the brakes."

There are two directions in which government might move on this basic problem.

First, a realistic statesmanship would, I think, reconsider and modernize our antitrust legislation in a manner that would make it possible for enterprise to operate on whatever scale is necessary to enable it to take full and effective advantage of the new philosophy of high wages, short hours, and low prices that power production has, for the first time in human history, made possible and profitable. It should not be impossible to set up the requisite social safeguards against the possibility of the abuse of power inherent in large-scale operation.

Second, I think we are nearing the point at which we may wisely consider the national determination of the hours of labor under our machine economy. I doubt that individual action will meet the issue promptly enough.

The technocrats may have indulged in cubistic prophecies of quick doom that were more fancy than fact, but the fact remains that the machine economy is enabling us to do more and more work with fewer and fewer workers. This fact makes unemployment inevitable only if we refuse to adjust our managerial policies to it. Technological advance is making a shorter and shorter working day and working week inevitable, unless we are willing to let technological unemployment work such havoc as it may in our economic order. And a shortening of the hours of labor is imperative in the achievement of that wider distribution of leisure which, alongside a wider distribution of the national income, is necessary if our industrial system is to assure itself an adequate and dependable market for its vast output.

I do not pretend that a sweeping adoption of the shorter hours policy throughout the industrial system would be easy of accomplishment. It may raise many issues of transitional credit with which government may have to deal. I insist only that the machine has not put an impossible problem to us. But, in meeting it, we shall have to blaze some new trails in the social control of work policies. I doubt, as I have said, that individual action will meet the issue promptly enough.

The national determination of the hours of labor may necessitate constitutional changes. I am not sure. There may be unexplored powers under the interstate commerce and welfare clauses as they now stand. It is worth while to see what we can do under the Constitution as it is. We go to it often enough to see what we can not do.

Senator GORE. Do you not think we ought to try to revise our system of distribution, so that urgent needs will be met, and even wants be supplied, before we resort to shortening of hours too much, or too radically?

Mr. FRANK. I do not think the two are consistent. I think the shortening of hours is one of the planks in the platform for relieving urgent human need.

Senator GORE. If there is permanent overproduction, that is true; but if there is not, I do not think it is true.

Mr. FRANK. I think there is not a permanent overproduction.

Senator GORE. I do not think so, either.

Mr. FRANK. I think there is a sluggish surplus, but there is no actual surplus.

As I see it, then, the two basic fields in which it seems to me most can be done to effect national recovery and to stabilize prosperity are: (1) The harnessing of a realistic foreign policy to the urgent need of our domestic industry and agriculture for export outlets. (2) The bringing of our economic policies, that is, respecting hours, wages, prices, and so forth, for the use of wealth abreast of our technical processes for the creation of wealth, in other words, the working out of the economic implications of the machine economy or power production.

It is a difficult situation that confronts us. There is no single remedy for it. We must declare a moratorium on all political bickerings and, regardless of normal party considerations, call to the colors, in this war on depression, the best brains and the best character the Nation affords. We can not waste time on stale catch-words and weather-beaten slogans. We must have realistic programs on which we can act. Maneuverings for personal or party advantage become, in a time like this, a kind of social treason.

Senator HARRISON. That is a very splendid statement, Doctor.

Senator GORE. So say we all.

The CHAIRMAN. We thank you, unless there is something further you wish to say.

## STATEMENT OF MATTHEW WOLL, VICE PRESIDENT AMERICAN FEDERATION OF LABOR

Mr. WOLL. Mr. Chairman and gentlemen, drastic economic changes are occurring with such rapidity that it is almost impossible to grasp their significance even after they have occurred. In fact, the laborer, the farmer, the banker, the business man are so bewildered that they know not how to act. Farmers can not purchase their normal amount of industrial commodities; honest laborers can not get work; home owners can not pay their taxes; and creditors can not collect interest and principal payments. Everyone is grouping about in the dark, trying to find a ray of hope in order that, in this swirl of economic turmoil, he may act promptly and wisely.

Before a remedy can be proposed, the case must be diagnosed and the cause of the difficulty determined. There are innumerable explanations of our present unfortunate state. Among these, some of the more commonly accepted explanations are unbalanced budgets, high wages, tariff, speculation, and overproduction. I shall discuss each of these subjects briefly and then present what I regard as a constructive program.

It is quite generally assumed by bankers, business men, and others that the unbalanced Federal Budget is the cause of the difficulty—that as soon as it is balanced our difficulties will be over. Although most of us, individually and collectively, normally balance our budgets, there are occasions when we find it impossible or inexpedient to limit expenditures to our receipts. It then becomes necessary to resort to borrowing to balance the budget—the only other alternative is bankruptcy.

At the present time, we are finding it impossible to keep the expenses of railroads, industrial corporations, governmental agencies and untold millions of individuals, within their incomes. It is, therefore, necessary that these individuals and institutions borrow if they are to balance their budgets. At the present time, railroads, corporations, local, county, municipal and State governmental agencies find it extremely difficult, if not impossible, to borrow funds. The banks and few investors who now have any funds, are quite chary of them. As a result, the Federal Government is the only agency that can borrow, and even it has found it expedient to confine its operations to short-term loans. It has been impossible for the railroads to reduce expenditures to receipts. As a result they have balanced their budgets by borrowing from the Reconstruction Finance Corporation. Many banks have met their difficulties in the same way.

Besides governmental units, railroads, and banks, there are at least ten to fifteen million unbalanced budgets of unemployed individuals. These budgets will, of course, always be balanced. We can not let them starve and we can not shoot them. Therefore, they are cared for either at public or private expense. Private charity, however, is not sufficient. The only method is public relief and the Federal Treasury will bear an ever-increasing share of this inescapable burden. We are going to continue to balance these budgets and we are going to balance them with credits obtained from the American people through Federal loans. In view of this, it is extremely unlikely that we can balance the Federal Budget. In fact, I would not recommend that an attempt be made to balance it at this time. Most of those who insist that we balance the Budget favor the present policy of extending public credit to public and private corporations. Efforts to defend this unusual paradox are prone to be ineffective.

During the last decade the American business man favored or acquiesced in the philosophy that advancing wages were an inevitable accompaniment to a rising standard of living, and were good for labor and good for business. Now he is not so certain that this is correct. Accordingly, many industries have reduced wages.

This policy of an ever-increasing standard of living and higher real wages was not based on a myth. It was a reality and it was based on a very fundamental principle. Since, over a long period of years, normal wages have always tended to rise relative to commodity prices, real wages have also risen. From 1840 to 1914, the purchasing power of wages rose at the compound rate of 1.71 per cent per year. From 1839 to 1914 the per capita output of the combined products of agriculture, forests, mines, and industry increased at the compound rate of 1.73 per cent per year. The long-time trend is for real wages to rise at the same rate as the increase in efficiency of labor—that is, the per capita output of physical goods. The theory of a rising wage structure was sound. Additional output per capita was continuous and advancing wages made it possible for labor to purchase its share of these goods.

Although over a long period of time, wages rise relative to commodity prices, fluctuating prices disturb this relationship, and rapidly falling prices produce chaos. If the pre-war trend of wages had continued until 1929 and if prices had remained at the prewar level, 100, wages in 1929 would have been 132 when 1910–1914 is 100. This would have been the normal growth in the purchasing power of wages during the period. In 1929 wholesale prices were 139 per cent of pre-war and to buy commodities at wholesale, wages should have been 183 when pre-war is 100 ($1.39 \times 1.32 = 1.83$). But laborers do not buy commodities at wholesale prices. They purchase goods at retail prices. At that time food was 174; and cost of living 172.

At an index of 172, wages of 227 per cent of pre-war would be necessary if laborers were to buy their normal amount of goods at retail prices ($1.72 \times 1.32 = 2.27$). In 1929 wages were not far from this level. Apparently this wage level was justified because men were employed and industry was prosperous. When prices collapse, as they did from 1929 to 1932, everything is thrown out of line. In 1932 wholesale prices were 95 when pre-war is 100. The cost of living averaged 138. If the buying power of wages increased at the pre-war rate wages in 1932 should have been 139. At wholesale prices of 95, the manufacturer might have expected wages to be 132 ($1.39 \times$

0.95 = 1.32). If debts were liquidated and wages were at this level, business would move forward. But for labor to buy the output of industry, they would have had to purchase these articles at a level of 138. This would have required that wages be 192 ($1.38 \times 1.39 = 1.92$), which indicates the chaos that occurs when prices collapse as they did from 1929 to 1932. The manufacturers contend that they can not proceed at this wage level and the laborer can not consume the product unless he receives those wages. The present maelstrom is not due to high wages. Wage rates at the present time, estimated at about 189 when pre-war is 100, are in line with the long-time trend in the purchasing power of wages and the cost of living.

At the present time, we have a highly sensitive machine closely meshed and if the machine is not properly lubricated, it ceases to operate. If this is the case, we must not blame the machine; the product of the machine; the laborer who operates the machine; or the consumer who buys the product of the machine. We must look at the lubricant—the monetary structure.

The laborer, like the farmer, is being crushed in this maelstrom of declining prices. The manufacturer contends that he hires the laborer at the wage that enables the laborer to buy the products of industry. The laborer's house shrinks in value, the equity vanishes; and a lifetime's savings melt away. Under normal conditions, the American laborer with an ever-increasing, but justly earned, rising standard of living, looks forward to promotion to a better job. With commodity price collapse, all promotions stop. The laborer's losses from these causes may be greater than any cut in wages that has occurred or is in prospect. The declining prices have meant economic retreat step by step; first 4 days; then 3 days; then 2 days; finally culminating in an honest, conscientious, upright, conservative human being converted into an unemployed, disgruntled, broken-hearted animal, now maintained at public expense.

The primary cause of the present situation is the collapse in commodity price. Falling prices weaken the creditor; reduce the purchasing power of labor and agriculture; contract the physical output of our industrial machine; result in bankruptcy, suicide, arson, and untold suffering.

The commonly accepted explanation of the collapse of commodity prices is overproduction. Our ever-rising standard of living and increasing population calls for more production. If our total production does not increase more rapidly than population, our standard of living stops advancing. A study of production of both that of agricultural and nonagricultural commodities indicates that there has been no great overproduction. From 1839 to 1914 the physical output per capita in the United States increased 1.73 per cent per year. During that period there was no excessive increase in output that might be cited as overproduction. From 1915 to 1929 the rate of increase in total physical output per capita fell to 0.64 per cent per year. From 1929 to 1932, production per capita in the United States declined 31 per cent. How can there be an overproduction with 12,000,000 unemployed and our per capita production reduced 31 per cent? I leave this riddle to the unemployed technocrats.

Price is a ratio between the things produced by farmers, laborers, and manufacturers and the volume of money of every form in circulation.

$$\frac{\text{Money}}{\text{Goods}} = \text{Price}$$

I can not convince myself that there has been an overproduction of goods; that is, that there is something wrong with the denominator. There is, therefore, only one other explanation for the collapse in commodity prices—something has happened to the numerator.

Up to this point I feel that I have been on safe ground. Changing the numerator—money—is a problem which it has not been possible for me to study carefully. It does seem, however, that the experience of the past three years indicates that our present monetary system gives us not assurance of a stable measure of value. An unstable price level has been the arbiter of our destiny. I think it is about time that we find some way to manage price level instead of permitting the price level to manage us.

Prices are the only criterion by which man acts. It makes no difference whether he be a manufacturer, farmer, or laborer; prices guide his production. Prices also guide consumption. The old widow with her mite, the unemployed laborer with his dole, the butcher, the doctor, and the captain of industry, all are dependent upon the price system. When prices are stable, the producer and consumer can act wisely; when prices collapse, there is chaos. It seems to me that our great problem is the establishment of a permanently stable measure of value.

There is also another important problem closely associated with the matter of stability; that is, the restoration of commodity prices. Although I have no plan for monetary change, I can visualize business proceeding at any price level provided debts, taxes, wages, salaries, telephone charges, freight rates, street-car fares, telegraph rates, lawyers' fees, doctors and dentists' charges and all other charges be brought into adjustment with that price level.

The primary problem is, therefore, to bring prices and other relationships into adjustment. This can be done by following one of two courses; either a complete deflation of all debts, taxes, and services to the present price level or a restoration of commodity prices to the level at which human relationships are most equitably adjusted.

We have been pursuing the policy of deflation and the practice of radical economy both in public and private business for three years. During this time, it would appear that common stockholders have been rather thoroughly liquidated. Also, although I know little or nothing about agriculture, it is difficult to see how farm prices can fall lower. Farm mortgages, however, have not as yet been liquidated. We are at the present time approaching a "mortgage standstill." It is comparatively easy to state that mortgages should and can be easily liquidated by passing the proper bankruptcy legislation; but writing down farm mortgages by 25 or 50 cents on the dollar has widespread ramifications. Although scaling down of the mortgage indebtedness reduces the farmer's expenses, it reduces the income of savings banks, private investors, and life insurance companies. If, as a result of declining prices, we must write down the farm debts, is it not logical that we write down the mortgage indebtedness on the laborer's home and on other sorely pressed groups in our industrial centers?. This method of bringing commodity prices and debts into adjustment is easily described but is difficult of accomplishment. It will strain our present economic order.

The value of America rests on commodity prices. If commodity prices fall, the price of homes, farms, in fact the value of all property falls. Figuratively speaking, we are in the process of writing down America 50 cents on the dollar. In 1929 then America was worth $362,000,000,000 and debts were about $203,000,000,000. At that time debts represented 56 per cent of the total value of the country. Since then we have liquidated a small part of the debt, but the value of the property has utterly collapsed. The extent of this collapse is any man's guess. If right to-day, it will be wrong to-morrow. Nevertheless, it is probably true that the debts to-day are as much or more than the value of America at the present ridiculous prices.

If we go on with deflation, it will also be necessary to reduce taxes. This will mean decreasing the number and the pay of teachers in our public schools and other Government employees. In addition it will be necessary to embarrass still further some of our State governments and our sorely-pressed municipalities.

If, on the other hand, we adopt the second policy and attempt to raise commodity prices to the approximate level existing in 1929, it may be possible to avoid the greater part of these unfortunate occurrences. Accordingly, although as I have said I have no definite plan, I recommend to your committee that it give serious attention to the various proposals for raising commodity prices to the level to which wages, debts, taxes, and other public services are most nearly adjusted.

The proposals I have in mind are: Management of credit; management of currency; wider use of silver; symmetalism; revaluation of the dollar; and the variable price for gold.

From these there should be chosen a plan which besides re-establishing higher prices will give us also a permanently stable measure of value.

Advocates of deflation tell us that if we attempt to raise commodity prices by managing gold, currency and/or credit, it will finally result in wild inflation and repudiation. There are now 33 countries off the gold standard and they are managing their currencies by permitting the price of gold to vary; and in no important case is there wild inflation. In fact the only cases of wild inflation until the currency was worthless in a first class modern nation occurred in times of revolution—French Revolution, American Revolution, Russian Revolution, German Revolution.

A modern nation with 12,000,000 unemployed laborers; thousands of bankrupt farms and home owners; a bankrupt industrial and transportation system; and a strained legal structure, is a ridiculous monstrosity. Such a state of affairs should not long exist—nor will it. Either we must settle the question promptly and wisely, or it will be settled for us in a manner not to our liking.

What the country needs most to-day is neither mere emergency measures nor some grandiose plan for a practically new economic system but a national economic policy. If such a policy were adopted by the Nation or by a sufficiently large majority we can be assured that ways and means would be forthcoming from our practical and business-like people to put it into effect and gradually not only to do away with depressions but to produce a prosperity we have never known.

Emergency measures are not merely too timid and too limited to fill the need, they are ineffective even for their modest and limited objectives. We simply must look ahead. As President Hoover's unemployment conference declared: "Prevention as contrasted with relief is only possible through foresight," and during a depression it is too late "for measures preventing these extreme fluctuations of business activity." That is true. But now, during the depression, is precisely the time, and the only time, when we realize most clearly the seriousness of the situation. If our immediate actions must be limited to the emergency, now is the one and the only time to plan ahead.

To plan ahead—but not for any variation of the five-year plan, not to institute a national board on the Russian model, nor to call for the reconstruction of industry by blue prints. We are not the sort of a people that undertakes in a few years to inaugurate a new economic system. What we want is not a plan to reorganize our economic structure. What we need is a policy, a common desire and understanding. We want neither a dictator nor new governing body of any sort. What we need is a few general but entirely practical principles, sufficiently consistent so that they can be brought together under one national policy. Certain definite measures for carrying out this policy should be presented at the outset but others could not be predicted and would be brought forward only gradually as the policy was put into effect.

What would such a policy be? I think we can be fairly confident as to its general outlines.

The foundation of an American economic policy must be the development of the maximum possible mass purchasing power: the raising of the standard of living of the masses of the people, wage-earners, the lower salary earners, farmers and all producers in the lower income brackets.

This is and always has been the tendency that has marked off the American economic system from all other systems. In recent years we have pulled away from it rapidly and alarmingly. But even to-day, or at least up to 1929, relatively high wages were at least verbally recognized as a foundation of the American system, though during those "prosperity" years we were already drawing away from that basic principle.

Mass purchasing power, the standard of living of the masses, must not only be raised—it must be increased at least beyond a certain known minimum. If we are not to have further depressions and ever worse depressions, mass purchasing power, the incomes of the great bulk of our wage and salary earners and farmers must be increased at least as rapidly as the increasing productivity of industry due to new methods and new investment.

Raising of our national standard of living at this tempo would prevent further retrogression, such as we are seeing to-day. Indeed, in proportion as the increased income of the masses exceeded the increasing productivity of industry, depressions would become less severe. But they would continue. They would continue until a balance was struck between consumption and production. That means that there must be a radical change in the present disproportion between profits and wages, between dividends, interest, rents on the one hand and, on the other hand, the incomes of the masses—whose purchases account for 83 per cent of our home market and three-fourths of our entire market, domestic and foreign. Not only that, but practically half of the new investment in industry, so much of it wasteful or excessive, has come from the higher income class (those having over $10,000 a year incomes).

To restore this balance, to insure more consumption and less investment in machinery in production, the first requisite is to advance mass purchasing power by every method adapted to that purpose. The second requisite is to use every practicable method to keep down excessive profits. Graduated income and inheritance taxes are the first and foremost means for this purpose—but not the only one. During the war we had also a highly practicable excess-profits tax. Nor is taxation the only method, by any means. The regulation of the charges of public utilities and all other laws to limit profits on behalf of the consumer are equally effective.

Taxation, the protection of the consumer, of the producer, and of the investor, all these problems must be viewed as parts of the basic policy, the raising of the American standard of living and the reduction of the disproportionate and excessive profits. For these excessive profits not only have held down the incomes of our masses of town and country but have produced the surplus savings and overinvestment in the machinery of production that have caused both the false prosperity of a few years ago and the overpowering burden of debt that keeps us where we are to-day.

The importance of the policy of keeping graduated income and inheritance taxes and all other taxes directed toward the reduction of excessive profits at the highest practicable maximum lies largely in its effect in enabling the Government to keep its debts so reduced and its Budgets so balanced that it will be able in a crisis such as the present one to extend the maximum aid to industry and to the people generally.

Senator GORE. Could you there develop the idea about how excess profits lead to excess debts? I did not quite follow you.

Mr. WOLL. Excess profits lead to overexpansion, incurring additional debts.

Senator GORE. On the part of whom?

Mr. WOLL. On the part of industry.

Senator GORE. On the part of the people who get the profits?

Mr. WOLL. Yes.

Senator GORE. They invest their profits, and still more, is that the point?

Mr. WOLL. Yes. At the same time these excess profits, themselves an evil leading to overinvestment in the machinery of production, are held down. If income and inheritance taxes, the excess profit tax, and other taxes leveled mainly against disproportionate savings had been kept at or somewhere near the war time level, two things would have resulted: First, excessive overdevelopment of the machinery of production would have been considerably less than it now is; and, second, the floating debt of the Government would be very much less, the Budget would be more nearly balanced, and the credit of the Government would be such that there could be no question of its ability to come to the aid not only of our great credit institutions and large corporations, but of the masses of producers and consumers of the country.

At a time like this, when the economic problem rises from unemployment, low wages, and so forth, the problem of the high cost of living is not so much in the foreground and the consumer is less considered. But we have only to look back a few years to the times—which will certainly recur—when the benefit of every improvement in employment and advancing wages was lost, owing to a mounting cost of living. There was a time, for example, under President Wilson, when he himself proposed legislation requiring commodities on which there was profiteering, in so far as they entered into interstate commerce, to be marked with the price with which they left the manufacturer or producer. It was also the demand of labor that the United States Department of Labor compile and issue monthly statements of the cost of manufacture of those staples which form the basis of calculation in fixing the cost of living, and that the Government be authorized to establish a permanent board for the prompt investigation of profits and prices.

All regulations of the charges of public utilities and all legislation to protect the consumer as to the quality of his purchases fall in the same category. They at once improve the standard of living of the masses and the prosperity of the nation as a whole and cut down excessive profits—and so by that much lessen the danger of depression.

Senator GORE. Right there, I remember that this crusade against the high cost of living went back even prior to President Wilson's administration.

Mr. WOLL. Yes.

Senator GORE. During 1910, 1911, and 1912, I know we were making quite a drive on the Republicans, because the cost of living was so high. We called it the "h. c. l.," abbreviating it. Everybody was protesting it, and trying to get it reduced, so it went to an extreme. Now it has gone to the other extreme, and we are all trying to get prices raised in some way.

Mr. WOLL. Absolutely true. I speak now, not of the immediate necessity, but of guarding against it in the future, because I am not confining myself wholly to the present emergency. I am speaking of long-term outlooks as well.

A broad policy against excessive profits will no doubt meet very great resistance. Nevertheless, there can be no question that once the nation has made up its mind, it will have the power to carry out that policy. Ways by which the nation and the Government can resume a reasonable degree of control over corporations have already been put forward by our leading statesmen. For example, President Taft first proposed, and President Wilson advocated, in a message of 1920, the Federal licensing of all corporations. The first result of such licensing would be that the Government would be in a position to obtain full knowledge about these corporations and to supply the public with that knowledge. It would then be possible on this basis to proceed to whatever regulation the public interest required and by one means or another to place at least some limit on the excessive profits of recent years, while protecting employees, consumers, and investors alike.

President Hoover has said that—

> The divorce of the ownership of our large corporations from the management is gradually bringing it about that the managers themselves see that a smaller proportion must go to profits and that they are thus getting a new vision of their relationships. Those relationships—

He said in an address given under the National Civic Federation, April 11, 1925—

> have a tripartite responsibility; to the consumer on the one hand, to the worker on another, and a grudging regard for capital in the sense that it shall be assured no more than security, and thus given the lowest terms in the market. Under this régime the savings we can make through application of invention, through increase in skill, through elimination of collective waste, are bound to be increasingly shared with labor to secure service and contentment, and to be decreasingly shared with capital, because capital comes cheaper with increasing security.

President Hoover might have added that the sound principle of less interest and dividends is a vital and indispensable necessity of the present moment. The Nation can not wait until the new managers of industry see the light.

There is no reason why the Federal Government as well as the State government should not enter whole-heartedly into the protection of the investor. Certainly if Secretary Mellon could intervene again and again to help the stock market, the Government could perfectly well issue full and periodical statements as to the prospects of the chief fields of investment—without going into situations of individual enterprises. The purpose would not be to find profitable investment for the investor, but, on the contrary, to indicate to him how limited that field was, with the knowledge that the result would be to discourage an excessive amount of investment altogether. As recent history has shown that the field for safe and profitable investment is limited by the market, the purchasing power of the people. It is to the advantage of the Nation first that savings should not be entirely wasted in enterprises which later have to close down; and second, that this money should rather be expended in wise purchases by the investor—investment in the health, education, or general well-being of himself, his family, or in scientific, artistic or philanthropic directions.

There is also the possibility and the need that the Government should use to the full its power over our credit structure for the purpose of carrying out this national economic policy. Up to the present the National Reserve Board and Reconstruction Finance Corporation and all other institutions and activities of the Government in the field of finance have been left almost entirely in the hands of the financiers themselves, to be used for the sake of safeguarding their investments at the expense of all other forms of income.

One can not be unmindful of the great importance and influence our system of credit has in our economic, financial, social, and political life. It was predominance of the credit factor in our economic structure that contributed so much to our present plight. The load of national credit and growing indebtedness is becoming almost a crushing burden to our productive industry. The very nature of credit now extended is such as may tend to lessen the security of productive enterprise and of every economic group depending solely upon this form of governmental aid. The further danger must be apparent that having once traveled this road it is difficult to know the limitations to be set.

Fortunately, a new light is beginning to dawn even on some of our financiers, in the proposition that governmental credit should be extended to industry in proportion as men are set back to work. This is a step in the right direction, but it is not sufficient. What is wanted is not merely that men should be set back to work but that their wages should be advanced sufficiently rapidly to insure the needed increase of mass purchasing power. If our bankers could accelerate the reduction of wages, as they undoubtedly did, by public statements and private pressure, there is no reason why persons put in high financial positions by the Government should not follow the opposite policy.

The banking and credit structure of our country is such that it is not thinkable nor desirable that the Government should attempt to direct it as a whole. But since it has been necessary for Government credit to come to the rescue of private credit, there is no reason why the Government should not demand that an economic policy aimed at the welfare not only of the masses but of the entire Nation, including business itself, should not be made dominant. The time has arrived when unregulated extension of credit for production should be curtailed and that some particularly public policy be set up which would to some degree at least regulate the development, expansion, and conduct of industry.

This policy applies also to our foreign relations. We can not hope rapidly to advance the standard of living of the entire world, desirable as such an advance might be, even from our own national standpoint. The standard of living of the American people can be raised only along strictly national lines. We can not throw open our doors either to the peoples or to the products of other nations. We must of course import what we can not produce in this country, or can produce only at very great expense. But as long as we have millions of unemployed and a huge surplus of idle capital in the banks, we must endeavor to set up every possible industry in this country, even if our facilities in some cases are inferior to those of other nations. We can not lean largely on producing goods which we can use for trade and export, for the reason that the export market is both extremely unreliable and very much less profitable than the home market. There is little danger that on any other ground the American people will abandon their own existing industries in favor of cheap imports or give up the hope of implanting in this country any industry for which there is any reasonable hope of practical success. The only danger is that the clamor for more exports may lead us to abandon some part of our home market.

International bankers, industrialists, and many of our liberals are urging that one of the chief cures for the present depression and for unemployment is the development of the export market. Then, too, our new Secretary of State, Mr. Cordell Hull, has said that—

> If this and other Nations could have profitably exchanged their respective surpluses since 1921, there would have been no surpluses piled up, no stagnation with resultant widespread unemployment, no agricultural collapse, no vast concentration of gold in one country, no serious German crisis, no domestic and world panic.

We can not subscribe to that theory. The cause of the depression and of our false prosperity has not been the loss of international trade, for international trade was never more artificially developed and inflated than during this period of so-called prosperity, and besides international trade has fallen no more than internal trade.

Might I add here that even the foreign trade we have promoted in the last few years has been promoted by American loans, and not because of any purchasing power had or developed in these foreign countries.

The cause of the depression is excessive profits and insufficient mass purchasing power in these United States.

American labor does not believe that the export market will rise in importance when compared with the home market. It is a practical certainty that for many years exports are destined to take a smaller and smaller proportion of our products when compared with the home market. Europe is not only providing for its own needs but is offering more and more formidable competition to us in other markets. The backward countries are getting lower prices for their raw materials. They can, therefore, buy less from us. In contrast to this, our huge home market has indefinite capacities for early expansion. For if real wages, salaries, and farmers' real incomes are progressively advanced, there is no limit to the possible increase of mass purchasing power.

Then, too, the foreign market is not so desirable as the home market—either for capital or labor. Goods exports must be sold at world prices in competition with goods produced by poorly paid, pauper, or even forced labor—and the certain results of large exports is always that the labor of the chief exporting countries, such as England and Germany, is forced to accept lower wages in order to be able to compete effectively in the foreign market. In other words, the predominance of the foreign over the home market totally destroys the benefits of the protection of labor.

Except in certain products which are mainly for export, there should be no exportable surplus. In cotton, naturally, the export market is and will remain of the greatest importance—unfortunate as that may be for the cotton producers dependent for their market upon the political and economic conditions of other countries, as well as being forced to compete with cotton produced by pauper labor. Only a few other American products of importance are in the position of cotton. Many more products are in the position of wheat, where the obvious remedy is that the exportable surplus should be reduced as quickly as possible to zero, for even if it is possible to sell it abroad at all, it will often have to be sold at less than the American cost of production. If the surplus exists, obviously this is the only thing to do. But it is equally obvious that the fundamental remedy is that there should be no surplus. The same thing applies to our surplus products of automobiles, machinery, or anything else which must be sold abroad below the American cost of production. The only result of such sales in the long run must be to lower the American standard of living more and more nearly to the level of that of other less fortunate countries.

Senator HARRISON. Do you not believe, Mr. Woll, that if the American automobile industry can sell abroad $500,000,000 worth of American-produced automobiles, that is good for American labor?

Mr. WOLL. Yes; it is good for American labor, but it is only temporarily good, because other countries will either restrict production to promote their own industries or American capital will invest its money abroad and establish branch factories abroad, and thus the foreign trade will have been lost anyway.

Senator HARRISON. American capital has moved to foreign countries, and is producing them now in foreign countries.

Mr. WOLL. Yes.

Senator HARRISON. Due to the benevolent tariff policy of the United States.

Mr. WOLL. I would not say that was true. It has been because of restrictions placed by foreign nations upon the importation of America commodities to some extent.

Senator HARRISON. Do you not think it has been largely at the invitation and because of the action of this country in doing that?

Mr. WOLL. No; I do not believe it. On this general subject, might I say I listened with great interest to Mr. Glen Frank's presentation of the subject. Propriety, of course, prevents my answering some of the statements he made, but I wish merely to draw your attention to the philosophy set out as to debtor and creditor nations. I think he answers his own argument better than any presentation I might make at this time.

Senator GORE. We have had a pretty ample protective tariff during the last 10 years, have we not?

Mr. WOLL. Yes.

Senator GORE. And have now.

Mr. WOLL. Yes.

Senator GORE. As a result, labor is prosperous, and we have no unemployment, and prosperity abounds.

Mr. WOLL. To-day, of course, with the depreciated currencies, we find factory after factory closing down.

Senator GORE. But we had this depression nearly two years before the foreign countries went off the gold standard.

Mr. WOLL. That is true, but all these factors contribute to the prolongation and the accentuation of the depression.

Senator GORE. When this depression occurred in this country we had a very high protective tariff, did we not?

Mr. WOLL. I would not say so very high. As a matter of fact, only one-third of the imports pay duty. Two-thirds are on the free list.

Senator GORE. I understand that. Coffee does not pay any duty, of course, and I do not suppose any protectionist would suggest that it should. But we had a pretty high protective tariff when this crash occurred in 1929. Then, whatever protection and whatever blessings it will produce, it will not prevent a panic, will it?

Mr. WOLL. I would not say it will prevent a panic.

Senator GORE. And it will not prevent vast unemployment, running up into the millions.

Mr. WOLL. I would not say the tariff legislation prevents panics at all, but I do say this, that since we exclude labor from foreign nations, to prevent undue competition among the workers here, and we are seeking to protect American industry and the conditions of the American workers, as against the lower standards of Europe, we must at the same time protect labor and industry against the competition of goods produced abroad.

Senator GORE. Do you not think, Mr. Woll, there is a fundamental difference between laborers coming in and living here and goods coming in?

Mr. WOLL. No.

Senator GORE. When a foreigner comes into this country he is a living human being. He may or may not be able to adapt himself to our institutions. Nobody will bring any goods to this country that does not want the goods, will he?

Mr. WOLL. I do not get you.

Senator GORE. There will not be any goods imported into this country that somebody does not want?

Mr. WOLL. That is true. They will not be imported here if somebody does not want them here.

Senator GORE. When a silk handkerchief comes here, or a piece of lace from Switzerland, that does not react on our whole social fabric, as immigration might.

Mr. WOLL. No; but when you have industries producing certain commodities at a certain cost of production, and those same commodities are produced abroad at a much lower cost of production, the want for the commodity is there, but, as between the competition of the homemade product and the foreign-made product and a lower cost and a lower price, the foreign commodity will close to the market to the American product.

Senator GORE. Our imports are paid for with our exports, are they not?

Mr. WOLL. What is that?

Senator GORE. Our imports are paid for with our exports, are they not?

Mr. WOLL. I take it our imports have been largely paid by loans made by our bankers abroad.

Senator GORE. Temporarily, that is true; but in the long run if the debts contracted abroad to buy our goods with are ever paid, they have got to be paid with imports coming into this country from those countries.

Mr. WOLL. That is the general theory of a balanced trade.

Senator GORE. The exports that go out of this country——

Mr. WOLL. I may also call your attention to this fact, presented by Mr. Frank. He set out the principle that a debtor nation must have a larger export market than import market; its trade must be balanced in its favor. And a creditor nation must be reversed.

Senator GORE. Yes.

Mr. WOLL. If that is also true, we are going to be the subjects of all the nations of the world, because we are the only creditor nation in the world. If we are going to wipe out our debts that way, it simply means the demoralization and destruction of American industry.

Senator GORE. I do not think it is possible to be a creditor nation and a protectionist nation at the same time. The two things are inconsistent and mutually exclusive. But I do not mean to embark on that now.

To get back to the question, the exports that go out of this country are paid for with the imports that come into this country. Do not those exports give employment to American labor?

Mr. WOLL. Those exports do give employment to American labor, but to the extent that we import it displaces labor.

Senator GORE. But take the farmer who produces cotton in Mississippi, or the farmer who produces wheat in Nebraska, and ships it abroad. Does he not have as much right to labor in this country and have a market for his goods as the man who produces stockings up here in New York?

Mr. WOLL. I say he has as much right, but he has not a greater right.

Senator GORE. But when you want to shut out imports so that the farmer can not buy these imports, then you are militating against the farmer in the cotton State and the wheat State, who has as much right to sell his stuff to somebody as a man has to sell his labor in a particular factory.

Mr. WOLL. Well, let us reverse the situation. Then in order to get the cotton grower what he wishes in the matter of foreign markets, we must manage to get our industries where they will have a foreign market.

Senator GORE. No, that does not follow at all, because we can only find a market for our surpluses that go abroad in the form of export by letting the foreigner ship his goods in here in imports.

Mr. WOLL. Yes, but he is going to ship his commodities in in competition with American industry and American workers.

Senator GORE. Now, Mr. Woll, I think that while we are a protected country and you say in advocacy of protection that it is to protect labor, nevertheless we have 12,000,000 unemployed labor to-day, notwithstanding high tariff. I think that notwithstanding that—you probably will not agree with me—measured by output, American labor is the lowest paid labor on the globe—measured by his output and the amount of labor cost in a unit of production.

Mr. WOLL. Well, supposing that were true: It is also true that the standard of living of the American worker is much higher than that of the people of any other country.

Senator GORE. Supposing that is true: That is the reason he gets the higher wages; he turns out more product. That is the reason he gets better wages. He earns more wages. Not because he is protected by tariffs, but because he has a bigger capacity and is a better worker and turns our more goods than any other living worker. It is not due to a high tariff, but it is because of his capability in muscle and mind and skill.

Senator HARRISON. Mr. Woll, have you any figures there to show what the unemployed are for to-day, and what proportion is due to our loss of foreign trade and how much has occurred in protected industries?

Mr. WOLL. No; I have not.

Senator HARRISON. There is a very large per cent of that 12,000,000 that are out of jobs now that are in highly protected industries.

Mr. WOLL. I will be very glad to secure the figures on that if it is possible, because I am in no position to either affirm or disprove your statement on that.

Point 8. The same principle applies to exports of capital. It has been proved and is now generally acknowledged that by far the larger part of our export of capital in recent years has been unwise. There has been sheer waste which can be defended from no standpoint.

It is also true that this capital has been used freely in promoting foreign competing industries, both in the form of short-term and long-term loans and by the establishment of branch factories abroad.

Recently the astounding charge has been made that those most urgent for the extension of foreign trade are themselves assiduously engaged in promoting and financing the trade of foreigners. It is quite freely alleged that some of our international bankers have not hesitated in the granting of short-term credits to foreign manufacturers and producers to promote trade between foreign nations and without the slightest concern as to the resultant restrictions, limitations, and reductions placed upon our own export trade.

Why should not a governmental commission investigate this whole subject, and why should not its sessions become permanent? It is natural and inevitable that if there is a vast surplus of capital seeking investment, owing to excessive profits and insufficient payments to the masses of our people in the form of wages, and so forth, that a part of that surplus would go abroad to be wasted or used to our detriment.

The evil lies in the existence of such a surplus. But as long as it exists, it is clearly to the Nation's interest to keep it as far as possible in this country, where at least there is some possibility of control. If the surplus is altogether too large to be put to any useful public or productive purpose, the only alternative is that it should be expended in private and personal consumption and not invested in already excessive machinery of production.

Ninth. As has been previously indicated, high wages and a continued increase in wages are conditions of national well-being. The buying power of the masses should and must expand if we are to maintain and raise the standards of living. If we are to recreate an early return of prosperity and maintain our Nation on a permanent basis of well-being, we must encourage and build an order, relationship, and practice wherein the distribution of surplus of industry will find more and more expression in higher wages and lower prices and less and less in the form of dividends, interest, and other forms of compensation to capital.

Inherently related to this problem of enlarging consuming power by means of a fairer and ever larger distribution of surplus of industry by means of higher wages is the shortening of the working week and working hours. It is the very essence of sound coordination. With productive capacity so greatly increased, through discovery, invention, and mechanization, and with a less rapidly increasing consumption, we shall have to choose between employing a relatively smaller number of persons in industry on the present hours or a larger number on shorter hours. As we come to realize what this means, there will be a universal demand for the 5-day week and a 6-hour day, so that work opportunity may be spread as well as earning capacity among our citizens.

In point of fact there are a number of prominent American industries which have adopted the 6-hour day to spread employment. The results have been so much more successful than they have anticipated, that it will be a part of their permanent industrial policy. I predict a great development in this direction of a shortened workweek and work-day as not only socially desirable, but economically necessary to achieve industrial balance.

A shortening of the hours of labor, if unaccompanied by any decrease in the daily wage, may act as effectively toward the restoration of the balance between consumption and production as an increase of real wages. Under our political system it is difficult to secure this shortening of hours by direct legislation but the same object may be indirectly achieved by the influence of the Government and the pressure of public opinion. If all branches of Government—National State, and local—not only established short hours and a short week for all their employees, but insisted on the same hours and week in public contracts, the country would already be far on the road toward the general establishment of this extremely important reform, important not only for the value of greater leisure to the individual, the family, the home and the State, but, as I have said, for the absolutely vital need of working toward a balance between consumption and production. Shorter hours and a shorter wroking week, like read wages, should be a part of every political program.

Tenth. It is unnecessary to remind you that unemployment has become the new barometer of American business. It is a much more effective tell-tale of the health of our industrial enterprise than the fluctuations of the stock market. When we deal with fluctuations in jobs, we are dealing with ultimate realties. When we deal with stock fluctuations, we are not infrequently dealing with fictitious values. The sorry commentary of the present situation is that while we have daily records of stock fluctuations, which are accurate, we have not any adequate unemployment index.

There should be some Federal agency charged to collect basic information on man-hours, length of work-weeks, productivity, employment opportunities, wage earners' incomes, and so forth, as a necessary device to facilitate any program of coordinated economic development. There is to-day in this country no adequate system of employment exchange. There is a dearth of statistics on actual hours worked, on the income of the American wage earners, on displacement, and a whole host of matters that are of vital concern in achieving economic balances. Labor believes that some such Federal agency is necessary to collect and collate such data as an individable part of our program.

Eleventh. A long step towards restoring the economic balance would also be taken if each industry were obliged to contribute to a reserve fund in order to insure steady work to its employees. There is no more economic justification for the establishment of reserves to maintain the industrial plant and to prevent depreciation than there is that the working staff should be maintained in a state of efficiency. Industry has no greater obligation to the shareholder than it has towards the employee.

Until recently the American Federation of Labor set its face against proposals for compulsory unemployment insurance. But conditions have been such that despite its understanding of the fundamental dangers involved in a system of state compulsory unemployment insurance, it is now favoring this legislation as an expression of its belief in the equality of the status of investment of the worker and the investor of capital in modern industry.

In order that such unemployment reserve funds should be created, each industry would have to be permitted a degree or organization which would perhaps be inconsistent with the present antitrust laws, but economic policy and public policy require in any event that these laws should be repealed and that they should be replaced by laws giving greater authority to the Federal Government through some appropriate agency and practical method of enforcing such regulation as is necessary without penalizing in any way the right of the industry to organize.

Twelfth. It will hardly be necessary for me to insist that we can no longer in this country trust to the operation of uncoordinated economic forces to achieve a balance in our mechanics. Unregulated competition, the doctrines of laissez faire are strangely out of tune with the needs of the present situation. We have moved out of the economic era where the prosperity of the Nation represents the sum total of the individual citizens. The basis of organization for activity must be shifted from individuals to groups through which the individual functions, and this in turn implies the necessity for learning the principles of group action and of group cooperation. We have had planning on a small scale in our own individual lives. What we now need is group planning—national planning that shall conceive of the economic activity of the Nation as a whole rather than individual parts. What has become necessary is some agreement as to both direction and purposes of economic undertakings in our recovered economic life.

Labor observes the fact that there are in this country less than 100 financial corporations that control 50 per cent of the total corporate wealth of the country and indirectly control the credit and investment policies of the country.

Senator GORE. Mr. Woll, did your suggestion a moment ago contemplate the enlargement of their holdings and the reduction of their number?

Mr. WOLL. Yes. That is a little further in this paper.

Senator GORE. Yes.

Mr. WOLL. Labor observes the fact that there are in this country less than one hundred financial corporations that control 50 per cent of the total corporate wealth of the country and indirectly control the credit and investment policies of the country. The labor outlook is clear and definite that power carries with it great social responsibility; that it will not be possible nor wise to trust to so small a group the dominion of so large a group of their fellow-citizens.

With coordinated planning we may achieve a better balance between production and consumption. We can make the things that people want and assure a distribution by planning for adequate consuming power. It is possible to increase the consuming power of the people without vastly increasing our productive capacity. But this can be done only through coordinated planning. To-day labor-saving devices frequently mean poverty and displacement of workers themselves. But that could not have happened if we had had a coordination of our economic activities.

Unregulated competition has become not the life of trade, but its death knell. There is thus nothing inconsistent with the removing of legal restrictions to cooperation and the development of quality production; indeed, the one should aid the other.

Undoubtedly, some legal and governmental control must be preserved. It is quite true that no form of effective and reasonable control has yet been worked out, but better no control at all than such as is provided in our present medieval statutes.

Industry is being charged more and more with a public trust and is being viewed less and less as an institution for the enrichment of a few and the impoverishment of many. Industry must, therefore, assume greater and greater social responsibilities and meet the changing order and conditions with a new economic outlook and with an entirely new attitude.

Many plans have been and are being presented for economic planning. It is our point of view that plans worthy of favorable consideration and acceptance must be designed to bring about a more even distribution of purchasing power, a workable basis for balancing consumption with production, the discouragement of investment of surplus profits in needless and unduly enlarged productive plants, encouragement of expenditure of large incomes for every sort of consumable goods rather than for productive instruments, and finally, for the spread of ownership of industry or profits of industry more evenly and equitably among all members of society.

It is not too much to say, I believe, that if modern capitalism is to continue, it must not only put its house in order, but be prepared to subject itself to a more vigorous ordering and coordinated development than it has hitherto known.

Senator GORE. You mentioned one point there, that industry would have to recognize larger social duties and responsibilities.

Mr. WOLL. Yes.

Senator GORE. Heavy taxes on its profits and incomes.

Mr. WOLL. Yes; and a fairer distribution of the earnings of industry.

Senator GORE. Do you think it will properly react to that prospect, Mr. Woll, or will it take refuge in tax-exempt securities?

Mr. WOLL. You are bringing up another question on the question of tax-exempt securities.

Senator GORE. I do not want to advert to that.

Mr. WOLL. Conclusion: An important aspect of the new economic policy embraces the organization of workers into trade unions as an important disciplinary and regulatory force in our industrial life. The union alone has the independence, power, and authority to assume responsibility for keeping wage earners' programs abreast of social and economic progress.

The prerequisite to industrial progress for wage earners is organization to mobilize and direct their forces. Organization represents consciousness of labor problems and the practicability of attacking these problems as something to be solved. Its first objective is a collective work contract. The unorganized worker either accepts the terms offered or hunts another job, if he can afford to run the risk of unemployment. Only when workers act collectively through their chosen representatives, can they negotiate a work contract, carefully weighing each item in order to reach mutually satisfactory terms. As the terms of contract or the relationship existing under a contract are more carefully defined, new fields for collective undertakings open up and the essential partnership of labor in the production undertakings is developed and utilized as the basis of progress.

Freedom and progress can only be achieved by thought and organization. This part of labor's program has been of the most effec ive force for the advancement of labor and a constructive national asset.

That, gentlemen, concludes the points I desired to bring to your attention.

Senator HARRISON. It is a very interesting paper, Mr. Woll. The committee thanks you.

Senator GORE. I would like to ask you another question, Mr. Woll: I failed at one point to keep step with you, and that is where you said that the entire commodity prices, or wholesale prices, are 95 per cent now, I believe, of pre-war.

Mr. WOLL. Yes.

Senator GORE. And in the next sentence said something about wages being 180 or 190—I just did not follow you there.

Mr. WOLL. The trend of wages has followed both as to the wholesale prices and as to retail prices, making clear, however, that wages must be adjusted to retail prices, because labor does not buy at wholesale prices but buys at retail prices.

Senator GORE. I get your point there, and I think you are right about it, but I did not follow your figures some way. If you will turn back to that. I would like to get that straight.

Mr. WOLL. I just do not have that right at hand now, Senator.

Senator GORE. I can check it up, then, later. I did not quite get the relationship.

Senator LA FOLLETTE. Mr. Woll, have you any figures or statistics available showing what has actually happened to wages during the depression?

Mr. WOLL. I did not prepare myself on that subject, because it is my understanding that President Green is to appear before your committee, and I felt rather it would be more appropriate for him to deal more accurately and more fully with the question of wages and hours.

Senator LA FOLLETTE. I have been unable to get any accurate figures, but such figures as I have been able to get indicate a very much more drastic reduction of wage standards than is generally believed to be true.

Mr. WOLL. Of course, the figures I have used are from the Department of Labor reports, which of course are average figures, and of course it does not tell the story in detail.

Senator LA FOLLETTE. Exactly; that is the point.

Mr. WOLL. But in this presentation I have sought to confine myself to such authorities as we have to base calculations upon, and which of course are in general terms and not in specific application.

Senator LA FOLLETTE. One of the bothersome aspects of this situation is that in completition for the ever-shrinking market wages seem to be tending to sweatshop levels.

Mr. WOLL. Yes.

Senator LA FOLLETTE. The director of industrial relations of the State of Pennsylvania, Mr. Roschenberg, appeared before the manufacturers committee on the relief bill, and I was appalled by some of the figures which he gave us concerning wages that were prevailing in some of the industries in Pennsylvania.

I cite one exapmle: He estimates that there are 100,000 women in Pennsylvania working for $2 a week or less.

Mr. WOLL. Not only that, but I might cite you a situation that in the Northwest, where we have our minimum wage laws for women in industry, not to work at less than $15 a week, and so forth, women are being dismissed and men are being employed at a lesser wage than $15 a week, because they can not employ women. So the depreciation of wages, of course, has been terrible. As I say, I have not ventured into that subject because, inasmuch as President Green is to appear before this committee, I did not feel that I would be justified in venturing into that field.

Senator HARRISON. The committee will adjourn until Monday morning at 10 o'clock.

(Accordingly, at 12.20 o'clock p. m., the committee adjourned, to meet again at 10 o'clock a. m. on Monday, February 27, 1933.)

×

# INVESTIGATION OF ECONOMIC PROBLEMS

---

**MONDAY, FEBRUARY 27, 1933**

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
*Washington, D. C.*

The committee met at 10 o'clock a. m., pursuant to adjournment on Saturday, February 23, 1933, in room 335, Senate Office Building, Senator Reed Smoot, presiding.

Present: Senators Smoot (chairman), La Follette, Harrison, George, and Walsh of Massachusetts.

The CHAIRMAN. The committee will come to order.

I have received a letter from the Hon. Nicholas Murray Butler, which will be placed in the record at this point.

(The letter is here printed in full as follows:)

NEW YORK CITY, *February 21, 1933.*

The HON. REED SMOOT,
*Chairman of the Committee on Finance,*
*United States Senate, Washington, D. C.*

MY DEAR SENATOR SMOOT: It is so difficult, perhaps impossible, because of academic duties here, for me to accept in the near future your invitation to appear before the Committee on Finance, that I venture to ask you to present to the committee the following statement of my views and suggestions concerning the topics under consideration. The time of the Committee on Finance at this heavily crowded period of the session will thereby be saved.

I. The present economic and financial crisis is in no true sense national; it is international and world-wide both in its causes and in its effects. In any given nation—the United States, for instance—the world-wide causes and effects are modified and either lessened or exaggerated by national happenings and developments of recent years. Fundamentally, however, the causes and effects are the same throughout the world.

The causes I believe to be: A. The colossal destruction in and by the World War of the world's saved-up capital accumulated through more than 200 years;

B. The destruction likewise of the whole system of international trade and commerce including the carrying trade which had grown up naturally since the end of the Napoleonic wars;

C. The artificial stimulus given by the World War to production of every kind and the enormous increase of capitalization attendant thereon in order that whatever supplies were necessary for the conduct of the war might be provided in the speediest possible fashion wholly regardless of cost. This was accompanied and followed particularly in the United States by nation-wise reckless and carefully stimulated speculation.

D. The effects concurrently with the foregoing of the rapidly developing system of mass production not only in industry but also in agriculture leading to the steady displacement of hand labor and to readjustments and reorganizations of agriculture, industry, and transportation which have not yet been undertaken because the necessity for them is not yet clearly understood;

E. The strain imposed upon the whole machinery of international credit and exchange with the result that the supply of monetary gold has been accumulated at a few centers leaving available for general international exchange an inadequate supply of this metal;

F. The almost unbelievable increase in the cost of government everywhere, attended by constant and inconsiderate borrowing which is involving huge increases in taxation at a time when agriculture and industry are least able to bear such increase and which is everywhere straining public credit to the breaking point.

G. And finally, resulting from the operation of all these causes and forces, a destruction of public confidence not only in our economic and financial system, but even in the fundamental principles of democratic government, which is unprecedented in modern times and is leading in more countries than one to changes in the economic, social, and political systems which, whether violent or not, are revolutionary in fact.

II. In the case of the United States it is, in my judgment, imperative:

A. That public budgets, whether Federal, State, county, or local, be immediately balanced and that the habit of public borrowing to meet current costs of Government be brought to an end. It is more than 150 years since Adam Smith wrote in his Wealth of Nations, "Great nations are never impoverished by private, though they sometimes are by public, extravagance."

This balancing of budgets should be reached not through increase in taxation, save in exceptional cases, but through reduction in governmental expenditures. These are to be made by the reorganization and simplification of governmental agencies and functions, and by the repeal of those statutes which give to privileged groups and classes vast appropriations from the Public Treasury. In the case of the Federal Government, as was clearly indicated when the plan for a Federal Budget was under discussion some 12 years ago, there is large opportunity for economy through the simplification and business-like reorganization of governmental agencies.

The power to effect this simplification and reorganization should be given to the President of the United States, whom the people can then hold directly responsible for the use which he makes of this authority.

The Departments of Agriculture, of Commerce and of the Interior all offer invitation for curtailment of their activities and consequent reduction of appropriations. In particular, the foreign representation of the Departments of Agriculture and of Commerce should be brought to an end and the conduct of foreign relations in their every aspect intrusted, as they should always have been, solely to the Department of State. An examination of the multiplicity of our governmental representatives, and their cost, at various foreign capitals will quickly and conclusively illustrate this statement.

The example of some 9 or 10 other nations should be followed through the unification of the present Departments of War and Navy in a single department of national defense, with under secretaries for the Army, the Navy, and the Air Force. The late John W. Weeks, when Secretary of War in the administration of President Harding, estimated that such a unification would save nearly, if not quite $100,000,000 a year. This step will of course be stoutly resisted by the professional servants of the people in the Army and Navy, but it is a step to be taken in the highest public interest none the less. A War Department is an anachronism and a breach of good faith when war, as an instrument of national policy, has been summarily and formally renounced.

The statutes which make possible the payment to veterans of huge sums in compensation for injuries and illnesses which have no relation whatever to their military service, should be promptly repealed.

The bringing to an end of this group privilege, which is nothing more or less than a dole, will, it is estimated, save the Treasury of the United States not less than $450,000,000 a year.

Governmental economy and balanced budgets are a first essential to recovery from the present disastrous crisis.

B. There must be no tampering with the foundations of our monetary system. In times like the present there is every temptation to adopt some plan of inflation. Nothing is more certain, however, than whatever may be the merely temporary and apparently favorable results of inflation, the larger and permanent results of such a policy can only be disastrous to the very individuals and groups for whose assistance it is now urged.

By this time it should be clear to the American people that their banking system is woefully inadequate. We have only to compare its operation in times of crisis with the banking systems of Great Britain or of Canada to see how greatly it needs reorganization and development. It is fortunate that plans to this end are already under way. Their perfection and adoption should be hastened by all possible means.

It is of the highest importance that steps be quickly taken to reach an understanding between the Federal Government and the Government of the several States, by which our outgrown and outworn systems of taxation shall be displaced for modern and scientific systems of taxation which will avoid heavily increasing the burden upon certain groups, individuals, or types of property by reason of their being made liable for both Federal and State tax.

III. The crux of the whole situation, however, is to be found in international understanding and international cooperation. Public confidence can not be restored, and neither agriculture, industry, nor transportation in the United States can again be prosperous until by international action the obstacles to these are removed.

A. First and foremost are the so-called intergovernmental war debts. These are not a problem in theoretical finance but are one of the sternest practical character. Their existence and attempted payment have imposed, are imposing, and will continue to impose an unbelieveable burden upon the taxpayers of the United States.

There is absolutely no analogy to be drawn between a debt and its payment which are under a single political jurisdiction and computed in a given national currency, and a debt which has to be paid, if at all, across political boundaries and in a currency other than that of the debtor nation. No matter how much wealth the debtor nation may have behind its political and economic boundaries, it can not pay indebtedness in another land save in goods, in services, or in gold. If tariff barriers, prohibitions, quotas and other vexatious administrative regulations will not permit payment in goods; if payment in services be not acceptable; and if there be not gold enough in the world to make these payments in gold possible, then the deadlock which now exists necessarily comes to pass. It would be a huge relief to the American taxpayer and the greatest possible stimulus to American agriculture, industry, and transportation, were our Government quickly to arrange with the debtor governments for a composition of these debts similar in form and spirit to that arranged by the former Allies and the German Government on July 9, last, at Lausanne. The mere announcement that such an arrangement was in contemplation, to say nothing of its quick completion, would go farther than any other one thing to restore public confidence and thereby give the greatest possible stimulus to our agriculture, our industry, and our transportation.

B. The Government of the United States should exert its full influence at the coming economic conference to stimulate agriculture, commerce, and transportation through international agreements; to diminish and, so far as possible, to coming economic conference to stimulate agriculture, commerce, and transportation through international agreements; to diminish and, so far as possible, to remove existing trade barriers set by high and discriminatory tariffs, by prohibitions and quotas and by other forms of administrative regulation. Such changes can not be effected suddenly or all at once without damage, but they can be arranged and entered upon for execution over a period in a way that would be of the greatest possible assistance at the present time.

C. The Government of the United States should make it plain that when it urges disarmament it means genuine disarmament and not merely some new change in the proportion of armaments which is agreeable to professional military advisers. It should not only diminish its own much too large expenditures for military purposes, but it should insistently urge like action on the part of those other nations, both in Europe, in South America, and in Asia, whose annual budgets contain very large and indeed increasing appropriations for military purposes. For Governments which have, through the pact of Paris, renounced war as an instrument of national policy this state of affairs is not only quite shocking, but it is an affront to instructed and patriotic public opinion.

D. Our Government should, through our Federal reserve system, cooperate with the Bank for International Settlements, that joint agency to which every leading central banking system of the world except our own belongs, in its efforts to study and adopt such measures within their power as shall put a stop to violent fluctuations of currencies, breakdown restricting existing exchange controls, and recreate a sound, international monetary system on a stable basis. This is essential to the resumption of normal international movements of capital and to the freer international movements of goods. These, in turn, are the conditions precedent to any thorough going financial and commercial regeneration in the United States.

E. The Senate should at once consent to the ratification on behalf of our Government of the protocol of accession of the United States to the Permanent Court of International Justice, which our Government signed on December 9, 1929. Such action would be in strict accordance with American traditional policy and in conformity with long-standing American leadership. It has been, in substance, recommended by every President since McKinley and by every Secretary of State since John Hay.

F We can not close our eyes to the fact that following the Conference on the Limitation of Armaments held at Washington in 1921–22, the very significant treaties of Locarno, signed on October 16, 1925, and the epoch-marking pact of Paris signed by representatives of 15 Governments on August 27, 1928, and now adhered to by no fewer than 60 nations, there has been a striking and world-wide backward movement toward reactionary nationalism with its inhibitions and complexes which is gravely threatening the whole of our present-day civilization.

The United States should take vigorous lead to counteract these reactionary tendencies and through close and helpful cooperation with the vitally important work of the League of Nations, seek to bring back the public opinion of the world to the support of the forward movements which it so eagerly embraced only a few years ago. Our people should give no hearing to the destructive and reactionary cry, "Buy American," but should substitute for it the motto, "Sell American."

In that way, and in that way only can national and international trade be restored.

IV. There remain some pressing problems to be solved that are national in character.

A. There should be legislation to free the Congress from the constant consideration of the mass of petty legislative details which now consumes a large amount of its time, in order that the Congress may be set free for the prompt and constant consideration of the grave problems of Government which affect all the people. A very considerable portion of the work which Congress now undertakes to do itself, can be done better and more satisfactorily by administrative action taken under authority of a general statute.

B. It must not be overlooked that the public mind is greatly concerned at the concentration of the control, in a few hands, of widely distributed wealth through prevailing forms of corporate organization and management. This is a highly dangerous development of recent years. A corporation exists by authority of law and there is no reason why those huge aggregations of capital of the sort referred to, should not be as closely supervised by government, either Federal or State, as are life-insurance companies and banks

C. The close interdependence of economic and political movements and problems is once more illustrated by the prevailing unemployment. There should be quickly formulated and put in effect, perhaps best by some cooperation between the Federal Government and the governments of the States, a scientific system of contributory insurance against the risks of unemployment and dependent old age. No single act would do more than this to bring a new sense of comfort and security to millions of our people.

It can not be too often or too strongly emphasized that what is now lacking is confidence. The public is in a state of fear It does not see what the end may be of the reactionary and ultranationalistic forces which are just now everywhere at work. It is certainly playing with fire to permit these forces to go on unresisted and unchecked indefinitely. The fundamental principles of our American form of Government, the unbroken lessons of its history, and any just and wise interpretation of our National ideals all call upon us now not only to take, but to claim leadership in bringing back prosperity, satisfaction, and peace both to our own people and to a world of cooperating and interdependent nations.

With cordial regards, I am

Faithfully yours,

NICHOLAS MURRAY BUTLER.

The CHAIRMAN. Is Mr. Fred R. Fairchild present?

## STATEMENT OF FRED ROGERS FAIRCHILD, POLITICAL ECONOMIST, YALE UNIVERSITY, NEW HAVEN, CONN.

The CHAIRMAN. Please give your full name to the reporter.

Mr. FAIRCHILD. Fred Rogers Fairchild, professor of political economy, Yale University, New Haven, Conn.

Mr. Chairman, I appreciate very fully the honor of your invitation, but I would be here under false pretenses if either your invitation or my acceptance implied that I thought I came with any panacea to cure all the economic ills of the country. The fact is, in my opinion, there is no panacea for our economic ills and, above all, I am very sure that government as such has no power, by its own action, to correct the economic condition. Economic prosperity will not be restored by act of Congress. I think that those who look to government magic to correct economic conditions have been disappointed for three years and that they will continue to be disappointed.

The causes of prosperity and adversity are too fundamental and too powerful to be controlled by direct action by Government. This may seem a discouraging introduction, and does not imply that I think that there is nothing that Government can do, or that I have nothing to suggest.

I would like to call the attention of the committee to what I regard as certain fundamentals in the economic situation. We are living under an economic organization which is extremely complex, and our modern civilization, with its extreme division of labor and its successful use of labor-saving machinery, has made the situation especially so. With an organization like this, which is like any complicated machine, the complexity of the machine is justified by the results it produces, but, at the same time, there is serious danger of dislocation, and what we are suffering now, I should say, is a dislocation of the smooth operation of our economic machine, not a collapse, not a breakdown, but rather a temporary maladjustment. What is needed to set us going on the road to prosperity is something which will restore the confidence and the courage of the business leaders and the investors.

After all, they are the ones whose decisions and whose action must be depended upon to bring about the upturn of business conditions; and so long as we have our present system, based on the fundamentals of personal liberty, private property, and individual control of business enterprise, as long as those who are in control are discouraged and look with misgivings toward the future, things are going to lag.

I repeat that I do not think that Government can itself revive business prosperity, but I think there are many things that the Government may do, and refrain from doing, which would tend to remove misgivings and restore the confidence of those upon whose action we must depend.

I would suggest that we consider those things which are peculiarly the functions of government, the things which government alone can do, and which the public relies upon government to do.

This represents a case of division of labor, in which certain functions have been set aside for government to perform, and upon the performance of which the business world must rely.

For instance, take the monetary system. It will certainly be admitted that it is the business of government to furnish a monetary system. I find that the business world to-day is considerably disturbed on account of the flood of suggestions which are appearing on every hand for tampering with the monetary system, whether these be by means of simple inflation of bank credit, or government notes, or by debasing the gold standard, or by restoring some sort of silver currency bimetallism, or by any of the various plans of fiat money, some of them extremely weird.

Business men who are looking forward to hazarding their capital and their business success on new ventures are certain to be very sensitive to the nature of the monetary standard, in which all of their contracts, their obligations, and their fortunes are expressed; and I think few acts of the United States Government would do more to put heart back into the business community than action which would make clear that the Government proposes to stand by the present standards and resist the many plausible and more or less popular proposals for its change.

I realize that proposals for modification of the monetary standard are often urged in good faith by those who sincerely believe that along this path lies restoration of economic prosperity. I am here to say, with due respect to their sincerity, that I feel they are mistaken.

The CHAIRMAN. You think they would be temporary in character, do you?

Mr. FAIRCHILD. Yes; and I think they would even be more than that. There would be danger that action to relieve temporary disturbance might create permanent dislocation of the monetary system.

As you will see, I am thinking of all this from the point of view of those business men and investors whose decisions to proceed with industry must underlie any restoration of prosperity. Those men can not make their plans if they are uncertain as to what the monetary standard is going to be, obviously, and they are disturbed by the possibility that there may be some tampering with it.

Another example is the war debts——

Senator HARRISON. Before you leave the other, there have been suggested at least three major propositions of inflation. One involves the cutting down of the gold content of the dollar, another the issuance of fiat money, and the third is silver bimetalism. Of those three, if one or the other were going to be enacted into law, which is the least dangerous and most effective in your opinion?

Mr. FAIRCHILD. That puts me in a rather embarrassing position, to choose among three measures, each one of which is vicious.

Senator HARRISON. You think all of them are vicious?

Mr. FAIRCHILD. Most certainly.

Senator HARRISON. And you do not think there is any difference in the viciousness of each?

Mr. FAIRCHILD. There are so many different ways in which they could be put into operation. I should say a mild form of one would be less vicious than the extreme of either of the other two; but, you see, I am in no position to give any commendation to any one of the three plans, all of which, I think, would be a very serious disturbance to business confidence, and which, I can say further, I think are not needed, and would produce eventually just the opposite of the result intended.

As to the war debts, there has been so much said by myself, as well as many others, that I do not think I need detain you long over that matter. The main thing, it seems to me, is to get the problem settled in some way or other, and that means by some immediate lump-sum arrangement, such as will take the problem out of international and diplomatic relations as quickly as possible, once and for all.

The CHAIRMAN. We had a definite settlement once.

Mr. FAIRCHILD. Yes, sir.

The CHAIRMAN. If we make another one, would they want still another in a couple of months?

Mr. FAIRCHILD. I think, Senator, the trouble has been that the definite settlement made implied such a long series of annuities payable in the future. With the very best of intentions, and the most serious attempt to marshal all the essential facts, it was inevitable that any such settlement, depending upon such a long series of future payments, must run up against unforeseen conditions. No human being can predict the future 63 years in advance, or determine so long in advance the capacity of different nations to pay.

The present situation has led to the claim by our interallied debtors that they are unable to pay. I do not think I need go into a long discussion of the soundness of that claim. At any rate, the situation is a disturbing one, but I can say, frankly, that I do not believe we could go on for two generations, more or less, collecting this series of payments from these European nations.

What I should like to see done would be a decision now upon some terms of settlement which would wind the thing up once and for all. I do not mean cancellation, although that would doubtless imply considerable reduction in the amount collected. I think the removal of this disturbance from our international relations and our international economic situation, on the best terms on which a definite, once-and-for-all settlement can be made, is, after all, more important than the precise number of dollars which we are ultimately to collect.

The CHAIRMAN. Do you think France is unable to pay?

Mr. FAIRCHILD. No; I do not think she is.

The CHAIRMAN. She refused to pay her yearly installment, and then immediately loaned more than she was to pay us to another foreign country.

Mr. FAIRCHILD. Yes. That is very obvious. I am not one of those who accepts without resistance the plea of inability to pay on the part of at least some of these debtors—not at all. I am not one of those who is crying for immediate and complete cancellation. I am not one of those who believe that these are not bona fide debts which we are entitled to collect. I am simply recognizing what seems to be a fact that we are facing.

The CHAIRMAN. Suppose some other country—England or France or some of the other leading countries that were involved in the war—were in the position the United States was at the close of the war. and these countries involved in the war had to make a settlement with that particular country—for instance, France. Do you think that France would ever have agreed to the terms of settlement that the United States has finally agreed to?

Mr. FAIRCHILD. I am inclined to doubt that, sir. Great Britain, on the other hand, of course, has taken a very different attitude.

The CHAIRMAN. The settlement, of course, was made between her and us.

Mr. FAIRCHILD. Yes. Great Britain, of course, was the only other nation that was largely a creditor as well as a debtor.

The CHAIRMAN. France was owing Great Britain about the same as Great Britain was owing us.

Mr. FAIRCHILD. Yes; and from Great Britain's point of view a wiping clean of the slate would not have meant substantial loss, whereas to France it would have meant a substantial gain and to us a complete loss.

I think those are all pertinent facts. I have no desire to cast any reflection at all upon the justice and validity of the American claims, or to give encouragement to the idea that some, at least, of these foreign debtors are not able to pay.

The CHAIRMAN. I think, as a member of the commission, I received more criticism for the settlements that were made, claiming that they were adverse to the Government, than any other thing in my public life.

Mr. FAIRCHILD. There has been a storm of protest in America, as well as abroad, over the collection of these debts, involving an emotional appeal which, it seems to me, has very slight foundation in fact or logic.

I am glad you gave me the opportunity to make my position clear as to that, beside my present feeling that some new adjustment must now be taken up.

The one essential thing that I would emphasize is the importance of arranging it so that payments as between nations shall be cleaned up now and for all time. If an obligation is left between nations and private investors, that is a different matter.

The CHAIRMAN. I do not think that can be done any more fairly than it was done. The American commission went into every detail of the expenses the debtor government was under, its resources from every source, its ability to pay, and then gave the debtor country the advantage in the final settlement based upon that theory.

Mr. FAIRCHILD. I have every respect for the thoroughness with which that matter was then handled. The trouble is that we are dealing with human nature and human prejudices and human ignorance, human emotions, and there you are. You have a businesslike, sound, logical system, on the one hand, against misunderstanding and ill will and disturbance, on the other hand, and perhaps logic must give way to the practical situation.

In this connection, of course, it is obvious that the United States Goverment has in the past taken a strong stand in favor of movements looking to disarmament, the outlawing of war, and international good will and peaceful relations generally. I only want to suggest that a continuance of such efforts toward minimizing international rivalries and ill will represents a line of action which the Government may take to help restore business confidence.

Now, I want to refer to a matter which will doubtless be considered more controversial, and that is the restoration of the normal flow of international trade. In recent years there has been a development of protective tariff interference with the free flow of goods in international trade, which is threatening to deprive the nations of the world of the elementary advantages of international trade.

In this modern civilization we can not have the prosperity to which our modern system would entitle us without trade between nations. America is suffering with all the rest. One reason, it seems to me, why this present depression is so serious and long continued and partakes so much of an international character is because the modern, complicated development of international banking, international finance, and international credit is not compatible with the present artificial interference with the free flow of goods in international trade. Here, of course, I am touching on a matter of long-standing American policy, the protective tariff, and I suppose you can discount my views in the light of the equally long-standing attitude of economists generally in favor of freedom of trade.

If, at the present time, the United States could see this matter as the economists generally see it, and could come to realize that the prosperity of America, like that of every other nation, is being depressed by interference with the free flow of goods between nations, and might be restored, in part at least, by the allowance of greater freedom, then America would be in a position to exert a powerful influence. As the traditional exponent of high protective tariffs, America's leadership in a movement toward gradually reducing the shackles which tariffs place on international trade would at once be recognized and would, of course, exert a profound influence.

So I want to urge in all sincerity and earnestness that action by this Government which would serve notice to the business world that from now on there is to be greater opportunity to develop our export markets; that the restrictions upon the import of foreign goods are to be reduced, with discretion and sound judgment, of course, would offer encouragement to business and serve as one measure to restore that confidence in the business world which must precede economic recovery.

Senator HARRISON. In 1929 when we were considering the last tariff bill there was filed a protest by 1019 economists against the passage of that act. Did you sign that?

Mr. FAIRCHILD. Yes, sir; I did. There have been various other memorials presented to you on tariff matters which I have not signed because, for one reason or another, they were not worded in language to which I could subscribe.

Senator HARRISON. That seemed to be a very important one.

Mr. FAIRCHILD. That document I signed. I do think that we might be better off to-day if a measure carrying such high rates as that had not at that time been enacted.

The CHAIRMAN. Evidently, though, the amount of our importations compared with our exportations and the volume of the trade of the country and of the world is no different than it was before the passage of the bill.

Mr. FAIRCHILD. True; but no one can say from that what they might have been had the bill not been passed.

The CHAIRMAN. I can say that if there had been more importations and not an increase in exports, it would simply have taken the labor away from America, that is all.

Mr. FAIRCHILD. I can agree with that; but the position I take is that had there been more importations there would have been correspondingly more exportations.

The CHAIRMAN. But they have not fallen off any more than the business of the world has fallen off, and not as much.

Mr. FAIRCHILD. They need not have fallen off as much, I should say.

What the economists believe is that international trade is, in the last analysis, an exchange of goods for goods and services, and I think the public has come to learn that lesson as never before in the last two or three years, partly as a result of the widespread discussion of the interallied debt payments and how those could be handled. That being the case, I believe that artificial action which tends to prevent imports is, by the same token and in about the same amount, preventing the capacity of foreigners to buy our goods and so checking our exports. The payment of balances in gold is a small matter and a temporary matter. In the long run, if we will not buy the goods of foreigners, they can not buy from us; and we gain from both. We gain from the purchase of the foreign commodities for our consumers and from the expansion of the foreign markets for our producers.

When we are not talking about the tariff, and when we develop that as an elementary mechanism of international trade, it seems to present no question whatever, and I think that in our discussions of the tariff we are apt to forget these elementry principles of international trade summed up in the general thesis that every nation in the world gains both from its exports and its imports.

The CHAIRMAN. Based upon that, I should judge that you think we ought to have free trade.

Mr. FAIRCHILD. I think we should have free trade. I do not mean that we should immediately and ruthlessly sweep away all protective barriers which we now have. I have undertaken to emphasize the necessity of a careful, gradual change.

The CHAIRMAN. Your argument leads to that.

Mr. FAIRCHILD. It leads to ultimate freedom of trade; yes, sir.

Senator HARRISON. In reading that protest over now, in view of the circumstances and conditions that have come about since you signed that protest, do you apologize for any of the prophecies then made?

Mr. FAIRCHILD. No, sir; I do not apologize for any of the prophecies, although I do not pose as much as a prophet myself.

Senator HARRISON. Is it not a fact that most of the things have come about that you suggested might come about in the event of the passage of that bill?

Mr. FAIRCHILD. Yes, sir; I think they have.

The CHAIRMAN. Then, do you believe the condition of the world was brought about by it?

Mr. FAIRCHILD. No; I do not.

The CHAIRMAN. Then, how could you judge?

Mr. FAIRCHILD. I said a moment ago that I do not think that we can judge. I think Senator Smoot is right in suggesting that to ascribe all the present economic ills to our tariff policy would be distinctly a mistake. In fact, I do not think our memorial made any such extravagant claim as that.

Senator HARRISON. You think it just played its part?

Mr. FAIRCHILD. Precisely. All I should say is that among these various causes which are responsible for our present economic condition I would place artificial interference with international trade as one; and among the actions which we might take to start the business upturn, I would say some definite promise of relaxation of these shackles upon international trade would be one. But I disclaim any confidence in extravagant charges against the protective tariff, or the extravagant statement that all our ills are due to this one cause. Certainly not.

In fact, I might interject here that anyone who tells you that some one factor is the cause of our present economic depression, and that one simple cure will solve the whole problem, is talking from the basis of ignorance, at least. The problem is not so simple as that, and the many complex factors involved are just what make it impossible, as you gentlemen both have suggested, to pin a precise result to a precise cause. The problem is not simple enough to make that possible; and, as a conservative economist, I should certainly not want to be charged with any such extravagant statement as that would imply.

Another matter in which government, in performing its own peculiar function, could help is, in general, the putting of its financial house in order. I realize how seriously and laboriously and courageously you gentlemen have been for some long time now struggling with this matter of revenues and expenditures, the balancing of the Budget, and the international debt. No one, I think, realizes better than I do the magnitude of that problem, the continual recurrence of unforeseen events which have disturbed the calculations and the difficulties which the United States Congress, and this committee in particular, have to face.

All I need to say is that the business world will be terribly affected by anything which casts the slightest suspicion upon the financial stability and integrity of the United States Government, and that your efforts to reduce public expenditures in a sensible, reasonable way, without injuring necessary governmental functions, but by economy and wise discretion, making the cost of Government as low as it may be now, in recognition of the straitened economic circumstances of the people generally, will be appreciated.

On the other side of the question the necessity of taxes sufficient to meet the cost of government is obvious, and the necessity of making that tax system fair and equitable to all parties concerned. I think the business world to-day is distressed on account of the high burden of taxation, and distressed in view of threats of increased taxation, which may well be inevitable. On the other hand, I do not think the business world wants essential Government services to be impaired. Here we have the difficult problem of imposing the necessary taxes to meet expenditures, reduced as low as they may be without sacrificing essential public functions.

The CHAIRMAN. There is not any question that anyone who studies the situation in the way that you have can see many, many things that are impossible of accomplishment from a political standpoint.

Mr. FAIRCHILD. Yes.

The CHAIRMAN. For instance, there are $900,000,000 paid to soldiers of the war, many of whom never saw the battle fronts, and who are in as splendid health as they ever were. We are paying $900,000,000 a year to them. That would be a very good subject to handle, would it not?

Mr. FAIRCHILD. I am glad you raise that.

The CHAIRMAN. Do you think that if you were in Congress you would vote for its repeal if you had an organization as strong as the soldiers have to-day?

Mr. FAIRCHILD. What I would do if I were a Member of Congress is a hypothetical question that is certainly very difficult for me to answer. I do not believe my answer would contribute much to the progress of your deliberations. As an economist, however, and not a Member of Congress, I want to subscribe to what you have said, Senator, and to express my very strong feeling that sooner or later such expenditures as that must be squarely faced. There is a cry all over the country now for reduction of the cost of the National Government and yet here is one item which represents very nearly 25 per cent of the entire Federal Budget, besides which the reduction of salaries, the elimination of bureaus and offices here and there all together make up a relatively small sum. The time must come, I believe, when the public must face this matter, and face it in such a way that the Members of Congress need not fear that their political lives are jeopardized by taking a straightforward, honest position on such matters. After all, the public is to blame in the last analysis, and I am certainly not here to blame the Members of Congress for a situation which they may have every reason to think the public is demanding. But, after all, is there not something rather futile in talking about balancing the Budget and reducing the expenditures of the National Government when, by common consent, we must never mention the one item that constitutes about 25 per cent of the total?

The CHAIRMAN. That is the reason I brought it to your attention. I wanted to know how you felt in relation to it.

Mr. FAIRCHILD. Precisely. Of course, we all recognize that some of this $900,000,000 is very necessary, and is an essential expenditure for the care of veterans who actually did suffer in the war.

The CHAIRMAN. Nobody has suggested that that is not true, but a great proportion of it is paid to those who are just as well as they ever were in all their lives.

Mr. FAIRCHILD. I am perfectly willing to go on record in favor of a most drastic pruning of expenditures of that sort. I think the business situation will be improved by a rapid funding of the floating debt. A situation is arising there which is peculiar, anomalous in the extreme—a rapid increase of floating debt, issued at almost unbelievably low rates of interest.

These are, of course, made possible by a disturbed business and investment situation which you understand as well as I do, but sooner or later the floating debt is going to be very embarrassing, and I think there is a very real necessity for its funding into comparatively long-term obligations at the earliest possible time.

If I may turn for a moment to certain policies which I believe are not likely to promote economic well-being, I would suggest the futility of attempting to restore prosperity by measures aiming to keep up the rate of wages, for instance; the expenditures of large sums on public works with the idea of promoting employment of labor; by currency inflation, with the idea of increasing purchasing power; or by any of these drives to increase purchasing or stimulate production, which are coming about in popular discussion to-day. I do not want to weary you with details. You all know of the flood of propaganda going about the country now in favor of a whole list of panaceas of this sort. In general, I believe that they will be futile and will create more harm than good. In particular, I see no hope in measures aiming to dispense prosperity to special groups of the people, whether they be farmers or miners or manufacturers or war veterans I do not think that governmental action can give prosperity; and if it seeks thus by artificial means to dispense prosperity to a particular group, the advantage to that particular group is very doubtful. Whatever advantage is given must be at the cost of the rest of the community, and the incidental disturbances to the delicate adjustment of economic conditions may well be disastrous.

Again, I am not at all optimistic with respect to various plans which you are now hearing looking toward a greater control of industry by government. These plans come under such titles as "Social planning," "Social control," and so forth.

I am not one of those who would deny the authority and the obligation of Government to exercise regulation over private business where that is required in the interest of the public. But these proposals we are hearing now go beyond that, and look to a usurpation by Government of some, at least, of the functions which our present economic organization imposes upon individual investors and business men.

Again, there is a division of labor. The Government has certain things to perform and certain other things are left to private enterprise. Among those are the protection of the capital of the Nation and the guidance of business enterprise. Along with that power to direct and guide goes the obligation to accept the risks of business enterprise The Government, I think, can not usurp the direction while leaving the risks in the hands of private business men and investors, and there is great danger, I think, involved in these measures which would thus deprive industry of the right of control which it now has. Carried to the extreme, of course, it means a socialistic state

But there are many who, not wishing to go to that extreme, nevertheless see good to be accomplished at some halfway point by increasing the degree of social control which the Government may impose. Such measures, I think, should be looked upon with great care. They involve, in my opinion, serious danger of fundamental disturbance, and they are not calculated to inspire confidence and courage in the minds of those who are now in control of business.

In conclusion I would say that America will, without doubt, work out of this state of depression sooner or later, in some way, through the operation of natural forces; that to aid in such recovery the Government should seek, first, to perform well its own peculiar functions and to let the business world see that in this division of labor between Government and private enterprise, Government is doing well its own special part, and, secondly, to refrain from such ill-advised interference in the conduct of private business as may introduce a discouraging element and add to or at least not remove the present misgivings which are holding back the present restoration of economic well-being.

I do not think I wish to add anything further, but I would be happy to answer any questions which you may wish to ask.

The CHAIRMAN. Thank you, Mr. Fairchild.

## STATEMENT OF A. D. NOYES, JOURNALIST, NEW YORK TIMES

The CHAIRMAN. What is your business, Mr. Noyes?

Mr. NOYES. Journalist.

The CHAIRMAN. On a daily paper?

Mr. NOYES. The New York Times.

The CHAIRMAN. You may proceed.

Mr. NOYES. Senators, I have only a very modest contribution to the discussion of this absorbing subject. Most of its aspects have been thoroughly convassed in your committee's hearings; I shall try not to repeat what has already been stated better than I could state it. There are some considerations, however, bearing both on the cause and character of this depression and on certain current proposals to deal with it, on which perhaps it may be worth while to place emphasis.

Reaction of such scope and magnitude must have had a cause of corresponding magnitude and scope. The usual explanations of reaction are not sufficient. Overproduction on the eve of the crash of 1929 will not do. Overemployment of credit and overconsumption of goods in the speculative period may have been and certainly were highly aggravating influences, but they are not sufficient to have caused the momentous worldp henomena of 1931 and 1932.

If we ask where we shall find a cause which measures up to the magnitude of the resultant catastrophe, the answer is, only one such cause can be found in the history of the period. But it is sufficient, in the light both of reasonable inference and of historical precedent, to account for everything that has happened in the last three years, and that is happening now.

The European war was economically the most wasteful and most destructive of all wars in history. There were a greater number of nations engaged in it than in any previous war in history. The actual destruction, both of capital and material, was probably greater than in any preceding war in history. Its requisitions for war material were unprecedented in the history of the world, and the material bought in such prodigious quantities was used entirely for purposes of destruction. The scale on which such purchases were made, at the moment when workingmen were being drafted by millions from normal industry into army service, paralyzed the production of belligerent states for other than military purposes.

It did more than this. Since ordinary supplies were thereby heavily reduced in the war period, and since military supplies were purchased regardless of cost, the advance in prices was the most rapid in history. Roughly compared, the economists have estimated that average prices in England rose nearly 90 per cent during the Napoleonic wars (1790 to 1810), 132 per cent in the United States during the Civil War between 1861 and 1865, and 144 per cent even in America between August, of 1914, and May of 1920. With prices rising to such heights, and the war purchases mostly made with borrowed money on the basis of such prices, national and international indebtedness was increased on a geometric scale that has never been paralleled in the history of the world.

When the war suddenly ended, what was the prospect? The orders for war material ceased suddenly, at the moment when they were at their largest. In due course, production for peacetime purposes was resumed. It soon came to be in the aggregate exceptionally great. It was so, first, because people in the lately belligerent Europe were poor and had to repair their losses through urgent pressure of their products on the markets. But it resulted also from the fact that the very high prices were an inducement for such selling. Furthermore, even when production for peaceable uses was restricted, plant and facilities for production had been abnormally expanded by the insatiable demand for war material. But finally, and of great importance, it was so because scores of neutral communities, cut off in war-time from the necessary supplies which had previously been imported by them, had started up, on a scale previously unknown, production of their own in both agriculture and manufacture. Coming along with the almost overnight disappearance of the war orders, and with prices jacked up by the war to an almost unprecedented height, this combination of influences in the producing and selling market was certainly sufficient to explain a sensational fall in prices.

All this might seem to be so self-evident as to need no argument. Yet it has absolutely fallen into the background in recent efforts to explain the present hard times. Instead, discussion has begun which is based on the assumption that something must be wrong with the standard of value, a favorite catchword has been the "rubber dollar," for which the Labor Bureau index number could go up from 67⅛ at the end of 1914 to 167¼ in the spring of 1920 and down again to 62½ at the end of 1932. Change the standard, we are now informed, inflate and depreciate the currency, and all this wild variation will be corrected. Probably this attempt to find a cause which is not at all obvious—which does not, indeed, conform with the known facts—when there is, as we have seen, another and an entirely convincing cause in plain sight, is largely a consequence of the fact that prices did not return immediately to the pre-war level when the war was over.

We all remember the great uneasiness which existed at the end of 1918 over that possibility. But we know also that prices went still higher in the second year after the armistice; also that, 10 years after return of peace, a wild speculation for the rise broke out on all financial markets. It was based on the absolute conviction that prosperity could never be impaired—a belief which was incompatible with a 30 per cent fall in average prices such as has occurred. Even the very omniscient economic oracle Gustav Cassel, in his lectures of last year at Oxford, insisted that all the causes for the reaction since 1929 must be found in the events and circumstances of that period. "The idea that a great war must necessarily be followed by a crisis of corresponding importance," he told the Englishmen, somewhat superciliously, "is of course pure superstition."

If it is so, it is a superstition which has pretty solid grounds in history. Strange as the wild speculation and unbridled optimism of four or five years ago may seem, coming as it did in the face of inevitable readjustment from the abnormal influences of the great war, as a matter of fact it repeated exactly what has happened in every similar episode of the past. Every great war in history which has upset the world's economic structure has been followed by precisely the same succession of events. I need mention only the two most striking periods of the kind; perhaps we shall find that we are not confronted now with circumstances wholly unparalleled in economic history. One of these instances was the sequel to our own Civil War. A year of much confusion but generally of financial hopefulness followed the ending of that war in the spring of 1865. The spirit of reviving cheerfulness was arrested, suddenly, by the panic of 1866. This violent readjustment was recognized by every one as the penalty for the war. But the period of liquidation was comparatively short. It was the 1921 of that period. The need for replenishing stocks of merchandise exhausted in war time became urgent. Credit expanded again, and in 1871 and 1872 a world-wide speculation in stocks broke out, and real estate and foreign loans. In those years, as in 1929, markets talked of a "new era" in which the old-time reactions were never to recur.

The panic of 1873, eight years after the end of the Civil War, put a quietus on the idea that the full penalty for that immense waste of resources had already been paid. The subsequent depression lasted acutely during four years; in our country it was marked not only by nation-wide bank failures never exceeded in number, but by extensive money hoarding, by outright collapse of the real estate market, by agricultural distress, by suspension of payment on scores of foreign loans, by "bread lines" in every industrial city, and, more interesting still as a parallel, by the disappearance of accumulated fortunes, great and small, the reduction of thousands of previously prosperous individuals to a condition of relative poverty.

Senator HARRISON. Quite a similar situation to the present.

Mr. NOYES. Absolutely. The parallel is almost exact.

Senator GEORGE. It might be interesting to note at that point that you had a dissimilar monetary base at that time.

Mr. NOYES. To that I shall refer a little later.

The other instance to which I wish to call your attention was what happened after the closing of the Napoleonic wars, a little more than a century ago. They resembled more closely than any other episode of the kind, in the multitude of nations involved, the recent European war. It is not so easy to obtain exact data of the period's economic movement, for historical writers in those days were apt to regard politics as the only theme suited to the dignity of history and financial and industrial movements as a minor incident. But some of the contemporary memoranda show that the peace of 1815 was immediately followed, first, by a period of much economic confusion, then, a year later, by "very great depression in the prices of nearly all products and in the value of all fixed property, entailing losses and failures which marked that period as one of extensive suffering and distress." This postwar reckoning also was brief. There were two years of gradual revival, followed in 1824 by a furious speculation for the rise, based on belief that the reaction from the war had been completed and that consumption was outrunning production.

At the close of 1824, the economist Tooke informs us—

> The example of successful speculation became infectious. The possibility of enormous profit by risking a small sum was a bait too tempting to be resisted. Crowds of individuals of every description—politicians, lawyers, physicians, divines, philosophers, with women of all ranks and degrees—hastened to venture some portion of their property in schemes of which scarcely anything was known except the name.

This has a familiar ring. Foreign loans were taken at London with reckless readiness. Tooke cites companies organized and placed on the market to develop pearl fisheries in Colombia, mines in Mexico, Brazil, and Peru; not to mention an "association for cutting a canal across the Isthmus of Darien." He adds that "in all these speculations only a small installment, seldom exceeding 5 per cent, was paid at first." Yet many of the shares rose to premiums as high as 40 per cent. This ended in the world-wide panic of 1825, perhaps the most severe that had visited Europe since the South Sea bubble, and possibly worse than our own collapse after 1929.

Senator HARRISON. How long did that period of speculation last?

Mr. NOYES. It is a little difficult, Senator, to put your finger on exactly the period, because the account is not chronological. I should suppose, however, from the account, that in the middle or towards the close of 1823——

Senator HARRISON. It lasted about a year and a half.

Mr. NOYES. It lasted about a year and a half. At any rate it did not last more than a year and a half in a violent form, as far as the records show.

There was a run upon practically all banks in Europe and America, followed by widespread suspension of banks and business houses.

Hoarding of money followed. In the memoirs of the period the four years of depression which ensued were recalled as a time of grinding poverty. It was plainly recognized when the hard times at last ended, that the true penalty for the waste of the Napoleonic wars had been paid by this depression. coming 10 years after the peace of Paris.

I may have dwelt at too great length on these invariable parallels of history. They seem to me, however, of great importance, because they show that the course of events since 1918, and especially since 1929, does not present isolated phenomena, but that it is, in time, order, and character of sequence, precisely analogous to what followed other devastating wars. They show, also, as we may learn from the subsequent record of history, that the nations which suffered from those other disheartening depressions—the United States especially—emerged from them, and entered eventually on a new chapter of economic progress and prosperity. They show something else, if the full story of these older depressions is traced; namely, that every one of these older depressions was brought to its end, not through rash experiments with the currency, but through the eventual assertion of the principles of sound money and the gold standard.

Whether the present depression is or is not, as many people contend, the worst in the world's history, is debatable. It is easy to assume too much in that regard.

Senator HARRISON. Are you giving to the committee anything specific that the governments did do at those particular times?

Mr. NOYES. That I am coming to. I should say, however, with regard to what the Governments did in the way of constructive legislation, I have not gone extensively into that. I realized I was taking your time at too great length in that.

Senator HARRISON. But did they do much?

Mr. NOYES. No. It was the period of laissez faire. There are some things to which I shall call attention, however, that they did not do, although they came very near doing.

But there is at least this point of useful interest in such historical comparison—that no one of these older periods of acute depression was ended by inflation of the currencies. On the contrary, the path out of all such depressions was the path if maintenance or restoration of a sound money standard, and rejection of the expedients of inflated currencies. This was in spite of the fact that, on every successive occasion of the kind, exactly the same campaign for currency inflation or depreciation came into the foregorund as that which has lately seemed to have captured popular imagination.

The organized movement of 1894 and 1896 to inflate the existing currency through the free coinage of silver is a very dramatic chapter in our financial history. The closely-fought presidential contest over the issue followed even wilder political declarations, one of which demanded the immediate doubling of our money issues. In the hard times from 1873 to 1877 the debates even of Congress were largely given up to proposals ranging from the indefinite postponement of gold resumption (we were then still on the "paper standard" of the Civil War), to the free coinage of silver or continuous paper inflation. It was the author of the free-silver-coinage bill of those days who declared in the House that, if his silver plan were not approved, "I am in favor of issuing paper money enough to stuff down the bondholders until they are sick." After the panic of 1866, public discussion ranged from declarations for paying off the Government bonds in depreciated paper to suspending interest on those bonds and applying the amount thus saved to bond redemptions.

As far back as the great depression in England after the Napoleonic wars, Tooke tells us that one strongly influential party was for degrading the gold content of the sovereign 20 per cent and that another would have gone as far as 40 per cent. There seemed to be highly responsible opinion for both expeients. But Lord Ashburton remarked afterwards: "Much might have been said for putting the pound sterling at 15 shillings, but the strong opinion, the moral feeling, was the other way." Recourse to such proposed expedients was never adopted on any one of these occasions in the past. In all of them, the sound-money standard was vonvicated after the struggle over currency experiments. The depression after 1825 ended with the pound sterling restored to its old gold parity, which it maintained through the subsequent century. The reaction after 1866 passed even without the payment of bonds in depreciated currency and without new currency issues. The confusing turmoil of proposals to alter the currency, brought up between 1873 and 1878, ended with the resumption of specie payments. The free silver coinage movement was defeated in the election of 1896, and the gold standard act which now prevails was adopted in 1900.

What were the results? Well, the facts are part of modern history. Great Britain became the world's money center of the nineteenth century, sterling a symbol of financial soundness, the world's floating capital flowed to London, prosperity returned to Europe. The 4-year depression after 1873 lasted as long as plans for currency inflation and depreciation seemed to prevail in Congress, but prosperity returned after resumption of specie payments in Janaury, 1879, and an era of great economic progress ensued. In 1894 and 1896, business was at times almost suspended in this country while the contest over the currency was in progress. The defeat of free silver coinage at the November election of 1896 restored public confidence; supplemented afterwards by the gold standard act of 1900, it ushered in one of our most famous eras of prosperity.

I think I may safely challenge any instance in which a period of severe economic depression has been brought to an end and prosperity restored through the expedient of inflated or depreciated currency.

This quite unbroken record proves in the first place that return to prosperity, which always came eventually after the other periods of depression had run their course, did not in any case result from inflation or depreciation of the currency. In the second place, it proves that the positive rejection of plans urged for such purposes was in due course followed by returning prosperity. This at least suggests the question whether the seeming deepening of depression at the present moment may not be consequence as well as cause of the prevalent talk about currency experiments.

And why not? No business plans are possible while the standard of value is at stake. Of necessity, the future is wholly obscure. It is not a question of one step in currency deflation or depreciation; it is the teaching of all experience of the steps that follow. All landmarks by which the course of the financial ship has hitherto been chartered would seem in danger of being swept away. The disastrous experience of other well-known episodes of currency inflation is bound on all such occasions to impress the mind of the careful business man with a sense of utter uncertainty about the future, if not of despair about the present.

I know that the advocates of such experiments are usually careful to talk about "controlled inflation", "a little inflation" such as would suffice to cause recovery in general prices. But there is in my judgment one serious fallacy involved in all such expectations. No one denies that, at some point, inflation of the currency will drive up prices. It will do so, if the inflation is carried far enough, for the reason that the gold value of the currency itself will depreciate and that prices, measured in that depreciated currency, will rise proportionately.

But how is the additional currency to be put into circulation? Our present Federal reserve system, established in 1913 with the utmost care and in accordance with the teaching of all financial experiences, provides the mechanism for an increase in outstanding currency if the requisitions on member banks by their customers, in the way of ordinary business, show need for it. If the business grows more active and prices rise, the genuine need for more hand-to-hand and pay-roll currency is automatically met. But the "inflation plan" puts the cart before the horse. It would give us the relief first and wait for the expression of the need for it. When people talk of voluntary inflation, what do they mean? Certainly not the requirements of business; for if those existed, they would operate automatically for increase of outstanding Federal reserve notes. But if the member banks did not ask for the authorized new currency, how would it be circulated?

The answer is that currency of this sort can not be circulated unless the Government itself directly puts it out. The Government can do that only in one of two ways: Through making a flat donation of the money, or else through issuing it to meet Government expenses which would ordinarily be covered by loans and taxes. But this would be merely what used to be called a "forced loan" without interest, such as has heretofore been utilized only in the extreme financial emergency of war time. That this is so, is illustrated by one of the bills proposed at this session, which directs the Secretary of the Treasury to pay the full principal on veteran's adjusted-service certificates, estimated at \$2,400,000,000, and "to issue United States notes to the extent to make the payments." This would inflate the volume of United States notes almost exactly sevenfold, and the total supply of all kinds of money by 42 per cent.

But it would mean more than that. Assuming that the purposes for which the new United States notes were paid out were valid expenditure of the Government, it would mean that the Treasury was meeting its deficit in virtually fiat money—which is precisely what Germany undertook to do between 1918 and 1923. In one respect indeed the experiment would be more dangerous even than Germany's because Germany at the start endeavored to issue the currency without raising prices, whereas the raising of prices is avowed as a primary purpose in such American proposals as I have referred to.

If the new currency issues on such a basis did not result in depreciation of the currency—and we are told that it would not so result—then it is not easy to see how they would automaticaly raise the general price level. But if prices were not raised, we should infallibly encounter proposals from the same sources for more inflation, and at some point currency depreciation would quite inevitably occur. Then prices, measured in the depreciated paper, would undoubtedly rise. What would be the limit fixed by the "controlled inflation"?

Another bill of this session directed the Federal reserve, rather footlessly, so to manipulate its loans and currency issues as to restore the prices of 1929 Another objective point is open to the minds of aspiring inflationists, but if the Government endeavors to adopt the policy of meeting its deficit in forced issues of new paper, no level of depreciation can be positively fixed

I have said that Germany struggled at the start against the violent rise of prices; nevertheless, such was the rapidity of currency depreciation when the huge Government deficit was habitually met with fiat money issues, and when the cost of running the Government increased along with the rise of prices measured in the depreciated money—so rapidly did the currency depreciate that in November, 1923, the Frankfurter Zeitung's "index number" of average prices in Germany, based on the average of 1914 as 1, was figured out as 49,071,500,000 No one imagines any such result under any combination of circumstances in the United States. But the road of forced currency inflation and currency depreciation is always the same The consequences differ only in degree In any case the Government trying the experiment will have cut loose from the safeguards that two centuries of experience have proved to be indispensable.

To sum up: The cause of our present distresses is the prodigious waste of the great European war, the rise of prices to a fantastic height as a consequence of war conditions, the incurring of enormous indebtedness at the high level of prices, followed by the fall of prices to the pre-war level, as has always happened after a great war, and by difficulty in meeting debt incurred at the higher prices. Undoubtedly the resultant situation has been very greatly aggravated on this occasion (as on the other similar occasions to which I have referred) by the extravagance of speculation which immediately preceded the crash

We talk much nowadays of the folly and recklessness of our foreign loans. But it must be remembered that our country's position as a world creditor after 1918 made it inevitable that the balance should be struck on our foreign account either through taking goods in payment from the debtor nations or else through advancing American capital in great sums to the governments and industries of the countries which are indebted to us. Payment in goods alone seldom meets the requirements of such circumstances, and in our own case we pursued the policy of excluding imports from abroad. Not alone our tariff but the fact that in primary materials we are nearly self-sufficient stood in the way of it on this occasion.

By far the greater part of our foreign loans from 1921 to 1929 were sound But one reason why the speculation from 1927 to 1929 was the immediate occasion, not only for the crash in our markets during 1929, but for the European crash of 1931, was that the insatiable demand of our own markets for credit to use in the wild speculation pulled the supports from under financial Europe. It was not alone that our foreign lending came to a complete stop In 1929 our extravagant money rates were actually depleting Europe of its own necessary working capital. Our own folly pulled down the foreign as well as the home financial structure. It immensely complicated the difficult readjustment which was in any case inevitable as a later consequence of the war.

To point out what were the causes of the present difficult position will not necessarily show how we are to emerge from it. Congress has pursued already the path of protecting our railway and fiduciary industries against the immediate strain This can not last indefinitely. But the next step must be adapted to the circumstances that arise. The widening of the provisions for reorganization of companies which shall have been brought to the necessity of reconstruction of capital is one exceedingly useful recourse. One of the impressive phenomena of the day has been the frank conference of corporations with their creditors, with the purpose of lightening the load of liabilities by mutual consent. This process may call for clarifying legislation.

That the Federal Budget should be balanced is an imperative necessity which every one recognizes.

To deal with the larger influences which have complicated the already tangled situation, the approach must be international as well as national. At the moment, not only are the orderly processes of international finance and trade blocked by the action of frightened governments, adopted with the mistaken idea that they were protecting their own countries by shutting out normal intercourse with others, but an utterly disordered conception of the underlying principles of a sound money standard has permeated countries which it never before has touched. If there was ever need for a world economic conference with a purpose to find the way out by frank and honest exchange of views, it is now. The United States, still the richest Nation of the world, would naturally take the leadership, because it is able to offer concessions of its own, both on the American tariff structures and on the intergovernmental debts.

The time will come, I can not help believing—after we have struggled out of the financial morass as we have always struggled out of others nearly or quite as deep—when the most astonishing recollection of the period will be the apparently willing ear that so many well-meaning persons have lent to proposals for degrading the American currency.

Senator HARRISON. Mr. Noyes, you have presented a very excellent paper. But may I ask you, in 1928 and 1929 when we had this wild speculation did you have an idea that the crash might come?

Mr. NOYES. Why, it is very easy to claim that one foresaw it. I have met large numbers of people who were extremely noncommittal at that time, who looking back at it from this background are sure now that they were sure then that it would all happen. Consequently I do not wish to claim too much.

I will answer your question in a broad way, however, by saying that the speculative markets comprising chiefly real estate and stocks were headed for a very severe reckoning, I think I can claim not to have doubted, during the progress of that speculation. I shall have to confess, however, in common with everyone else, however experienced and enlightened, that I did not foresee the scope of the consequences which have followed.

Senator HARRISON. But you did believe that there was to be a reckoning?

Mr. NOYES. That there was to be a reckoning was—well, I dislike to claim anything of that kind.

Senator HARRISON. The reason I asked the question was that I had understood you had entertained that viewpoint in 1928 and 1929

Mr. NOYES. Well, I presume that as financial editor of the Times I was singled out as the most unpopular member of the community at all in touch with Wall Street. And at times the attitude was unpleasant personally—altogether dislikable.

Senator HARRISON. Well, you are very modest in your statement.

The CHAIRMAN. Thank you, Mr. Noyes.

Mr. W. W. Royster.

## STATEMENT OF W. W. ROYSTER, CHAIRMAN OF THE RAILROAD EMPLOYEES' NATIONAL PENSION ASSOCIATION, CHICAGO, ILL.

The CHAIRMAN. State your name, your address and your position for the record.

Mr. ROYSTER. My name is W. W. Royster. Chairman of the Railroad Employees' National Pension Association, 341 East Ohio Street, Chicago.

I am a locomotive engineer in active service. I am a member of the Brotherhood of Locomotive Engineers of nearly 30 years' standing. I have been chairman of the Minnesota State Legislative Board of the Brotherhood of Locomotive Engineers for the past 20 years and was chairman for 16 years of the Railroad Brotherhood's State Legislative Board of Minnesota, composed of the Brotherhood of the Locomotive Engineers, Order of Railway Conductors, Brotherhood of Locomotive Firemen, and Enginemen and Brotherhood of Railroad Trainmen.

I am national chairman of the Railroad Employees' National Pension Association, located at 341 East Ohio Street, Chicago, Ill. This is an association of all railroad, express, and certain sleeping-car employees of the United States, irrespective of positions or craft affiliations, organized for the purpose of promoting a retirement pension for the transportation worker. Perhaps more than 98 per cent of our dues-paying membership are members of some one of the 21 standard railroad labor organizations.

There is pending before the Interstate Commerce Committees of both Houses of the present session, bills S. 4646 and H. R. 9891, introduced by Senator Hatfield and Congressman Keller, respectively, which provides for a retirement pension for transportation workers after 30 years of service or attaining the age of 65 years After three years of service and completing 30 years, or attaining age 65 years, each employee is credited with 2½ per cent of his average wage to be multiplied by his number of years of service, but in no instance shall a greater number of years be used in such computation than 30 so the maximum percentage will not be greater than 75, and the greatest amount of such maximum percentage shall not exceed $300 per month. This bill covers every transportation employee from the president of the railroad to the least-paid employee It is to be financed by such an indentical percentage as is necessary to meet the pension roll, levied on the operating revenues of the transportation industry and the wages of the employees. So the wages of the industry and the wages of the employees afford a source to be taxed to provide a retirement pension for the worker. No part of a wage in excess of $400 per month would be subject to a tax. This, briefly, is the skeleton of the bill.

Mr. Chairman, as a citizen of many American generations and as national chairman of the Railroad Employee's National Pension Association, it affords me great pleasure to offer our suggestions to your honorable committee of a cure for the so-called depression, which we interpret as an industrial revolution.

During the past 150 years we have developed the confines of the nation. In that process we have constantly made use of machines and their myriad improvements to produce the people's needs. Man power production has been increased many fold, to such an extent that the people's needs are produced with little effort. By reason of the use of these multiproducing machines which displace workers we have to-day an army of more than twelve million workers who are unemployed. These unemployed who with their dependents number nearly forty million people—one-third of the Nation's population, have no job nor a wage and consequently can not buy the product of the machines. Without purchasers of the products the machine is idle. That is the condition to-day which we call "depression." It is not the fault of the worker, the machine or a lack of need of the Nation's production. It is a lack of a wage in the pockets of the worker. When a machine is installed in industry it displaces workers. The cost of the machine is charged to capital account. The savings accruing by reason of displaced workers goes to pay interest and dividends on the machine. In effect we have the condition of disemploying the worker and putting the dollar to work. The worker is in competition with the dollar for a job. The dollar gets the job. When the dollar displaces the worker it is a matter of momentous concern to the people. The dollar has displaced the worker by reason of which hunger, want, misery and dispair confront us. It is the work of the Congress to correct it In doing so be sure to preserve the machine and make it a benefit to the people instead of a curse. When the cost of the machine is charged to capital account it has the effect of constantly expanding capital structure to such an extent as to impose unbearable capital charges on industry.

To meet these charges, the price of the product must be raised or employees be disemployed and the same work be performed with fewer employees. Competition keeps prices down and battles rage to maintain wage schedules, with the result that fewer workers are employed, the savings of which are used to pay "wages" to dollars employed in capital account. Most of these dollars in business capital account are bogus dollars known as watered stock. The use of watered stock is racketeering for the purpose of hijacking the public. In comparison Al Capone is a miserable piker who risks his life and liberty for a few paltry thousand dollars while big business brazenly steals millions of dollars from the people. See Samuel Insull, who expatriated himself after robbing the people of more than two thousand millions of dollars. Note the testimony of Chairman Mitchell and President Reutschler, of the National City Bank, how their investors were deflated of three thousand millions of dollars. How bland and suave they are in telling it to the committee in such a way as to imply: What business is it of yours and what are you going to do about it? The above-cited practices are being practiced in thousands of different ways throughout the country without regard to public welfare. It is your business to regulate all matters that affect public welfare in any way and make it beneficial for the public.

The industry of the Nation can afford a standard of living for all of the people better than $5,000 would have afforded the average family in 1928. The industry of the Nation was instituted to provide the people's needs. The people man the industry, consequently by reason of that operation and the consumption of its products, it is subservient to the people's welfare.

Governments are instituted by men to promote the public welfare. All functions of the Government are subservient to public welfare. It is the basic clause of the Constitution of the United States. No other clause is its equal or matches it in importance. Every part of the Constitution was written for the purpose of promoting public welfare. It is the duty of the Congress of the United States to so regulate the conduct and industry of the Nation as to promote the social and economic welfare of the whole people. That you may do that very thing I respectfully refer you to the principle in the Hatfield-Keller retirement pension bill S 4646 and H. R. 9891. Bear in mind that the industry of the Nation can and must support the people.

Enact legislation which will afford a retirement monthly pension adequate and sufficient to maintain a standard of living such as $150 will provide for a man and wife and for single persons what $100 will provide, to heads of families and single persons who have attained 65 years of age. Make retirement compulsory at a to-be-determined age such as will put to work in the Nation's industry all who at that time are unemployed. This will obviate the need of unemployment insurance and will insure the stability of the Nation. These prospective pensioners who have served a lifetime in the Nation's industry will be afforded a means with which to live a proper standard, they will be a power in the purchasing market consuming the Nation's goods, they will be an asset to their respective communities, they will carry their end of the economic log. The job they will have vacated will be filled by men now in the bread lines. The most of these, victims of the evil administration of our economic affairs, are between 25 and 50 years of age. Their homes are broken up and in many instances their children are scattered in four ways. These people are the most important of all the American people. They should have jobs and wages. Their homes should be reestablished and their families gathered together. Their children should have educational and cultural opportunities to fit them to carry the torch of enlightenment and civilization in their generation. That these things may be done they must have a job and an adequate wage. By the use of machines such a wage will be insured. The use of newer and labor-saving machines is to be encouraged.

We have another factor of unemployment that comes to us constantly. Our young men and women attaining 21 years of age are looking for an opportunity to serve to earn their economic needs. These young people are eager and ambitious to serve but there is nothing for them to do. Why isn't there something to do? The wants and needs of the people are unsatisfied. The means of producing these needs in great abundance is present. Why may they not be used? Must we tell them, our children, that a "tribute" must be paid to certain persons, like the tribute that was demanded of our commerce by the Tripoli pirates, before we can satisfy our economic needs? How will we respond to our children's indictment of us for our incompetence of self-government? We are competent to govern ourselves. We have the intelligence and wisdom. Pension off the older people and keep the younger people at work. As a condition of unemployment develops lower the retirement age enough to absorb it Make use of the inventive genius of the people by using labor saving devices. As these machines are installed in industry charge their cost to operating expense thereby writing off their cost as soon as possible. Deflate the capital structure of industry by at least 75 per cent. It is mostly water anyway. The people who would suffer by this will not be as badly off as the many millions of other people who have been deflated 100 per cent and who in many instances have lost their lives. They should not complain because, if matters continue as they are, a revolution is in the offing. We don't want a revolution. We should have intelligence enough to avoid it. Establish sinking funds to pay off all capital accounts in 10 years. This can be done at the rate of 2½ per cent annually. Revise the inheritance and gift laws so all estates revert to the Government. Why should an heir be endowed with the sweat and brawn of the people? They are no better or no worse than the common people. Legislate at all times in the interest of the whole people and do not forget that "public welfare" is the basis of the Constitution.

With such laws in effect the whole people would have the means of living a proper standard The wheels of industry would spin as they never turned before Our home market which is usually referred to as consuming 90 per cent of our production would be trebled and perhaps quadrupled. Our children would have every educational and cultural opportunity to fit them for citizenship Unemployment, the producer of poverty and the breeder of crime, will be wiped out by affording a job and wage for all persons. This legislation will afford equality to all, economically as well as politically. It is of the utmost importance that it be enacted immediately to save the Nation. It is practicable, equitable, and fair to all persons and is consistent with the basis clause of the Constitution of the United States of America.

The CHAIRMAN. Thank you, Mr Royster

We will now hear Mr. Robertson in executive session. This afternoon we will hear Mr. Weir and Mr. Smith, at 2 o'clock.

(Thereupon, at 11 25 o'clock a. m., Monday, February 27, 1933, the committee went into executive session, for the purpose of hearing Mr. Robertson, after which an adjournment was taken until 2 o'clock p m. of the same day.)

AFTER RECESS

The committee reconvened at the expiration of the recess at 2 o'clock p. m.

Present also: Senator Reed.

Senator REED. The committee will be glad to hear your statement, Mr. Weir.

## STATEMENT OF E. T. WEIR, CHAIRMAN NATIONAL STEEL CORPORATION, PITTSBURGH, PA.

Senator REED. Will you please state your position?

Mr. WEIR. I am chairman of the National Steel Corporation, of Pittsburgh.

I come here not to present to you new theories of government or economics nor to propose legislation, because I believe it is within the wisdom of this committee, after full hearing of the case such as you are now carrying on, to work out the details and take such definite action, both with and without legislation, as will be important in furnishing the leadership, which must come from the Federal Government, in restoring confidence to this distressed Nation. I am here simply to give you the opinions and experience of a business man, from daily contacts with situations relating to the present position of both capital and labor.

The causes of the depression can very definitely be traced to the World War because the seeds of terriffic inflation were sown therein both mentally and practically. Prior to the war—in 1914—conditions in this country were what might be termed "normal." There was slight hesitation and some little reaction from 1913, but nothing abnormal in any way. This is indicated by bank clearings of the United States, as follows: 1911, $160,000,000,000; 1912, $174,000,000,000; 1913, $170,000,000,000; 1914, $155,000,000,000.

At that time—1913–14—this country was on a scale of living much lower than that developed later because wages, salaries, dividends, and earnings generally were on a modest scale; and while people were beginning to reach out for better living conditions, more of the luxuries, and a greater percentage of necessities, yet it was not a well-defined movement—only the beginning. This is indicated by the trend of automobile production, which was, in 1911, 210,000 cars; in 1912, 378,000 cars; in 1913, 485,000 cars; and in 1914, 569,000 cars, these being the largest annual productions up to the dates mentioned.

Following the beginning of the war, we had a growing demand for materials for shipment abroad, and European money was poured into the United States both in the shape of gold and liberal credits extended to them by our own banks. When we entered the war, this developed into a great boom in materials.

Credit inflation on an enormous scale occurred as a result of putting into circulation nearly $25,000,000,000 of new credit and money, as indicated by the increase in our Federal debt from approximately $1,000,000,000 at the beginning of the war to practically $26,000,000,000 at its termination.

After the war, while we had a short period of hesitation it was only temporary because we had unlimited money and credit, and there was great demand for materials as a result of war destruction and failure to maintain standards during the fighting period; and tremendous demand for new buildings of all kinds, including homes. Also, of course, the appetite of the individual for better things and more of them had been keenly whetted so that our great activity and prosperity carried on. Practically every one was employed who was willing to work. This movement carried on into 1928, by which time it had grown to such proportions and prosperity was so firmly fixed in the mind of every individual that even sound thinkers, bankers, business men, statesmen, and economists came to the conclusion we had come into a new era and never again would we suffer from the privations of panic and depression.

Thus developed such confidence that it carried us into the great security boom of 1929. At that time there was no limit to values. Everybody wanted to buy with no one inclined to sell, and paper profits accumulated every day. No real effort was made to stop this mad scramble to build up sensational but ridiculous values. State and municipal governments went into riotous spending and the issuing of new securities for all kinds of projects, some of them good and many of them foolish. Governmental organizations grew in size and cost. People paid taxes without objection because they had the money or could borrow it, and having large paper profits felt the taxes were conservative and within their ability to pay. Banks loaned money with very little consideration, making it easy for people to go into debt to a degree beyond wisdom. Then we reached the climax. Europe began to sell our securities; some of our large holders at home began to dispose of their holdings, and the market became glutted and we had the first radical break in prices. This started the downward movement because practically everybody was in debt, their collateral was over-priced, and when the decline took place it was but a short time until the available collateral was entirely exhausted and then the banks proceeded to sell in order to protect themselves.

Also, while there is always some inequality in the distribution of income between capital and labor, the unusual conditions as recited above accentuated this and there is no question but that during this period the percentage that went to capital was considerably in excess of a fair division. This had its influence on the breakdown and on the extent of the depression.

The above are the causes for the depression; the seeds go back absolutely into the war and responsibility for this movement can be placed as an additional cost of the World War.

The importance of the connection between the causes as given in the above recapitulation and the effects as outlined in the following remarks is in the fact that through the great inflation and disturbed conditions of the whole world as a result of the conflict that lasted over four years there was produced an entirely new and unknown situation with every country in the world; there was thrown into use enormous credit inflation; and from the destructiveness of the war industrial activity was stimulated more extensively than in any previous history, which produced the thought that prosperity was a permanent factor and resulted in building a top-heavy structure which, in the leveling-down process, has carried us into a state of chaos and depression unprecedented.

We have now passed through more than three years of continued liquidation of values, prices of commodities, earnings of labor and capital, and are finally where the volume of activity in the country is so low as to leave us nonsupporting Practically all the people have suffered severely, and are worn out not only in their resources but in their patience. I believe that further liquidation now along the above lines will be extremely dangerous and, also, that it is unnecessary. People in all walks of life are in sore distress and uncertain in mind as a result of the multitude of cure-all panaceas, proposed legislation, and chaos from which, so far, little that is constructive has come. More than 11,000,000 of people are without employment and other millions are so partially employed as to not earn enough to provide a living, and without as yet stopping liquidation. Certainly of a necessity we are now where the paramount question is the developing of constructive measures and deciding on what basis the upbuilding can be started.

I can not emphasize too strongly the critical situation which exists among the wage earners in all lines of activities, and which is daily bringing about the breaking of the standard of living that we have secured through years of earnest struggle I am firmly convinced the main consideration now is the building of confidence in the fact that we have seen the worst and that violent and forced liquidation is ended. To attain this, as a beginning confidence in our financial institutions must be established. There is nothing that so undermines belief of the individual and corporation in the present and the future as bank failures, particularly the large ones which affect wide agreas and which tie up money of the individual and corporation so that neither one can do business After these years of depression, the important thing has become the "bread and butter" question and the necessity of actual cash for daily use. To those who have resources—and there are still millions in the country, although many such reserves may be small and growing smaller each month—the fear of tying up of these reserves is so predominant as to be a point of most importance. The situation that developed in the State of Michigan within the past two weeks has done untold harm, has broken down confidence in all sections of the country, and reestablished fear of widespread bank failures.

Therefore, I believe it is a fundamental and important necessity that the Government, which after all is the only power in the country to-day that has sufficient resources, should protect the banking situation where possible failures are of such magnitude as to break down confidence This can be done through the Reconstruction Finance Corporation with Government funds, and it must be done on a basis of liberality in estimating the value of securities put up as collateral, because where these situations are not protected the loss to the country at large through failure to protect them will be many times greater than the possible loss than could come to the taxpayer in keeping open for business daily necessary banking institutions.

Senator HARRISON. Have you given any thought, Mr. Weir, to the proposition of guaranteed bank deposits as a temporary proposition?

Mr. WEIR. Yes, Senator.

Senator HARRISON. Do you discuss that in your brief?

Mr. WEIR. No; I do not. I can not subscribe to that.

Senator HARRISON. You think the better way is through the Reconstruction Finance Corporation?

Mr. WEIR. Meeting the emergency situation.

Senator REED. What are your reasons for disapproving the proposed guarantee of bank deposits, Mr. Weir?

Mr. WEIR. The guarantee of bank deposits, if inaugurated, would be, to my mind, almost a permanent thing. Once it is established it would be hard to eliminate it. It would destroy, I think, or hurt our credit the world over, to undertake to guarantee $40,000,000,000 of bank deposits. Also it would certainly put a premium on bad banking.

Senator REED. Suppose we made it temporary, for a year only. What would be the situation, say, in the twelfth month of that year? Would there not likely be a sudden run on the banks in anticipation of the expiration of the guarantee?

Mr. WEIR. I think that is right, Senator. The banks of this country are sound, as a general thing. Their trouble now is lack of confidence and uncertainty on the part of the depositors, which create these drives and bring down the liquidity. Assets which are valuable and will in time pay out many times over, of course, are impossible to dispose of now.

Senator HARRISON. Do you think confidence would be restored to the depositors, with moratoriums already having been declared in two States, through the policy that you suggest, of the Reconstruction Finance Corporation making advances?

Mr. WEIR. I do not understand that the moratoriums have been the result of the policy of helping the situations. I think that in the State of Michigan the moratorium could have been prevented by liberally loaning to the institutions there. Then, of course, it would not have spread into other States, because if one State has a moratorium, naturally the people in the adjoining States fear a repetition of the same thing.

Senator HARRISON. It has come to our knowledge that there was a very liberal policy of loans or advances upon the part of the Reconstruction Finance Corporation in the case of the two banks in Michigan, and that it was the failure on the part of certain stockholders there to come to the rescue with a very slight amount that they were asked to put up.

Mr. WEIR. I think the policy in connection with these banking situations that have been in distress must be very liberal. It must be to the point where the protection of the situation is the important matter. In view of the fact that this was the first situation that developed, while some of the large depositors there may not have done their part in protecting the situation, I think now in other districts the large depositors realize the importance of this, to the point where you will find that they will do their part. But the basic support must come from this Reconstruction Finance Corporation money.

Senator HARRISON. I agree with you thoroughly in your contention with reference to loans from them.

Mr. WEIR. I do not think that the situation has developed yet so far as to make it impossible to stop it. I think the resources of the Federal Government can be used now to prevent it from going further. I think that is very important to-day, Senator.

Should the Government follow out this policy, in a short time the fear of bank failures would pass and the beginning of permanent and secure confidence develop. Carrying out of this move is not a matter of politics. Whereas there may be criticism and the claim made it is protecting the rich, the sound facts are that it is the greatest protection to the greatest number of wage earners, small depositors, and industries that are employing labor.

I can not emphasize too strongly the necessity for this banking protection because no improvement can possibly be expected, in fact, I fear we will sink further, without the assurance that the banking situation of this country has the Federal Government behind it in an aggressive way.

Much harm has been done by publication of loans made to institutions by the Reconstruction Finance Corporation because it has created the impression in the minds of many people that because a bank has borrowed it is in a weakened condition, and the very activity which should develop confidence has in many cases operated to the contrary as a result of this publicity.

Since the break in prices in the late fall of 1929, we have had liquidation of values, debts, and earnings unprecedented in the world's history, yet the country is surviving, and progress in being made. But the demand for payment has been so continuous, so intense, as to have finally reached the place where we must have a stopping point, a holiday period, so that the resources of the individual will not be completely exhausted but that he will be given time with which to again build up and be in position to eventually take care of his obligations and pay his debts. A movement in this direction would immediately help to restore confidence. We still have vast resources in the country which can be used to rebuild. Values to-day certainly are generally conservative, and common sense tells us we have reached a point where we can stop the downward movement and start back. Therefore, I suggest that creditors adopt a policy of leniency toward debtors, this to apply to mortgages whether on farms, homes, or of whatever type may be in effect; on loans whether in bank or other form, the debtor being given time and not forced into further liquidation.

Also, in order to help restore the ability of the creditor to pay, that interest charges, where necessary, be reduced over a period.

In the aggregate, this would be of tremendous sentimental value in addition to practical help, and change hopelessness into hope.

I would not recommend that this be done by legislation, because it is such an unprecedented action that legislation which might and frequently does become established as a permanent practice perhaps later on would interfere with the normal extension of credit. We have 12 Federal reserve districts, and the President, either through the Federal Reserve Board or direct, could appoint an active committee for each district, entirely nonpolitical in character, which committee in turn could appoint subcommittees over the district whose object it would be to establish contacts between the debtor and creditor in each district. Where a creditor was pushing for payment of an obligation in an unjustifiable way or a debtor was trying to take advantage of a situation, the committee could use their influence in a proper and equitable adjustment. The very fact that these representative committees, operating with governmental approval, would review situations with the intention of securing proper extension of time for worthy debtors would have its immediate influence in preventing forced liquidation and certainly aid in establishing confidence through a decrease in the volume of liquidation. I am suggesting the idea and in no wise trying to offer the technical application. There is no question as a business method that this can be done and would be effective.

The financial credit of the Government of the United States is after all the basis for financial stability, and just so soon as there arises any doubt or question either at home or abroad as to our ability to meet every obligation, just so soon will confidence in all private undertakings be shaken. It is a well-known fact that even governments can not carry on indefinitely expenditures in greater volume than income—when I say income I mean not what might be estimated or forced through the levying of taxes, but what can be collected legitimately out of the earnings of the people; and our national income has suffered such a severe deflation that it is not hard to estimate the paying ability of the people.

National income has declined since 1929 about 50 per cent, and it certainly is plain that on this reduced basis it is not possible to carry costs, either for government or anything else, such as existed in more prosperous years. Business and the individual have had to adjust to the new conditions, and the people certainly expect the Government to do the same.

There exists, as a matter of restoring confidence, the great necessity for balancing our Budget, and this applies to Federal, State, and municipal governments. It may be possible to carry on for a time with a large deficit, issuing governmental securities to cover same, but it is undermining confidence. I believe one of the great necessities is an immediate and earnest effort on the part of the Government toward balancing its Budget in such a manner as will give confidence to the public that this will be done. As a result of this, Government credit would improve, questions as to permanent substantiality of our credit removed, and public confidence built up. Government is no different in the long run from business or the individual. The greater credit of the Government may carry it in the face of unsafe policies for a longer period, but these are days when people are beginning to analyze situations carefully, and confidence in stability of our financial structure will be undermined through a continuance of a large Federal deficit. Therefore, as another means toward restoring confidence, a balanced Budget is necessary.

Balancing of the Budget would permit the refunding of our Federal debts, also transfer the short time indebtedness into a long-time obligation. The large saving in interest obligations of the combined debts as they stand to-day and what would be possible through refunding would have the popular support of the investor. This refunding would be another substantial link in forging the chain necessary to establish confidence.

There should be no question as to continuance of the United States on the gold standard. Inflation, or the breaking away from this known financial basis, would immediately undermine confidence because there would be no known standards for commercial interchange, and uncertainty would be universal. Property, securities, wages, and earnings of all kinds, would assume a basis of doubtful value. It would mean such a reconstruction of our estimate of values as to undermine confidence in the stability of the American dollar. There is, to my mind, no necessity for inflation because we have ample money and credit to carry on such a volume of business as it may be possible to develop. Irrespective of the ideas of the various inflationists, I fail to find one good point on the theory of inflation or the changing of our demonstrated gold standard of value. Any radical change of this nature would immediately undermine confidence whereas an announced determination to maintain the gold standard and deny inflation would bring about confidence with substantiation of existing values. I know of nothing that would be more harmful to reestablishment of normal conditions than the matter of inflation or any doubt as to our ability to stay on a gold basis.

I am opposed to any extensive use of Government funds for large building programs, either of liquidating or nonliquidating character. These projects would naturally be scattered and take months in which to even make a beginning. They would increase the burden of taxation, and the majority of them would be of doubtful value.

They are unnecessary because we have already over the length and breadth of this country facilities, plants, factories, railroads, farms, and all kinds of activities built, organized, and all ready to start producing as soon as demand for their products arises. Therefore, we must aim to put these activities back to work, which would give immediate employment to the regular organization whose homes and interests are centered around their employment. The demand that would start these factories would very promptly begin to develop, with a return of confidence in this country and belief in the fact we have reached the end of liquidation. This confidence would bring into active employment the capital that is now in hiding and willing to stay so without remuneration until assured of safety and profit.

We must have adequate tariff protection against the deflated currencies of competing nations. The propriety or impropriety of a protective tariff under the changed conditions that have made us a creditor instead of a debtor nation is to-day a strictly doctrinal question, and not one that can be or should be decided now to the point of making any change in our basic principle of protection. We have back of us a history of many years of protective tariff under which we have developed a standard of wages and living, and wealth and prosperity, that speaks for itself. We certainly can not afford to speculate by trying out new tariff theories, particularly in a time of such serious depression. Being now a creditor nation, the new influences and effects can be studied over the years to come and when our conditions are so normal as to allow a fair contemplation, then, consequently, a decision based upon known facts can be made. Radical departures such as the bringing in of materials from abroad produced under deflated currencies and standards of living such as we can not countenance, certainly will be a factor in the destroying of confidence.

Unquestionably, a readjustment of debts owing us by foreign countries is an important matter for consideration not from a political angle but as to its effedt and influence on our present situation and on our future. My thought is that readjustment would be followed by a stirring of confidence in other sections of the world which would react on us. When I say readjustment, I mean not only in amount but in time and interest.

Much consideration is being given to the low prices ruling on farm commodities, particularly the leading staples like wheat and cotton, prices of which have been seriously affected by meeting those established in the world's markets. There is no sound reason why that portion of these crops consumed at home should not be priced on a basis in harmony with the general domestic price structure, and only that portion sold for export priced on a competitive basis. This is done on other commodities that are partially exported and partially used in our home markets.

Help in establishing machinery to coordinate prices of these farm products could well be done by Federal Government action, but certainly without obligation on the part of the Government to assume financial responsibility for the plan which may be developed. Any plan must have the approval of the farmers themselves and its cuscess will be in proportion to their interest in the movement. Prices of these competitive farm products can be materially improved by the farmers voluntarily decreasing production, this being done by all other lines of activity; and after all the farmer must decide whether or not he wants better prices with lower production or greater production, a large part of which must flow into the world's market. This country can well afford to pay higher prices for these farm products, operating as it does under a protective tariff and resultant scale of costs and values above that of outside competing nations. Furthermore, farm products have ample tariff protection and are not under the necessity of meeting in our home markets the foreign prices. The farmer is deserving of support of the Government in carrying out corrective plans and the country, as a rule, would be benefited by improved prices on these staple agricultural products.

The propaganda that is developing toward scaling down of debts of all classes through the statements that they are too great to carry and will never be paid, or that the interest or carrying charges are impossible to earn, I do not believe is sound or helpful at the present time. We are in such a period of deflation and depression that no one has any specific knowledge as to what legitimate values or available earnings will be. The decision as to values and earnings, which naturally will have their ultimate influence on debts of the country, should be developed through time and then automatically, in the course of business, debts will be adjusted on a basis of proper values. Legislation to effect such standards would certainly have the effect of destroying confidence. One trouble, as I see it, is the anxiety of certain classes—largely theorists—to correct everything in a short time to coincide with their theories. What we need after these several years of severe deflation is a moratorium period, a resultant establishment of confidence, stimulation of commerce, an activity through that confidence and hard, persistent work into a stability which will indicate what are normal and reasonable values.

Senator Reed. Do you mean that literally, that we need a period of moratorium throughout the United States?

Mr. Weir. Yes, as I have described here.

Senator Reed. You mean a period of quiet.

Mr. Weir. Yes. I do not mean that we should establish officially a moratorium, but in effect we should have a period of delay.

Senator Harrison. In other words, it is a bad time to collect debts.

Mr. Weir. Yes. It is a bad time to force collection, Senator.

Senator Reed. I think we understand it.

Mr. Weir. That may have been a rather unfortunate place to put that word.

Following the principles of sound and sensible action such as will restore confidence is the crying necessity of our situation. It should be faced not from a partisan standpoint but from an appreciation of the serious conditions of the rank and file of the people in this country toward the end that liquidation of labor shall stop both in size or organizations and in wages and earning power.

Senator Reed. Mr. Weir, I think we can assure you that there is not a particle of partisanship in the attitude of Congress toward this question. I believe I speak for the Democrats as well as the Republicans in saying that.

Mr. Weir. I think that will establish confidence, that very fact, Senator.

Senator Reed. Congress realizes, speaking generally, the terrific seriousness of this present situation, and we are all determined to do the soundest thing to help the situation, without regard to any party lines at all.

Mr. WEIR. Then you will help it on that basis. People have suffered to an extent that I feel is not thoroughly recognized nor appreciated either in Washington or any of our State capitals.

That may not apply to Washington, Senator. It does apply to some of our State capitals.

The necessity for improvement is immediate. We have in this country an understanding of sound principles developed and demonstrated from our history since the Revolutionary War. The examples are all there. We do not need in this great period of stress to apply undeveloped plans or drift into uncharted seas. We should be careful to stand firmly on principles—commercial, governmental, financial, in human relationship—that we know to be sound. Let experiments come when the country is able and willing to try them.

Let me say in conclusion that I believe this country has reached a point of liquidation where it is justified in facing about, and beginning to do business. Supplies of all kinds have been heavily liquidated and obsolescence of property has been going on for the past three and one-half years. We have money, credit, and an earnest desire to resume business but impetus for such resumption must be confidence on the part of all people, capital and labor that our Federal Government is not only in position to protect them in the building of a new prosperity but determined to do so on the basis of sound and demonstrated principles.

Then will come a new courage, the ending of the depression, the reemployment of labor, and the gradual return to the standards justified by the wealth and resources of the United States.

I now consider the situation so serious that I plead for quick and decisive action.

Senator HARRISON. That is a very good statement.

Senator REED. You have been very helpful, and we are glad to have it.

If you were Congress, what would you do first?

Mr. WEIR. Well, of course, I think the present emergency is a banking emergency, Senator.

Senator REED. You would put your mind to that first?

Mr. WEIR. Absolutely. That is the crying necessity of to-day, not to-morrow. That is here to-day. I would put into the hands of the Reconstruction Finance Corporation, as I say, sufficient money immediately, because it will take less money to-day than it will in the future.

Senator HARRISON. They have a pretty good sum of money and they have the authority. We went to the rescue of the banks to that extent. Of course, I agree with you that this publicity right now is probably doing some harm. I do not know whether what we have already done will save the situation, and if it does not save the situation, so far as I am concerned, as much objections as I have to the principle of the guarantee of bank deposits, I would go to it as a temporary proposition.

Mr. WEIR. We may be able to do it without that.

Senator HARRISON. I hope so.

Mr. WEIR. If it comes to that, I would dislike very much to see that.

Senator REED. I do not know of anything else. Thank you very much, Mr. Weir. The committee appreciates your coming.

## STATEMENT OF DICK SMITH, MANAGING EDITOR, KANSAS CITY JOURNAL-POST, KANSAS CITY, MO.

Senator REED. Tell us, first, your occupation.

Mr. SMITH. I am a newspaper man; managing editor of the Kansas City Journal-Post. I have prepared a brief statement that may form the basis for some discussion that may crystallize some worth-while thought.

I do not come here with a cure-all, but I do have some convictions that I want to outline in the broadest and most general terms.

It may help you to follow me if I state at the outset that I am a free trader and a deflationist. Knowing this you will perhaps understand if my views in some respects seem extreme and make allowance for them.

I know that progress usually comes through compromise, but before we can reach a middle ground we must know what the extremes are.

It seems to me that it has become the fashion for every one to look to the Government to make good his losses, whether suffered in farming, in business, playing the stock market or shooting craps.

I believe that the distinctions that once existed between the functions of government on the one hand and the functions of business on the other have become sadly entangled, confused and merged.

I feel that the Government, in a measure at least, has abandoned the job of governing for the job of financing the business of the country, which, by and large, ought to fight its own battles.

I don't think the farmers, industry, the insurance companies, the ex-service men or individuals have any right to unload their problems on the Government.

I seriously question the wisdom of many of the things we have done to try to prevent orderly deflation from taking its natural course. It seems to me that instead of letting it trickle until it found its level and began to build up a body of water that would float the craft of business, we have sought to dam the stream at its source and have created a flood menace that threatens to break through the dam and sweep all before it.

We have resorted to the use of Government credit to try to jack up prices so that they will pay a return on many capital structures based on boom conditions. But prices keep on falling. I seriously doubt that there will be seen in the lifetime of anyone here a return of the prices and the profits of the boom period. In fact, I can not conceive of any sane person wanting to see the same conditions return and precipitate another depression like the present. And yet, it seems to me, that that is what we have been trying to bring about.

What, then, is the alternative? As I see it, it is a washing out of excessive capitalization. Much of this can be accomplished without foreclosures, receiverships, and bankruptcies. But in other cases, in my judgment, foreclosures, receiverships, and bankruptcies are inevitable.

They have been taking place right along in spite of the Reconstruction Finance Corporation, in spite of the Federal home loan banks, in spite of Federal farm loan schemes, the lamented farm board and a hundred and one other palliative that treat only the symptoms and not the disease.

Let us examine into some of the causes that created over expanded capital structures. I am not a technocrat, but I know that machinery and mass production played a part in it. Machinery and mass production produced excessive profits instead of what they should have produced—reasonable profits, higher wages, better working conditions, shorter working hours, lower commodity prices and more of the good things of life for everybody.

These excessive profits in many instances were based to an idiotic degree on debt (foreign laons and installment buying) instead of real assets. They were capitalized in the unfounded belief that they would be earned forever. We now know that this was a fasle hope, but we are trying to recreate these excessive profits to support that fictitious capital structure.

The Government borrows for this purpose and runs into debt to pay its operating costs as though Government credit were a bottomless well. I tell you it is not, and if we keep on along the present course, Government credit will dry up as commercial credit has dried up. And when the Government's credit is gone everything will be gone.

What then, you may ask, do I consider the proper functions of Government in the present emergency? I would say that first and foremost it should virtullly limit all future relief appropriations to the sums required, with those raised locally, to furnish the necessities of life to those out of work and their dependents. Public works to relieve unemployment amount to taking money out of one pocket and putting it in the other and losing a percentage of it in the process. They result in structures that require higher taxes to maintain them once they are finished. They are like trying to lift yourself by your bootstraps.

Next, if it is possible, the Government should spread a feather pillow for business to land on so that there will not be too many broken bones and bashed heads. Perhaps the proposed changes in the bankruptcy law would serve this purpose best. The States already are modifying foreclosure laws.

Then the Government should return to the business of governing. This would call first for balancing the Federal Budget, principally by reducing expenditures, particularly veteran costs. Any additional revenue required should be raised through a sales tax—a tax so imposed that it would make every person who spends a dime tax-conscious.

Next in importance I would rank adjustment of international debts. This should be hand in hand with the following:

Removal of international trade barriers.

Stabilization of debased currencies.

Reduction of armaments.

Satisfactory settlement of these problems would be of more benefit to the farmers—and I come from a farming section—than half a dozen farm relief plans, and to industry, too. Such a settlement would be be the first step toward a world economic system that must be evolved if society as we know it is to survive.

When we talk of farm relief we all seem inclined to forget that depression and trouble have gripped agriculture most of the time since 1920, when land ceased to increase in value. Hard times are nothing new to the farmer. He did not share in the profits that accrued to industry in the boom period and he never has shared proportionately. It follows, therefore, that the present chaos in business is not responsible for his troubles and we must look elsewhere for the cause.

If we face the facts, I believe, we must confess that he has been the victim of a system that, through tariffs, subsidies and other forms of special privilege, has worked solely to the advantage of his urban brother.

Attempts to put him on a parity with industry by the same artificial methods have failed, and always must fail, because collectively he sells in an unprotected market and buys in a protected market.

This is true because the farmer produces a surplus above what is needed for domestic consumption. The solution then must lie in wiping out the special privileges that have made it possible for industry and industrial workers to hi-jack him, and that have caused foreign buyers to take revenge on him because their products have been barred from this country. Even the most rabid protectionists of other days, through enlightened self-interest, are coming to recognize this. They have finally found out that they can not have even half a loaf when the farmer is bankrupt, and that half a loaf is better than none.

In this connection I want to say a word about the so-called "Buy American" movement. It is as fallacious as the theory upon which the farm board was based—as fallacious as any scheme must be that has for its purpose national self-containment.

I need only cite one instance to show how all of these schemes work, directly or indirectly. You may not know it, but various State legislatures are attempting to usurp the power of levying imposts which is vested solely in the Federal Government by the Constitution. They are adopting bills which provide for what amounts to a tariff on coconut oil imported from the Philippines for use in the manufacture of margarine, a butter substitute. These bills are sponsored by the dairy and live-stock interests which want to force the use of animal fats in place of coconut oil.

The sponsors of the bills have lost sight of the fact, or do not know, that the Philippines pay more for American dairy products, principally condensed milk, than we pay for coconut oil used in margarine.

This is the short-sighted policy that marks all movements for national self-containment. It epitomizes our whole tariff policy—that great filler of dinner pails which has finally left us without dinner pails to fill.

When the country learns that the Government is devoting itself to the things which properly fall within the sphere of government and has adopted the principle laid down by Grover Cleveland that the Government can not support the people because the people support the Government, industry and agriculture and the money lenders will begin to attend to their own knitting. They will find that the obstacles that have confounded them are not insurmountable. In fact, there already is a marked trend in this direction, particularly with reference to foreclosure of farm mortgages.

What we need in business is a little more shirt-sleeve tackling of business problems by business men and less running to the Government for pap, pork, or whatever you are minded to call it.

The kiss of a mother may soothe the burnt finger of her child, but the caress of Government blights business.

I can not remember that I ever heard that the Government was asked to pension pony-express riders or put the mules that used to tread the towpaths of the canals on pasture when they were put out of business by the railroads, the telegraph, and the telephone.

It is not of record that the Government voted an endowment for the fox terrier that used to listen to "His Master's Voice" when radio sent the phonograph to join the corset and the hairnet in the limbo of forgotten things.

I have said nothing about proposals to inflate the currency and to go off the gold standard. It is impossible for me to conceive that Congress will consider them seriously—at least not until we see how the other nations behave at the coming world economic conference.

Prohibition repeal needs no discussion, as it is on the way. But beer should be legalized pending repeal of the eighteenth amendment.

It is perhaps too early to talk about what to do to prevent a repetition of the conditions that preceded the depression in this country. Personally, I am of the opinion that those manifestations of the boom that were purely domestic might have been controlled, at least in a much larger degree than they were, by proper exercise of the authority of the Federal Reserve Board. The Glass banking bill, as I understand it, is designed to increase the authority of the board. But one trouble seems to be that many State banks refuse to join the Federal reserve system. They prefer to keep their reserves on deposit with member banks where they will draw interest. What we need is one banking system instead of 49. Pending attainment of the 1-system ideal, why not prohibit banks which are members of the Federal reserve system from acting as depositories for nonmember banks? This would tend to force nonmembers into the system, where they could be controlled.

Senator REED. Do you think we will ever be able to convince the people of the United States that the Government does not owe them a living?

Mr. SMITH. I have been trying the best I can in my feeble way for the last two years, in the columns of our paper.

Senator REED. And you are called hard-hearted?

Mr. SMITH. I do not know. We have not had many protests from the farmers when we have told them that their solution did not lie in some action by the Government. We have had more protests from the business men. I was talking to the Governor of Kansas the other day, and he told me he had called in a number of insurance-company executives and told them that he thought that they were going to have to go part way in the matter of farm mortgages. They said Congress should do it. But about a month later Iowa passed a foreclosure bill which gives the man a right to stay on his farm if he turns in a certain portion of the income from it to the court, and so forth. One of these very insurance presidents who was there talking to the Governor of Kansas hailed that as a fair plan for relief in the agricultural sections.

Senator REED. Has anybody loaned any money on a farm mortgage in Iowa since they passed that law?

Mr. SMITH. I do not know; but this one insurance company president did make that statement. If the insurance companies and the other lenders on farm mortgages lent their money as recklessly as lenders on real estate in the city all during the boom, then I think they ought to take a loss. They built apartment hotel buildings in Kansas City, bought the land and built the buildings, and they furnished them, even down to tinted toilet paper to match the walls in the bathrooms, and had some money left over. The builders borrowed all the money and had some left over. I had a representative of an insurance company solicit me to increase the mortgage on my home by $2,500 six or seven years ago. He wanted the extra commission. If they lent their money on the same basis in the country, they are due to take a loss.

Senator HARRISON. What is the sentiment among your constituents with reference to the abolition of the Farm Board?

Mr. SMITH. I think it is favorable, among farmers as well as city people.

Senator REED. Have you any further questions?

Senator HARRISON. No, sir.

Senator REED. Thank you very much.

Have we any more witnesses to-day?

Senator HARRISON. A message just came from Governor Smith that he would like to be heard the first thing in the morning, so he will be here.

Senator REED. The committee will stand adjourned until 10 o'clock tomorrow morning.

(Whereupon, at 3 o'clock p. m., the committee adjourned to meet to-morrow, Tuesday, February 28, 1933, at 10 o'clock a. m.)

# INVESTIGATION OF ECONOMIC PROBLEMS

**TUESDAY, FEBRUARY 28, 1933**

UNITED STATES SENATE,
COMMITTEE ON FINANCE,
*Washington, D. C.*

The committee met at 10 o'clock a. m., pursuant to adjournment on Monday, February 27, 1933, in room 335, Senate Office Building, Senator Reed Smoot presiding.

Present: Senators Smoot (chairman), La Follette, Thomas of Idaho, Metcalf, Harrison, King, George, Walsh of Massachusetts, Barkley, Connally, Gore, and Costigan.

The CHAIRMAN. The committee will come to order.

Hon. Alfred E. Smith, of New York City will be the first witness this morning. You may proceed, Governor.

## STATEMENT OF HON. ALFRED E. SMITH, NEW YORK CITY

Mr. SMITH. Mr. Chairman and members of the committee.

The CHAIRMAN. Mr. Smith.

Mr. SMITH. I first want to take up the question of the extent of unemployment. I, however, want to preface my remarks along that line by saying that my intimate knowledge is confined to New York State. Although I assume it is pretty nearly the same at least through the eastern part of the country.

I happened to be in Albany last Friday and there was a conference of the mayors of the different cities. They were conferring with Governor Lehman, and as I heard the different mayors report on conditions in their respective cities I came to the conclusion that unemployment is as widespread now, if not more widely spread, than it was at any time during 1932. And as far as any of these mayors are concerned with their knowledge of affairs in their own cities, and as far as New York City goes, with my knowledge of it, I see nothing in the immediate future to give it any great relief. Therefore I think we ought to speak for a minute or two on this question of public relief by construction projects.

Made work in New York paid for with State and city funds and from private sources is not working out so well. The class of people that are employed upon these made-work projects are not equipped, are not able to do that kind of work. And I fail to see that the taxpayers in the last analysis are getting very much of a return from made work. They have men cleaning up in the parks. It does not mean anything. And we have an awful lot of people on what we call home relief. The Commissioner of Public Welfare in New York spoke to me about it a short time ago and he said that he thought that it was coming to an alarming stage where there were so many people receiving what was really the dole.

The CHAIRMAN. Does the State provide that money?

Mr. SMITH. Yes, Senator, the State; and the R. F. C. provided some of it.

The CHAIRMAN. Well, that is, the State is responsible, however, for the amount of money that they received from the R. F. C.?

Mr. SMITH. Yes, sir. Plus that the State bonded itself by vote of the people last November for $30,000,000. And plus that the so-called Gibson Committee, a private committee of citizens, by public subscription, raised $18,000,000.

Senator BARKLEY. Just there, Governor. The R. F. C. furnished how much? It has only recently made an allotment to New York.

Mr. SMITH. I believe the R. F. C. gave $6,000,000.

Senator BARKLEY. $6,000,000?

Mr. SMITH. Yes.

Senator BARKLEY. So that for this current winter you have had about $52,000,000 or $54,000,000 for relief work in New York?

Mr. SMITH. We had $30,000,000, $18,000,000, and $6,000,000.

The CHAIRMAN. $54,000,000.

Senator BARKLEY. Yes, $54,000,000.

Mr. SMITH. Yes. But of course that is budgeted to run into June. Now by June the $300,000,000 for direct relief provided by Congress will be exhausted. And I notice that a bill for $300,000,000 more has passed the Senate. I believe that that bill should also pass the House and become a law, because we are going to be in bad shape at the end of June is there is not some place to get money, because these people will probably be in want in the summertime just as well as in the winter.

One weakness, however, of the appropriation for the direct relief is that none of it can be used for materials. Now, if some reasonable part of the $300,000,000 could be used for material, there would be something of substantial benefit to the taxpayers after we get out of the fire. When we get out in the clear sea again, we will see something. Because we have not got down there the price of a shovel or a pick to put some of these men to work. They are on what we call made work, but it can be done without materials; work such as I said a minute ago, cleaning in the parks, and so forth.

The CHAIRMAN. Could not the State provide that money and use the Government allotment just as it was intended, for relief?

Mr. SMITH. By the time this additional $300,000,000 for direct relief from the R. F. C. will be available, the State money will be gone.

Senator GORE. Could not the State money be used for providing the shovel and the pick for the men to work with and the money advanced by the R. F. C. be used to pay the fellow who works with the shovel and the pick?

Senator BARKLEY. There was no restriction placed on the $18,000,000 that was raised by public subscription as to materials?

Mr. SMITH. Oh, no; that could be handled in any way.

Senator GORE. They could buy shovels and picks with the money?

Mr. SMITH. Well that, of course, would be up to the committee that raised the money, and they have never spent any of it for materials.

Senator GORE. There is no reason why they should not. There is no restraint on that power to do so, I mean?

Mr. SMITH. No, no; they can do what they like about it. It is practically their money.

Senator BARKLEY. But it has not been as a general thing regarded as wise for money raised by private subscription for charitable purposes to be used for the purpose of buying material for the construction of buildings?

Mr. SMITH. That is the way the people that give the money feel about it.

Senator GORE. Is the same restraint laid upon money appropriated by the State for this character of work?

Mr. SMITH. Well, the money appropriated by the State has been given to the localities.

The CHAIRMAN. To be spent as in their judgment seems best?

Mr. SMITH. Yes. But the point that I want to make is that it will be all gone by the end of June, or by the middle of June.

Now there is one other matter that I would like to call the attention of the committee to, and that is with regard to the ruling of the R. F. C. that they have held that projects must be self-liquidating as to all of the money put into the project, whether it is from an appropriation by the R. F. C. or otherwise. And that has kind of held things up a little bit, and I asked the members of the R. F. C. about it, and they said that they had an opinion of their lawyer that under the strict wording of the reconstruction finance act that the projects had to be fully self-liquidating as to all moneys, whether put in from the R. F. C. or whether put in by private individuals, as in the case of housing, or whether an initial appropriation may be made either by a city or by a State.

And the question came up in an application on behalf of the State of New York for the money to construct two bridges at Niagara Falls. The State having already appropriated a million dollars, and expended $500,000 of it in the purchase of land for approaches to the bridge; in considering a loan the R. F. C. wanted the toll rates so fixed and wanted other things so fixed as to make it self-sustaining, not only as to the $3,000,000 that the State desires to get from the R. F. C., but the other million that the State of New York has put in already, and probably does not expect to get back because it is going to be State property when it is finished.

Then we come to the next question: The question of the interest rate. I am of the opinion that that probably ought to be fixed, because the R. F. C. feels that inasmuch as they charge 5 per cent to California for the California bridge, that everybody must pay 5 per cent. I think 4 per cent would be enough. Because every 1 per cent that you add makes it more difficult to prove that the project is self-liquidating, or increases tolls in the case of a bridge or a toll highway.

The next thing I would like to call the attention of the committee to is the——

Senator BARKLEY. Just a moment, Governor. Do you think that the R. F. C. ought to in the fixing of its interest rate take into consideration the possibility of losing on some other project, or that each project ought to bear an interest rate based upon its own self-liquidating quality?

Mr. SMITH. Yes, I do, Senator. I think the R. F. C. can afford to take a little bit of a chance.

The CHAIRMAN. Well, we all think, Governor, that they are taking a great deal of chances as the situation exists to-day.

Mr. SMITH. Well, maybe. I am familiar only with the projects in New York State, and I am satisfied that there is no chance in any of those.

Senator GORE. Do you mean no chance of losing, Governor, or no chance of getting the money back?

Mr. SMITH. No chance of losing.

Senator GORE. I wanted that in the record.

Mr. SMITH. Another matter that I would like to call the attention of the committee to, and that is somethng that I have spoken of publicly before, and that is either some individual or some small commission to start up United States construction work. Now I have had a great deal of experience in New York City. I know it is a hard thing to do. I know that it takes the Government usually twice as long as it does a private concern or a private individual to progress construction work. We can put enormous buildings up in New York inside of a year, but it took three years to build the State office building in Albany. I was there during all the period of its construction, and when we followed all the checks and balances that we would find in the State law and wait for the attorney general to come from a trip he was making some place through the State to give us an opinion as to whether or not we could substitute some other kind of marble for the kind of marble there was in the contract, or in the plans and specifications, because the builder finds that the marble he got does not work well, it cracks when he tries to bore holes in it, and so forth, so it took three years to build a 36-story building. And we can put them up down in New York inside of a year and run them up to 86 stories.

Senator KING. Well, all private concerns do not have Governor Smith to run them.

Mr. SMITH. Well, I do not know as I had anything to do with the building. I only just stood looking at it. You see at a time like this when there are so many contractors looking so hard for work and there is a glut of material and it is cheap, something in my opinion should be done to speed up this building.

Now I consider that this present condition we are in here is something like war. I was around all during the war and I did not see nearly as much suffering or as much hardship as the starvation and bread lines I have seen in the last two years. I think we have got to battle with this thing the way we do with an enemy, and just cut out all the red tape and get away from all these rulings and go at it. Build the buildings the way we built cantonments, overnight.

The CHAIRMAN. You say the last two years. I thought it would be very much better if you would have said for the last two months. The suffering in the last two months is perhaps more than all the suffering during the war time.

Mr. SMITH. As far as the people of this country are concerned, sure, Senator.

The CHAIRMAN. That is what I mean.

Mr. SMITH. Sure. No doubt about it.

Now I do not remember how many years ago the appropriation was made for the Albany post office. I think it was before Senator Wagner came to the Senate. But there is no post office there yet. Now down in New York we have the same story. General Will Hays in the administration of——

Senator KING. Harding.

Mr. SMITH (continuing). President Harding, asked me to serve on a citizens committee to select a site for a new post office. That was back in 1921. We have had the site for quite a while, but no post office.

The CHAIRMAN. Well, that is Congress's fault.

Senator GORE. Do you know how far along they have got with the plans and specifications?

Mr. SMITH. No, Senator; there is no way of finding it out either.

Senator GORE. You would have to consult three or four departments or offices here in order to get a line on that.

Mr. SMITH. I believe the amount appropriated for public buildings was $100,000,000, and there has been about $10,000,000 of it spent.

Senator BARKLEY. Governor, do you believe that in proportion to the amount of money involved the construction of a public building affords as much employment to labor as in any other character of construction?

Mr. SMITH. Well, if you speed it up it does, because it is not the number of men that are employed in the actual construction of the building; it is the number that are employed in the fabrication of all the material. Take the Empire State Building. The highest number of men that worked on that at any one time was about 4,000. Somewhere in the neighborhood of 4,000 men. But all that stone was quarried in Indiana. All the glass was made in Mississippi. It is the Mississippi Glass Co. I do not know whether it is out of Mississippi.

Senator GORE. I see.

Mr. SMITH. And all the cement had to be bagged and carted. It helped the railroads. It helped trucking in New York. Most of the steel was moved in the nighttime. It is the amount of work that it gives that counts in construction. It goes around in the mines, to the steel works, to the brickyards, to the cement works, where plaster is made, and other materials are made, woodwork—all that goes into it.

Now there is one other thing I want to say: The most effective aid to unemployment is the Federal highway. The Federal-highway money. Highways are all designed. We know just where they are to be built. You get the quickest action in the relief of unemployment from the use of highway aid money than from any other thing that we do, because we are ready to do it right away.

The CHAIRMAN. In a hearing the other day before the committee, Governor, that same question arose. And it was disputed upon the ground that nearly all of that work now on the highways was done by machinery and not by hand labor. How is it in New York?

Mr. SMITH. Well, the superintendent of public works estimated that about 60 per cent of the total appropriation for the construction and repair of highways went into labor. And that 40 per cent of it was materials.

Senator BARKLEY. Governor, the same witness I think the other day made the contention that we had built highways too rapidly in this country. That by reason of that we had bonded States and counties——

The CHAIRMAN. And districts.

Senator BARKLEY (continuing). And districts all over the country, and heaped up large debts against them which reflected in the interest and sinking funds, in addition to the appropriations by Congress. What is your reaction to that?

Mr. SMITH. Well, Senator, as to any other State outside of New York or New Jersey I would not be able to give you any opinion on it. But I certainly know that as far as New York State is concerned the greatest investment that we ever made is in our highway system. Of course we have the Adirondack and the Catskill Parks. We have Bear Mountain Reservation, and we have the great parks system on Long Island and on the Niagara frontier to attract people into our State. And I would say that the first roads we built we built from bonds. We issued $100,000,000 worth of bonds. After that we changed the State policy and we put cash into roads, and we sold bonds for the construction of hospital buildings and prisons and other State construction.

We are building roads in New York State now with cash, and of course with the number of automobiles there are now, the business that they take along the road to the country places in the summer time has been a great advantage to the State. It has opened up parts of the State of New York to people that never saw them before. I was a member of the legislature for eight years before I saw Lake George, and I do not suppose I would have ever got there if I had to go up on the D. & H. Railway. I went up in an automobile.

Now with respect to the unemployment and relief act of 1932, I would like to suggest that the function of relief and unemployment be put into another commission instead of being with the R. F. C., because there is such a thing as loading a commission down with so much that they do not make the progress that they might. Now if they deal with the kind of projects they have had right along I think they have got about all that they can handle.

Another thing. I believe that the Federal Government could build bridges or public highways that are on what we call national routes. And I do not believe they should not build them inside of a city if they are connecting links of the national road system.

In order to do that I come back to my recommendation of about a year ago, that we have a reconstruction bond issue. And I would sell that bond issue the same as we did the Liberty bonds. And I would give the people around in the clubhouses and in the literary organizations and the different associations a chance to buy the bonds the way they bought the Liberty bonds. There is a great deal of money in hiding that would be put into government bonds, but it is being held by people that do not know how to buy a Government bond; they do not know where to go to buy it; they do not know anything about a bank. If they could be offered just the same as the Liberty bonds were offered, and in the offering make an appeal to their patriotism and their devotion to the country to help it in a time like this you could float a good-sized bond issue and put some part of the cost of getting us out of this trouble on the next generation. So much for that.

I read what Doctor Butler said and what President Hoover said about monetary inflation. I would be against cheapening or reducing the gold in the dollar, or the adoption of any silver standard, or any free coinage of silver, or any arbitrary fixing of higher silver value, and I would certainly be against fiat money.

I do not believe that by inflation of the monetary system you are going to help us at all. It is just like giving a sick man a shot in the arm of something; that goes on for a little while and when it dies out he must get another one.

Senator GORE. And a little bigger one.

Mr. SMITH. And each time in order for it to be effective it must be a little bit stronger than the last one. It won't get us any place.

In a recent report on the railroads I said that I did not believe that the Reconstruction Finance Corporation ought to be authorized to lend money to railroads without adequate security. And I think that is right. I think the railroads ought to be forced to consolidate. That is one way to make them do it. They will never do it voluntarily. We have talked it, we have heard about it. We have heard first about regional consolidation. Nothing happened. Now we are going to come to the time when there is going to be a consolidation of all the roads in this country, and it will not be necessarily a railroad, it will be a transportation system. And the railroads will be enabled to go into new and modern forms of transportation. There is not any reason why they should not be able to run airplanes to supplement their transportation lines; there is no reason why they should not carry water-borne traffic; there is no reason why they should not operate motor trucks.

Senator GORE. Except they are mossback conservatives.

Mr. SMITH. Well, they are wedded to the idea that they are a railroad. And there has been so much talk in the past about railroads being the arteries of commerce and being to the body of the United States what the blood vessels are to the human body that they seem to have a notion that nobody must disturb them. And that they can carry this great big capital structure indefinitely. Now they can not do it, and they might as well get ready for it.

The CHAIRMAN. Most of the roads have bus lines, have they not, Governor?

Mr. SMITH. Well, they have them in a kind of a way. They have them through the ownership of subsidaries. But they do not run them in conjunction with the present line. They have them on the side. I believe the large part of the stock in the Greyhound line belongs to some of the railroads.

The CHAIRMAN. I believe that the railroads own it all.

Senator HARRISON. The Pennsylvania owns part of it.

Mr. SMITH. The Pennsylvania owns it. That one runs to Philadelphia.

Now, there is another thing I want to call the attention of the committee to. I think it was a mistake——

Senator GORE. Governor, are you passing from the transportation?

Mr. SMITH. Yes; Senator.

Senator GORE. I wonder how it would do, Mr. Chairman, to have printed in the record in connection with the governor's statement the report just made by the committee on transportation a short time ago? Would there be any objection to that?

The CHAIRMAN. No; I hardly think so. If the governor does not object it would be best to print it in the record following the governor's remarks.

Senator WALSH of Massachusetts. Is it a public document?

Mr. SMITH. Oh, yes. It was published in the newspapers.

Senator WALSH of Massachusetts. I mean, has it been published officially by the Government, do you know?

Mr. SMITH. I do not know that the Government published it at all.

Senator WALSH of Massachusetts. Why should it not be a public document?

Mr. SMITH. This committee made this report to a group of life and fire insurance companies and trust companies

Senator GORE. I ought to be in this record, I believe, Senator, so that students of this record may have it.

Mr. SMITH. And it is bound in their portfolios.

Senator WALSH of Massachusetts. I think the suggestion a good one that any students of this record should have the benefit of that report

Senator HARRISON. There were two reports that were made, as I understood it You made a separate report?

Mr. SMITH. Yes.

Senator HARRISON. So both of them ought to be placed in the record.

Senator BARKLEY. While that committee was unofficial, it was not representing the Government of the United States, I think its report and the governor's report are of sufficient importance that they ought to be made public documents.

The CHAIRMAN. Why not put them in following the remarks of the governor, in this record.

Mr. SMITH. Do you want me to send you some copies of that report?

Senator GORE. Send a copy to be printed in the record in connection with your statement.

The CHAIRMAN. Governor, if you will send them as quickly as possible, because we want to keep these prints up to date.

Mr. SMITH. I will send them to-morrow.

(The report of the committee on transportation and the separate report by Mr. Smith will be printed in a subsequent volume of these hearings.)

Senator BARKLEY. Governor, before you get away from the transportation problem. You are, of course, familiar with the plan adopted or recommended two or three years ago—the consolidation of railroads into four great groups?

Mr. SMITH. Yes.

Senator BARKLEY. I have not read the full report of the committee, or your report, except hastily. Did you go into detail as to the four big transportation systems outlined in that recommendation?

Mr. SMITH. No. At that time was that called the regional consolidation?

Senator BARKLEY. Yes.

Mr. SMITH. Well, we dealt with it, but not with any explanation of the set-up of it.

Senator BARKLEY. Are you sufficiently familiar with it to be able to say whether that is somewhat along the lines you have in mind in the consolidation of railroads?

Mr. SMITH. I believe that would be the meaning. And thereafter, following that, would come the complete consolidation of the four groups.

Senator BARKLEY. Into one great system?

Mr. SMITH. Into one great system.

Senator BARKLEY. How would you have it operated? Is there any one man who has sufficient grasp of the transportation problem of the country to operate the entire railroad system, or would you have it divided up into regional groups for purposes of executive authority?

Mr. SMITH. Well, you could have one man at the head of the entire system, dependent then upon those under him to take control of certain sections of the country. I think it might be a good idea to make a secretary of transportation.

Senator BARKLEY. To what extent would you increase the powers of the Government over such a consolidated system?

Mr. SMITH. I think if you had a bureau, or at least a secretaryship of transportation, you might take over such duties as would then be required, that now repose with the Interstate Commerce Commission.

Senator GORE. The newspapers say that the Department of Commerce is to be converted into a department of commerce and transportation. That is a step in the direction you have in mind.

Mr. SMITH. Well, that would probably answer.

Senator BARKLEY. If any such new department of transportation should be established it would have to include all forms of transportation, not merely railroads, would it not?

Mr. SMITH. If you permit the railroads to go into these other forms of transportation, it would automatically bring them under any department of the Government that would be regulating them. But I do not believe that you could extend that regulation to the individual truck owner or to the contract truck owner. You would have to have them in the common-carrier class.

Senator BARKLEY. Yes; I agree with that. But what I have in mind is: Following your suggestion of a secretary of transportation, whether you can separate some forms of transportation put under the jurisdiction of such a department, or would it necessarily result in the consolidation of all the Government authority over all transportation over which it has authority under that jurisdiction in that department?

Mr. SMITH. That is what I think would finally work out.

Senator BARKLEY. That would include railroads and steamboats, interstate electric lines, bus and truck lines that did an interstate business?

Mr. SMITH. And the common carriers.

Senator BARKLEY. And the common carriers; yes.

Mr. SMITH. Yes.

Senator GORE. Pipe lines, inland waterways, and ocean transportation? Do you not think it ought to embrace them all?

Mr. SMITH. Now, there is another thing that I would like to call the attention of the committee to. I think it was a mistake to publish in the newspapers the banks that borrowed money from the R. F. C. Now, whatever was the original intention of that, it did not carry out as was intended. It evidently was intended to give people confidence in their bank by publishing the fact that they were in sufficiently good condition to be able to borrow Government money. But it did not work out that way. In the small banks in the country sections in New York State when the people saw that their bank had to go to the Government for aid they got suspicious about it.

Senator GORE. They even get suspicious, Governor, when a bank rediscounts now with the Federal reserve. One bank will use that against its competitor when that appears.

Mr. SMITH. Well, that is not so well understood as this is. When one bank is dealing with another bank it is not so well understood.

But in this instance here is what I found out in talking and listening to people, that as soon as the bank came down here to Washington to borrow money from the R. F. C. they were afraid the bank was in trouble. And they did not look any further to find out just what the facts were. They just said, "Well, the bank can not be all right. It had to go to the Federal Government for aid." That is what prompts the thought in my mind that it was a mistake to publish it.

Senator HARRISON. Would you not apply the same stricture to life-insurance companies?

Mr. SMITH. No; because you can not go and draw your money out of a life insurance company, but you can go to the bank and say, "I guess I will have my money." And then they go downstairs and rent a safe-deposit box and put the money in it.

Senator HARRISON. It has come to the attention of some of us that so far as insurance companies are concerned it is affecting the policyholders. They are not taking insurance in certain ones that borrowed, and so forth. And that one competing insurance company uses it against another. I have felt that the insurance companies and the banks were in a class by themselves. It does not affect mortgage companies, and so forth, but it would those.

Mr. SMITH. Well, Senator, I did not hear anything about the insurance companies, but I did hear it about the banks.

Senator BARKLEY. Of course, that publicity feature was put into the bill on the theory, which is correct as a theory, that the people who are putting up the money have a right to know who is getting it. But I can not see just what good it has done to carry out the theory, although it is correct in theory in this particular situation. That is your viewpoint, is it?

Mr. SMITH. That is the way I feel about it. I feel—well, I go a little bit stronger than that. I think it has done a little bit of harm.

Senator BARKLEY. I go with you.

Senator THOMAS of Idaho. Governor, when you say it has done a little bit of harm I think you could make it stronger.

The CHAIRMAN. The results that have followed from it have been bad in some cases.

Senator THOMAS of Idaho. Governor, I think you could make that a little stronger than saying it has done a little bit of harm. I think the publicity feature has meant the closing of a number of banks.

Mr. SMITH. I do not know of any banks that closed as the result of it, but I do know, talking to people in New York, that, particularly in the small localities where the borrowing was small, human psychology being what it is, the bank having to borrow three or four hundred thousand dollars, the publishing of it did not have a good effect.

Senator THOMAS of Idaho. The publicity of the large loans in the cities, too, to the city banks, such as the Dawes loan, has created a very bad impression throughout the country, Governor, I think.

Mr. SMITH. I do not think the publication of the large loans to the big banks made so much difference. I am thinking of the small banks throughout the country.

Senator THOMAS of Idaho. I was thinking of the general psychology that was created throughout the country that caused the unrest.

Senator GORE. You are right about that.

Mr. SMITH. There is another matter I want to talk about, and that is the moratorium on foreclosures on farm dwellings and properties.

I believe it should be limited to a year, and where the proceeding is brought in a Federal court Congress could erect a procedure that would give reasonable time to these people. It would have to be done by cooperation with the States, so that the States may so fix their laws in the different States to fit in with the statute that would be enacted for the Federal courts.

I got the notion from what happened in New York in 1920 when we enacted what was called the rent laws. I do not suppose that ordinarily the court of appeals would have sustained the rent laws, but they did on the theory that there was a chance of public disaster, and it was the exercise of the State's police power. Now we called them rent laws for short. But all they really were were amendments to the Code of Civil Procedure that allowed a tenant who was served with a dispossess to set up the defense that the rent was oppressive, and the money at the old rental was paid in to the municipal court, and the judge became a kind of a judge of whether the proposed increase in rent was justified. And it was the first time that a lot of our people found out who paid the taxes. They always thought the landlord pays them until they get into court and then they found that they paid them.

Senator BARKLEY. Governor, in that connection of course we all realize that most foreclosures on farm and city property are proceedings under the State laws and in the State courts. Mortgages are executed and enforced under State laws. There is a very limited field in which the Federal court even try foreclosure cases. And we can not, I suppose, as a matter of law, compel any creditor to withhold foreclosure if he sees fit to go into a court to assert his rights.

We have now on the calendar in the Senate, and had it up for consideration yesterday, and I hope we can pass it to-day, a bill based on the Hull bill introduced here, with which you may not be familiar, offering to loan money up to $500,000,000 for the purpose of postponing foreclosures on farms and small dwellings in cities for a period of two years while Congress attempts to work out some permanent refinancing solution of the whole farm and small home mortgage problem. Is that somewhat in line with your idea?

Mr. SMITH. That would be helpful. And of course as President Roosevelt is going to have the governors of all the States here on Monday, as I understand it from the papers, that might be a good time to call the attention of the governors of the different States to the necessity for State legislation on foreclosures.

Senator GORE. Several of the mid-Western States are doing that now, Governor. There is a bill pending in the legislature of my State. I think perhaps Nebraska and Iowa have already passed such laws.

Mr. SMITH. Well, I am in favor of it because it gives a fellow a chance.

Now, on our foreign debts. I still feel that I was right last spring when I said that I thought we ought not to cancel them but just declare everything off for a good long period of time.

The CHAIRMAN. What would you call a long period of time?

Mr. SMITH. Well, you could start with five years. You could say, "Here, we won't talk about this for five years, if you will do business with us." But of course you have go to do something to the tariff before you invite a man to do business with him. We have built a wall around this country here that nobody can get through.

The CHAIRMAN. But they are getting through, Governor. The same proportion or a greater proportion are getting through than our own trade in the United States.

Senator KING. That statement is subject to modification.

Mr. SMITH. Senator, I do not believe in the big, high tariff.

The CHAIRMAN. I know. That I do not object to at all.

Mr. SMITH. My opinion of the tariff is that it should be only what is necessary to take up the difference between the cheap labor of foreign countries and the high-class labor of this country.

The CHAIRMAN. That is what I think, too.

Mr. SMITH. But I think we have got it a little higher than that. That is the trouble.

Senator THOMAS of Idaho. Governor, may I ask you a question on that?

Mr. SMITH. Certainly.

Senator THOMAS of Idaho. Do you think the depreciated currency affects the situation any so far as our tariff is concerned at this time?

Mr. SMITH. Do you mean the depreciation of the foreign currencies?

Senator THOMAS of Idaho. The depreciation of the currencies in the foreign countries.

Mr. SMITH. Oh, yes; sure. They have got a poor money. They have got no money, and what they have isn't very much good. And when they get here with it they can not get anything with it.

Now, I got this notion from what would go on in a bank. You have got a customer in a bank and he owes you, and he can not pay. He is willing to trim down his overhead in his business. And we might take this up with the foreign countries to trim down their armaments a little bit, because I call that an overhead. You do not throw the fellow out of the bank and send for the sheriff and try to get the money out of him when you know he has not got it. You want to give him a chance. The way to give him a chance is to say "All right, now, we will just carry your loan along here in the deferred account for a couple of years; you keep doing business with us, and as you do business with us we will be kind to you."

Now, if we could say to these foreign countries: "All right, you come over here and buy some of our cotton, and buy some of our wheat, and some of our manufactured articles, and in accordance with the amount of good will that you display toward us we will deal in the future with these debts; for every million dollar's worth you buy from us we will take 10 per cent of it from what you owe us"—I think we would get out that way quicker than by standing back and insisting on getting something that we all believe we won't get.

The CHAIRMAN. That is quite different than when the settlement was made. For instance, when the settlement was made it was made in every case upon the basis of ability to pay. And there was not a Government at that time that particularly objected, outside of France.

Mr. SMITH. The answer to that, Senator, may be that at the time these arrangements were made these countries were in better condition to pay.

The CHAIRMAN. We understand that. So was the Government of the United States at that time in better condition to reduce the obligations.

Senator KING. Well, it is obvious that the United States is not getting it and the other nations are not paying. So the philosophy of the ex-Governor of New York is eminently wise at this time.

The CHAIRMAN. Well, that is a question that is doubtful, too.

Mr. SMITH. Here is another thing that I believe. I believe that we ought to recognize Russia. I do not know any reason for not doing it. Somebody says they owe us $100,000,000. We kept troops in Russia for quite a while when we were not at war with them, and we did some damage to them. I think we could sit around the table and settle that matter very easily.

There is no use of trading with them under cover. We are doing it. Through the Amtorg, or whatever you call it, the Russian Trading Co., our material and stuff is getting into Russia. We might just as well be represented there and let them be represented here at Washington and let us do business with them in the open.

Senator GORE. They have got a counterclaim against us based on the fact that we sent an army into Russia although we were at peace with Russia.

Mr. SMITH. Yes.

Senator GORE. I think you are right to the extent that we ought to sit down and see how much their claims amount to, if anything, and offset them against our claims against them and arrive at what the difference is, and then have them agree to pay it. Our objection to recognition is gone then.

Mr. SMITH. Of course, I do not believe in being against them just because they have a form of government that we do not like, you see. Because Jefferson told us in our Declaration of Independence that any time we did not like this Government we could pull it down and build it up the way we want it.

Senator GORE. He limited it to this Government. He did not say we had a right to change other people's governments, did he?

Mr. SMITH. No.

Senator BARKLEY. Governor, I do not like to base the idea of recognition of Russia purely upon the possibilities of trade. That has the appearance on the surface of being a more or less mercenary way to look at it. But waiving all the other ethical and international questions involved, to what extent do you think the recognition of Russia would bring increased trade to the United States which would tend to relieve our present economic situation?

Mr. SMITH. Well, to begin with I think that if we were on a friendly relationship with Russia that she would buy a lot of wheat here.

The CHAIRMAN. Has she not got a lot of wheat for export?

Mr. SMITH. She has, but it has all gone over to that far eastern front where all those soldiers are. The most of it has gone there.

The CHAIRMAN. She is exporting wheat to nearly every country.

Senator BARKLEY. Would she buy cotton?

Mr. SMITH. I do not know, Senator. I am not in a position to tell just what it is, but I know that they are buying in this country now.

Senator GORE. Machinery and things of that sort.

Senator BARKLEY. They buy machinery.

Senator HARRISON. Yes; they could buy some cotton. They have tried to buy cotton.

Senator BARKLEY. I was in Russia two years ago and came to a little town where they had a cotton mill, and the mill was closed and about 1,500 laboring men were out of work, and when we inquired the reason, they said they could not get cotton from the United States. And they propounded a very pertinent inquiry, to this effect: They said, "We want cotton, and our mill is closed, and we are all out of work because we can not get cotton. You have got your cotton piled up in the fields. You want to sell it. Why can't we buy from you the cotton that you want to sell to us?" And that was a very embarrassing inquiry.

The CHAIRMAN. Do you think that they can not do that? What is to prevent them from doing it now?

Senator BARKLEY. There is no law against it, but the economic situation and the political estrangement between the two countries contributed to a situation that made it impossible for them to buy our cotton. In other words, they could not obtain either the money or the credit with which to purchase it although they wanted it.

Senator KING. Senator, it is simply a question of credit. Germany backed her exports up to 60 per cent and therefore Russia bought considerable commodities from Germany so long as the German Government backed the exports.

Senator BARKLEY. At that time I will say that our Government was not only frowning upon any proposals in this country to loan money to Russia, but frowning upon any proposal on the part of American manufacturers to sell to Russia on credit.

Senator KING. However, it is well known that it is not a question of debts—if the governor will pardon me—that are impediments to recognition. When I was in Russia I told the leaders—and I talked to all of them—that as far as I was concerned I would forgive them their debts and recommend it to the Senate of the United States provided they would keep their international agreements, would cease their propaganda and disassociate themselves from the Third Internationale. They absolutely refused and said the Third Internationale was an organization which was to be utilized in the battering down of the walls of other governments because communism in order to succeed was to be world-wide.

The CHAIRMAN. The very basis of their present government.

Senator KING. It is not a question of their debts at all. I would forgive them their debts to-morrow if they would do the right thing.

Mr. SMITH. Well, I do not think myself that they are making any headway with this communism. If there would be any place where you would see some of it, you would see it in a city like New York, and it does not mean anything down there. New York City is contented. The people are satisfied. They are suffering but they are satisfied. Now and then down in Union Square there are a half a dozen crack pots jump up on the platform and holler out at the people, but that has been going on down there since I was a boy.

Senator GORE. To what extent, Governor, do you think that the fact that they have forced labor should enter into the consideration of the subject? To me that has been the most important consideration. The fact that they have forced labor and do not pay wage of any sort, you might say, and produce things to sell without the payment of living wages, and then inject those products into a world market or into our market in competition with our products when we do pay a living wage. I think that is the most serious consideration

Mr. SMITH. Well, we protect ourselves there with our tariff.

The CHAIRMAN. Well, that is to be abolished.

Mr. SMITH. How?

The CHAIRMAN. That is to be abolished, from what you say.

Mr. SMITH. Oh, no. I am not for abolishing it, Senator.

Senator GORE. I agree with the governor in regard to the tariff, but we have dumping laws, and I think we ought to have dumping laws, and they might protect us against forced labor.

The CHAIRMAN. We have dumping laws now and just as strict as words can be drawn.

Senator BARKLEY. Mr. Chairman, in connection with that, and in connection with this depreciated currency, the chairman of the Tariff Commission, who does not belong to the political party that is supposed to be in favor of lower tariffs, issued a statement the other day in which he ridiculed the idea that the depreciated currencies were bringing an increase of imports into the United States. And in view of his position I think his statement is entitled to a good deal of credit.

Senator GORE. We can not increase imports without increasing exports.

Senator HARRISON. We have the law with reference to forced indentured labor.

Senator WALSH of Massachusetts. What time does the Senate convene, Mr. Chairman?

The CHAIRMAN. At 11. Can we not expedite the hearing?

Mr. SMITH. Yes. I will finish in about five minutes. I have got a few more things.

Senator BARKLEY. If we do not ask you any more questions.

Mr. SMITH. On economy. Of course I believe in the reorganization of the Federal Government. I think it has got to be done. I think the machine has gotten too big. And I would favor the granting of broad power to the President for the consolidation of overlapping agencies of the Government and the reduction of them to a smaller number.

And I am not in sympathy with all this talk about dictators and monarchs and kings when you give the President of the United States the power to run the business of the country the way it would be run if it were a private undertaking. There is a great deal to that suggestion, and it can be taken from a speech that was made by Will Hays back in 1921, at a dinner of the Fifth Avenue Association in New York, when the original bill for the consolidation of the scattered activities of the Government was pending before both Houses here.

The CHAIRMAN. Well, he did not get anywhere with it.

Mr. SMITH. I know, Senator.

The CHAIRMAN. Congress would not do a thing. We presented a plan then. They just laughed at it.

Mr. SMITH. I know it is awful hard to do it. It took 10 years to do it in New York State. It was proposed originally in the constitutional convention in 1915, and it never became a part of the constitutional law of the State of New York until 1926, 11 years later, although everybody seemed to be in favor of it. Nobody every made any speeches against it, but it never moved. The people that were to lose their jobs by it were the great force behind the knifing of it all the time, but they kept under cover.

Senator BARKLEY. And they will fight any such thing.

Senator GORE. That is the sensitive nerve here.

The CHAIRMAN. Have you studied any soldier payments?

Mr. SMITH. Yes, sir; Senator. I am just coming to that. At the last session some committee of Congress was charged with the responsibility of looking into the question of all these veterans' payments. I do not know what they did about it. I never saw any report on it.

Senator HARRISON. They are still considering the question.

Mr. SMITH. Well, they worked on it.

Senator HARRISON. They are still considering it.

Senator GORE. Yes.

Mr. SMITH. I believe that the original agreement that was made in the time of President Wilson with our soldiers was the fairest and squarest that was ever made between any country and soldiers that served it during the war probably in the history of the world. But it has been these recent bills that followed afterwards adding on new burdens. I do not believe anybody is entitled to any money from this Government that can not show that the disability then is directly traceable to his service to the country in time of war.

The CHAIRMAN. We have nearly $1,000,000,000 of that kind of expenditure of the Government now.

Senator GORE. $3,000,000 a day.

Mr. SMITH. I think it ought to be cut out. I do not believe that a man that 10 years after the war is all over—who never left this country, who went down to camp and got the benefit of regular living down there, and had his teeth all filled and his flat feet corrected, if he had flat feet, and had all the acid taken out of his system by good, regular living and good food—just because he gets hit by a taxicab 10 years later, I do not think that we ought to take care of him forever.

The CHAIRMAN. If it were only a taxicab, or accidents, it would be quite different, Governor. But they do not stop there.

Mr. SMITH. If he is hurt, they take him to the doctor's. They write the prescriptions in some foreign language and they have some way of finding out that no matter what is the matter with you, it can be traced back to a war.

Senator GORE. I know of an instance in my State that occurred about three years ago where a man was out driving a pair of mules, and he was supposed to be in his cups more or less, and the mules ran away, broke his leg, and you and I and the people in this room are paying taxes to pay him an allowance.

Mr. SMITH. Well, I believe it ought to be cut out.

Now, prohibition. I would certainly be opposed to congressional action on the make-up of State conventions. That ought to be left to the States.

Senator GORE. Well, you do not think Congress has any power to regulate or even indirectly to meddle with those conventions, do you, Governor?

Mr. SMITH. Well, it is a sharp question. The Constitution says, "by conventions of the people." There are a great many lawyers that think that Congress can define what a convention is and how it is to be made up.

Senator GORE. Congress can submit amendments to the States and the States ratify them. I do not think, and I do not want you to admit that Congress has any power on earth to meddle with those conventions, directly or indirectly. It is a State convention pure and simple.

The CHAIRMAN. There would be such a howl, Governor, that would come from all over the Union that it would cease immediately.

Mr. SMITH. What I am a little bit afraid of is that Congress may amend the Constitution in this respect, as it has in many others, without the consent of the States. I hold that Congress amended the income tax law. I was the leader of the assembly and Senator Wagner was the leader of the senate in the New York State Legislature when the income tax of the United States was ratified by New York State, and it had never been ratified if the people in that State thought the Congress was ever going to define income. But Congress has done it. I believe they have amended the Constitution with the consent of the United States Supreme Court.

Senator BARKLEY. Regardless of whether the Congress has the power in the submission of the amendment to conventions to prescribe the methods of holding the conventions and the qualification of delegates thereto, we have not attempted it in this resolution. And presumably it is to be left to the States.

Mr. SMITH. I thought I read in the paper that there was something either introduced or going to be introduced as to how the conventions are set up. If what you say is true, Senator, why I withdraw it. I read it in some paper.

Senator WALSH of Massachusetts. There was a proposal made by former Attorney General Mitchell Palmer along the lines you indicated.

Senator HARRISON. That matter is behind us. It is up to the States.

Mr. SMITH. Good.

Senator WALSH of Massachusetts. Senator Wagner says that Congressman LaGuardia was going to introduce a bill to the effect that you read about.

Senator BARKLEY. Suppose the legislatures of a number of States deliberately refused to call conventions to pass on it at all, would you think then that if Congress had any power to make any law about it that it ought to do it?

Mr. SMITH. No; I would not like to see Congress interfering with the sovereign right of a State. There were some States did not ratify the eighteenth amendment.

Senator BARKLEY. I am not speaking about that. Of course we are assuming in the submission of this resolution to conventions that all the States will through legislation provide for the conventions, fix the qualifications of voters and delegates, and delineate districts to be represented by them. But assuming that they did not do it? If we could assume that say 15 or 20 States through their legislatures would not call these conventions, then would you favor Congress taking any action at all, or just leave it suspended in mid air like that?

Mr. SMITH. I would leave it right to the States.

Senator BARKLEY. On the theory, then, that the members of the legislature who would refuse to call conventions are responsible to the people, and the people can have their own remedy?

Mr. SMITH. That is the answer to it. It is pretty much the same thing as the States that did not act on the eighteenth amendment when it was submitted. They just did not do anything about it. Now, Rhode Island kind of threw it out of the window.

Senator GORE. Yes, it did.

Mr. SMITH. I would make another suggestion, that there ought to be a tax plan prepared by conference with the State governors covering tax on liquor in connection with repeal and in the event we get repeal. We do not want to have both the State and the Federal Government rushing right at liquor right away and taxing it so that it won't be any good.

Senator HARRISON. Do you mean the tax won't be any good or the liquor won't be any good?

Mr. SMITH. The tax won't be any good. By the time they pay the big high tax on it they will have to make it cheap.

Senator METCALF. And the bootlegger will continue to sell his product.

Mr. SMITH. Encourage the bootlegger to keep going because he probably will be under the price of the legitimate fellow if the tax is too high.

The last thing I want to speak of is the balancing of the Budget. I do not know whether that can be done or not. But it is very important, and it would go a great distance toward restoring confidence at a time like this. And if you have to resort to it I think we ought to put on a manufacturers' sales tax.

The CHAIRMAN. That is right.

Mr. SMITH. I really believe we should do it. Exempt from it, of course, food, clothing, and so forth. The man that spends say $1,000 a year, if he paid 1 per cent on it that would not hurt him. It would give everybody a chance to throw in a white chip when we need it to keep the ship going.

Senator BARKLEY. Governor, in that connection, one of the objections raised to the suggestion of the sales tax years ago before it ever became involved in the balancing of the Budget, was that it was promoted for the primary purpose of substituting it for the income tax as the final method of raising money to support the Government. Do you subscribe to that theory if in normal times the question of a mere balancing of the Budget became a side issue or was not serious like it is now—would you favor the substitution of the sales tax as a method of raising money to support the Government in lieu of the present income tax law?

Mr. SMITH. I would use it in normal times to make it possible to reduce the rate of tax on incomes. I believe in an income tax. But the present rates are just holding capital down to the earth. Take a man who takes a chance—if he loses, why it is just too bad. Everybody is sorry for him. But if he wins look what happens to him. They come in and take the largest part of it away from him.

Take the man that is fixed in this kind of a position. Back in 1928 and 1929 when we were all sitting pretty on top of the earth he signed a long lease for his apartment; there were not many of them around; rents were high, he wanted the apartment, and he signed a long lease. He has run into the decrease of salary made necessary by the red figures of the concern that he is working for, and the income tax comes along and takes the rest of it away from him.

Take my case. I got $50,000 a year as president of the Empire State Building. I have no other money. I got myself a nice apartment. After I left Albany, after living in a mansion for six years I couldn't see First Avenue very well, so I went over on Fifth Avenue. I signed a lease for $10,000 a year.

Senator GORE. You left the Fulton Street Market?

Mr. SMITH. Yes, I left the market. Now, in 1932 with my salary decreased, with the lease still in my lap, the Federal Government and the State together are going to take $10,800 away from me in taxes. Well, lay up the automobile. Chauffeur out of work. If three or four more fellows in the garage follow my example a couple of car washers are laid off. Less gasoline bought. Less rubber tires bought. It is a kind of a vicious circle. It keeps rolling around and grabs everybody.

Take a man to-day that wants to invest his money. The Pennsylvania Railroad says to him, "Here, we are electrifying the lines to Philadelphia. Come in and buy some of our first mortgage gold bonds. Pay you 5 per cent." The fellow looks at him for a minute and says, "Well, it will put people to work, that is true. But the trouble is I don't get 5 per cent. By the time the Government gets finished with me that is down to about 3 per cent. So I think instead of doing business with you I will do business with the Government." So he goes and buys a Government bond and there is no money to build the railroad.

The CHAIRMAN. And no money comes in to the Treasury as taxes.

Mr. SMITH. No. The Government gets no taxes from him. It is all velvet.

The CHAIRMAN. Senator Barkley, on the subject of the sales tax taking the place of the income tax, no thought of that ever entered my head.

Senator BARKLEY. I am not talking about the present situation, but there was an objection 10 years or more ago to the sales tax, because it was thought to be projected in the hope that it would some day supplant the income tax.

Senator GORE. We will spend all we can get from both.

Senator HARRISON. It is advocated by some influential people in this country because they want to use it to substitute for the income tax.

Senator BARKLEY. It may be necessary to adopt it as a supplement to the income tax.

Mr. SMITH. I believe in the income tax, but I do not believe in the high rates, because I think they are stifling business. If you will go back in your mind and study the history just before the election of President Coolidge in 1924, we had high income taxes. Mr. Coolidge recommended their reduction. Everybody was afraid to reduce them, but they did it anyway, and then he was elected in 1924, and when they saw the tremendous plurality he got in the face of his outspoken recommendation for reducing the rate on incomes, everybody rushed in reducing them a little more, and the direct result was that beginning in 1925, with the inauguration of Coolidge, we went into the greatest era of prosperity the country has ever known.

Senator BARKLEY. The great reductions in the income tax were due largely to the fact that each year we would have a surplus of revenue ranging from $300,000,000 to $900,000,000 a year, and, of course, we did not have any right to collect taxes from the people and pile up surpluses.

Mr. SMITH. My theory is that if you put on the manufacturers' sales tax, balance the Budget in the first instance, and hold it there, proper reductions in the income tax brackets can be made. Take the man who goes into a business venture. Suppose he makes $1,000,000.

The Government takes about $675,000 of it away from him. So, after he has risked all his money to make $1,000,000, all he gets is $325,000 out of it. With these high brackets it is going to be hard to induce men to go into great projects.

The CHAIRMAN. It has prevented them already. Is that all?

Mr. SMITH. That is all, Senator.

The CHAIRMAN. Thank you, Governor—unless there are some questions some members of the committee want to ask.

Senator CONNALLY. Just one question. I understood the Governor to say that on a $1,000,000 income a man would pay about $675,000 Federal taxes.

Mr. SMITH. In New York State.

Senator CONNALLY. That includes both Federal and State income taxes.

Mr. SMITH. Yes.

Senator CONNALLY. We are not responsible for the New York State income tax. That is the State's own business.

Mr. SMITH. I know; but you are responsible for a terrible part of it.

Senator CONNALLY. Not of your own State income tax.

Mr. SMITH. No; the total tax.

Senator CONNALLY. I thought the Governor referred to the Federal tax, and I knew he did not want that statement to stand.

Mr. SMITH. No. I referred to both taxes.

## STATEMENT OF MARY VAN KLEECK, DIRECTOR, DEPARTMENT OF INDUSTRIAL STUDIES, RUSSELL SAGE FOUNDATION

The CHAIRMAN. Whom do you represent?

Miss VAN KLEECK. I am director of the department of industrial studies of the Russell Sage Foundation.

Senator LA FOLLETTE. I ask for order.

The CHAIRMAN. I have asked for it. I wish those present would please let us have order. Proceed.

Miss VAN KLEECK. A brief statement of what I believe to be the basic cause of the present depression, as well as the starting point for consideration of legislative remedies, is contained in a report issued by the Bureau of Labor Statistics of the United States Department of Labor. The bureau has made a study of "the relative share of wage earners in the product of their labor, together with the relation between the purchasing power of the wages paid to labor and the value of the products of that labor."

Senator GORE. What is the name or number of that bulletin?

Miss VAN KLEECK. United States Bureau of Labor Statistics, Bulletin No. 541, Handbook of Labor Statistics, 1931 edition, page 615.

The basic figures were the data gathered by the United States Census over a period of 80 years. From this analysis the following summary was derived:

> That the average yearly earnings in manufacturing industries were 76.2 per cent greater in 1899 than they had been 50 years before, that the value of the product per wage earner was 130 per cent greater, that the value added to the raw material as the result of manufacture was 119.8 per cent greater, that the per cent wages bore to the value of product had decreased 23.2 per cent, the per cent that wages were of value of product added had decreased 19.8 per cent, and wholesale prices had decreased 13.1 per cent.

Senator GORE. What was it?

Miss VAN KLEECK. What was the actual amount?

Senator GORE. Yes. You say it was decreased 19 per cent.

Miss VAN KLEECK. I have not the figures here; but they are obtainable in a table in the bulletin, taken from the United States Census figures. It is the relative percentage that was the vital point here, rather than the absolute figure. (Continuing reading:)

By 1929, or 30 years later, the average yearly earnings had increased over 1849, 431.5 per cent, the value of products per wage earner had increased 651.7 per cent, the value added by manufacture per wage earner had increased 649.9 per cent. The per cent that wages were of the value of the product had decreased 29.2 per cent, and the per cent that wages were of value added had decreased by the same amount, while prices had increased 60.6 per cent.

Here in brief compass is a statistical picture of the failure of purchasing power to keep pace with production. It is not surprising, then, to read to-day the final results of this lack of balance between production and consumption in the figures of declining employment and decreasing income. In its most recent report on "Trend of employment" for December, 1932, the United States Bureau of Labor Statistics shows for manufacturing (including 89 industries) a decline of 12.6 per cent in number of employees compared with December, 1931; and a decline of 27.8 per cent in total pay rolls. The general index for ths 12-month average of 1932 (with 1926 as 100) was 60.1 for number of employees and 41.6 for pay rolls.

Senator GORE. State that again, please.

Miss VAN KLEECK. The general index for the 12-month average of 1932 (with 1926 as 100) was 60.1 for number of employees and 41.6 for pay rolls.

Senator GORE. You mean the number of employees had declined 60 per cent?

Miss VAN KLEECK. The index of number of employees had declined from 100 to 60.

Senator WALSH of Massachusetts. Forty per cent.

Miss VAN KLEECK. Pay rolls had declined 59 per cent. This pay roll figure refers not to wage rates, but to the actual total earnings paid to wage earners in these industries.

A further analysis of these earnings showed that the highest per capita weekly wages received in December, 1932, were $33.88 in the newspaper branch of the printing trade, while the following industries had per capita weekly earnings of less than $15: Confectionery, $14.12; cotton goods, $10.39; hosiery and knit goods, $13.15; silk goods, $12.76; men's clothing, $11.41; shirts and collars, $10.67; millinery, $14.72; corsets and allied garments, $14.73; cotton, small wears, $14.58; men's furnishings, $11.05; iron and steel, $12.50; cast-iron pipe, $12.63; hardware, $13.46; plumbers supplies, $13; saw mills, $10.86; millwork, $13.98; furniture, $13.22; turpentine, rosin, $13.59; boots and shoes, $12.76; fertilizers, $13.27; cotton-seed oil, and so forth, $10.44; brick, tile and terra cotta, $12.25; stamped and enameled ware, $14.92; clocks, and so forth, $13.96; chewing tobacco, $13.42; cigars and cigarettes, $12.81; agricultural implements, $14.72.

The index of employment on Class I steam railroads as computed by the Bureau of Labor Statistics from figures obtained by the Interstate Commerce Commission, was 58.1 as an average for 11 months of 1932, the low point for the whole series having been 55 in August, and 55.9 in November. It is noteworthy that this index reached 100 only in two years in the last 10—104.1 in 1923 and 100 in 1926. Comparison with car loadings, which before 1929 sustained themselves better than the number of employees, would show that part of this decline of employment on the railroads was due to technological unemployment; but in these last few years it may be regarded as a general reflection of decrease in interstate commerce. This, of course, is also an indication of decreases both in production and in the distribution of articles in interstate trade.

As to the declining income of the farmer, no statistical evidence is needed here, but as we have quoted the figures for December, 1932, in comparison with 1931 for manufacturing, it may also be of interest to note in the report on wholesale prices issued by the Bureau of Labor Statistics for December, 1932, that the index of the price of farm products at wholesale reached in that month the record low point of 44.1 compared with 55.7 in December, 1931. In a report of the same date on retail prices and cost of living, the index number of the principal articles of food at retail for December, 1932, was 98.7 (with 1913 as 100) in comparison with 114.3 for December, 1931.

We might go on and on with statistics for the different industries, but the point is probably sufficiently made, that, despite many inadequacies in the statistics of wages and farmers' income, the fact can not be doubted that in all our basic industries purchasing power is out of line with productive capacity to a degree which amply justifies the description of our present economic situation as "starving in the midst of plenty." No wonder that a mounting burden of debt has depressed the status of farmer, wage earner, and the gainfully employed in many other occupations, to a level which still further disturbs the necessary balance between the consumer's purchasing power and capital investments in production.

It should be pointed out here that not since the war have we had any study of standards of living. The figures published regularly by the Bureau of Labor Statistics on cost of living are quite different. The earlier studies of standards of living are used as a means of weighting the articles entering into typical family budgets, and the costs are determined on this basis. They show what buyers pay when they have income with which to buy; they do not show the actual standards or levels of living as they exist at the present level of wages and under the present conditions of part time and unemployment. An actual picture of the present level of living of workers, including part-time employees, and those who are unemlpoyed, does not exist; but it would be alarming in what it would indicate about the undermining of standards and of purchasing power.

This, then, is the basic fact in the present industrial depression—a decrease in the national income due to decrease in production which in turn has arisen from the lack of distributed and sustained purchasing power.

If this be a true analysis no remedy will be adequate which is not directed toward the raising of standards of living by the full utilization of productive capacity. Only so can the national income be increased or even sustained. Unless it is sustained it is idle to talk about balancing the Budget of the Government, or solving the problems of taxation.

If we have a declining national income, where can rising taxes come from, and how can you balance the Budget of the Government which, on the other hand, in our complicated civilization, has to give additional services to people or else we go down still further in our standard of living?

Moreover, financial arrangements and banking policies can not be sound unless they are controlled as instruments for the planned distribution of wealth, that is, the planned distribution of purchasing power. We have begun to discover that total wealth is meaningless, unless that wealth is distributed and used. That is merely economics, and not a social theory.

Nor can agreements to restrict production in order to maintain or raise prices for one group of producers be permanent or successful, even in accomplishing their own short-sighted purpose, if the purchasing power steadily goes down.

In short, the central problem to-day is to restore earning power to all the gainfully employed, and to establish security of income for those who work. In contrast, policies of deflation and of restricted production for price maintenance have the opposite effect, as have many of our international arrangements tending to depresss our total production because of the lack of a market for the exportable surplus.

If as a nation we seriously undertook to plan economic organization so as to raise standards of living in proportion to productive capacity, we would have to make considerable changes in economic organization, and particularly to study the functioning of corporate ownership, in the present development of the industrial and financial structure of the United States. Pending this fundamental action which our technological development demands, it is possible, however, to face in the direction of social economic planning which can have no other foundation than the raising of standards for labor.

In our present economic organization, efforts to maintain standards for labor have taken two forms: (1) Legislative action; (2) collective agreements between organizations of workers and the management in the industries in which they are employed. The second method, collective agreements, represents the field of action of the trade-unions. Legislation bears upon it in so far as it restricts or frees the trade-unions to function in winning sufficient power to make and maintain labor agreements. Into this question it is impossible to enter here further than to call attention to the constructive program put forward by the American Federation of Labor in its annual convention last November. The organized-labor movement can and must function to maintain and to raise standards of living by the twofold means of safeguarding wage-earners' security of income through wages and of decreasing the length of the working day. To make it possible for the trade-unions to function a radical change of policy must occur in the large corporate industries of the country, which have generally opposed what is called "recognition of unions," substituting for them the so-called "company union" and the "yellow-dog contract."

As to the method of legislation to maintain labor standards, it is of course complicated for the United States by the limitations upon the Federal Government's power to enact labor laws. In general this is a function of State governments. The disadvantages of different legislation in different States are quite as keenly felt to-day by the management of our industries as by labor, in those trades and occupations which are found in many States.

Talk to some of the cotton manufacturers, who wish that there were a uniform standard that their competitors would have to maintain. Talk to any of the producers who are worried over the toboggan slide in prices, bearing little or no relation to their costs of production, but with no apparent stopping place. In general, this need for interestate cooperation is recognized.

Perhaps we shall soon begin to see the necessity for a constitutional amendment which will give power to the Federal Government in cooperation with the States to establish basic standards. Pending such a change perhaps some form of agreement between States with the Federal Government acting as a standardizing agency, might be developed to prevent the present lags through the failure of some States to keep pace with those in which the same industries are competing.

The message of the Governor of New York State to the legislature published to-day, on the minimum wage for women and minors calls attention to cooperation between several industrial States which is already under way, and in which the Federal Government may have an opportunity for leadership in achieving uniformity in our basic standards.

The Department of Labor is the agency through which the Federal Government has the opportunity to deal with labor standards. The following immediate steps are suggested as feasible if as a nation we are in earnest in our intention to adopt a new policy directed toward economic security for wage earners:

1. Give to the incoming Secretary of Labor the responsibility and the appropriation necessary for a rounded program within the scope of the department's purpose and powers. The act creating the department declared that its purpose "shall be to foster, promote, and develop the welfare of the wage earners of the United States, to improve their working conditions, and to advance their opportunities for profitable employment." In general its relation to State departments of labor is to give leadership and coordination in fact finding for current statistical purposes; in investigations upon which the States may base legislation; and in the setting up of standards for industrial policy and practice.

Of its budget of $12,900,000 (round numbers) for 1932–33 $9,450,000 was for salaries and expenses of the Bureau of Immigration, with an additional $30,000 for immigration stations and $975,000 for the Bureau of Naturalization. Thus the amount available for the direct service in maintaining labor standards as distinct from the enforcement of immigration and naturalization laws is somewhat under $2,500,000 (72d Cong., hearing before subcommittee of House Committee on Appropriations, bill for 1934, p. 1.) In the report of the Committee on Appropriations for 1934, the Immigration Service alone was recommended for increase; all other divisions suffering a decrease. Moreover, even in the past year limitations on the printing budget result in withholding from the public certain valuable studies which are pertinent to the present situation.

In contrast to this action, recommending decreased appropriation, there is needed a more vigorous program of fact finding and publication to give stimulus to the labor legislation programs of the States.

2. New Federal legislation is needed for a comprehensive and effective Federal State employment service, such as has been proposed in the bill introduced into successive sessions of Congress by Senator Wagner. Such an employment service would be a means of organizing the labor market and preventing the waste involved in fruitless search for employment where none exists, or in the inability of industries seeking workers to find those available without delay. Moreover such a service, through its recording of opportunities for employment and applications for work, would serve as a barometer.

3. The Bureau of Labor Statistics needs a larger appropriation than has been recommended for this year if it is to fulfill its obligations under the law, particularly in gathering current statistics of the trends of employment and earnings. A very vital need is to measure in this way the effect of a public works program upon employment and earnings. In addition special studies bearing upon such vital problems as technological unemployment are needed, besides investigations of standards of living and the amplification and extension of current data on wholesale and retail prices and cost of living.

4. Because of the special problems of women in industry, their generally lower wages as compared with men, and the necessity for safeguards for an economically disadvantaged group, the Women's Bureau was created to carry out the department's purposes for women. It has cooperated closely with the States, but its investigations have had a broader scope than is possible for any one State. The industrial depression has tended toward abnormally low wages and long hours for women, with consequences for the labor standards for men. At this time the program of the Women's Bureau is especially needed, and an emphatic protest should be made against the opinion of the Committee on Appropriations which stated that it—

> feels that a large part of this work should now be done by the States; the justification for the national Government entering this field being to stimulate the States to make these studies. (72d Cong., 2d sess., House of Representatives, Rept. No. 1890, p. 34.)

5. The Children's Bureau is also suffering a reduction despite the urgent importance at this time of Nation-wide comparable studies for the protection of children in so far as it is possible to protect them against the devastating effects of unemployment.

6. In the office of commissioner of conciliation, the Department of Labor has a mediating service for industrial disputes which is susceptible of much greater development in the just settlement of grievances arising in the relationship between labor and management. If wages, hours, and other conditions of labor were made the subject of collective agreement between organized workers and management on a much more extensive scale than at present, it would be sound public policy for the Department of Labor to extend its conciliation service as an aid in the administration of these collective contracts. Without these collective agreements the need is all the greater for disinterested mediation for the protection of labor standards.

Such a program, going as far as the Federal Government can in leadership in investigations, and in the formulation of standards on which the States can base their legislation, with perhaps some very much more definite concurrence between the States and the Federal Government as to the standards to be embodied in labor legislation, would, in the last analysis, do little more than maintain services already provided by law, but their maintenance can be made to express a new social objective in the national economic policy.

When we speak of the necessity for immediate action, that is, of course, true; but if we are going to postpone any permanent solution in order first to take the immediate action, and then if we postpone, also, the immediate action, we shall be in an alarming state as the months go by. It seems to me that we need to divide our people into two groups, those who will look after immediate action, and those who will think out what is fundamental; and the sooner those who think out what is fundamental get to work and have influence, the better it will be.

I want to speak of one aspect of our foreign trade which seems to me the most hopeful for increase of employment by the only sound method, namely, the giving of orders to our own industries. I refer to the recognition of Russia. Without that recognition, it is impossible for our manufacturers, especially the smaller ones, to make the arrangements which they ought to be able to make, in order to sell goods to the Soviet Union. I speak as having been in the Soviet Union last summer, and having made an examination particularly of the second 5-year plan, and of the completion of the first 5-year plan in the mines, the factories, on the farms, and on up through the administrative agencies which have to do with planning. And I can testify, without taking the time to give the details here, that the U. S. S. R. gives evidence now of a steadily expanding demand for goods.

Although the foreign trade of the United States has always been a comparatively small part of our total production—recently about 10 per cent—it is axiomatic that the export of that surplus and the price received for it influences the selling price of the remaining 90 per cent. One of the influences which is now causing unemployment is the great reduction in world trade, including exports from the United States. In 1930–31 trade with the U. S. S. R. was beginning to assume promising proportions, but the present difficulties of doing business with the U. S. A. which has not recognized diplomatically the U. S. S. R., have turned the purchasing of the Soviet Union toward other countries. To remedy this situation would be an important element in restoring employment in the United States, not only in the industries from which the U. S. S. R. would buy, but also for those products which employees in these industries would purchase.

The U. S. S. R. alone of all the nations, offers now a steadily expanding demand for goods—what the economists have called "an effective consumers' demand"—which may be expected to continue because it is the result of national economic planning directed toward the distribution of purchasing power. A competent market analysis of the Soviet Union, would certainly show it to be a very good prospect.

The first 5-year plan, just completed, has laid the basis for industrial development by its emphasis upon providing machinery, equipment and power. The second 5-year plan, which is now in its beginnings, must continue this emphasis upon producers' goods while at the same time stressing more than in the past the consumers' goods, including the food supply.

The Soviet Union's policy with reference to exports is to sell only what is needed to make possible the necessary imports. The U. S.

S. R. has no surplus. It is not seeking a foreign market. Exports are a sacrifice made by the people in the hope of a higher standard of living in the near future. The U. S. S. R. has a plan for exports handled by a government monopoly which makes possible thoroughly rational and controlled trade arrangements with other countries.

This policy of planned exports as a means of securing imports removes all danger of "dumping." The Soviet Union is naturally unwilling to sell below the market because it is selling so that it can buy goods in return. Therefore it is not going to sacrifice its own exports. But whatever the circumstances, the most effective way to deal with problems of world market prices is by agreement; and moreover by the extension of credits to the U. S. S. R., enabling that country to buy from us.

It is not impossible, also, that such a policy on the part of the United States would make unnecessary some of the exports of wheat, for example, from the U. S. S. R. to European countries which might otherwise be a market for the wheat of our own farms. The Soviet Union needs wheat at home; and if a policy of recognition by the U. S. A. makes it possible without exporting it to receive the machinery and other goods which we can sell, the result of such planned international trade will give us far greater security than the present policy of inaction.

Generally speaking, our imports from the U. S. S. R. are noncompetitive with our own industries, and a mere fraction of our exports to that country. Our balance of trade with Russia has been uniformly favorable to the United States.

In 1932, American exports to the U. S. S. R. dropped almost 90 per cent compared with the preceding two years, amounting to less than $13,000,000, as compared with over $100,000,000 in 1931, and in 1930.

Senator GORE. What country was that?

Miss VAN KLEECK. Soviet Russia. I am talking entirely about Soviet Russia.

Senator GORE. Do you mean Russia's entire trade, or her trade with us?

Miss VAN KLEECK. Her trade with us. Her trade with us dropped from $100,000,000 to $13,000,000.

No such depression was shown in trade between the U. S. S. R. and other countries. It is true that in 1932 there was a contraction in foreign markets and that the drop in world market prices reduced the monetary value of Soviet exports, but nevertheless Germany, Great Britain, Italy, and other leading European countries maintained their sales to the U. S. S. R. at almost the level of 1931.

Senator GORE. But Germany and the Scandinavian countries guaranteed part of the sales to Russia; guaranteed that their people who made sales to Russia would collect at least, say, 60 per cent.

Miss VAN KLEECK. Yes. They gave a guarantee for that amount.

Senator GORE. And Germany borrowed the money from us to guarantee it.

Miss VAN KLEECK. Yes. As some one has expressed it, we permitted our loans to Germany to be turned into "a good note (credits to the U. S. S. R.) with a bad indorsement (Germany's incapacity to repay us). There has been no default in payment on the part of the U. S. S. R.

Senator GORE. Germany has discontinued the policy of guaranteeing these payments.

Miss VAN KLEECK. I am sorry I can not answer that question, but German sales to the Soviet Union are now much larger than ours.

Senator GORE. There is no doubt, Miss Van Kleeck, that we could sell goods to every country on earth if we ourselves would guarantee payment for the goods.

Miss VAN KLEECK. I am not proposing such a guarantee of payment for the goods in trade between the Soviet Union and the United States, but recognition which would facilitate credit arrangements.

Senator GORE. Do you think it was necessary on the part of Germany and the Scandinavian States to make the guarantee, but it would not be necessary with us?

Miss VAN KLEECK. I am not familiar enough with the policy which led to that arrangement in Germany to answer the question. I am somewhat familiar with the situation in this country, and the fact that manufacturers are ready to do business as they have in the past with the Soviet Union. But the lack of recognition, of course, creates many difficulties which are reflected in the present decrease.

Senator GORE. There is no doubt of that.

Miss VAN KLEECK. Such drop as there has been in Soviet purchases has been borne by American manufacturers, affecting primarily industrial and electrical machinery, which constitutes the principal group of American exports. Naturally, the loss of some $80,000,000 of possible sales which might have increased considerably about that figure affects not only our sale of industrial and electrical machinery but the purchasing power of all employees in those industries who would otherwise be purchasing from American manufacturers of consumers' goods.

By the way, some one asked Governor Smith for some data in connection with his testimony favoring recognition of the Soviet Union; and I am glad to put into the record the figures which I have in my manuscript here, but which I shall not read at this time.

Some one made the statement that it is rather mercenary to put favored trade as the reason for diplomatic relations with the Soviet Union. Of course, I do not think it is mercenary to advocate trade relations. They are fundamental in the life of the people. They go beyond the mere selling of goods to the Soviet Union. What we want is economic cooperation on this globe of ours. We need international economic cooperation, both for the sake of our own institutions and for the sake of what it would mean to world trade as a whole to have these two big, growing, enthusiastic, and, on the whole, optimistic, countries working together.

In contrast with this decline in actual trade, is the possibility of economic cooperation which would not only give trade to the United States but would put us in a position to cooperate in international relations generally more effectively than is possible without these diplomatic relations with the U. S. S. R. Recognition would of course be merely a first general step which would be followed by negotiations dealing with unsettled questions between the two countries and agreements laying the basis for future relations. These agreements would have their basis in trade agreements already existing between the Soviet Union and other countries.

In answer to questions which are raised as to the Soviet Union's good faith, and as to the danger of propaganda for communism, I want to call attention first, to the pact of Paris, signed November 29, 1932, between the U. S. S. R. and France, in which they bound themselves:

> To participate in no international agreements which would have the practical consequence of prohibiting purchases to be made of the other party, or the sale of goods, or the granting of credits to the other, and to take no measures which would result in excluding the other party from any kind of participation in its foreign trade.

Incidentally, this is a practical expression of the principle in article 23 of the covenant of the League of Nations—which Woodrow Wilson succeeded in having inserted—calling for "equitable treatment for the commerce of all members of the league." It is a pity that we and the league have made no effort to enforce that principle.

The same idea is embodied in the draft protocol for economic nonaggression put forward by Litvinoff, Commissar for Foreign Affairs of the Soviet Union, at the session of the League of Nations Commission for the Study of European Union at Geneva, May 18, 1931. He called first for a reaffirming of the principle proclaimed at the International Economic Conference in 1927, "of the peaceful coexistence of countries, irrespective of their social, political, and economic systems." Acting upon this principle, the proposed draft protocol would require of all countries—

> the complete cessation of all forms of economic aggression, both avowed and concealed, by any countries or groups of countries against any other countries or groups of countries.

If that had been adopted in Europe to-day, we would have less risk of economic warfare, instead of cooperation; and the other kind of warfare that comes out of it.

The draft further declares that:

> The cessation of economic aggression is an essential condition for the peaceful cooperation of States in the sphere of economics, irrespective of their political and economic systems.

The spirit of this declaration which was put forward by the U. S. S. R. opens the way for exactly the policy of recognition which has always controlled the United States of America.

Senator GORE. Have you that declaration in full?

Miss VAN KLEECK. I have. You mean Thomas Jefferson's declaration?

Senator GORE. No. The soviet declaration in favor of the cessation of economic aggression. Have you set that out in full?

Miss VAN KLEECK. I shall be very glad to file the full protocol with this committee.

Senator GORE. I wish you would.

(Printed at close of testimony.)

Miss VAN KLEECK. The spirit of this declaration which was put forward by the U. S. S. R., opens the way for exactly the policy of recognition which has always controlled the United States of America. This principle was first pronounced on March 12, 1793, in an instruction issued by Thomas Jefferson, Secretary of State, to Gouverneur Morris, Minister to France, in these words:

> We surely can not deny to any nation that right whereon our own Government is founded—that every one may govern itself according to whatever form it

pleases, and change these forms at its own will; and that it may transact its business with foreign nations through whatever organ it thinks proper, whether king, convention, assembly, committee, president, or anything else it may choose. The will of the nation is the only thing essential to be regarded.

That will in the Soviet Union has now been expressed in a form of government which has lasted 15 years and which is so intertwined with the economic administration of the country and so shared by the mass of the workers in the Soviet or the council in each work place that no one who has had an opportunity—as I am glad to say I had last summer—to observe the Soviet Union at work to-day in the shops, mines, and factories can doubt the stability of its present form of government grounded in economic planning.

Although it is clear that recognition would not imply approval, it should be pointed out that recognition would open for us in the United States a valuable opportunity to study the methods of administration of industry in this new economic system. We in the United States are forced to-day to a fresh study of economics. There are two ways of studying economics: (1) By reading books; (2) by observing a system different from our own and comparing its results with ours in order to see where ours may be made to work better. It is especially challenging to us, with our millions of unemployed, to study the reasons why in the Soviet Union there is no unemployment, but rather a shortage of labor.

Recognition would give to the United States and to its travelers in the U. S. S. R. sources of service and of information which are always provided by embassies and consuls; opportunity for observation of economic developments; a chance to watch more closely such international developments as are now occurring in the Far East; trade relations which for the moment at least would place orders and give employment to thousands of American workers in a form more fundamental than any program of relief; and finally, the opportunity to set at rest the fears and the district which arise through our inability to negotiate differences by established methods of international conference and agreement.

We are tremendously handicapped in our policy in the Far East because we are not cooperating with the Soviet Union, whose purposes are like ours, a desire to maintain the territorial integrity of China. The Soviet Union is strong in the Far East, and is informed about it. We are weak. There is nothing more important that could be done for the peace of the world to-day than the recognition of the Soviet Union.

As to the fears of some in the United States that there will be propaganda directed by the U. S. S. R., it is important to quote the following Article V from the Franco-Soviet Non-Aggression Pact, signed in Paris, November 29, 1932, to which reference has already been made. Article V reads as follows:

> Each of the high contracting parties undertakes to respect in all relations the sovereignty or dominion of the other party over all its territories as defined in Article I of the present treaty, in no way to interfere in its internal affairs, and in particular to refrain from any action inclining toward incitement or encouragement of any kind of agitation, propaganda or attempts at intervention which would have the aim of violating the territorial integrity of the other party or of changing by force the political or social structure of all or part of its territory.

There have been instances where charges of communist propaganda by the Soviet Government have been officially investigated; and in every instance official investigation has cleared the Soviet Government of the charge of propaganda in foreign countries.

Senator GORE. You mean in other countries?

Miss VAN KLEECK. And in our own. Our own fish commission undertook to investigate the one charge against any representative of the Government of Moscow, namely, the Amtorg, and failed to find evidence in any way supporting the charge that the Amtorg was guilty of disseminating propaganda in this country. Another famous case is the Arcos, which is a similar organization in England, and which was "raided," if you will. Its offices were in the hands, for several days at least, of the very competent investigating agencies of the British police. They used all the instruments needed to open strong boxes, but they discovered not one bit of evidence.

On the contrary, it has been the policy of the government of the U. S. S. R. to enter into such relationships as are defined in the pact of Paris, and to maintain the agreement in every particular.

Incidentally, of course, it is not Moscow, nor the Third International which endangers our institutions, but the shaking of confidence in the capitalistic system, through the failure to manage wisely its banks and its financial institutions, and through the spread of unemployment. Whatever dangers we have can be met only by our undertaking a thorough-going program of our own in accordance with sound economic principles.

The following table with the succeeding comments gives more in detail the trends in trade between the United States and the Soviet Union since 1923, as compared with the average for the four years preceding the war.

(The table referred to is here printed in the record as follows:)

*Balance of Soviet-American trade for the years 1923–1931*

[In thousands of dollars]

| Year | Exports from United States to Soviet Union | Imports into United States from Soviet Union | Total turnover | Balance in favor of United States |
|---|---|---|---|---|
| 1910–1914 average | $24,604 | $20,865 | $45,469 | $3,739 |
| 1923 | 4,550 | 1,448 | 5,998 | 3,102 |
| 1924 | 42,103 | 8,168 | 50,271 | 33,935 |
| 1925 | 68,906 | 13,120 | 82,026 | 55,786 |
| 1926 | 49,906 | 14,122 | 64,028 | 35,784 |
| 1927 | 64,921 | 12,877 | 77,798 | 52,044 |
| 1928 | 74,091 | 14,025 | 88,116 | 60,066 |
| 1929 | 85,011 | 22,551 | 107,562 | 62,460 |
| 1930 | 114,399 | 24,386 | 138,785 | 90,013 |
| 1931 | 103,669 | 13,206 | 116,875 | 90,463 |
| Total, 1923–1931 | 607,556 | 123,903 | 731,459 | 483,653 |
| 1932 (preliminary) | 12,610 | 9,600 | 22,210 | 3,010 |
| Total, 1923–1932 | 620,166 | 133,503 | 753,669 | 486,663 |

*Share of the U. S. S. R. in exports and imports of the United States*

[In thousands of dollars]

| Year | Total U. S. exports | U. S. exports to U. S. S. R. | Share of the U. S. S. R. in total U. S. exports |
|---|---|---|---|
| | | | *Per cent* |
| 1910-1914 (annual average) | 2,165,818 | 24,604 | 1.1 |
| 1928 | 5,128,357 | 74,091 | 1.4 |
| 1929 | 5,240,995 | 85,011 | 1.6 |
| 1930 | 3,843,181 | 114,399 | 3.0 |
| 1931 | 2,424,289 | 103,669 | 4.3 |
| 1932 (preliminary) | 1,612,306 | 12,610 | .8 |

| Year | Total U. S. imports | U. S. imports from U. S. S. R. | Share of the U. S. S. R. in total U. S. imports |
|---|---|---|---|
| | | | *Per cent* |
| 1910-1914 (annual average) | 1,688,876 | 20,865 | 1.2 |
| 1928 | 4,091,044 | 14,025 | .3 |
| 1929 | 4,399,361 | 22,551 | .5 |
| 1930 | 3,060,098 | 24,077 | .8 |
| 1931 | 2,090,635 | 13,206 | .6 |
| 1932 (preliminary) | 1,322,745 | 9,600 | .7 |

American-Soviet trade increased in volume each year from 1925 to 1930. During this period the Soviet Union purchased $5 in American goods for every dollars' worth of Soviet products sold here. For the six years ending with 1931 the favorable American trade balance in this business was nearly $400,000,000. Most of the American exports to the Soviet Union were sold on credits and there were no delays or defaults on payments.

The peak was reached in this trade in 1930. In 1930, according to the Department of Commerce, American exports to the Soviet Union amounted to $114,400,000. The Soviet Union was America's sixth best foreign customer. It was the leading foreign customer for American agricultural machinery and the second-best customer for American industrial machinery. This was quite a contrast with the situation before the war, when Russia had been a negligible customer and the average annual American exports to that country were about $24,000,000.

In 1930, the United States furnished 25 per cent of the total imports of the Soviet Union. In 1932 it furnished only 4½ per cent of these imports.

In 1932, the Department of Commerce reported about $12,600,000 for American exports to the Soviet Union, as compared with $114,400,000 in 1930.

The Soviet Union imports machinery and equipment from Germany, England and Italy, as well as from the United States. Soviet customs figures for 1932, recently published in this country by the American-Russian Chamber of Commerce, show that as compared with 1930 imports from the United States decreased 88 per cent, while imports from Germany, England, and Italy increased 30 per cent.

The figures for imports from the four countries for the two years are as follows:

| | 1930 | 1932 |
|---|---|---|
| United States | $136,162,000 | $16,466,000 |
| Germany | 129,176,000 | 167,072,000 |
| England | 41,266,000 | 46,830,000 |
| Italy | 5,601,000 | 13,979,000 |

Purchases from the United States decreased from $136,162,000 in 1930, to $16,466,000 in 1932 These are soviet figures of customs entry, and are not exactly identical with our Department of Commerce figures, because there is a lapse of time between export from us and arrival in the Soviet Union, and so forth. But the relative percentages are similar.

The drop of 88 per cent in American exports to the Soviet Union in two years, as compared with a gain of nearly 30 per cent in exports to that country by America's business rivals is the result of conditions implicit in our situation of diplomatic nonintercourse. American manufacturers and exporters, under such conditions, can not successfully compete for such a broad market against foreign competitors who are backed by the usual facilities and protections furnished by Government agents on the spot. Under the present abnormal conditions of American-Soviet trade the establishment of adequate trade credits is impossible. In Germany, England, and Italy the Governments went out of their way to establish a suitable credit base, even going to the extent of guaranteeing from 60 to 70 per cent of the credits extended by their own manufacturers. They got the trade that we were losing.

The logic of events may be expected to lead very soon to recognition of the Union of Soviet Socialist Republics. This step is logical and therefore inevitable on three grounds: (1) As a part of the policy of economic cooperation essential to our national life; (2) as a step forward in leadership in international economic cooperation which we can not neglect without danger to our own civilization; (3) as a safeguard of world peace which is jeopardized by economic insecurity and by international antagonisms arising out of the collapse in world trade.

The Far Eastern situation makes it imperative that it should be without delay There is a tremendous amount of information available. No further information is needed to enable us to make up our minds on this subject.

The CHAIRMAN. Thank you.

Senator GORE I infer, Miss Van Kleeck, that you do not attach as much importance to balancing the Budget as some of the other witnesses?

Miss VAN KLEECK. I think balancing the Budget is always essential, both in the Government and in private life. What I am troubled about is the possibility of balancing the Budget with a decreasing national income.

Senator GORE. That is what I want to come to. Would you balance the Budget by decreasing expenditures, or by increasing taxes?

Miss VAN KLEECK. If I may answer that question by going back of it, I would look toward——

Senator GORE. We are standing face to face with that question, and we have to make a choice.

Miss VAN KLEECK. I would balance the Budget, in the first place, by allowing a longer time than a year for balancing it, which I assume is possible. I would balance the Budget by a very carefully worked out procedure of taxation. We certainly need more sound taxation policies. The income tax certainly appears to be a sound method; and I would maintain Government services which are needed. Now is the time for a thoroughgoing study of Government services, but not for curtailing those things which are imperative.

Senator GORE. Those things that are imperative you would spare. You would limit your curtailment.

Miss VAN KLEECK. I would limit expenditures for armaments.

Senator GORE. That is the point I wanted to bring you to, Miss Van Kleeck. You would use the pruning knife on other departments than the Department of Labor?

Miss VAN KLEECK. Yes. I would maintain the Department of Labor and some other departments.

Senator GORE. In other words, you would spare the one department in which you are interested, and would pare others that you are not interested in. That brings us to this point, Miss Van Kleeck, so that you may see our difficulty——

Miss VAN KLEECK. May I interrupt to say——

Senator GORE. Just a minute. I want to give you this: The Senate struck out a $19,000,000 subsidy—and I will say graft—for air mail contracts. The air mail concerns that were affected lobbied and got it back in. At least, it went back in. You can not cut down anybody's expenditures, because they are concerned in those, and they come here and lobby and protest. I respect your principles in regard to labor—and I say this, Mr. Chairman, as a basis for another question——

Miss VAN KLEECK. May I answer what you say, before you ask me another question? May I answer the first one?

Senator GORE. I thought you had.

Miss VAN KLEECK. May I just say, with reference to this decision to cut down or not to cut down because somebody lobbies for it, that it is high time, of course, that we had a fundamental principle for the working out of our Budgets in the National Government, so that those services of the National Government would be maintained which bear directly upon the standards of living of our people; and that those services should be discontinued which represent destructive forces, or graft, or incompetence in the Government. I think it is high time that it was no longer a matter of who has the greatest power to persuade Congress, but it should be a matter of the principles upon which Congress and the National Government act.

The CHAIRMAN. There is no department of the Government but what comes up to the Appropriations Committee and asks for increases—the Labor Department, and all of them.

Miss VAN KLEECK. I should think decision would be very difficult unless we have a national policy, clearly declared.

The CHAIRMAN. That is what we try to do.

Senator GORE. The friends of this aviation subsidy insist that it is indispensable to national defense. There is always an excuse, whether there is a reason or not.

I agree pretty well with your philosophy against restricting production, and in favor of the use, and even the increase, of our productive capacity until every legitimate human need is satisfied, and every legitimate human want is supplied. I think we ought to attempt that before we go into reverse. For that reason I could not agree with your proposition to cut down the days in the week or the hours in the day until that becomes at least indispensable. You want labor to have a larger share in the joint output of labor and capital. I think you are right about that, in the main. I agree with you in the philosophy of high wages, but I do not see how you can cut down the days and hours and expect labor still to have a larger share in the joint output, which you think is indispensable—and I think it is, too.

Miss VAN KLEECK. Is not that simply a matter of technological development and the production of a surplus, which is well recognized in all industries? There are two ways to cut down a surplus; one is to attempt to do it by "cartels" and international or national agreements. The industries of rubber, sugar, and others have come up against stone walls and have not been able to do it. Another way is to plan production, and to get the hours of work down to the point where our machines will not run away with us. We can not keep them going too long without piling up goods which can not be sold, with the results that we have to-day.

Senator GORE. That is the point I was coming to. You stated—and correctly—that labor's share in the total output of capital and labor is a smaller percentage than it used to be. That was part of your statement.

Miss VAN KLEECK. Yes.

Senator GORE. I believe you also stated that labor's share in the value added to the product is less than it used to be. The increased output of labor and capital, this enormous increase, is mainly due to the increase in machinery, mechanization, and technology, is it not?

Miss VAN KLEECK. Not wholly.

Senator GORE. I didn't say wholly. I said mainly. Is not that true, that the increased mechanization, the increased use of machinery and mass production account for the major part of the increased product of labor and capital combined?

Miss VAN KLEECK. That, with other elements.

Senator GORE. Is it not indispensable, then, that a larger share of the joint product of capital and labor must go to capital, in order to induce it to enter these enterprises?

Miss VAN KLEECK. I think that the industries to-day do not need more capital for equipment. They need purchasers, from whom comes the money with which to run industry.

Let us define what we mean by labor. By "labor," we do not mean simply the industrial workers gainfully employed in this country. I think the percentage of men gainfully employed is something over 90 per cent. What I am talking about is earnings from salaries or wages, as distinct from interest or returns on capital, and I am discussing it not in the least from a social or ethical standpoint, but from the standpoint of the problem of planning production, and balancing production with purchasing power. And when technological development produces goods with such rapidity, if in this revolution from steam to electricity we do not put enough money into purchasing power to buy the increased production, the capital investment becomes worthless. It is simply a problem of economic planning, and I am assuming that it is not a group of people called capitalists, and a group of people called labor. What we are talking about is the distribution as between earnings and purchasing and consuming power, and the amount put into capital investment for increased production to expand industries which are already over-expanded, which is not an economic thing to do. Our labor problem to-day, if you want to put it that way, has become a problem of the survival of technological methods of production, because only by attention to the amount that goes into earnings, and the amount that goes into the purchasing power—and I refer to all salaries and all wages—only by that can we distribute the goods.

Senator GORE. That is largely true in manufacturing lines, but not so much in railroads and building.

Miss VAN KLEECK. Is it not true that the railroads are dependent upon purchasing power par excellence? What has happened to car loadings?

Senator GORE. Everything is dependent upon purchasing power. That is true.

Miss VAN KLEECK. It is not only the purchasing power of their own workers, but of all other workers. What is the matter with the railroads to-day? In my humble opinion they have not enough freight to carry, and they have not the freight to carry because people are not buying goods, and no amount of credit will remedy that situation.

The CHAIRMAN. I suppose if the trucks were off the roads, they would have just as much business as they had before.

Miss VAN KLEECK. But, Mr. Chairman, there actually is not as much production. The figures show that. They have not as much to carry, even if not divided with the trucks.

Senator GORE. I think you can say that no amount of credit can take its place.

You mentioned the fact of the minimum wage for women, and I inferred you favored that?

Miss VAN KLEECK. Yes; distinctly.

Senator GORE. This relates to this general principle of restriction, which you are against in the first instance. One of the Western States has a minimum wage law for women. They are discharging the women in that State because of this depression, when men are willing to work for that wage. So that your effort to protect women with a minimum wage is destroying their wages altogether, because they can not accept less wages, and their employers can not pay less wages. Undoubtedly, they would like to keep these women on the pay roll, and I have no doubt the women would like to accept reduced wages, in view of this depression, but your iron-clad law, ignoring the depression, and ignoring economic necessity, says to the employer, "You have got to pay these women $17 a week," let us say. The concern says, "We can not pay it and run." In this town, they are willing to accept less. The result is that your solicitude for the women has destroyed their jobs, and their employment. They are being discharged, and men are being employed in their places at women's wages.

The important point is that your philosophy against restriction is sound, and very often these restrictions destroy the main purpose they have in view.

Miss VAN KLEECK. May I say that I am not in favor of flat legislation for a given wage. I am in favor, in this field as in many others, of the proper methods of negotiation and investigation as a basis for decision. A minimum wage law of the really justifiable kind is a law which says that when an industry goes below the cost of living for its workers and seems able to survive only becuase of the desperate need of workers to take jobs at any price, that is time, in the interest of public policy, for a commission composed of representatives of labor, of management, and of the general public, to look into the facts as to the cost of living and the ability to pay, and to set the wage rates accordingly.

And may I say, Senator, that if Congress will appropriate the right amount of money to the Women's Bureau in the United States Department of Labor, we shall be currently and accurately informed of all these facts, which otherwise we are in grave danger of misinterpreting, when we speak only of one instance.

Senator GORE. Does not the admission that wages can be too low—which everybody admits—involve the admission that wages can be too high?

Miss VAN KLEECK. Certainly. There can be a maladjustment in wages. I believe in a planned wage system. I do not believe——

Senator GORE. In this town, the carpenters union are insisting on $11 a day, in this depression, for work that has to be paid for by the people of this country—by the farmers, for instance, who are selling their hogs at 3 cents a pound, their cotton at 5 cents a pound, and their corn at 10 cents a bushel. Do you think there is any justification for that?

Miss VAN KLEECK. There is often a justification for $11 a day for a carpenter. I am not familiar with this particular situation. We must bear in mind the insecurity of employment in the building trades and the wastes due to this insecurity.

Senator GORE. There are hundreds of carpenters in this town now receiving public aid, no doubt, and yet some are insisting on $11 a day.

Miss VAN KLEECK. If there are hundreds receiving public aid, it shows that there is something wrong with the building trades not having been able to give security of employment to their workers.

Senator GORE. Undoubtedly there is something wrong if they can give employment to two carpenters at $5.50 a day, and yet they are insisting on $11 a day for one.

Miss VAN KLEECK. I am glad to say a word on this problem of sharing work which you imply in your question, because sharing work is a policy which says to labor, "We are sorry we can not help you in this difficulty, but if you will just get the man on the next machine to share his pay envelope with you all will be well," and the result is a still greater decline in purchasing power. It is not a national policy which should be permanent.

Senator GORE. Is not the purchasing power more widely distributed? The one man who got $11 a day might save half his pay and not spend it at all, whereas if two men were employed on that both would spend more.

Miss VAN KLEECK. But if the first man has not enough now to pay his rent or the mortgage on his house, or to buy clothes and shoes for his children, dividing it with the next man is not a fundamental remedy for the discrepancy between purchasing power and production.

Senator GORE. You would tax the taxpayer to maintain him out of the Government Treasury—the second man?

Miss VAN KLEECK. No. I am insisting that industry shall maintain its workers, not taxation.

Senator GORE. I am glad to hear you say that.

Miss VAN KLEECK. In my opinion, taxation for relief purposes to-day is an evidence of the failures of industry.

The CHAIRMAN. We have an hour, now, Senator, to get through with two witnesses. If you have no further questions to ask, we thank you, Miss Van Kleeck.

(The text of the economic nonaggression pact put forward by the Soviet Union is here printed in full as follows:)

At the request of a member of the committee the following text of the economic nonaggression pact put forward by the Soviet Union, and quoted in the preceding testimony, is hereafter given in full. It was proposed by the People's Commissar for Foreign Affairs of the Soviet Union, Maxim Litvinov, in his address before the League of Nations commission for the study of a European union at Geneva May 18, 1931. The text of this draft protocol is as follows:

"The representatives of the European countries enumerated below, recognizing that mitigation of the economic crisis which has affected national economy of most of the countries of the world, requires in addition to the renunciation of war as a means for the solution of international conflicts the complete cessation of all forms of economic aggression, both avowed and concealed, by separate countries or groups of countries.

"That the cessation of economic aggression is an essential condition for the peaceful cooperation of States in the economic field, irrespective of their systems.

"That such peaceful cooperation is possible and desirable in the interest of mitigating the economic crisis of European countries in the first place.

"Taking into consideration that the cessation of economic aggression will help to put an end to the present atmosphere of mistrust, uncertainty and alarm, which gravely affects the economic position, and hoping that inspired by their example all other countries will join in this protocol, have decided to recommend that their respective governments sign the following protocol:

"1. The contracting parties once more solemnly affirm the principle of the peaceful coexistence of countries irrespective of their social, political and economic systems, proclaimed by the International Economic Conference of 1927.

"2. In accordance with paragraph 1, the contracting parties undertake not to apply any discrimination whatsoever in their relations with each other, and regard the adoption in any of their countries of a special régime directed against one or several countries subscribing to this protocol as incompatible with its principles.

"3. This protocol is to be ratified and will come into force between those of the contracting parties who submit their ratification papers to the president of the commission for the study of a European union. This protocol may be subscribed to by all the States of the world. Notification of adherence is to be submitted to the president of the commission for the study of a European union and the agreement will immediately come into force between the States newly subscribing to it and all other participants. The president of the European commission will notify all adherents of the protocol of each new ratification or adherence immediately upon receipt of the ratification papers."

## STATEMENT OF SIDNEY HILLMAN, NEW YORK CITY

Senator LA FOLLETTE. What is your business, Mr. Hillman?

Mr. HILLMAN. I am president of the Amalgamated Clothing Workers of America; chairman of the Amalgamated Bank of New York City; and president of a cooperative housing corporation, the Amalgamated Dwellers of New York City.

As a representative of thousands of organized workers in the men's clothing industry, I appear before your committee solely for the purpose of stressing the fact that nothing else matters in this country until the millions now totally unemployed and the millions employed on part time are given work at a wage that will enable them to maintain a standard of living to match our productive capacity. Only when this is done can you solve the problems which now trouble us so much.

I have noticed, day by day in the public press, that many of those who have appeared before your committee have stressed the "balancing of the Budget." How can any budget of any government ever be balanced on a daily decreasing revenue? A budget made this month must in the very nature of the thing, be totally out of balance next month, when the total national income day by day continues to decline.

If I am correct, I think Congress balanced its Budget six months ago.

Why does it decline? Because such a large proportion of our population have no jobs. If they had jobs many of the problems which you gentlemen discuss every day in Congress would not exist. I repeat, that nothing else matters for the moment but putting these millions back on their jobs.

A little over a year ago, I appeared before a Senate committee which was holding hearings looking to the establishment of an economic council. Men of affairs from all over the country testified before a Senate committee. It was the general consensus of their opinions that something should be done to plan for industry; that a planned industry would save us form wasting billions of our national income and that such a plan would provide employment for all persons willing to work and at the same time maintain a high standard of living. It was the belief of those in favor of the establishment of such an economic council that it would help to give security and comfort to the country as a whole.

And yet, nothing has been done about it. At the time these hearings were held, our industrial experts told us there were over 8,000,000 people totally unemployed in the country. To-day they tell us that there are between 13,000,000 and 15,000,000 totally unemployed. If that bill had been acted upon, I think you would have had more actual information—not special pleading information—at this time, or long before this.

Our national industrial house is literally falling on our heads and it is pulling down with it the financial structure of the country. It is not necessary for me to cite any evidence before this committee to prove the truth of this statement. The front pages of our newspapers, day by day, should be sufficient and most convincing evidence of this.

The truth is that we are in a vicious circle of declining employment and wages which affects the purchasing power of consumers and causes increasing unemployment. The policy of the present administration, as you well know, has been to wait for something to turn up which will by itself cure the situation. I do not believe that we will make headway by following this kind of policy, especially because of such a new problem as technological unemployment, which was not present in previous depressions.

Senator GORE. We can not wait for the "breaks."

Mr. HILLMAN. No. Any substantial revival in industrial activity will have to be based on a national policy which will inspire confidence in the country and which will promise not only a check to unemployment but the return of a large part of the unemployed to work. The result could only be achieved by checking the forces which make to-day for a continuous contraction in the earnings of labor. Not only are there now over 12,000,000 people totally unemployed, but wages have declined to the lowest levels imaginable. In the clothing industry, which is the picture of the wearing apparel industries, employing several hundred thousands of people, together with the textile industries, employing three-quarters of a million, we are drifting back to a condition of sweated labor as bad as any of which we have any record. A real investigation of the wages prevailing in many factories will show that a very substantial proportion of the labor force is to-day working for less than minimum subsistence wages. Individual employers seem to be helpless. I think if it goes on that way, we will compare pretty soon with the countries abroad that we sympathize with so much when we consider the conditions of labor in those countries. Cutthroat competition makes the most unscrupulous employer the leader in each industry and the rest willingly or otherwise follow.

It, therefore, become necessary, as I have indicated before, for the government to take action to check this progressive deterioration in the working standards of labor. In order to do this, it will be necessary to regulate industries by means of a national effort. During the period of war when the problem confronting the country was the shortage of labor, the Federal Government, through its war labor board established rules to guide industry, subordinating the interest of the group to the welfare of the country. The emergency to-day so far as the welfare of our people is concerned is much greater than during the war and similar action should obviously be taken.

I hear people comparing this emergency to the emergency of the war. During the war employers made profits in the hundreds of millions of dollars. The workers were receiving high wages. There was not a real emergency, as far as the people are concerned, as compared with the emergency of to-day with millions of people actually starving.

There ought to be established by Congress a labor board whose function it shall be to regulate hours in the different industries in a manner that will not only check further lay offs but will replace part of those who are at this time unemployed. In our industry the enforcement of 30 hours a week would give employment to tens of thousands who are without work now and are bound not to have any in the near future. It shall also be the duty of the board to establish minimum wages for men and women in each industry. The establishment of a minimum wage will not only check further decline in earnings, but will raise the standards of workers who are to-day forced to accept remuneration below the barest minima. This will increase the purchasing power in every community where labor is employed.

No industrial program can prove efficient that is not national in scope. And the enforcing agency for such a program must be part of the National Government. I have mentioned the vital importance of maintaining a high standard of living. We should never lose sight of the fact that even during the time of so-called prosperity wages, these wages were not sufficient to purchase the capacity of our production. But we have sent to Europe $12,000,000,000 to $13,000,000,000 that we could not use here.

Senator GORE. They have borrowed from $10,000,000,000 to $15,000,000,000 to buy here.

Mr. HILLMAN. Yes; instead of giving it to labor here we gave it to those people abroad, so that they could purchase from us.

It is my belief that this depression is the direct result of the irresponsible running of industry—the direct result of everyone planning for himself and no one giving a thought to what will happen to the people at large.

As one who has given some thought to these problems and who every day is in contact with them, I earnestly advocate the immediate passage of legislation which will establish an instrumentality to coordinate the industries of this country and with power to put its planning at once into effect, Unless this is done, and the millions put back at work, it is my belief that the chaos which will result from a prolonging of this depression will make any other legislation futile.

Senator GORE. You suggest the reduction of hours. Let me ask you this question, so as to get this clear in my own mind: Take a group that are working eight hours a day for $8 a day, and the hours are reduced to six hours. Would you reduce the pay to $6 a day?

Mr. HILLMAN. I would establish a minimum wage to protect a decent standard of living in the country, and let everything above that represent bargaining between the employer and the workers. I do not believe the Government can establish wages for every group in the country in industry.

Senator GORE. You would vest your board with power to regulate?

Mr. HILLMAN. Just to establish the minimum wage.

Senator GORE. Would you give your board power to raise and lower the minimum wage in accordance with good and bad times?

Mr. HILLMAN. According to the needs of the country.

Senator GORE. That is all.

## STATEMENT OF T. S. HOGAN, MIDLAND, TEX.

The CHAIRMAN. Give your full name to the reporter.

Mr. HOGAN. T. S. Hogan, Midland, Tex.

Permit me to say that I am in total disagreement with the opinions of a large majority of the witnesses who have preceded me both as to the cause of the depression and the proposed cures for the nation's ills.

If we start on a false premise all our conclusions will be wrong.

The World War was not the cause of the depression; instead, it actually delayed the economic collapse.

Senator GORE. Don't you think it aggravated it when it did come?

Mr. HOGAN. No. If you will pardon me, Senator, I will cover that fully in just a few minutes.

Senator GORE. Do you think you can destroy $330,000,000,000 of wealth, and burden people with $200,000,000,000 of debt, in as short a time as four years, and in as small a place as this globe, without some economic loss following?

Mr. HOGAN. I will cover that in just a minute.

What might be called the banking type of mind can see in the consequences of that conflict only what the financial ledger shows—a great destruction of property and an unbalance of the financial set-ups of all the nations of the world.

By them the loss of life is computed in the dollar earnings of each adult male during the years of his prime.

Devastating and appalling as these losses were, the fact still remains that the only way the World War hastened the world depression was through an accelerated development of the mechanization of industry and agriculture throughout the world without any, or at least sufficient, raising of the world standard of living to absorb in times of peace this increased production capacity.

It is to that fact, and not to the direct destruction of the war, that we can trace most of our social ills.

Under the urgency of war we mounted "The Man With the Hoe" on the modern tractor of the fields of Europe, the plains of Morocco, and the hinterlands of Asia and South America.

Recall the tens of thousands of Ford tractors alone which rapidly displaced hand labor with machine labor even in the country estates of England, to say nothing of remote areas whose agricultural possibilities had theretofore received but scant development.

The apex of this hysterical expansion of agriculture is symbolized in the activities of Thomas D. Campbell, now known throughout the world as the wheat king of America.

Backed with millions by some of the leading financiers of America and encouraged by the Government to the extent of turning over to him two great Indian reservations in Montana, in which he was permitted to select the choicest lands for broad-scale wheat farming, he inaugurated the largest wheat farming operation in history up to that time.

It may be cruel to bring that up now, but his Wall Street backers lost all the millions they put into it, despite the high prices of wheat prevailing at that time.

Senator GORE. The scheme failed.

Mr. HOGAN. He produced wheat, all right, but it cost more than the market price.

Having started some hundreds of tractors and combines on these great bench lands of Montana, he was sent to Morocco with Government backing to develop wheat growing on the same broad scale in that nation.

I illustrate with this specific example only for the purpose of demonstrating how rapid the mechanical development of world agriculture became during those hectic days.

Tens of thousands of others, in lesser degree, were hastening the process in every corner of the world.

The predominant incentive was, of course, the personal profit anticipated out of war prices for food.

Industrial development likewise received a world wide impetus with a corresponding displacement of crude hand methods by modern mass production.

Abnormal, selfish, vicious, and stupid as has been the handling of national and world finance during and since that time with the resultant pyramiding of a debt structure impossible for the workers of the world to maintain, it is still true that the sudden mechanization of industry and agriculture without equally rapid improvement in the standard of living of the masses was, and is, the primary cause of this world wide panic.

In the lifetime of those of us who are 60 years old, there has been more mechanical advancement than in all the previous history of mankind.

Inventions, chemical discoveries and highly coordinated production methods revolutionized industry and came to be symbolic in the minds of the people of the world in the mass production of Henry Ford.

Necessarily these rapid changes disorganized long established methods of production and caused great social maladjustments. The life of the whole communities built around what was considered fairly permanent methods of producing consumers goods was totally disorganized by the new methods which centralize in a relatively few places the manufacture of these goods. When modern changes are discussed everyone immediately thinks of the great steel plants and automobile factories but the garment makers of New York and the shoe manufacturers of New England were a greater factor in disorganizing established custom in the homes, villages, and towns of the country.

Shoemakers, tailors, dressmakers, blacksmiths, and so forth, were compelled to seek the means of livelihood in other fields. Enlargement on this subject is unnecessary as it is a matter of common knowledge.

The benefits that came from the new discoveries and new methods were many and enormous and the statistician may be able to prove to you that the mechanization of production actually increased the demands for labor, but that is but poor consolation to the jobless, destitute, and homeless left in the wake of these prodigious changes.

I risk your displeasure in consuming your time in the recital of these trite, well known, and established facts for the purpose of impressing on you that methods of government must change to meet fundamental changes in society, or that government will cease to exist.

Much of the legislation proposed before this Congress might as well be written to lay down the legal methods for hunting buffalos, for no matter how much our political leaders attempt to refute it, rugged individualism in business or government is as extinct as the buffalo.

An ordered, planned, and national program based on the ultimate welfare of all the people must take the place of governmental policies designed to encourage free and unrestricted competition.

The evidence to support this statement is omnipresent and irrefutable. It reaches into the most ancient conceptions of individual prerogatives and, as a matter of urgent necessity, seeks to regulate what the farmer must grow on his own farm. His failure to conform to an agricultural program national in scope would only bring him further and more complete bankruptcy. Attempts to evade the direct application of a planned agricultural economy through the adoption of palliatives and half-baked theories is evidenced in a score or more of proposed laws pending before this Congress, the most grotesque and absurd of which is the Smith cotton bill which proposes to reward farmers for incompetency by penalizing the fertilization of their lands and undertakes to convert cotton growers into cotton brokers by forcing them to gamble on the Cotton Exchange on the future price of cotton.

Everywhere the initiative and courage is lacking to reorganize fundamental facts and take the consequences of a legislative program bold enough to meet the needs of the times.

Faced with the alternative of complete collapse the oil business swept aside all precedent and usages and, except for one fatal defect, established a planned economy in production which might well be used as a national model.

The defect was that the fixing of the price of crude oil was left to the manipulation of powerful groups instead of being fixed by the Government.

In the face of an overproduction so great that high quality crude oil sold for as low as 8 cents per barrel, which was less than one-tenth of production cost, the oil industry, backed by governmental support, established a system of proration under which production was reduced by an amount equal to, or less than the daily consumption. Many injustices and harsh invasions of the rights of individuals and small producers accompanied the inauguration of this proration system most of which could have been avoided if the Government had assumed direct control instead of forcing the issue through indirection and evasion of responsibility.

But with all its faults the proration of oil production saved the Nation from an even more severe financial collapse than now exists.

I doubt if more than a small minority of our law makers realize how large a part the oil business plays in the whole economic life of the Nation.

The approximate 2,200,000 barrels of oil consumed each day, including Sundays represents at the wells where produced a market price three times as great as the total price received by the farmers for the wheat crop of the United States.

The number of barrels of crude oil and bushels of wheat produced in the year 1932 were almost identical.

When ultimately purchased as gasoline, kerosene, lubricants, and by-products, the consuming public pays nearly as much for oil products as the entire agricultural crops and livestock brought the farmers in 1932.

So if an industry of this magnitude can balance its production with its consumption, others can do likewise.

To summarize the state of the Nation, we have:

First. A tottering financial structure controlled by the same men whose unsound policies precipitated the depression.

Second. A farming situation bordering on open, organized revolt against the Government.

Third. A labor situation in which the opposing forces are preparing for a titanic struggle which will almost inevitably shake the whole social structure.

Fourth. An unemployment situation that has already cost more lives than we lost in the American forces during the World War, set us back a full generation in the dearly won social progress of the past, and which if not corrected quickly may conceivably bring on another era comparable with the Dark Ages of past history.

Fifth. Capitalism as a system of industry and government is a demonstrated failure in the face of national crisis and has been destroyed by the practice of its adherents as evidenced in testimony taken before the Banking Committee.

It will take more than the vision of moles and the courage of rabbits to correct a situation as desperate as this. Temporary expedients are foredoomed to failure. The diagnosis indicates the imperative need of major surgery.

The question to be decided, and that promptly, is what measures should be enacted to meet the situation.

I beg leave to respectfully suggest as measures necessary and attainable by congressional action the following:

First. Immediate government control of the entire transportation system, including railroads, waterways, pipe lines, aviation, and truck and bus lines.

Second. The establishment of a 6-hour day and 5-day week in all industry accompanied with the right of employees of collective bargaining.

Third. The establishment of a national monetary system based on bimetallism, and as a collateral proposition use all the power and prestige of the nation to secure a voluntary international agreement for the use of both gold and silver as equal basic money in world commerce. The bank of international settlements or a world exchange band should be set up as an international agency whose certificates, based on gold or silver in approved depositories of the several nations, would be accepted in lieu of the actual transfers of the metal itself.

Fourth. Arbitrarily fix by law the price of all basic farm products and fix that price high enough to cover production costs in which are figured the maintenance of a standard of life on the farm commensurate with the resources and mechanical development of the nation and energy and intelligence of the people. This price could, of course, only apply to products used within the nation.

Senator GORE. Would you have this country do it alone, or do it in concert with other nations?

Mr. HOGAN. Alone.

Fifth. Readjust international debts on the best practical basis obtainable on the broad principle that concession should, where feasible, be compensated by increased international trade.

Sixth. Provide the machinery for a readjustment of debts and interest but not through omnibus bankruptcy laws or moratoria unsupported by the means of increasing earnings and income. Coupled with the program above set forth a temporary moratorium on mortgages would give the debts time to rehabilitate themselves under the increased price of their products and would not pull down the whole financial structure of banks and insurance companies as general bankruptcy and moratoria laws inevitably will do.

I admit these proposals are sweeping and revolutionary but they are not one-tenth as sweeping and revolutionary as the changes will be if you permit the rapid deterioration of business and even of the people themselves to continue. Unless you recognize that a crisis of wartime emergency confronts us it is, of course, futile and useless to consider the suggestions here made.

Considering these proposed measures in the order named, we begin with the transportation problem and I place that first, not because it is first in importance, but because you who are members of this Congress are compelled without any respite or delay to either continue your support of the existing railroad organizations through the Reconstruction Finance Corporation or by abandoning that policy without devising another method of control assume the responsibility for the financial disasters which are certain to follow the latter course.

Briefly summarized here are the essential high spots of the facts in the railroad situation as it stands to-day:

First. The people, through investments in bonds, stock, and securities, own the railroads.

Let us not forget that the railroad companies, as such, have practically no ownership left as the bonds and debentures held by insurance companies, savings banks, trust companies, and individual investors cover the full present value of the railroads and much more than covers it. These insurance, trust, and savings bank companies used, not their money, but the people's money in acquiring these bonds.

Also rest assured that even if the executive officers of railroads do not know enough to successfully operate the roads they at least know enough not to be caught holding the stocks and bonds of their own companies.

It is therefore fundamentally important that the people and the lawmakers clear their minds of that habit of thought in which they look on the railroad problem as a matter primarily affecting railroad companies.

When you talk of letting them collapse, you are talking about your own, or your neighbor's life insurance, savings bank accounts, and even bank deposits, for if the railroads collapse the whole financial structure falls.

Second. The funded indebtedness of the railroads at the end of the year 1932 amounted to not less than $13,000,000,000.

Default on the quarterly or semiannual interest on this indebtedness under the terms of the bonds gives the bondholders the right to force the railroads into receiverships.

To obviate, or at least delay, these receiverships the Reconstruction Finance Corporation loaned the railroads in 1932 the sum of $359,000,000.

Practically all of this money went to the payment of interest on indebtedness or for some manner of purely temporary readjustment of existing indebtedness.

By June 1, 1933, further immense sums must be advanced by the Reconstruction Finance Corporation to meet interest payments due on that date or again the railroads will be subject to receiverships.

It is self-evident that this futile and repetitious process solves no problem and carried to its logical conclusion will bankrupt the credit of the Government.

Third. From 1929 to the end of 1932 the net operating income of the railroads dropped 75 per cent.

In 1929 the net operating income was $1,274,000,000.

In 1932 the net operating income was $324,000,000.

That this merry-go-round of the Government loaning new money to meet each recurring interest period will continue until radical changes are made is proven beyond controversy by the fact that of 138 class I railroads, only 38 finished the year 1932 without a deficit.

One hundred of them did not earn enough above operating cost to meet the interest on their bonds and other fixed charges, and 45 of them did not even cover operating expenses.

The financial situation of the class II railroads is, of course, even much worse. To waste time talking about a possible upturn in general business rapid enough to meet this desperate situation is sheer stupidity.

Fourth. There is no power in the management of any one railroad, or one group of railroads, to make the basic changes necessary in the whole problem of transportation.

Fifth. Despite the intrusion into the field of transportation heretofore held exclusively by the railroads of busses, trucks, automobiles, inland waterways, oil and gasoline pipelines and aviation, there still remains, and will continue to remain, a wide and important field in which no other transportation system or all of them combined can take the place of the railroads.

If the railroads are losing out to other agencies it is, in a large part at least, due to the fact that they have not been and are not now financially in a position to inaugurate the improvements in methods and service so necessary to meet the competition of this day. Their present position is about comparable to what the position of Henry Ford would be if he were trying to sell his ancient Model T Ford in competition with 1933 models of other makes.

To even suggest the needed changes is beyond the scope of this article, but every railroad technologist knows that 24 hours could be removed from the running time between Los Angeles and New York with no more complicated process than straightening of curves, double tracking, and other entirely practical changes in the roadbed and yardage facilities.

The locomotive already has the required speed capacity for that improvement in time. The speed of freight trains is even more important than in passenger trains in meeting competition. With a night and day average speed of 75 miles per hour not even aviation could seriously compete.

Sixth. Any market value left in the stocks of railroad companies can not be based on earnings or prospective dividends but is solely dependent on stock-market manipulation or the incurable optimism of an ill-informed people.

It is fundamental that the bonds of any company have first call on its net earnings and if it is established that the bond requirements can not be met now or in the future, then the stock is valueless.

The frantic attempts of powerful financial interests to becloud this simple fact render the solution of the railroad problem more difficult.

Every one of these facts were as manifest one year ago as they are today except that today large sums of the people's money have been poured into the bottomless coffers of railroad corporations. Nearly a year ago I submitted to a member of this committee a proposed solution of this problem, and I still believe that no other solution short of immediate and complete government ownership will solve the intricate and complex question:

Briefly the proposed plan is—

First. Congress shall declare a national emergency of such threatening proportions as to require and justify the assumption temporarily of such extraordinary powers as are usually exercised in war time by the executive and legislative branches of the government. The only purpose of this declaration is to cut through the technicalities and legalistic objections with which any comprehensive plan would otherwise be met.

Second. Organize the transportation corporation of America.

Third. Transfer to that corporation all of the railroads, inland waterways, pipe lines, interstate bus lines, truck lines, aviation, and such other transportation agencies as the administrative authority established by this Act of Congress shall deem advisable to include in its operation.

Fourth. Establish a maximum work day of six hours in order not to add to the distress of the unemployment through the economics in operation which are to be inauguarted under this law. Provide in said law that reduced hours per day shall not operate to reduce the daily wage scale.

Fifth. Cause to be transferred to said corporation all of the outstanding bonds of these several transportation agencies if it can be shown that the proceeds from the sale of these bonds had been used in the construction, equipment or necessary operation of said transportation facilities.

Issue in lieu of said bonds in like amount the bonds of the transportation corporation of America back of which would be the credit of the United States.

As to stocks of railroads companies, pipe lines, and so forth, no bonds of the corporation would be issued therefor unless it could be affirmatively shown that the corporation issuing said stock was earning enough to accumulate surplus, above operating cost and fixed charges, to the credit of said stock.

The extensive surveys recently completed by the National Transportation Committee on which there are such able citizens as Bernard M. Baruch, Alfred E. Smith, Alexander Legge, and a corps of learned technological experts headed by Dr. H. G. Moulton, furnishes the information on which a just nad equitable adjustment with the several interests involved can be made.

Sixth. In the management of the acquired transportation facilities disturb as little as consistent with efficient operation the present managements but cut out all needless competition whether between one railroad with another or with other agencies.

Organize the whole transportation system with the primary view of adequate and reasonable service to the public and make due allowance in the program for inventive and technological improvement in the several fields of transportation. Under such a plan, for instance, all letter mail, except for remote places and short distances would be carried by aviation.

Certain fields would be assigned to trucks where there is a demonstrated advantage in that method over rail transportation.

Seventh. A schedule of freight, mail and passenger rates should be established. These rates to cover all operating cost and the interest on the bonds of the Transportation Corporation. This of course, would include all proper charges of maintenance, improvements, and so forth.

I concede that this is a tremendous and daring program but it is not more tremendous than the problem we have to meet. This is no time for men with weak hearts and timid souls to be in the public service. The only alternative to this or some equally drastic program is national financial disaster.

This one bold step will inspire the confidence of the people in the virility of their government and remove a crushing burden from the banks and insurance companies of the nation.

The next proposal—a 6-hour day and 5-day week is an imperative necessity to overcome present and prevent future social maladjustments in the progress of improved processes in industry.

Having listened for three weeks to testimony offered before this committee and the questions asked by its members, I will try to answer in advance the objections that will be raised by some of your members.

I agree at once that there is no over-production except within relatively narrow bounds, in our industrial machine. But I submit invention goes on apace even with more rapidity in this depression than in normal times.

I repeat that the last 60 years saw more mechanical advancement than all the previous history of mankind.

In all human probability the next 20 years will far transcend the past 60 in that advancement.

The emphasis of proof is often best illustrated by personal example. Since I was a boy on a Wisconsin farm the effectiveness of a man's labor has increased in that occupation at least twenty-seven-fold. What it took our large hard working family 12 years to do in clearing 320 acres of timber I have seen a half dozen men with two 110 Holt caterpillars do in a few days and the same two machines cleared of brush and trees, leveled and prepared for seeding 8,000 acres in a single year.

It may be well to say in passing that this wonderfully fertile 8,000-acre farm of irrigated land on the Rio Grande River, near El Paso, Tex., lost its highly competent owner over $1,000,000 in the last three years due to ruinous cotton prices.

As a very young man I worked on building railroad grades and laying railroad tracks in Washington and Montana. What it took hundreds of us to do with picks, shovels and spike hammers a single machine now does with ease. A few years ago before the railroads were stricken with creeping paralysis they had in use a machine that set the ties, laid the rails, screwed the bolts in the fish plates, drove the spikes and smoothed the roadbed at the rate of 10 miles per day.

In the copper smelters at Anaconda it took 3,000 of us working 12 hours a day to do what a few hundred working 8 hours can do with ease to-day.

Thirty years ago when I first became interested in the oil business we thought it good speed to drill a 3,000-foot well in a year. Now they can drill a 4,000-foot well in a week.

And so in greater or less degree the process of increased efficiency of labor goes on in all varied activities of modern life.

Forty years ago many of us foresaw the wreckage and ruin of human lives that would accompany the coming industrialization of industry and agriculture unless an intelligent citizenry would adjust the hours of labor and the social life of the people to the changing tempo of production.

A great railroad magnate and several other witnesses stressed before this committee the doctrine that our present distress is due to the fact that labor received too much and lived too high a few years ago. That ossified doctrine was abandoned by all thinking men before those witnesses were born.

If we had set our standard of living high enough, we never would have had a depression. They say men bought automobiles and radios who had no business to buy them.

Why shouldn't they buy them? Who built them but the men who labored. How could men busy with their daily toil know that men they were led to believe were great financiers and industrialists had ceased to function in their legitimate occupations and become mere gamblers in a game that would presently destroy the whole business structure of the country?

These men come to you now and tell you if you balance the Budget all will be well. Unless this poverty that stalks in a land of plenty is a ghastly dream we are faced with a war-time crisis.

If a citizen of Japan or China insisted on attempting to balance the budget in the crisis of war, he would be promptly and properly shot.

There are 10 men in America out of whose private fortunes your Budget could be balanced and they would probably be happier men than they are to-day.

If you must balance the Budget, you know where to find the money to balance it with, and it is not on the farms or in the homes of workingmen.

With six hours' labor per day and all our people employed, we can supply every table in America with an abundant and balanced food ration from soup to nuts. The New York garment makers can put a new suit on every man in America once a month and a new dress on every woman once a week and have lots of time and material left.

Our manufacturing plants working in 6-hour shifts can supply every family in America with a good automobile, radio, furniture, and a thousand incidentals to add to the joy of life.

There will still be left abundant labor and material to remove 10,000,000 obsolete, unfit, and unsatisfactory, insanitary human habitations and substitute for them modern, sanitary homes in which to raise a generation of healthy, happy children.

Having thus raised the standard of living to something like the possibilities of the Nation, the inventors, chemists and technologists will still be a full generation ahead of us with new vistas of glorious achievements to come.

Of course such a program presupposes the elimination of economic waste and senseless competition.

The most simple, direct, and immediately effective piece of legislation which this Congress could pass is the Wheeler bill for the establishment of bimetallism. Giving due weight to all that has been said before your committee about the relative unimportance of changing the monetary system, and with proper deference to those scientific minds that waste their mental efforts in devising plans for the introduction of scientific money, there yet remains the immediate pressing problem of establishing a workable medium of exchange with which the world's business can be done in a manner which does not destroy international trade and relegate a large part of the population of the world to economic dependency.

By no edict of this Government can we compel 1,000,000,000 of the people of the world to substitute their silver money for strips of paper no matter how beautifully engraved. Fifty centuries have taught them that governments come and go, but a silver coin lost in the days of the Pharoahs if found again retains its value as a medium of exchange.

Neither have the international bankers after 100 years of effort succeeded in forcing a gold standard on them.

Our farm population are especially dependent on these silver-using countries for their market.

The figures for the 1932 crop are not yet available, but in 1931 Japan purchased 1,233,000 bales of American cotton and has for years taken about one-sixth of our cotton exports.

Without a rehabilitation of silver, practically all of our oriental export markets are now closed to us, as they can not afford to buy our gold dollars with 25 cents per ounce silver with which to buy our goods.

Senator GORE. You realize that our trade with China has declined less than our world trade in general?

Mr. HOGAN. Yes; but I also realize, Senator, that there is a special situation in China that is accountable for that, instead of this matter of the silver alone.

I believe there is more misinformation accumulated in the banking houses of Wall Street than in any other like area on earth.

They talk of floods of silver that would be dumped on us under free, unlimited coinage.

These are established facts on silver supplies available to anyone with the energy to look them up.

My fear is that sufficient silver might not reach our mints to properly expand our basic money.

Little of the 7,000,000,000 ounces of silver coins and bullion now used as money can be spared by the peoples dependent on that supply for a sufficient medium of exchange.

Incidentally, the war in the Orient makes the urgency of silver money over there more than ordinarily pressing.

Even the best-informed opponents of bimetallism estimate that the maximum amount of silver likely to be offered for coinage under the Wheeler bill would be 650,000,000 ounces, and that some two or three years would be required in which to make full delivery of that amount.

As to silver in ornaments and commercial uses which may be offered for coinage the facts are that even at $1.29 per ounce an insignificant percentage of silver so used would bring large enough a price to justify remelting for coinage purposes.

It would be something of a shock to the housewife to discover how few silver dollars could be coined out of her prized silver sets. But with restored silver coinage the trend will be to the purchase, not the sale, of silver ornaments and utensils. That is the proven course in all history.

Having covered this subject at length in a statement before the Coinage Committee of the House, which statement is available to any one who might consider it of enough importance to read, I will pass to the next proposal.

Senator GORE. When did you make your statement before the House committee?

Mr. HOGAN. Just a short time ago; and I have copies of it here for any of you who care to have it.

Senator GORE. I would like to have it.

Mr. HOGAN. With respect to farm prices, a statement made by me before the Senate Committee on Agriculture embodies my views on that subject.

Every objection to price fixing is overbalanced by a situation that menaces the stability of every institution in this country.

What good are moratoria and bankruptcy laws unless the debtor can find a market in which his products will bring high enough a price to meet his postponed obligations?

Again our scientific economists can learnedly demonstrate theoretic objections to such a course but if we are forced to a dictatorship, as so many people anticipate, the first act of an intelligent dictator would be the fixing of a living price for the farmers' products.

The dairy products of this country now exceed in value any other farm commodity. That industry has as efficient a business set-up and is more intelligently managed than any industrial enterprise of anything like its proportionate size. The dairy farms of Wisconsin, Minnesota, Illinois, and other States are well conducted manufacturing enterprises in which hay, corn, mill feeds and other stock feeds are converted into milk with the least possible waste.

Scientific study by State agencies has established the best possible methods. Each dairy farm represents an average investment of perhaps $30,000 and yet these intelligent, thrifty farmers are being rapidly forced into bankruptcy.

Why shouldn't the consuming public pay an honest price for an honest product?

Every consumer must know that he can not enjoy anything but the most temporary prosperity unless the producer receives at least the cost of production for his goods.

These indirect and elusive proposals like leasing of excess acreage by the Government and retirement of marginal lands have no basis in sound economics and could not possibly become effective in time to prevent the loss of the farms through foreclosure.

A fixed price on butter fat is a simple and direct way of restoring prosperity to that great group of farmers engaged in dairying.

We hear much talk of careful, limited experiments to test out methods of aiding the farmer. The trouble with the proposed experiments is that the patient will die before the experiment is completed.

As to the foreign debts it's time to substitute common sense for hysteria and spurious patriotism.

Every man in this room knows that these debts are not going to be paid so why not admit and proceed accordingly?

As to the domestic debts, you listened to the president of an insurance company which holds $1,100,000,000 in mortgages on farms and small homes. You will recall his statement that the fulfillment of the insurance companies' contracts with the holders of $103,000,000,000 of life insurance is dependent on the collection of the face value of the mortgages and the agreed rate of interest thereon.

That is why any necessary legislation however drastic must be resorted to to increase earnings so that those obligations can be paid.

Nothing herein suggested calls for a drain on the Federal Treasury. Each suggested proposal contemplates the exercise of governmental mandate to put in motion the fundamental processes of agriculture and industry.

The Government can make the transportation system pay. No other agency has the power to do so.

The Government can establish a work day and a work week suitable to modern life. No other authority can.

The Government can coin money. No other agency can even if we do see communities trying to usurp that governmental function.

No power short of the Federal Government can establish a just price on farm products.

For three years we have drifted in indecision waiting for some mysterious force to save us from our incompetency.

For the past year we have been pouring Government money into railroads, banks, and insurance companies and have taken no constructive step to increase the earnings of the people without which there is no prospect for the repayment of these loans.

Great programs of public developments such as President Roosevelt proposes in the Tennessee Valley are in line with the spirit of the times and the economic evolution of the world, but the necessary preliminaries to their beginning eliminates them as a solution to our immediate problems.

A hungry man, a starving family can not be nourished with dreams of future plenty.

In conclusion, candor compels me to say that in common with millions of other citizens, I have about abandoned hope of congressional action in time to prevent violence and bloodshed.

The turbulent, desperate, but as yet, inarticulate one-third of our population have nothing further to lose and await only a courageous leadership to grasp the power from those who appear to have neither the wisdom nor the courage to use it.

In their confused thinking the conservative element in government and society delegate to themselves the virtue of patriotism. In a desperate time like this excessive conservatism may become treason.

I am grateful for the opportunity of appearing before this committee. I have a large family of children and grandchildren, and I want to escape the judgment of posterity that will be passed on those who, in a land equipped to produce every material need of men, and with resources in profligate abundance, permitted misery, poverty, and degredation to become the lot of a large percentage of our people.

Senator GORE. I would like to ask one or two questions. Did you hear Governor Smith's statement this morning?

Mr. HOGAN. Yes.

Senator GORE. Did you hear him say that it took three times as long for the Government to construct a building as it did for private contractors?

Mr. HOGAN. I did.

Senator GORE. Do you think that is true, or not?

Mr. HOGAN. No; I do not think it is true.

Senator GORE. You said in your paper, in express terms, that the Government was a demonstrated failure in the face of this depression.

Mr. HOGAN. I said the capitalistic form of industry and government was a demonstrated failure.

Senator GORE. In the face of this depression?

Mr. HOGAN. Yes.

Senator GORE. Yet you would enormously increase both the powers and functions of the Government?

Mr. HOGAN. Yes; but I would change its character in the process.

Senator GORE. How would you change the character?

Mr. HOGAN. Governments are always changing. Senator, do not overlook the fact that one-third of the area of the earth has changed entirely its governmental set-up in the last few years.

Senator GORE. In view of the fact that government is a demonstrated failure, you would transfer the entire railroad system of the United States to the Government?

Mr. HOGAN. Yes; I certainly would.

Senator GORE. Now, then, you say that industry—and I think you are right about it—lies prostrate in this depression; that capital is not earning a profit, and labor is not employed and not earning reasonable wages.

Mr. HOGAN. Senator, would you let me tell you why I would transfer the railroads to the Government instead of to private enterprise? I can appreciate, I think, as well as you or anyone else the difficulties that have been experienced in what you might call government inefficiency and operation. I have operated in several businesses myself. I have mined in Idaho. I have drilled oil wells from the Canadian border down into Old Mexico, and I have farmed and raised cattle on a really large scale. But you have to figure on the alternative proposition when you talk about the railroads. What group is there in the railroad set-up that can finance the necessary readjustments? They simply do not exist. We try to reach it in some of the States—

Senator GORE. Mr. Hogan, if the Government undertook to finance it, it would do it through taxing the people of this country, the same people and the same victims, you might say, that could, if they would, finance these railroad concerns.

Mr. HOGAN. Senator, if there had been time to complete the reading of my statement, I would have pointed out that no one of the suggestions made by me imposes any tax on the government.

Senator GORE. To begin with.

Mr. HOGAN. Or at any time. What agency is there in America that can make the transportation system pay? Only one, the Government. They can fix a rate that will cover the charges.

Senator GORE. The Government, Mr. Hogan, is running behind $143,000,000 now in its postal returns.

Mr. HOGAN. Incidentally, I think the Postal Service of the United States is the best evidence anywhere on earth of the competency of government. No private agency can even approach it in competency. We get terribly fed up with hearing about the charges against the Post Office Department of the United States. They give us service that no enterprise could.

Senator GORE. Don't you think private enterprise could run it for a third less?

Mr. HOGAN. Not at all.

Senator GORE. And with a third less employees?

Mr. HOGAN. Private industry would cost the American people three times as much as the present post-office service. Have you any idea, Senator, that you could mail a letter for 3 cents across this continent under private enterprise? If you have, you have not a very definite idea how it does business.

Senator GORE. I do not doubt at all that private enterprise could run it for a third less money, with a third less employees. Private enterprise is undertaking to carry the air mail, through a subsidy, and it has cost as high as two or three or four or five dollars a pound—even a letter. This private enterprise is subsidized by the Government.

We are pay'ng one concern now $24,000 a day to carry mail, and it sometimes carries a handful; and, when they based it on poundage, instead of mileage, they caught them carrying bricks in the mail, to get the pay. But we will not pursue that.

Mr. HOGAN. Senator, I would like to pursue that.

Senator GORE. I look on it as a human institution, with human limitations. Do you think any government, except a dictatorship, could administer the railroad system of this country?

Mr. HOGAN. Yes.

Senator GORE. Do you think a democracy could do it?

Mr. HOGAN. Very much better.

Senator GORE. Don't you know that one of the main causes of the breakdown of parliamentary government in Italy was the government ownership of railroads?

Mr. HOGAN. I think the breakdown of governmental agencies in Italy was exactly what is happening here, the failure of those in authority to act and assume broad powers for an existing condition. They hesitated, and they failed to act in the face of a great crisis, and the result was that the people rose up and destroyed them. That is exactly what will happen here.

Senator GORE. It was a policy that loaded the railroad systems down with railroad employees. Everyone who wanted a job would appeal to somebody with parliamentary influence, and he would say, "Here, put this man on." They had to do it, and the scheme broke down.

Reverting to the fact that industry is prostrate under the existing system, and that government is an admitted failure, you would institute a planning board, or system, at least, for industry, as I understood it?

Mr. HOGAN. I did not complete my statement.

Senator GORE. You said in the beginning that you would have some sort of planning power.

Mr. HOGAN. Yes.

Senator GORE. Our industry has been planned, in a way, by people who have their earnings of a lifetime invested in it, all their capital, all their past earnings, and all their hopes for the future And yet, under their planning and leadership, we have prostration, as you say. Where would you get somebody to plan our industry that would have more interest in it or more experience than the people who have had charge of it?

Mr. HOGAN. Senator, if you will permit me to answer your question——

Senator GORE. I will be glad if you will.

Mr. HOGAN I will say that the difficulty is that the man planning his own individual enterprise must deal with factors entirely beyond his control—the rapid technological changes that are being made in industry. How many industries have failed because they were producing a product that was very presently displaced by something more desirable to the people? All those things are beyond the power of the individual to anticipate or plan for.

Senator Gore. And you would substitute the government?

Mr. HOGAN. Yes.

Senator GORE. And government is a demonstrated failure now?

Mr. HOGAN. Well, you are trying to put words into my mouth that I did not say.

Senator GORE. You said, in express terms, that the government was a demonstrated failure in the face of this depression, and I am not trying to put words in your mouth. I repeat what you said.

Mr. HOGAN. Parden me, Senator, but the exact words are here in black and white.

Senator GORE. Read them.

Mr. HOGAN. Yes, sir. I will be glad to read them. I think we would have saved time if I had read it all, to begin with.

Senator GORE. This is not in the part you read?

Mr. HOGAN. Yes; I read this. [Reading:]

> Capitalism as a system of industry and government is a demonstrated failure in the face of national crisis—

And so forth. I did not say government was a failure. I said:

> Capitalism as a system of industry and government is a demonstrated failure in the face of national crisis and has been destroyed by the practice of its adherents as evidenced in testimony taken before the Banking Committee.

Personally, I want to say that I never subscribed to the theory so recently and so universally applied throughout this country, that capitalism and government were one. They never should have been one. It is true in the last few years they tried to make them one, but, nevertheless, Government ought to be independent of capitalism and function for the people, instead of for special industries and special interests.

Senator GORE. I have no doubt of that.

Mr. HOGAN. So, you see, Senator, what I said was that capitalism was a failure, but not government.

Senator GORE. Under government.

Mr. HOGAN. Capitalism running the government is a failure, yes

Senator GORE. In view of that fact, you would have the government take over the railroads. Would you have it take over other enterprises?

Mr. HOGAN. No. I do not propose any other enterprise except the railroads, and there is a very specific and definite and pressing reason for that.

A year ago, when I wrote a Senator who is a member of this committee, Senator Costigan, and suggested the changes that I indicate here, I wrote from New York. I am not a stranger among those big buildings in New York. I have done millions of dollars of business up there, and I found, in my investigation up there, that $5,760,000,000 of railroad bonds were held by insurance companies, and savings banks.

And that if they undertook to sell them it would totally and utterly demolish the price of those bonds. Now in what position is a company, any of those good companies, railroad companies, in to obtain credit to match the improvements that are going on with their competitors?

I have traveled a great deal through this country. I have gone out of El Paso, Tex., with four trains leaving on a 900-mile trip within a half an hour of each other, and I would have a whole Pullman car to myself. Now, there is a senseless competition all down the line that has got to be eliminated, and no other agency short of the Government could do it.

Senator GORE. Coming back to that question. Where would the Government get the managerial skill to supervise and direct this vast and complimented system, outside of the men who have been connected with it in the past and have accumulated to-day some little experience?

Mr. HOGAN. I suggested right in this article not to disturb the existing organization, but to the lowest possible maximum let those that are in charge continue in charge.

Senator GORE. But you say capitalism under the Government is a demonstrated failure.

Mr. HOGAN. Yes. I say in my statement:

> Capitalism as a system of industry and government is a demonstrated failure in the face of national crisis and has been destroyed by the practice of its adherence as evidenced in testimony taken before the Banking Committee.

Senator GORE. Would you not make it worse by more governmental interference? I think we have had too much of that. And I do not know yet where the Government would get the managerial skill to supervise these industries and prevent them from becoming prostrate.

Mr. HOGAN. Senator, do you think there is any man working for any railroad company that would not gladly give his skill and ability to the Government if they took it over to-morrow?

Senator GORE. I think there is coming a time when they would be glad to come under the wing of the United States and find themselves in the lap of the Government.

Now, you say that rugged individualism is gone, and in the light of machinization and technology and mass production we have got to abandon it, modify it, and substitute a different system in its place.

Mr. HOGAN. That is true. I did not create the facts, but they are there.

Senator GORE. In other words, then, the world has evoluted out of these old methods and machinery?

Mr. HOGAN. Yes, exactly.

Senator GORE. A great many people seem to think that the world has evoluted out of a system of bimetallism which it tried for five centuries and could not make it work; the world has outgrown that, according to some of these economists. Yet you would have it come back to an abandoned and antiquated system of bimetallism.

Mr. HOGAN. Senator, 60 per cent of all the people of the world never abandoned bimetallism, and I propose to go back——

Senator GORE. Just how does that 60 per cent compare in point of advancement and ordinary prosperity with the 40 per cent that did adopt the gold standard? Now if the silver standard makes for established and better system of civilization, and if the people have achieved more progress under the silver standard, then there is a point in your argument.

Mr. HOGAN. Senator, I can not believe that you are seriously contending that any other kind of a monetary system, gold, for instance, would have advanced those countries more rapidly than they have advanced.

Senator GORE. They have adopted a system, I assume, generally speaking, adapted to their own conditions and environment, industry, progress, and I am not disposed to meddle with it. Some people want us to buy enough silver to double the price of silver in China, which would give them dear money and cheap things—what we have got now—that say we want cheap money and dear things in the

United States. Yet the bimetallists and the silver people want to reverse that situation. They think dear money would be a good thing for China although it is a bad thing for us, and that cheap things would be a good thing for China although it is a bad thing for us. The principle does not seem to work in both cases, is the point I make here.

Mr. HOGAN. Well, Senator, I am a good deal more familiar with Mexico than I am with China. And I know that dear money would be a very, very great help to Mexico.

Senator GORE. And cheap money a good thing for us?

Mr. HOGAN. Dear silver would give them a greater purchasing power.

Senator GORE. It would. And if you did what you have suggested, the man who was so fortunate as to have a $10 gold piece in his pocket would have the purchasing power in proportion. And how many people do you think have a $10 gold piece in their pocket?

Mr. HOGAN. Not many. And I am afraid there will be less.

Senator GORE. I am afraid so, too. If you bring silver in here, it will be less. That will be all. Thank you, Mr. Hogan.

Mr. HOGAN. Thank you.

Senator GORE (presiding). The committee is adjourned without day.

(Thereupon, at 1.05 p. m., Tuesday, February 28, 1933, the committee adjourned without day.)

---

(A letter and brief submitted by Mr. Frederick W. Beinecke are here printed in full, as follows:)

NEW YORK, N. Y., *February 15, 1933.*

Senator REED SMOOT,
*Chairman Senate Finance Committee,*
*Senate Building, Washington, D. C.*

MY DEAR SENATOR: I am inclosing herewith an article that I have written on the economic situation, and a suggested way out.

This has been read by a great many of my friends who are bankers, lawyers, business men, etc., and their comments have been very flattering indeed.

It will take only a very short time to read, and perhaps it may assist somewhat in the investigation which you are now conducting.

Respectfully yours,

FREDERICK W. BEINECKE.

## THE ECONOMIC SITUATION, THE UNDERLYING CAUSES, AND A SUGGESTED SOLUTION

Modern society has become so complex that we lose sight of the fundamentals upon which the modern edifice of industry and commerce rests. We talk of foreign exchanges, bank reserves, balancing budgets, gold standard, war debts, etc., and we little know what these things actually are and how closely one is interlocked with the other. Plans are proposed which will ameliorate conditions in one particular field, and these in their application seriously aggravate conditions in other fields. Arguments, statistics, analyses may conclusively demonstrate that a certain plan will materially assist and almost save a particular industry, and therefore, it must be satisfactory and can not be refuted. Yet this very plan may save one situation and positively cripple another. So it is vitally important that we view these fundamentals, that we learn what is the basis of all this mechanism, and that we realize what are the prime objectives of civilization.

The first great urge of man is the preservation of life, and man must use enough of his efforts in order to produce the means of existence, or else he will starve and his race will disappear. We often confuse this paramount necessity and consider that our desire is making money; that this latter is the supreme impulse that spurs on and drives us continually. Our coal mines operate, we say, primarily to make money, whereas they operate primarily for the purpose of producing the substance that will release heat, power, energy. Our railroads, we say, exist to make money, whereas they primarily exist to bring production to consumption. So it is with the endless articles of commerce. A shoe manufacturer exists primarily to supply people with shoes, and a clothing manufacturer to supply people with clothes. These are the fundamentals, these are after all the foundations upon which our economic machinery must be erected. We mine coal to turn it into heat, we grow wheat to turn it into bread, we raise cattle to turn them into meat, and we grown cotton and wool to turn them into clothes. Those are the primary opjects, and we do not fundamentally do any of these things to turn them into money; that last process is secondary. Yet we have so confused our thoughts that we believe that that last process is primary, and we endeavor to conduct our civilization by making our economic mechanism rest on a foundation which does not exist.

It is like saying that the elevators in a department store are more important than the merchandise the store displays. To-day our shelves are full of merchandise, our elevators are of ample capacity, but the customers are lacking. The elevators are the financial machinery, the merchandise represents the producers and the customers represent the consumers. The producer and consumer can not be brought together by increasing the speed or changing the capacity of the elevator, that may assist, but we must look deeper. We must find out definitely and conclusively why these two groups do not get together. Why I, who am a producer and consumer at one and the same time, am held powerless? Is it this machine age? Is it the gold standard? Is it the war debts? Is it the burden of taxation? Is it the system of Government? Are these the underlying causes of our difficulties, or is there something deeper, something that we have permitted to permeate our civilization to such an extent that we believe it is as necessary to us as the air we breathe or food we consume?

This study that has been written, is a sincere effort to endeavor to trace the real causes, and to offer a solution that can be controlled and that will permit the ingenuity and productivity of man, a broader and wider scope than now exists.

In order to view clearly the functioning of society, it is absolutely necessary that the reader grasps the conception of the divisibility of society into its four fundamental groups. Furthermore, he must understand definitely that it is the surplus energy of man and his machines which determines whether or not a country is advancing or declining and lastly he must be willing to delve somewhat deeply into our financial mechanism, and learn what kind of a system we have created, where its limitations are and how dangerous it can become.

In these few pages, it has been shown what has caused the conditions under which we to-day live. It has been shown that it is not necessary to have Socialism, Fascism or dictators. The truth is so simple, that due to its very simplicity, it has been overlooked. First we must arrange our society to utilize the surplus energy created; second, we must design our financial machinery so that this can be accomplished; and third, we must so design this mechanism that never through the functioning of this mechanism, demand can be made to turn this surplus into the medium of exchange. To-day we can not see the woods because of the trees, and we close our eyes and intelligence to the facts, with sorry excuses and foolish platitudes. "None are so blind as those who will not see," and by far the major task is to open those eyes and let them see the grandeur of the spectacle, the great Republic of the West, ready and willing to banish hunger and poverty from its people, and able and anxious to bring security, comfort and contentment to its citizens.

## Chapter I

### THE RISE OF BARTER AND EXCHANGE

In the consideration of modern economics, it is necessary to distinguish the ripples and waves from the tides which are the underlying conditions that cause the tremendous upheavals in our present civilization. The movements of gold, the erection of tariff walls, the balance of trade, the reduction of armaments, and the prices of securities and commodities are only the backing and filling of the waves which ride on the ebb and flow of the tides. These are man-made effects on the major phenomena.

In order to clarify the intricate system of civilization we must examine critically the stage, the scenery, the actors which make up the theater where commerce is carried on, and upon which modern society rests.

As man slowly evolved from barbarism, his means of intercourse through the ages followed various expedients. At first these means were extremely modest and consisted of very simple methods of bartering and trading, as to-day, for example, boys swap three small marbles for one large one. The transactions in our early civilization were hardly more complex. They carried on in some such manner, naturally, a very limited trade and even in these early processes certain standards were adopted. A single ox might have been acceptable in trade for 4 sheep, 10 chickens for 1 sheep, and a handful of salt for 1 chicken. Clumsy expedients at best, but yet no brain had conceived anything better. As long as tribes were more or less self-contained, this method served its purpose. As two tribes had commercial transactions with each other, this method of barter and exchange became difficult and cumbersome. In order to handle more extensive commerce, where divisibility and transportability were desired some other method was evolved what to-day we call a medium of exchange. It was not a spontaneous result, nor was it adopted over night by all existing civilization. It came about through desire, through covetousness.

A beautiful shell or a handsome tusk of some wild animal was a thing to be desired and its desirability was represented by a few handfuls of grain, or by so many skins of a particular animal. A semiprecious stone, a piece of shiny metal, was more desirable than the common things at hand, and these served as the first media of exchange. At one time or another the media was represented by each of the different metals we know,—precious, semiprecious, and others. Even such things as shells, arrowheads, and animals' teeth were once employed. These media had transportability and divisibility. They were not evolved and adopted by a group convening together and after long deliberation finding that such a thing was required, and choosing one that had these two features. Covetousness made certain things more desirable than others, and these were the things that served as the earliest media. In this manner, the real value of the article itself was lost sight of and vanity, possession, ownership, became the paramount urge.

So, through the ages as man discovered more of nature's secrets, desirability changed. What was to-day desirable, to-morrow became commonplace. Iron had its place, copper, tin, silver, and finally gold. These all had the two factors of transportability and divisibility. But as more iron, copper, and tin were discovered and mined, each lost the desirability value, and consequently were abandoned as a permanent medium of exchange. Gold and silver remained. These two still possessed that additional factor, in that they were relatively scarce, and these two metals consequently have become the present media of exchange throughout the world. Gold, in addition to the transportability, divisibility and scarcity value has still a fourth value, a great superiority over other metals as a medium in that it does not deteriorate due to the action of time and the elements. Consequently its weight to-day will differ very slightly from its weight in 20 or even a hundred years. A perfect medium should have these factors, unchanging, fixed and unvarying. In three of these factors gold is ideal, but in one factor it is not stable. Its desirability value or as we know it to-day its scarcity value, fluctuates due to an increase or decrease in the amount mined, and the varying amounts used in the arts and sciences. Gold, however, is the best medium, as yet, evolved, and without doubt, its scarcity fluctuates the least of all the metals so far employed.

Gold has, therefore, become the measuring stick of commerce and relative values are arrived at by a reference to and comparison with this measuring stick.

It must be borne in mind that this measuring stick fluctuates and many of the ills of modern society are caused by these fluctuations. Congress has enacted a law whereby it is fixed that a dollar shall be a coin consisting of 25.8 grains of gold, nine-tenths fine. It would therefore seem that by such an enactment the value of gold was fixed—could not fluctuate. If in the world due to the discovery of new mines, there is a greater abundance of grains of gold, the scarcity value naturally becomes less, and gold is, therefore, cheap. Whereas if there is a great scarcity of grains of gold, due to hoarding or other causes, this factor increases and gold becomes dear. The measuring stick, consequently, moves up and down, lengthens and contracts; and therefore, measures relatively inaccurately.

By act of Congress it has been enacted that 1 standard foot is equal to 12 inches. So carefully is modern society erected on this standard that there is treasured by the Bureau of Standards in Washington a bar of metal that is called the standard foot and this particular piece of metal determines the standard foot and is the basis of all measurements in this country. It is to-day the final reference for all linear measurements. It is, therefore, a standard. It is fixed. It can not vary. A bridge is built in California. The concrete piers and foundations are erected at the site. The steel superstructure is fabricated in Pittsburgh. The finished steel beams, trusses, plates arrive at the bridge site. These finished steel pieces invariably fit the substructure almost perfectly, even though they have been constructed at opposite ends of this vast continent. That little standard foot at Washington has made such a remarkable achievement possible, though, we, in our daily routine of life hardly realize such a stupendous accomplishment of civilized man.

The engineer, the architect, the builder, and finally the artisan, himself, could not create these structures, these machines, and the endless articles of society, unless a fixed, permanent, absolutely unvarying standard was maintained. Man has fixed his standard foot, his standard gallon, his standard meter, his standard degrees of latitude and longitude, and yet his standard unit of commerce on which the bloodstreams of civilization depend, varies with the vagaries of discovery and the daily customs of society. This is the unit with which the international banker, and the business man must work. Is it any wonder, occasionally, that the entire machinery goes awry, and the market places of the world become upset? Is it any wonder that commerce and trade are bewildered when their measuring unit expands and contracts so elastically? Gold! Gold! The cry is for gold and has been so since earliest recorded history. It has become so ingrained in the minds and consciences of man, as to become a sacred idol to be venerated and adored beyond all other things.

This, then, is one part, an important part, upon which society plays its drama. We know its weakness. We know its drawbacks. Nevertheless it is there and as it is the best tool we have so far created for the purpose, we must continue with it until such time as a better instrument of commerce is evolved. As long, therefore, as the drama of society must be staged with an orchestra out of tune, just so long must we play our parts upon this stage and hope that eventually this orchestra, finally through education, through knowledge, through experience and invention will approach a more perfect and efficient state.

## Chapter II

### THE DIVISION OF LABOR AND THE RISE OF CREDIT

In primitive society hunting was the first means of livelihood. A single hunter matched his own skill and ingenuity against the wild animal, and it was the invention of the sling-shot, bow and arrow, and spear that gave him a marked superiority over his prey. However, he soon learned that his own single skill was augmented greatly if with other savages the beast was surrounded and not permitted to escape. Man discovered in some such manner that more could be accomplished by a group than by an individual. It was easier and more certain to employ such a group, and man learned the great advantages gained in this cooperation.

Evolution and experience opened other paths. It was quite apparent that one individual could make the sling shot a little better thanan other. Without doubt, here, a savage was more proficient in the use of the sling shot and used it with more deadly accuracy than another. So, gradually, through the limited accomplishments of the tribe, a division was made, specialists appeared. The tribe or clan had its hunters, arrowhead makers, fighters, hut builders, and whatever other primitive divisions existed. The group as a whole functioned better under this system than as formerly when each individual performed all functions.

At times there was required the united efforts of two or more specialists to complete one task. It was a simple transition from individuals within the group to more elaborate organizations. In this society one particular savage was expert at making the arrowhead, and another, the shaft. Their combined efforts manufactured the finished arrow. A partnership here existed, and under this method they became more efficient and productive. Their value to the tribe was in this way greater, and the return from their fellow tribesmen was increased. Here, then, existed a very primitive state, and as civilization advanced further divisions in labor were created until to-day thousands of specialists are required in producing the most simple article. A fundamental setting on the state of civilization in some such manner made its appearance.

As this crude society expanded, we also begin to see the first glimmerings of credit. Some tribesmen found a few flints suitable for arrowheads and went to the arrowhead maker with these flints, loaning them to him and eventually receiving in exchange the finished arrowheads. Credit had been established. A credit of a handful of many flints against the future delivery of several arrowheads. The artisan was a man to be trusted. He was a man one could place some confidence in. Faith was there that the raw material would be fabricated into the finished article. A new force had entered into the machinery of society. Credit. Trust. Faith. Confidence. Something revolutionary. A tremendous step up from savagery. A stupendous advantage that thinking man gained over other animals.

As credit evolved, so also exchange, barter, trade broadened. The discoverer of the raw flints found one day that he had plenty of finished arrowheads. It was of no immediate advantage to have any more. His supply was sufficient. Yet what could he do with this raw material? The arrowhead maker desired raw stock and offered in exchange finished arrowheads, suggesting that for a handful of finished arrowheads, he could go to the hunter and receive in exchange a part of the carcass that this hunter had just killed.

These dim, first struggles of credit, or barter and of exchange gradually expanded, until what first only existed within the small circle of the tribe itself, reached out further and included other tribes. Some due to their environment were better hunters, better herdsmen, better farmers, and these exchanged between them articles of one kind for another, whatever each group desired that the other had. These transactions at first took place instantaneously, that is, they were evolved, haggled over, and consummated at one and the same time. It soon developed that time often entered into a particular trade. There was a lapse between the delivery of the raw material and the receipt of the finished product. In other instances, one man went on a visit to a neighboring tribe, entrusted with commissions from several of his fellow tribesmen. He had with him goods to exchange, loaned to him with the understanding that he would return with other goods. The idea of loaning had occurred here. A further ramification of credit.

As the clans and tribes became more amalgamated, credit became more of a factor. A canoe had to be built. This was a large undertaking. It required a variety of skill, as well as the strength of many individuals. The tree had to be cut, the branches trimmed, the log peeled, the wood hollowed out and shaped, and finally transported to the river. All the united labor of many men. It took, furthermore, time to build this and naturally, during its construction the workmen had to be fed and provided for. This construction required financing and this financing had to be done by the tribe. Somewhere the food had to be procured. A credit of food against a future delivery of a finished canoe. These credits were transient credits, extinguishing credits. For as soon as the canoe was completed, the debt of food was canceled or transferred into a credit of the canoe. For each advance in this instance something tangible resulted. So were built the shacks, the rude huts, and the dozens of other things that made up the habitations and equipment of these early primitive peoples. Often, however, a transient credit extinquished itself without any material gain. The farmer desiring some fresh meat, loaned some wheat to the hunter, and upon the delivery of the meat, the credit so advanced was canceled, it disappeared. In order to build canoes, the shacks and the implements of the hunters, it was necessary for the tribe to advance transient credits that extinguished themselves without any tangible gain, and also transient credits that were ultimately transferred into these tangible objects. Therefore, it is evident that those engaged in producing the necessities of life had to furnish a little more than their particular requirements in order to support those engaged in producing the more permanent articles required in this society.

When the productivity of the farmer and the hunter was barely sufficient to support the community no gain was made in the permanent fixtures of the tribe, and the people remained poorly fed, poorly housed, and poorly clothed. The credit advanced by the hunter was extinguished in its entirety by the wheat of the farmer, and as there was not any surplus of the necessities of life, consequently all were compelled to devote *all* their time and energy to produce these. A society where all transient credits extinguish themselves in this manner is static, impoverished, and unable to furnish itself with even the most primitive forms of improvements. A society that produces transient credits, some of which are extinguished and some of which are transformed into fixed credits, advances, becomes richer, and supplies itself with the permanent forms of wealth, unless artificial barriers are erected which restrict and retard the transfer of a transient credit into a fixed credit.

## Chapter III

### THE RISE OF CAPITAL

The transfer of a transient credit into a fixed credit produces capital. The canoes, the huts, the hunters' weapons and the implements of war were all produced by the united efforts of the tribe, and as they were produced by the tribe they no doubt belonged to the tribe. A strictly communistic society where all created and capital assets belonged to the people as a whole. Even in this rude state there existed some hunter a little more skilled than his neighbor. Due to his excess prowess or energy he accumulated more skins in his hut. These were his rugs, his mats, his clothes, and made him a little more cheerful and a little more comfortable than those about him. They were his in their entirety. Private ownership. Private capital.

It was not a very long step from private ownership to group ownership within the tribe. Four or five hunters grouped their efforts, united their skill, and the result of their combined prowess belonged to them exclusively. The trap or pit they built to ensnare their prey belonged to them as a group and became a capital asset owned collectively. Each man devoted his time and labor to the construction of this trap and upon its completion had his share of the spoils derived from the successful manipulation of the device.

This trap, as in all undertakings, that required time in their accomplishment, was built on transient credits. Each man loaned his labor to the enterprise, knowing full well that he would be repaid in part ownership relatively to his contributions. A partnership had in this manner been formed, and credit, mutual trust, faith, confidence had made the enterprise successful.

Another element also entered into this crude transaction, for at the time of the building of this trap, some hunter either was delegated, or perhaps, volunteered to keep the workmen fed, provided that for his labor he also would have some share in the finished products. Another evolution of society made its appearance. A share in an enterprise where that share did not directly construct or labor at the machine itself. A loan of labor, of food, of meat, had been made in order to participate in a future capital asset.

Money, shells, wampum, teeth, iron or whatsoever medium was later evolved did not enter into these various transactions. The fundamental idea was faith, belief that the participation in an endeavor having been agreed upon, that the contract would be lived up to, and that the shares would be proportioned in accordance with some prearranged scale. The later evolution of the measuring stick, the medium of exchange, did not change the fundamentals. It served simply the purpose of comparing one man's canoe against another's pile of skins. The ownership remained the same. The relative participations remained the same. This great invention of money basically did not change common property or private property. This existed before the invention and after the invention, in the same form and in the same quantity. The pile of skins had not changed, the number and size of the canoes were the same, and the relative ownership in these were the same. The medium of exchange was simply a different method whereby each share was translatable into some other form.

Fixed capital, then, is produced by the excess production of the necessities of life, and this excess production permits some of the labor and time of the community to be devoted to creating these permanent improvements. Transient credits are either totally extinguished by consumption or transferred into fixed capital.

The medium of exchange, the tool, whereby barter and exchange can be handled in an easier manner, whereby ownership can be changed from one individual to another, has not created anything. Man's hands, with nature's bounty, do the creating. The results, however, are translatable into money. In modern times this is often lost sight of. We look at money, at gold, at any medium, as the thing itself, whereas we must remember that in itself the medium has no value. It must be translated into goods, into food, before value actually exists.

Centuries after centuries moved through the calendar of human events, and slowly, painfully, man increased out of the necessities of life, his capital goods. War, famine, drought, pestilence, earthquakes, hurricanes, all the adverse forces of nature and man destroyed them, but the indomitable spirit of man replaced them again and again and added to the store.

The sailing ship replaced the canoe, the road the trail, and the town the group of mud huts of our early savage forebears. The system of ownership had not changed through this long evolution. The sailing ship was owned in the same manner as the savage canoe, in shares, in certain parts, by certain percentages, these shares translatable into money, into the medium of exchange. Fundamentally the ship itself existed; that was the thing of value.

This early sailing ship, a large enterprise, was owned by a group as partners, each of whom shared in certain fixed ratios, the success or failure of the venture. So came into existence other partnerships, and finally, early in the Middle Ages, the modern corporation was evolved, an unlimited number of partners, a tool whereby hundreds and to-day thousands of individuals can particpate in one common enterprise. In all these schemes, in all these systems of commerce, with all these tools of trade ownership still remained the same. Money simply the translatable medium whereby ownership shifted from one individual to another, money only the emblem of ownership, a method whereby the relative shares could be more easily computed and compared.

In modern society the emblems of ownership consist of partnership shares, corporate shares, bonds, deeds, mortgages, notes, and other instruments, all translatable into money, but fundamentally the tokens themselves indicate simply a participation in the capital asset itself.

This complex and vast society was builded up on these instruments of ownership, and credits, money were advanced against them. The railroad first issued its direct ownership certificates, which we know as stock certificates, then its indebtedness certificates, which we know as bonds, and these were issued in order to procure credits against future participation in the enterprise. The individual industrialist issued his securities in much the same manner to procure credits to finance his particular business. These pieces of paper represented shares in fixed credits. They were issued on faith, on trust, and on confidence. Confidence that he who first advanced the credit would ultimately share in the final venture. They consequently became the capital structure itself, translatable into money, and transferable from one enterprise to another. The ebb and flow of commerce, the slow increment to this capital structure, moved more or less smoothly. Spasmodic drifts and changes in the shifts of prosperity occurred and usually what was one localities gain became anothers loss. This was and is to-day the capital structure on which credit rests. The transients credits over and above those necessary for the necessities of life, were transformed into these fixed, capital assets.

The transient credit that is extinguished is temporary, short lived. It is extinguished when the goods or commodities on which the credit is based are consumed. In modern times the financing of the wheat crop is an example of this. Credit is advanced to the farmer in order to finance his crop and as he sells it to the elevators, the proceeds from this sale extinguish the credit he incurred. The elevator man finances the wheat in his bins in a similar manner and has recourse to credit. As he sells his wheat to the mill, his temporary credit is discharged and extinguished. So these credits are passed along, each one extinguishing a former one, until finally as a barrel of flour, or a loaf of bread it reaches the ultimate consumer. Out of his wages the consumer buys the bread and the credit disappears. His wages may have originated from labor performed in producing other necessities of life, when a new transient credit originates or else his labor may have been employed in erecting some fixed capital credit, and in that manner the transient credit was transferred into a fixed credit. The circle is then completed and this particular credit is then totally extinguished. The iron ore from the mine, the cotton from the plantation, the oil from the oil well, all pass through this cycle. The consumer liquidates the last temporary credit. He may have turned it into a new transient credit or transofrmed it into a fixed credit, but the main thing to consider is that this temporary credit has served its purpose, brought the raw material from the farm, the mine, the oil well, and that upon reaching the consumer, the credit is liquidated.

Capital credits do not extinguish, but exist on a very permanent basis. The railroad pledges its right of way, the manufacturer his plants and machinery, the real estate operator his land and buildings, the oil producer his wells, pipe lines, ships, and terminals, the steamship operator his ships and wharves and so through the whole structure of civilization. Credit has built the world and civilization would still be in a barbaric state, if this wonderful instrument of commerce had not been evolved and expanded.

The actual extinguishing of a capital credit is a complete loss to the entire credit structure if that capital credit is extinguished through destruction. The loss of a building through fire, the destruction of cities through earthquakes, the wanton devastation of war, the wear and tear of time and the elements, all remorselessly tend to wear down and destroy capital credits. Man in his system has set up reserves against some of these losses. He has devised a scheme of insurance and out of his daily labors has set aside a part into a fund to replace into the credit structure that which by fire has been destroyed. He attempts in all forms of insurance to rehabilitate the structure when through calamity it has suffered. In case of tremendous conflagrations, enormous destructions by earthquakes, the insurance fund is inadequate, can not fill the breach, and the credit structure shrinks accordingly. Man has used every expedient possible to protect this structure, realizing, unconsciously, that its collapse is worse than any disaster that can overtake the world.

Credits, then, exist in those two fundamental forms, capital or fixed credit, and transient or extinguishing credit. The former is the bedrock of civilization, the latter simply a means for bringing production to consumption. When production is consumed that particular credit has served its purpose and usefulness and disappears. Capital credit is permanent and every means is used by man to keep it permanent and to replenish any loss which that structure may suffer.

## Chapter IV

### THE EFFECT OF THE WAR ON THIS CAPITAL STRUCTURE

Prior to the war the credit structure existed in the manner described before. The purpose of this chapter is to endeavor to describe how that cataclysm, that foolish destruction of the world's goods affected the structure, this carefully created, this zealously guarded mechanism that man laboriously reared out of the darkness of the past.

Immediately after war was declared credits on capital still existed, though the immediate shifts and changes caused terrific upheavals. The actual credits, however, still were there. Their particular ownership simply changed. The actual destruction came about in two general ways.

In times of peace the capital structure is maintained and increased by the excess production of the necessities of life, this excess production of a certain group, permitting others to devote their time and energy in the production of fixed, permanent goods. The capital structure of itself depreciates, wears out. Parts of it become antiquated, due to new inventions, changes in the modes and styles of living, and the general improvements in the advancement of civilization. Other parts due to wear and tear, use, and the action of the elements, continually are depreciating. During the progress of the war these replacements and capital increases were lacking, thus causing in one major way the actual shrinkage of the capital structure.

The more obvious destruction was caused directly by war. The burning of villages, the tearing up of railroads, the dynamiting of bridges, the wanton destruction of all things created by man, were direct losses to the capital structure.

Here, then, was a structure that was rapidly being destroyed and allowed to decay. On this structure had been erected all the credit instruments of a past civilization. These instruments still existed though the capital back of them was disappearing. In order to prosecute the war the governments of the belligerents borrowed vast sums on credit from each other and from the Government and the people of the United States. These sums originated as transient credits, credits used in bringing raw materials to the consumer, and should have been extinguished either by transfer into other transient credits or by exchange into fixed or capital credits. It might at first appear that these credits did extinguish themselves, because upon consumption of the war supplies, the necessary products were consumed. However, the vast armies were consumers only, and the surplus production of the necessities of life by the noncombatants was insufficient to maintain this tremendous drain.

There was, therefore, created enormous debts, which though the goods were extinguished, still remained. In addition thereto, there was, as has been shown, the old credits resting on a structure which through direct destruction, obsolescence and decay was shrinkage rapidly. Such was the condition at the conclusion of the war.

Immediately upon the peace of Versailles came hysteria. The victors demanded that the vanquished pay this enormous depletion, and by force of arms imposed staggering burdens. Believing that this war was similar to other wars, and not realizing that in this conflict the entire world had engaged. The damages were so enormous, that no one nation, nor small group of nations could replace the destruction wrought. Even if the defeated foe were willing to restore these capital losses, no reasoning man could for one moment imagine that this were within the remotest possibility. Hysteria, still, had its way, and panaceas were elaborately improvised whereby, by words and phrases, destruction would be rebuilt. It savored of Aladdin's lamp, and it was hoped that by ponderous words and complicated formulas, some genie could be aroused who would rebuild the cities, restore the farm lands, and by the magic of words obliterate the colossal damage caused by that Armageddon.

The plans and schemes became a fact, and they served simply to make the channels smoother and the route shorter toward the day when the liquid assets of the debtor nations disappeared. One nation, only, either through foresight, or as I more firmly believe, through necessity, realized that credit impairments caused by the war, could only be replaced through one source. That source, a levy on capital, an out and out confiscation of property. France, whether through necessity or otherwise, reduced its obligations by 80 per cent, when it revalorized the franc, and levied on all its citizens and creditors a tax of 80 per cent of its obligations. She practically tore up tokens where the property no longer exited.

The major portion of obligations within a nation are based on the legal tender of that nation. Only a small fraction of obligations are gold obligations. In one move, France paid its internal obligations for, as we term it, 20 cents on the dollar. Any instrument of indebtedness, bond, mortgage, note, etc., that was payable in gold or could be exchanged into gold canceled and at least five times as much as its face value indicated. By one stupendous stroke there was squeezed out of the credit structure a large amount of the shrinkage that had been caused by the war.

Germany endeavored to accomplish the same results, but went about it in a different manner. Necessity did not offer her the same opportunity. Inflation was the only means she had at her disposal for levying on capital, and squeezing the water out of the credit structure. An enormous amount of internal debt was thereby canceled. The enormous wastage of the war left Germany with barely sufficient production capacity to supply the necessities of life. By dint of utmost economy and frugality, some excess was produced, which was turned into fixed capital. The reparation payments were, until recently, financed by the credit extended by the people of the United States. In fact, these payments practically equaled the credits extended. When the credits stopped, reparation ceased, and Germany to-day has simply added again to her credit structure. It is again out of balance. Cancellation of these credits, inflation, or the slow accumulation of surpluses will once again balance her credit structure. Payments of reparation will simply distort it further.

France and Germany have each taken out of their citizens a great share of the impairment of the credit structure caused by the war. Russia, the smaller nations of Europe, have each in some such manner, voluntarily or involuntarily, contributed their share. What of Great Britain, and what of the United States? Sentiment plays no part, patriotism has little say, and Christianity, unfortunately, can not meet the situation. Cold, hard facts must be met. The damages caused by the peoples of the world must be paid for by the world. In the United States we may avoid our share for a time. Great Britain may have hoped to evade, or at best, postpone her share, but the inexorable forces of economics can not be gainsaid.

England, through pride in her institutions, through the desire to maintain her good name, through her almost holy reverence for the spirit of a contract has bled herself white. The task was too great. The damages to the world too colossal for even her indomitable spirit to win through. England was at last forced to make her capital levy the same as all the nations of Europe. The abandonment of the gold standard, depreciated sterling, and England's capital has paid by capital its share.

Whether it will be necessary for England to revalorize the pound remains to be seen. Probably its revalorization will make England's recovery more rapid than the present process. If surpluses of centuries that England has accumulated are sufficient to deflate her share of the credit structure, then the pound will stabilize without revalorization, but if they are not sufficient that step will have to be taken.

In the United States we are also paying our share, because of the inability of the debtor nations to pay their debts to us. England has sold its long accumulations of capital in the only market where gold is still available. The French market is still open, but England's investments in the securities listed in France are small as compared to her investments here. When, either by statute, as has happened in England; or by repudiation, as is happening in Germany, no more gold flows to the United States, then we shall realize that these vast sums we loaned to the warring nations will not be paid in gold, because the debtors who have it will not part with it, and we can not be paid in goods, for our tariff walls shut them out. We in turn shall pay our contribution to the credit structure so terribly impaired by the war, by finally cancelling completely the last penny of war debts.

## Chapter V

### THE EFFECT OF THE CANCELLATION OF THE WAR DEBTS ON THE UNITED STATES

In the analysis of the effect of the cancellation of the war debts, it will be necessary to digress somewhat, and review in a general way the banking system of this country as it exists to-day.

The function of a banking system is to facilitate the exchange of commodities of one kind for another. Fundamentally, the ability of banks to perform this service rests on bank deposits. A depositor in one bank, having arranged to purchase goods, takes payment by drawing a check against his deposit and by a bookkeeping entry; the amount so drawn is transferred to the account or deposit of the seller. If the buyer and seller were both depositors in the same institution, the transaction would be simplicity itself. However, in order to expand such a system so that deposits of one bank can readily be transferred to deposits of other banks, the "clearing system" has been evolved. In reality the members of such a system, which of course, are the banks, are in a similar position as the buyer and seller in the one bank. In this case they become debtors or creditors of the clearing house association. For example, one bank may have $10,000 worth of checks drawn against it by other member banks; and it must, therefore, transfer $10,000 worth of its deposits to these other banks. This is accomplished by the exchange of cash. In actual practice, on the average, the total amount of checks drawn against any one bank, are offset by the total amount of checks this one bank has, drawn against the other member banks, so that, in reality, there in very little exchange of cash. This clearing process is now extended by use of the Federal reserve system, and the respective debit or credit balances of the several reserve banks are adjusted by gold fund in Washington.

By the use of the clearing house method, the transfer of checks or credits and, therefore, the exchange of goods is facilitated tremendously, and by comparatively simple bookkeeping entries, exchange facilities are handled expeditiously and economically. The deposits in the various banks shift from day to day. The cash holdings are transferred from day to day. As a whole, however, in this process of clearing, bank deposits do not change, nor to the cash holdings. Cash holdings are only increased by the production of the mines or by the purchase of gold from foreign countries.

Bank deposits, as a whole, are increased by actual deposits of gold, and by loans. In general, the fact that a borrower increases deposits is not understood. At first it would seem that this borrower has taken the funds of the lending bank, and consequently, these funds are reduced. In this particular bank, they are reduced, but the funds of the borrower eventually find themselves into the deposits of other banks. The deposits of the lending bank have not been reduced, for the borrower has not drawn against them. This leading bank has purchased a promissory note and it has by illustration, substituted in place of the cash of one of its depositors, a promissory note. The deposits of the whole system have been increased. Deposits increase when loans increase and deposits decrease when loans are reduced.

There was published in 1927 an article by the Standard Statistics Co. (Inc.) entitled "The Banking Process". It very clearly explained the manner by which banks expended their loans and investment accounts. The graphic illustrations of the results have been so well shown, that I doubt if a better explanation can be made, and there has been added an Appendix "A" reprinting this in full.

This system, though it may appear involved, is comparatively simple, and a grasp of it is necessary in order to view the effect of the cancellation, repudiation or repayment of loans. The great bulk of deposits are derived from loans. We often consider as loans only those directly made by a bank. In fact, on most bank statements appears the item of loans receivable and an additional item of securities purchased or held. These securities are in reality loans receivable and when a bank purchases a government obligation, or a railroad's obligations, even though the bank did not directly loan that amount, it is actually a loan receivable, and therefore, the issue and purchase of these securities also increases bank deposits. In the same manner the retirement or repudiation of a security reduces bank deposits. It has been shown that the deposits of this country originate, in the main, through loans and through securities, and these are kept within bounds by the gold reserve requirement of this bank.

The repudiation of securities reduces bank deposits in a more direct way, than the actual repayment of securities. For example, a bank has purchased or loaned to a railroad $10,000 in the form of a railroad bond. Deposits have, therefore, increased $10,000 somewhere in the system. The bank carries this item in its investment account at that figure. Due to bankruptcy the $10,000 bond is worthless. The bank has suffered a loss of that amount and takes that loss out of its profits or surplus. The amount of deposits have not as yet been reduced. The bank simply replacing the $10,000 deficiency of the railroad's by $10,000 of its surplus. Unfortunately in the case of tremendous depressions, the surpluses of the banks are not sufficient to absorb all these losses. Consequently banks are forced to close their doors, and in the liquidation, or readjustment of the closed bank, these losses eventually are charged to the depositor, causing a shrinkage in deposits.

Loans are the basis of deposits and deposits are the basis of credits. When one shrinks, the other shrinks. This digression on the money system has been necessary in order to make clear the mechanics involved in the cancellation of loans. The loans of the Federal Government to the allied nations were financed by loans to the Federal Government from its people. As has been shown these loans originated deposits and as long as the allied governments used their credits in this country, deposits did not shrink. At the conclusion of the war, some of these allied debts were paid in gold, cancelling some of the loans. Gold, being the only other source of deposits, the deposits were only theoretically decreased in the repayment of the loans, for the influx of gold brought them back to their former figures. In fact, as gold through its reserve function is the basis for further credit, domestic credits expanded enormously.

The repayment of these debts by gold has ended. For the debtor nations either can not or will not pay in gold. The only other recourse is their repayment in goods. If repaid in goods, there would be an influx of goods which to-day seemingly we do not need. Cancellation of the war debts would not reduce deposits, or credits, for these credits were advanced by the Federal Government. Fortunately the credit of the Government is strong enough to absorb such losses.

In addition to the war debts, there are also the loans made after the war to Germany and other foreign countries. These can not be repaid in gold, for the obvious reason that there is no gold. They can not be paid in merchandise, for as yet, we can not use this merchandise. They should not be canceled, because the private creditor can not absorb the loss. His credit is not sufficient to absorb it. They, therefore, must be held in abeyance until as in the case of the war debts we can discover the means whereby we can use them. Furthermore the debtor in most cases does not wish them canceled, for he considers them an honorable debt, but during this period is simply unable to pay.

It is often claimed that the European governments by a reduction in the amounts spent for war armaments, could pay us the sums so saved, and thereby reduce their indebtedness to us. Suppose that in this manner five hundred millions were saved per annum. How could it be paid to the United States? It could only reach us in two ways, either by gold or by goods. Gold can only be sent us by France, the other nations have not even sufficient gold to maintain the gold standard. If France sent us her gold in payment, eventually she also would be forced off of the gold standard, and we here, would be the only nation on a gold basis. Without doubt the European countries would of necessity contrive some new medium for exchange purposes, and gold as an international standard would disappear, for the only manner by which gold could return to Europe would be through the purchase of goods or services from Europe by the United States. It, therefore, resolves itself, in the final analysis that payment to us by a reduction in the amounts spent by the European governments in armaments, can only be made in goods and at the present time we appear to have more than we need.

These war debts were incurred through the purchase of goods from us by Europe, and they can only be paid off by our receiving goods from Europe. Even the item of interest on these war debts must be paid in goods, in the same manner as any savings effected by a reduction in armaments. For example, England in order to pay interest to us must tax her people. Her people do not pay their taxes in gold, for they have no gold. They simply transfer certain credits they have over to the credit of England. How, then, can these credits of England be transferred here? She has no gold. Only through the purchase of dollar exchange and dollar exchange can only originate through the purchase by our people of goods or services from England. It must be apparent to all thinking people, that the war debts should only be paid to us, when our own consumption far exceeds our productive capacity.

## CHAPTER VI

### ARTIFICIAL SURPLUSES

It would appear that surpluses exist in this country to-day. There are automobile factories, seemingly of unlimited capacity; farms, which produce more wheat, corn and cotton than we know what to do with; apartment houses crowd the cities, office buildings fill the business centers, stores line the market places. These all seem to be the visible signs of surpluses. We seem to have too much. In fact, the cry is raised, "Let us produce less, let us even have scarcity". How seemingly ridiculous is the argument to produce more. In all appearances we would simply be in deeper than we are now. Yet bread lines exist in every city, clothing is distributed by every charitable organization, and shelter is provided in every municipal lodging house. Surplus is on my right hand; and want, privation, and even starvation, are on my left. We have artifically fenced in our stores of goods, wheat, cotton, provisions, shelter, manufactured articles, transportation, and all the articles of commerce. The "Open sesame" to this barrier is gold, and he who does not possess gold or its equivalents, money or credit, can not pass that barrier and can not share in the goods there waiting for him. This is the ridiculous situation; this is the result of a man-made piece of machinery that has enmeshed us in its cogs. How can that machine be started again? Who can remove the worthless cogs? Where is the solution? The cause was engendered by the war, as has been outlined. A credit structure exists, which is imposed on a capital structure that has shrunk. Bankruptcies, insolvencies, receiverships, are slowly bringing this credit structure into line. A slow and very painful process and a process that may lead to pillage, riot, and perhaps revolution.

There is a surer, saner and safer way than this drastic method. We must revive the transient credits. We must make it possible for the farmer to sell his wheat to the elevators and the elevators in turn to the millers and so on to the consumer. Each credit transaction extinguished by the succeeding one, until finally the consumer is reached. Here, at the present time, it can not be extinguished because the consumer is unemployed or is barely receiving wages enough to exist. It can not be turned or transformed into a fixed or capital credit because the private entrepreneur can not obtain credit for his venture. Consequently the excess production of the necessities of life pile up in seeming surpluses. Consequently the shoe factories, the cotton mills, the automobile plants, shut down because of their excess production which can not be consumed, because the group that would normally consume this excess production is unemployed, and finally because those who would normally employ that group have lost confidence or can not obtain the credit necessary to replace the transient credit, and turn it into fixed capital.

In all periods of stress and strain, there immediately starts a mad scramble by every individual and bank to become as liquid as possible and consequently, loans are paid off, either voluntarily or through necessity. Consequently, deposits shrink and in turn credit further shrinks. In fact, the only credit satisfactory in such circumstances is transient credit, credit that will liquidate itself as it comes to the ultimate consumer. The productivity of this country is greater than its immediate consuming needs, and if only these consuming needs are financed, the excess assumes terrific proportions. In spite of repetition, it must be emphasized again that credit originates as transient credit. The farmer grows his wheat, the miner mines his coal, his iron, his copper, the oil producer produces his oil, the cotton planter his cotton, and so through the production of all raw materials. These processes are financed by the bank or individual and as the processes of turning raw materials into finished products advance, step by step, each former step is liquidated. In a rich, industrious country a certain percentage of the people are employed in originating these credits, another percentage are employed in transferring these credits in the process of manufacture, another percentage in transforming these credits into capital credits and finally a last group employed in protecting, housing, entertaining and governing the entire people. These are all consumers. Consequently, when the group occupied in turning transient credits into fixed credits is unoccupied, the ranks of the consumer thin. Not only, therefore, are surpluses created due to the inability to turn these credits, but further surpluses build up due to the inability of this group to consume.

We see, then, an overproduction of everything, too much wheat, too much corn, too many automobiles, too many miles of railroad, too many freight cars, too much cotton, so through the thousands of products of civilization. All manner of panaceas are suggested and attempted. The wheat is burned, the cotton is sold for little or nothing to foreign lands, the crops are allowed to rot in the fields and the universal cry is overproduction. Destroy in some manner these surpluses and we can start afresh. In Brazil, coffee is burned on the beaches or taken out to sea and dumped, because somehow too much coffee appears to exist in the world. The rubber plantations are allowed to serge back into the jungle. Was there ever a greater misconception?

We have here a country rich in all natural resources, populated by an energetic, industrious people, equipped with all manner of plants, and yet somewhere the mechanism is upset. Each automobile plant, each shoe factory, every farmer, every cotton planter, every cement mill, all the steel plants, are able and willing to run to capacity and produce enough to give each of us aplenty of everything. We should have all the concrete highways, all harbor improvements, all the irrigation systems, all the dwellings we desire, paid for in corn or wheat, or automobiles, and yet the nation as a whole is impotent, unable to function.

## Chapter VII

### GOLD AND MAN'S ENERGY

Through the ages we have built up a medium of exchange, a measuring stick to determine relative values, and to-day we hold in higher esteem the measuring stick than we do the article it measures. If all the gold should disappear to-morrow, the field would not be less fertile, the railroads would not be a railroad tie poorer, and the cotton mills would not suffer the loss of a single spindle. Of all the metals discovered by man, gold is perhaps the most useless. In the arts it has some value, but industrially it does not compare with iron or steel, copper or bronze, zinc or brass.

If to-morrow, stealthily and unobserved, all the gold in the Federal reserve system were stolen, put on shipboard and the ship scuttled in the mid-Atlantic, so long as no one knew that this had been done, commerce and industry would proceed as heretofore. If gilded blocks were substituted for each brick in the subterranean vaults, as long as this substitution remained undetected, just so long would business continue, undisturbed and unafraid.

Gold, within the confines of this, country, has simply a psychological effect. It is something tangible, something on which man can rest his confidence, and something that, if necessary, we can see and feel. Gold is useless, and in these subterranean vaults it is even worse than useless. It requires man's time to count it, to guard it, to move it, and to store it. Gold, however, has been venerated through the ages, and in its psychological effect it inspires that confidence, that source of security, that is so necessary where credit is considered. Where gold is, there is financial security. We speak with fear and trembling of leaving the gold standard. We have visions of all manner of dire disasters that may befall us, and we trust and hope that our golden anchor will stop us from soaring up to the clouds in a wild orgy of inflation. We seldom realize that that same golden anchor may plunge us into the depths of despair and hold us there. No matter what briefs may be held for it, no matter what learned theories may be advanced, results speak for themselves. It has failed woefully. It has not brought together the fertile fields, the marvelous factories, the modern dwellings, the great transportation systems, and the endless variety of other useful, efficient, and pleasant things that this great Republic can produce. We have erected a golden idol, we have created a terrible juggernaut, which has turned on us and instead of facilitating the interchange of goods, actually, to-day, restricts it. The gold standard, as it functions to-day, will be a thing of the past, and it may take many years before an enlightened civilization realizes it.

The credit of this country, based upon its vast fields, its countless rivers, its tremendous cities, and above all its energetic, industrious, and resourceful people, is the soundest, safest, and surest rock on which to build confidence and on which to rear our financial edifice. We think of a Government bond as an obligation of the Government. It says "payable at maturity in gold," with interest at a certain rate. It is, in fact, a certificate of ownership in the wealth of the United States, backed by the resources and capital of its citizens. It is certainly of more real value than any quantity of gold. Long ago the British Government realized that a Government bond is not an obligation of the Government's and the British consols, therefore, do not mature, have no maturity date. They are the foundation of the country, and were England independent of foreign exchange, a gold standard would not be necessary.

Evolution, we fondly hope, will bring us back to first principles, and we shall redeem the medium of exchange into the tangible thing itself rather than what the world and we are to-day doing, changing the substance into the medium.

James Watt harnessed a pair of draught horses to a system of ropes and pulleys and found that one horse could raise 33,000 pounds 1 foot in one minute. He, therefore, in this crude manner, defined one horsepower. Volta found that in a certain electrical cell an electrical pressure was produced, and this unit has since been called the Volt. It is a basic measuring unit of the electrical world. So Ampere determined the ampere, Ohm, the ohm, all measuring units, fixed, unvarying on which industry to-day exists. How can we then determine or fix a unit of real value?

In order to determine this value, we must first analyze what real value is. The iron ore in the mine has no real value until it is brought to the surface. Then it has real value. Its value further increases when it arrives at the blast furnace, and so as it changes into different forms, its real value increases, until it becomes a finished steel beam in a bridge. What has this brought about? Man's energy, supplemented by harnessing nature's aids to his assistance, has brought a piece of useless ore from the bowels of the earth and transformed it into a tremendous bridge, spanning a wide river. Man's energy has again taken this iron ore, the copper ore, the rubber from the jungle, the cotton from the plantation, and the raw materials from the corners of the earth and transformed and woven them together to produce the modern miracle, the automobile. It is man's energy that determines the real value of anything; and in the last analysis, this is the real measuring unit of value.

We have to-day translated this into gold money, and we think and believe that it is gold that is the determining factor. A pound of iron has less value than a pound of steel, because in the market place a pound of iron is worth a fraction of the value of a pound of steel. The real value has been changed because energy has been expended on the iron and that energy has been translated in terms of gold. The unit of value is man's energy.

In the barbarian, uncivilized times it was man's energy that changed the tree in the forest into the hollowed out canoe and the grass of the fields into the rude thatched huts. Advancing civilization has used more efficiently man's energy, has found that this energy can be multiplied many fold by harnessing it with nature's power house. We have hidden this unit under a golden blanket, and we have refused to recognize it, because it is all about us, commonplace. We have been unable to value it because it varies with the energy, ability, and enterprise of each individual. Its average value can be arbitrarily fixed, just as Watt fixed the horsepower, Volta, the volt, and so forth.

If, for example, we valued at to-day's prices one unit of man's energy at $10 and said that this unit is 2,000 bricks laid in a row, by one man in eight hours, the unit would be arbitrary, for no two men would do exactly the same amount in exactly the same length of time. However, the unit of horsepower is just as arbitrary, as undoubtedly it would be impossible to find two horses that would do exactly the same amount of work in exactly the same length of time. Nevertheless, it would establish a unit, man's unit of work. For purposes of this discussion, let us assume this unit of man's energy and let us say that at to-day's prices, it is exchangeable for $10 in money. Let us give it a name so that our illustrations may be simplified. Let us call it one "Adam," he was the first man.

It is then an easy arithmetical calculation to turn dollars into "Adams." The Federal debt, instead of being $19,000,000,000, is now 1,900,000,000, "Adams," and so on through all industry. My $25,000 house has now a value of 2,500 "Adams" and the office building across the way which has a dollar value of ten millions has now a value of 1,000,000 "Adams." There seems to be no practical change in the procedure. It is simply calling the rose by another name.

If a railroad wishes to electrify its system, it will offer securities to cover this expenditure. If an investor has $10,000 on deposit he may purchase that amount of these securities. Prior to his actual transfer of his deposit, he indirectly owns a a proportionate share in his bank's assets. As soon as he pays for these securities, his credit or deposit is transferred, and as this deposit is drawn out by the railroad, through a readjustment his former proportionate share in the bank's assets finds new owners. Now, if there were only one bank, and if the entire transaction were consumated in the one community, the result would be that the bank would get back the $10,000 in the shape of deposits, through the individuals that the railroad had paid. In the process the electrification has been completed and man's energy has created something new. The bank is in the same financial position as when it started, but in addition there now exist the securities of the railroad, represented by the completed enterprise.

If, now, we translate this into our new medium, we find that our investor has now acquired 1,000 "Adams," that did not exist before, and if the electrification cost $10,000,000, or 1,000,000 "Adams," we find that there has been added to our wealth, to our store of capital, 1,000,000 "Adams." If we consider this as a productive enterprise and if we assume that the amortization and interest on this expenditure is, say, 6 per cent, this electrification must annually, during its useful life, pay 60,000 "Adams," or, in other words, release 60,000 "Adams," for other pursuits. It must replace 60,000 "Adams" annually or, otherwise, it is not a productive enterprise. If, again, the Government builds an irrigation system, at a cost of 10,000,000 "Adams," and the amortization and interest, say, amounts to 5 per cent, in order to consider it as a strictly productive enterprise it must replace annually 500,000 "Adams." If a great city constructs new subways at a cost of 20,000,000 "Adams" and calculates that interest and amortization is 5 per cent, in order to consider it productive, it must release annually 1,000,000 "Adams." The productivity of an enterprise is then measured by the number of "Adams" that it annually replaces and which can be transferred to other endeavors.

In a previous chapter I have divided the citizens of a country into four general groups.

1. Those employed in originating credit or producing raw materials.
2. Those employed in transferring these credits in the process of manufacture.
3. Those employed in transferring these credits into capital or fixed credits.
4. Those employed in protecting, housing, ministering to, and entertaining the entire people.

In group 3 there is a further subdivision into two groups: (*a*) Those employed in transferring these credits into fixed productive capital and (*b*) those employed in transferring these credits into fixed nonproductive capital.

I have shown that the productivity of an enterprise is measured by the number of "Adams" that it annually replaces, and which can be transferred to other endeavors. Now let us substitute in those groups the term "Adams" for credits. Groups 1 and 2 originate the "Adams" that support Groups 3 and 4, and by their excess production of these "Adams" permit Group 3 and 4 to function. Group 4, in fact, is strictly non-productive, giving no productive "Adams" in exchange for the productive ones. Though a doctor, a lawyer, a policeman, or a fireman are absolutely necessary, they produce not one productive "Adam," but must obtain their livelihood from the excess production of groups 1 and 2.

Group 3 is engaged in turning these transient "Adams" into fixed "Adams." If all the energy of Group 3 is in the subgroup (*a*), namely, transferring transient "Adams" into fixed "Adams" that continually release more "Adams" for still greater productivity, we would have a country of boundless productivity, a land of plenty, everywhere produced by man and his machines. Unfortunately these labor-saving machines are continually wearing out, need repairs and replacements, and a great proportion of Group 3 is engaged in those pursuits.

In Group 3 (*b*) are the infinite number of capital "Adams" which are non-productive—the dwelling, the store, the hotel, the theater, the apartment house, all the dwellings of a city, the radio, the automobile used strictly for pleasure, the furniture in the house, the clothes we wear, the thousands and thousands of articles that we daily purchase. None of these release on single "Adam," but all have been exchanged for transient "Adams."

I fear that the reader has, perhaps, become confused by this discussion of "Adams" and dollars. If I have been successful in dismissing from the reader's mind the idea of the dollar, and if I have demonstrated clearly that the economic process is an exchange of man's energy from one activity to another and that finally the excess of man's energy not directly used up in supplying the necessities of life, must be turned into productive and nonproductive capital, then I feel that the rather prolix discussion has not been in vain.

I have included in Group 3 (*b*) the apartment house, the theater, the hotel and so forth. At first these may seem to be prooductive in that they produce income. They do not, however, release one single "Adam" for further productivity, but act simply as a reservoir, or clearing house, where many streams of transient "Adams," in the shape of rent and admissions, merge to be again dispersed as interest, profit, and taxes into the hands of others.

Man's energy or this "Adam" can be and is continually being translated into gold, into money, into credit. We built in this country a beautiful, wonderful machine. It produced all we required, but its productions became so gigantic that it staggered us. We still believed in the old adages when production was limited. We still had the old fears that were engendered by famine, drought, pestilence, and war. We little realized that actually we stood on the threshold of a new era. We were years ahead of our time and were unable to drive from us the fears and superstitions of the past. Furthermore, our productivity strained to the breaking point the old system of exchange. Our "Adams" or man's energy grew faster than our stores of gold, and the old system collapsed. Panic and fear seized everyone, and at once a mad rush started to turn the certificates of ownership, their bonds, their stocks, into gold. The banks strengthened their reserves, attempting to have almost one gold dollar for each dollar of deposit. Industry stopped, commerce faltered, and slowly the hoarder made further drain on our gold. The ranks of the hoarder included not only the individual but even the bank and the corporation. Liquidity became the cry and naturally you could turn the electrification of a railroad, the wires, the towers, the generating stations into gold. Yes, we could keep on pumping more gold into this sytem until all the capital created by man's energy was represented in gold. But the gold mines of the world are not plentiful enough, and the stores of gold in the world would not be large enough. These are limited, whereas the world's productivity is unlimited, and we attempt to rear a continually expanding edifice produced by the daily output of man's energy on a foundation whose extent is woefully inadequate.

## Chapter VIII

### FOREIGN EXCHANGE AND ITS INFLUENCE ON PRODUCTION

So far in this discussion we have considered each nation or country as a self-contained unit, independent of the productivity or scarcity in other countries. However, the peoples of the world divide themselves into the same four groups that exist within the units of each individual country. There are the producers of the raw materials, there are those engaged in turning these raw materials into finished articles, there are those employed in transferring these finished articles into capital credits, and then there are those who watch over, entertain, and minister to the wants of the entire population.

In a nation where, due to the lack of fertility of the soil, or due to the density of the population, or due to the lack of industry among the people, all the effort and energy of the nation is required to produce the necessities of life, there is no surplus.

Consequently, no portion of the population can be engaged in any other pursuits. Only such raw material can be produced as is required for the necessities of life. The instruments of agriculture will be of the crudest form. The habitations will be of the simplest kind, and the clothes of the people will barely suffice to protect them from the action of the elements. Such a nation will be static, will be in a barbaric state.

When, however, just enough of the necessities of life are produced so that a certain percentage of the people can be employed in Group 2 (the group that is transferring raw materials into finished product), part of Group 1 will produce the absolute necessities of life for the remainder of the population and another portion of Group 1 will produce raw materials other than those simply required for sustenance. Such a nation will have improved agricultural instruments, better habitations, better clothing, but yet will be unable to accumulate fixed, permanent capital, because there are not sufficient of the necessities of life to permit any portion of the population to be engaged in turning the finished products into permanent capital.

Finally, that nation that produces a great abundance of the necessities of life, permits certain percentages of its people to be employed in Group 2, in Group 3, and in Group 4. Such a nation is continually progressing, adding to its store of wealth, and enjoying all the benefits and improvements of an advancing civilization.

If there were no artificial barriers erected by man, if man were not as firmly rooted to his native land as the staunchest oak, and if language and custom did not forbid, the peoples of the world would gravitate into these groups and there would be a sufficiency of the necessities of life, just so long as the fertility of the world was sufficient to support its entire population. We are confronted, however, with the fact that there are certain nations known as agricultrual nations, producing the necessities of life; others as mining nations, producing raw materials other than the necessities of life; others as manufacturing nations, employed solely in turning raw materials into finished products. In each nation there are employed a certain percentage in Group 3 and 4. Very seldom do we find one nation that combines all these groups in perfect balance. The United States approaches that balance as nearly as any nation.

For example, we may consider the Argentine Republic as an agricultural nation. The great percentage of her people are engaged in Group 1, practically none in Group 2, some in Group 3, and a normal percentage on Group 4. Her agricultural products, therefore, find the nation that has a preponderance of people in Group 2, and she receives in return finished articles. If all the excess production of the necessities of life were exported, so that there was not sufficient remaining to support Group 3, the Argentine Republic could not create any capital assets. Unless some artificial barrier was erected by man, the excess production of these necessities of life would be replaced by articles produced by Group 2.

In a mining nation, such for instance, as Chile, where most of the population, we shall assume, is engaged in producing copper or nitrates, raw materials of Group 1, hardly any in Group 2, some in Group 3, and a nominal number in Group 4, we find that this raw material must be replaced with a sufficiency of the necessities of life to support the remaining groups and in addition must be able to command enough of these necessities so that these additional necessities can be exchangeable for the products of Group 2. If this additional production is not sufficient, we have, consequently, a nation that is obtaining just enough of these necessities to maintain its population and can not spare any of its people for other pursuits than those in Group 1.

In a manufacturing nation such as England very few are employed in Group 1, many in Group 2, some in Group 3, and a nominal number in Group 4. England, therefore, must contrive to exchange the products in Group 2 for the necessities of life. Otherwise, Group 1 must be recruited out of the other groups, and if the soil of England is not fertile enough to produce the necessities of life required by all her population, the population will be reduced either by emigration or starvation. There is no other alternative.

I have described the processes existing in the three general type of nations—agricultural, mining, and manufacturing. It must be understood that they are not each exclusively devoted to these pursuits, but for purposes of illustration, they have simply been used as examples. What is true of these illustrations can be extended and expanded so as to include every nation in the world. To-day a paradoxical situation has arisen which embraces every nation on this earth. England desires Argentine wheat and cattle, Brazilian coffee, Chilean copper; and each of these nations desire what England can produce, yet a barrier exists which seemingly can not be surmounted. Fortunately, and I say it advisedly, this barrier is only a man-made barrier. The productivity and fertility of the world still exists.

If, to-morrow, Chile, for example, should suddenly discover a vast store of gold, what would almost immediately take place? Without doubt, the people and Government of Chile would become purchasers of the products of the necessities of life and also at once the products of Group 2, giving in exchange this gold recently discovered. If Chile bought its wheat and cattle from the Argentine, the latter would at once have gold and proceed to purchase products of Group 2 from, say, England. England, in her turn, having received gold for its products, would in turn repurchase the products of Group 1 from the Argentine and Chile, and gold would flow back again. England is disposing of its products of Group 2 has added to the raw material man's energy and consequently will be reimbursed in gold for this man's energy sent back in the shape of finished goods to Argentine and Chile. In other words, there will be a slow pumping of the gold in Chile into the treasury of England. If the supply of gold in Chile is enormous, an equilibrium will be established long before that store is exhausted. The competition of other nations for Chile's gold will keep relative exchange values in line until the treasuries of other nations are in such shape as to secure their credit structure. In fact, as Mill says, "The efflux would continue until the currencies of all countries had come to a level; by which I do not mean until money became of the same value everywhere, but until the differences were only those which existed before, and which correspond to permanent differences in the cost of obtaining it."

Then, if through some such process gold were in equilibrium throughout the world, the relative exchange values of articles would fix themselves on the relative values of man's energy in the respective countries. If in England, due, perhaps, to the climate or the state of civilization, three units of the necessities of life are required to produce one man's energy, and if in Chile only one unit of the necessities of life is required to produce one man's energy, then, in general, in order to trade, articles would have to be exchanged between them on some such ratio. But due to the use and invention of machinery, the Englishman has multiplied many fold his unit of man's energy. Without this use of machinery the Englishman would be compelled to trade three units of these necessities for one of the Chilean's. Interchange could, therefore, not take place. But by the use of machinery, in this example, the Englishman must produce out of three units of the necessities of life, three units of man's energy, in order to trade with the Chilean. If it were increased by more, the Chilean could not trade.

I have omitted from this discussion the effect of tariffs and other man-made devices that attempt to direct the flow of goods to the particular advantage of any one country. These effects are transient, and though they may change the map of the world, they can not change the physical characteristics of the world. Fortunately, the life principle that instinct or force with which nature has endowed all living things will somehow contrive to circumvent all interference with its progress and its relentless pressure will ultimately break down any barriers which may have been erected and which momentarily confine it.

The important fact to consider is that in trade between nations it is man's energy, the "Adam" as we have called it, that after all measures the relative values of commodities. In different countries the "Adam" may be produced by different amounts of the necessities of life, but it is the "Adam" in foreign exchange relationship just as it is the "Adam" in domestic relationship that finally determines real value.

## Chapter IX

### THE ACCUMULATION OF CAPITAL

It is, as I have shown, the excess production of the necessities of life by one group, which permits other groups to exist. If this excess is sufficient to permit the group engaged in producing capital goods to function, then a country so organized is progressing and accumulating wealth, and it is rich in that it is producing all "The necessaries, conveniences, and amusements of human life." The proper distribution of these may, however, be effected by an unbalance in the relative labor engaged in each group, and also by particular advantages of labor within each respective group.

In all endeavors to arrive at an ideal medium of exchange, it has been impossible to obtain one that did not vary. However, for the purpose of our argument, we can assume one. We have adopted in the discussion here an "Adam," as measuring the unit of man's energy. In order to further attempt to analyze the economics of our social structure, it is necessary to adopt one further unit, and though I have used a unit of the necessities of life, let us assume that this unit is the least amount upon which a civilized man can exist. The Chinaman, we understand, lives on a handful of rice per day. This, therefore, let us take as our unit of the necessities of life and let us call this unit one "chin." There is then, some ratio between the amount of those required by the Chinaman and by the average citizen of the United States. Again, this ratio does not necessarily have to be absolutely determined, but can be also assumed. Let us say that this ratio is 10 for 1. The American, therefore, will require 10 "chins" to produce 1 unit of man's energy, without the use of machinery, or without the advantages of the soil, etc.

We can now return to our discussion of the proper distribution of these, among the different groups.

If in Group 1 it takes 5 units to produce one "Adam," and in Group 2 it takes 10 units to produce one "Adam," Group 2 of necessity would be forced to exchange two of its "Adams" for each of Group 1 "Adams" to gain the proper number of units and unless its production of "Adams" per unit of the necessities of life were increased either by the use of machinery or other force, ulitmately Group 2 could not continue to interchange with Group 1. The reverse procedure might equally well take place. There is, therefore, a continual shifting in the production of "Adams" by each group. The invention of some machine that will increase the production of "Adams" in Group 2 will for a time throw out of balance the relationship of these two groups, but finally, an adjustment will be reached that will balance the necessities of life of each group. It must be so, as otherwise, there would be a continual draining of the necessities of life out of Group 1, until the point was reached where farms were abandoned, or rendered less productive. It is as true in domestic exchange as it is in international exchange. Where there are exports, there must be imports, and each must be offset in the long run by the other.

With these units clearly understood in our minds, the unit of the necessities of life, and the unit of man's energy, the "Adams," we can understand how capital is accumulated. A farmer produces 1,000 "Adams." He will use, for the purpose of this illustration, 200 "Adams" for his own use, 200 for the products of Group 2, 200 for the services of Group 4 and have left 400 for the products of Group 3. The products of all except Group 3 are transient, are extinguished, are consumed. Therefore, there have been created 400 new "Adams" of fixed capital. What is true of those engaged in Group 1 is also true of those engaged in the other groups. Each will have left some "Adams" available for the products of Group 3, even Group 3, itself.

Let us imagine that there exists an ideal medium of exchange, one that always remains constant in value. Let us further imagine that each group is supplied with the proper quantity of this medium required for exchange purposes. In addition, we assume that the relative productive capacities and requirements are in perfect balance. If we stretched our imagination and considered that this mechanism of commerce all started simultaneously, and made one complete cycle, what would be the result? The medium of exchange would have permitted the perfect interchange of commodities between the respective groups, and each group at the conclusion of the cycle would have on hand the exact amount of the medium of exchange it started with. The necessities of life would have spread to the respective groups and been consumed. The raw materials would have spread through the respective groups and most of them returned through Group 3 as fixed capital. The products of Group 2, such as transportation, flour, electricity and power would have been consumed. The products of Group 2, such as wire, cotton cloth, railroad rails, glass, plaster, cement, etc. would have passed to Group 3, to be turned into fixed capital. The services of Group 4, such as the doctor, the lawyer, the banker, the policeman would also have been consumed. There would then be left all the products of Group 3, distributed to the various other groups and the country as a whole would be that much richer in its capital goods.

Though there never could be any such perfect mechanism, still that is what is actually transpiring day to day. The farmer as a result of his exchange with group 3 might have built a new silo or erected a new barn. The copper miner could have turned his exchange from Group 3 into a new smelter or sunk a new shaft. The steel mill could have turned its share into a new rolling mill or blast furnace, the doctor his share into a new X-ray apparatus and the hotel owner his share into a new wing to his property. Then, again, indirectly, they might have pooled their shares and constructed a new subway system in some large city. Such a pooling might have been brought about through the many avenues of investment that exist to-day. The payment of a life insurance or fire insurance premium by the farmer might be a channel whereby his share of Group 3, participated in the purchase of a municipal bond that built the subway.

From this simple example it must be apparent that the quantity of the medium of exchange has no effect on the exchange of the commodities nor on the creation of capital goods. Double the quantity of exchange in each group and no more nor less of the commodities will interchange. Multiply or divide the unit itself, and the interchange of commodities will not be affected. Prosperity will not return by injecting more currency into the system. The solution must be found in some other direction.

There is also a prevailing misconception that capital is accumulated at the expense of the farmer or by grinding down the factory worker, so that the working man can scarcely exist. The rich and powerful do not rise through the want and misery of the poor. Capital goods may gravitate into the hands of a few, but this capital is actually created by those who can be spared from producing the necessities of life and who can devote their time and energy into turning transient goods into capital goods. Society must, however, keep in balance the relative interchange between the various groups. Unbalance will cause readjustments and if this unbalance assumes large proportions, the process of readjustment may cause pillage, riot, and even revolution.

## Chapter X

### THE PRICE LEVEL

Prior to the war, the products of Group 1, the necessities of life, went abroad in great quantities, and we received, in exchange, the products of the other three groups. In some instances, such as the importation of sugar, we also received, in return, products of Group 1. In this interchange, the adjustments between the various groups took place continually and the general machinery of commerce functioned so as to produce as a surplus of this machine the products of Group 3, wealth. Our production of the necessities of life was not only sufficient to support adequately the entire population, but also through the export of the necessities of life, permitted the peoples of Europe to align themselves into Groups 2, 3, and 4. For example, we received in exchange from Germany, toys and dyes; from Holland, bulbs and cheese; from Canada, wood pulp; from China and Japan, silk; from England, woolens; from France, dresses and perfumes; and so on through the commerce of the world. Our organization, therefore, had aligned itself to function normally in this general machine, and industry had so adjusted itself that commerce moved more or less smoothly.

In a new nation, such as ours, while it is in the process of accumulating capital, its exports, measured in price, are usually less than its imports. The effects of price on this structure need not here be discussed. Price, through the medium of profits acts simply in changing the ownership of the products of Group 3, but does not in the general sense increase or decrease production of the various groups.

Through the action of price and profits, ownership of capital is acquired. The ownership of much of the fixed capital accumulated here was vested in Europe prior to the war. In the early stages of the war the armies of Europe immediately were enrolled in Group 4, drawing an enormous number of people from the other groups. In addition, Group 2 drew many people from other groups for the purpose of manufacturing war materials. There was, therefore, a terrific readjustment in the alignment of the machinery of commerce, which reacted upon this country and caused a realignment in the various groups here. In fact, as the demand of Europe increased, and drew more and more of the necessities of life from this country, it naturally created a tremendous expansion in Group 1, which in turn affected the other groups. The United States also finally entered the war, which again caused a further tremendous realignment.

The war ended, and for a time the realignment functioned much the same as it did during the war. The demands for the products of Group 1 still continued at a large rate, until such time as the belligerent countries were able to produce their own products of this group. During all this period profits through the action of price were so large that ownership of capital in this country, vested in the European countries returned here, and furthermore, the ownership of capital in the European countries was also sent over here. It took about three years for the armies of the world to demobilize and reenter the various groups of industry. During that period the necessities of life were still in great demand and were hardly sufficient to supply the population of the world. We had shortages of sugar, of wheat, of all manner of products, and then in 1921 we felt the first tremor of readjustment. Almost overnight we discovered that this great demand was slackening in its proportions. Group 1 was beginning to re-form itself in Europe; the first group that must establish itself in any community. For two or three years we felt, in our slackening demand for the necessities of life, the establishment of this group; and then in Europe Groups 2, 3, and 4 began to function and separate themselves into their respective organizations. These again began to draw on the products of our Group 1, and we received in exchange the manufactured goods of Europe. Europe had in a general way reestablished her groups, not in perfect balance, but at least functioning. A table might more clearly demonstrate what took place:

| Date | Europe | United States |
|---|---|---|
| 1914 | In balance: Groups 1, 2, 3, and 4 | In balance: Groups 1, 2, 3, and 4. |
| War | Unbalance: | Unbalance: |
| | All in Group 4 | Groups 1 and 2 increased. |
| End of war, 1921 | All in Group 1 | Groups 1 and 2 decreased. |
| 1921–1923 | Groups 2, 3, and 4 forming at expense of Group 1. | Groups 1 and 2 increase again. |
| 1925–1929 | Groups 1, 2, 3, and 4 reviving | Groups 1 and 2 used to revive all Europe. |
| 1929 | Slowly balancing: Groups 1, 2, 3, and 4. | Slowly balancing: Groups 1, 2, 3, and 4. |

From this table, it is apparent that there have been six stages which have caused the upheavals through which we are passing. The first stage, prior to the war, when industry throughout the world was in balance and civilization was formed into its respective groups, and properly functioning. The second stage, terrific unbalance caused by the war, when all Europe went into Group 4, and a consequent readjustment took place in this country. The third stage, the end of the war, when all Group 4 in Europe went into Group 1, resulting in a readjustment here, the fourth stage when Europe began to realign itself into the four groups of commerce, again affecting conditions here. The fifth stage, when the four groups in Europe began to function, resulting in a further readjustment, and to-day the sixth and last stage, balancing the various relationships between the groups in this country. Continually, as will be observed, Group 1 contracted or expanded, depending upon the processes occurring in Europe. The consequence has been that during the vast expansion of Group 1, capital assets were created for the purpose of continuing the production of this group.

We have in this discussion considered the economic situation, when the production of the necessities of life were insufficient or just sufficient to permit the functioning of the other groups of society. The war, with its upheavals and the reconstruction period with its convulsions, has upset the machinery of civilization so that unbalance is particularly apparent in the products of Group 1. We are confronted to-day with the condition that there is too much produced in this particular group in its relationship with all other groups. The cause of this, I have endeavored to explain above. If this analysis is correct, and if it is the necessities of life that control the prosperity and finally account for the accumulation of wealth within a country, we must then determine the method or methods whereby these necessities of life can again be reestablished in balance with the other groups of industry.

In the consideration of price, economists have determined its causes and its effects. Price that is established on a gold basis, in general, is determined by the amount of the necessities of life required to produce gold. Gold may be plentiful or scarce, and consequently, it will, therefore, effect price from that score. The actual fluctuations in the price of gold have not been violent enough to effect the general price structure. The fluctuations of price are caused by the variation in the price of the necessities of life. When this price is high, the price of labor must be higher, as otherwise the laborer can not exist. When this price is low, competition will force the price of labor down to conform with it. Therefore, in industry price will have little effect on production or on the accumulation of capital, provided that price is relative through all industry. Again we must examine the effect of price, during the period when the products of group one were in great demand by Europe. It is quite obvious that in this period the demand exceeded the supply, and naturally the price advanced, causing as has been shown a general advance in all prices. During this period the accumulation of capital continued, and the farmer created his silo, the railroad expanded its facilities, the utility its transmission lines. Profits of the various industries were in turn translated into these accumulation of capital. However, these accumulations were translated at prices determined by the existing price for the necessities of life. Furthermore the interest rate, or we may call it the charge for the use of this accumulated wealth, was also based on the existing price for the necessities of life. In other words if a railroad electrified its system when wheat was selling at $1.50 per bushel, it paid for this improvement on the basis of $1.50 wheat. If this cost $15,000,000, it represented 10,000,000 bushels of wheat. If the interest rate was 5 per cent, the charge would be $750,000; represented again by 500,000 bushels of wheat. Wheat, due to conditions outlined above falls to 50 cents a bushel. What then happens to this particular investment? It now can be replaced for one-third its cost and, furthermore, the interest charge being $750,000 requires now 1,500,000 bushels of wheat instead of 500,000 bushels when it was first completed. If we expend this further and assume that it takes 5 bushels of wheat to produce one unit of man's energy, at the time of the electrification, it would have released in interest charge alone, 100,000 units of man's energy per annum. At a price of 50 cents a bushel to-day for wheat it must release 300,000 units of man's energy per annum to justify its existence.

What is true in this instance is true of all capital accumulated during the high prices of the necessities of life, and of course, we see to-day the result. Security prices fall, interest and dividends disappear. If we broaden our viewpoint and include the whole world in our horizon, we find the identical conditions existing. Our productive machinery, which was originally designed to release a certain number of units of man's energy when prices were high, to-day is releasing the same number, but, due to the low prices of the necessities of life it should to-day release three times that amount to warrant its existence. Consequently, factories are shut down and men are unemployed.

We have come a long way to reach this conclusion. We have traced the effects of the disturbances created by the war. We have found that panaceas and complicated formulae have little constructive result. If we are to compete in the world markets, the price of the necessities of life will be givenned by the world market. The price of the necessities of life determines our price level. We can not hope that the world will pay us higher prices when lower prices can be obtained elsewhere. If we wish to raise prices here alone, we must relinquish world competition and if we wish to relinquish world competition we must restrict the production of the necessities of life to conform with our own requirements. We have geared our facilities to supply Europe as a customer and, in the process, we have thrown out of balance our domestic economic organization. We have lost Europe as a customer and must, therefore, either realign our machinery for our own purposes, or else we must realign it so that we can offer our products on a competitive basis with Europe. The value of the fixed and capital assets acquired during high prices will still be here, but their price will be reappraised. Every bankruptcy, every insolvency, every repudiation, is a process of reappraisal and, though the anguish is severe, we must pass through it. Price level has little effect on the prosperity or the accumulation of wealth of a country. The readjustment of the price level causes the havoc and this havoc is accentuated due to our carrying over capital assets created at a high price level and endeavoring to function with them at a lower price level.

## Chapter XI

### THE SOLUTION

The creating of a capital asset produces profit to the Nation. In fact the entire asset results in profit. This is true whether the asset is a vast bridge, an office building, a modest home, or such a simple thing as the inkwell before me. These are the tangible results of the surpluses of society. These measure the wealth of a country. These determine whether or not a country is rich or poor.

The proper distribution of this potential wealth is to-day the great problem that confronts society. Society, with its machines, can produce plenty for each man, woman, and child. But society has no adequate mechanism whereby this production can be properly distributed to its peoples.

In the past, before the machine age was so developed that it multiplied man's efforts manifold, the problem of civilization was the production of surpluses, and these were so slowly and painfully produced that they were comparatively easily absorbed by the financial structure as it then existed. To-day the surpluses are produced in vast abundance and the financial structure has not yet kept pace with this tremendous expansion. We are still confusing the golden measuring stick with the object measured. The wealth of an individual or a nation is represented by the ownership of certain tangibles. Among these tangibles is a call or demand on gold. A large corporation owns its buildings and machines, and has, in proportion, a relatively small cash balance—i. e., a demand on gold. Even the artisan has his outfit of hand tools and also has a relative cash balance. Now, when in adverse times this cash balance is consumed—due to lack of trade and industry—the real wealth still exists but can not be turned into gold. Loans, of necessity, are called and paid off, deposits shrink, and the vast storehouse of credit dries up, leaving only a small amount of credit resting on a solid base of gold. It is as if a large watershed had been controlled by man, and the waters from the watershed impounded in a great reservoir, for the purpose of operating a vast generating system. As long as the brooks, the streams, and the rivers flowed into the reservoir, the turbines generated the power that spread to the countryside. But, due to drought, these tributaries dried up, and the flow became less and less, until there was barely sufficient water flowing into this reservoir to turn over the generators. This small amount of flow can be compared to the small credit structure existing to-day. Our cry has been liquidity; and, in our anxiety to have our affairs in such condition so that at a moment's notice we can turn our wealth into gold, we have dried up these tributary streams of credit.

We erected, in our prosperity, a tremendous reservoir and, from this reservoir, we generated an enormous output of energy. The waterways of commerce feeding this reservoir were flowing full from bank to bank, when suddenly the drought of fear descended upon us, drying these waterways, and crippling the generators of prosperity. We attempt to-day to operate this vast system with rivers of gold only, when we know full well that there is not possibly enough gold in the entire world to operate this structure.

Economic problems, as they exist today, are confused and involved. There must be a solution. There must be a way out of this labyrinth. Science, industry, invention, and all the manifold activities of man have advanced in the past 100 years at an incredible rate. The telephone, the automobile, the aeroplane, the radio and the many hundreds of other inventions have annihilated space and distance. All about us man's ingenuity is apparent. But with all this plenty we have not found the method of distributing it properly among ourselves. Why? Because the financial machinery that controls it is antiquated, inadequate and, furthermore, terribly dangerous. We issue our currency, we erect our credit edifice on a store of gold, and we are so zealous in our endeavors, and so painstakingly honest in our undertakings, that we promise to redeem this currency and credit in gold on a moment's notice, knowing, in our hearts and consciences, that all the gold in the world can not meet one thousandth part of the demands that might be made for it. We have learned through experience that in normal times, when man is fearless. the maximum demands for gold that may be made are relatively small. But we live in fear and trembling when disaster threatens, then mob psychology has full sway, and reason is forsaken. We do not know how far the demand for gold may go, and each one of us hurries and scurries in the mad scramble for gold to be a little quicker, and perhaps more nimble than his neighbor, so that he, at least may be safe. The harm he does is secondary as long as he feels secure. The vicious machine turns him into a selfish, thoughless brute, and the misfortune of one man is augmented by the thoughtlessness, and selffishness of his neighbor. Securities topple, real values disappear, for, man in his wild anxiety, will sell at any price so long as he can get gold. This is true of the individual, the bank, and even the Nation.

When the hysteria is over, we awaken to a sorry realization of the terrific devastation wrought by this juggernaut. Patiently, and laboriously, we start again to rear our edifice on gold, destined for another calamitous fall. It is the financial house builded on sand, the inverted pyramid of credit balanced on a small pot of gold that always must fall, and, in its crash, tear down the industry of man with it.

Why will not our leaders of industry see, why will not our able statesmen perceive, and, why can not our eminent thinkers understand that the shame of the world and the misery of mankind is caused by a financial mechanism terribly inefficient, woefully inadequate and horribly cruel? Where are our leaders? Where is our courage? We must, and shall, change this mechanism, for it is the curse and scourge of mankind.

Doctor Robert Eisler in his analysis of the causes and effects of the unbalance in production and consumption, has presented a picture of the economic situation to-day. In his book entitled "The Money Maze," he stated: "Nothing but the borrowing and spending power of the community can start the wheels of industry whirling again after such prolonged lethargy and continual fall of prices." Furthermore, he stated: "All expenditure commensurate with the magnitude of the task must unavoidably create in the actual state of our monetary system, a credit and even a currency inflation," and "Such an inflation would mean considerable rise of the general price-level and therefore of the cost of living. After a time this, in turn, would produce the inevitable falling away of the consumers' purchasing power and precipitate a new crisis." He sums up the situation in one question: "Is it possible to organize an expansible currency with a constant unalterable stable purchase power of the monetary unit?"

In order to put to work again the vast army of unemployed in the world, it is necessary to create currency and credit inflation, but this very procedure will so affect the price level that this will again throw out of employment a great number of men, and result in a more serious situation than to-day exists. Doctor Eisler has viewed this problem from the world standpoint, and his solution is, without doubt, an idealistic one. Eventually, when animosity is replaced by friendship, when nationalism is replaced by internationalism, and when nations—such as the United States and France—discard their policy of "splendid isolation," an international accord can be attained. Meantime, here in the United States, as long as we are unwilling to assist in solving the difficulties of the world while we are solving our own, we must continue in this "splendid isolation" and endeavor, through our own efforts and resourcefulness, to work out a solution.

I have shown that our society is divided into four fundamental groups, these groups depending for their existence on the production of the necessities of life by one particular group. I have also shown that, as this production increases, more and more of the people are drawn from the first group, and that finally the combined production of all the groups over and above what is consumed, results in fixed capital. If, therefore, the productivity of Group 3 (those who produce capital assets) were increased, it would immediately recruit men from other groups and increase the purchasing power of all groups, rapidly exhausting the apparent surpluses which to-day exist. This would increase the general price level and "Everywhere the prices of bread, meat, potatoes, butter, shoes, clothes, and underwear, etc., would rise at once and the outcry against the high cost of living would again be in full swing," unless during this process, "It is possible to organize an expansible currency with a constant unalterable stable purchase power of the monetary unit."

In an ideal socialistic system we would have long ago mobilized our army of peace and recruited its ranks from the unemployed, turning this army into the production of national improvements, roads, reforestation, abolition of slums, flood control, dams, power sites, etc. The same energy expended by us in the late war, if devoted to peace-time endeavors, would create for each of us wealtn, prosperity, and happiness undreamed of. Why can not this be done to-day? Because we find that just as in the war, the Government must pay for these improvements, and, in order to obtain the funds for these, it must borrow the money from its people. Let us see what happens when the Government borrows money. If a bank buys $1,000,000 of Government bonds, the effect is the same as if a regular loan were made. Somewhere in the banking system deposits have increased by $1,000,000. Now, if this money is spent by the Government in building, for example, a bridge, there has been created through man's energy a new capital asset. New wealth has been added to the store of this country's goods, and it will be distributed as profit through an infinite number of channels to a countless number of people. The entire amount expended is profit. It could not be otherwise, for the bridge is there. It exists where something did not exist before.

If an individual had bought this $1,000,000 bond issue, deposits would not have increased or decreased, the credit of the individual simply being passed to the Government. The Government expending this sum for the bridge would pass this deposit to others and the deposits of others would increase, whereas, naturally the Government's would decrease. The increase in wealth or profits of a country are represented by its increase of capital goods, and the more capital goods it produces the more profits will accrue. In order, therefore, for a community to make profit, it must produce capital goods.

The same effect occurs when a private enterprise, such as a railroad, manufacturing business, or utility borrows money through the sale of securities, when the funds so obtained are used for productive purposes.

In a previous chapter it was shown that the electrification of a railroad, or similar enterprise, in order to justify the expenditure for the improvement, must release a certain number of units of man's energy for other pursuits. The electrification may result in the railroad consuming less coal, and consequently, it may affect the coal miner and actually throw him out of a job, requiring him to go into some other endeavor. So, it is true of capital expenditures which release man's energy. It affects the production of raw materials and requires a realignment of society. Most of these processes are gradual, and, consequently, in most instances, the resorting is not attended with a great deal of suffering. But, when, as in the present time, due to the upheaval caused by the war, the realignment is sudden, tremendous hardship—and even disaster—occurs. It is then, as has been said, the part of society to assist in this realigning—not by aiding the miner, or the farmer, but by making it possible to consume the excess productions of these groups which excess has been effected by the construction of capital goods which, in themselves. replace and release man's energy

We must. at once, draft more men into the group that produces nonproductive capital, such things as the elimination of slums, construction of highways, bridges, flood control, reforestation, irrigation systems, dams, power sites, buildings, furniture, automobiles, ice machines, radios, dwellings, etc. The Federal Government, the various States, and municipalities can, through the sale of their securities, finance such enterprises as come within the province of public works. Private capital must finance the consumer of other things. What if a great part of this were wasted? Is there any greater wastage than that caused by war?

If, to-morrow, the United States were engaged in war, the funds would be found to prosecute that war. The channels of finance would at once clear for the destructive engines of war, whereas to-day they are closed to the constructive enterprises of peace. We must mobilize our army of peace. Consumption by the armies during the war quickly speeded up private enterprise, and if, as has been shown, capital expenditures by Government or individual, ultimately results in profits, a dollar spent in such expenditure multiplies itself many times before the effect of this expenditure ceases.

Let us examine what takes place when a million dollar bridge is built. The contractor receives $1,000,000. He is able to make a profit of, we will say, 5 per cent—$50,000. This leaves $950,000 which he pays for labor, material, etc. Let us say $500,000 is spent for direct labor, and that this labor's profit over and above the necessities of life is also 5 per cent, i. e.—$25,000. There is, then, left of this direct labor item $475,000. That is expended with the landlord, the butcher, the baker, etc. Again, let us say, their profit is 5 per cent, or $23,750. This leaves $451,250, and it, in turn, is disposed of by the landlord, the butcher and the baker. So on through the myriads of channels of commerce. If the average rate of profit per transaction was 5 per cent, before the total $500,000 was entirely extinguished, it would have created exchange of very nearly twenty times that amount. The same is true of the $500,000 spent for materials. This, in turn, is disbursed through the subcontractors, in the same manner, and, before its effect is entirely extinguished, it will have increased exchanges by twenty times that amount. It is, therefore, apparent that expenditures for capital improvements will multiply themselves by the reciprocal of the average amount of profit per exchange. Immediately after the panic of 1929, this was attempted and the policy of the administration encouraged all to keep spending, railroads, industrials, individuals, etc. Due to our mistaken policy of war debts payments and tariffs, we suddenly lost our foreign customers, and all this spending had slight effect as it could not fill the void left in our foreign trade. To-day, the situation is different. Europe and this country have adjusted themselves to meet the tariffs, and the war debts have been—to all intents and purposes—canceled as far as their effect is concerned. To-day, we must spend to produce capital goods. We must use every endeavor to encourage the purchase of capital goods as that produces wealth, profit. If government starts, private capital will quickly follow.

Inflation will occur only when the purchasing power becomes available faster than the productive facilities of the country can keep up with it.

Mr. R. C. Hawlsey is quoted by Doctor Eisler as saying that: "The large loans involved, if they are *not to involve inflation*, must draw on existing capital resources." We, however, here must have expansion, and we confuse in our reasoning the two terms, inflation and expansion. Government borrowing, for the purpose of public works, the construction of capital goods, revives and speeds up the productive facilities of the country, and, if the purchasing power of Government, or—in other words—credit expansion, does not exceed these productive facilities, we can not have inflation. The natural tendency for this influence is to raise the price level, and in our foreign relationship to face the danger of losing our gold reserves.

The first problem, and, for the time, the major problem, that of returning to work those unemployed, can be solved by government through its credit expansion, proceeding on expenditures which will not increase productive facilities. All have viewed with great trepidation this expansion of government credit, fearing the threat of inflation and its consequent disastrous results. We, therefore, must contrive by some limiting mechanism to prevent the purchasing power of the country expanding at a faster rate than the productive facilities of the country. Let us then endeavor to erect an ideal mechanism, which will suit the requirements that Doctor Eisler has so ably expressed: "An expansible currency with a constant, unalterable, stable purchasing power of the monetary unit," and let us see what steps must be taken in order to adopt that mechanism to the system under which we now operate.

Under the existing system, with bank deposits payable in gold, the purchase of securities by a bank results in the increase of deposits. The securities purchased may be payable at maturity in gold, but, due to the fact that the bank has purchased these—and, consequently, established credits, or deposits, on its books—the process has turned a future demand for gold into an immediate demand for gold. If an individual had purchased these bonds, the procedure would simple be a transfer of the individual's bank credit to the borrower.

However, if this individual hypothecated his bonds with the bank and disbursed the moneys received, the result would be the same as if the bank itself had loaned this money or credit. As soon as a demand credit is established by the bank by a loan on a long-term obligation, it results at once in turning a future demand for gold into an immediate demand for gold. As there never was any gold in these entire transactions, how fundamentally unsound is such a situation! If we quietly, soberly sat down and examined such a transaction, would we not most severely criticize any manager who permitted himself to get into such a muddle, promising to deliver something which he knew he could not possibly get?

It might be said that the bank could take these securities and sell them to some, one who has gold, but, as the stores of gold are not inexhaustible, eventually the supply of gold will run out, depending simply upon the size of the credits advanced by the banks and the desire of the depositors for gold.

We have erected a mechanism which, at times, rushes impetuously on to its day of reckoning. A mechanism which, in itself, is very hazardous, and upon which we blindly pin the hopes, happiness, wealth and very existence of the people. That civilized man has allowed this to function so long, and permitted himself to become helplessly enmeshed in its cogs, seems almost unbelievable.

The ideal system must incorporate three necessary factors. There must, first, be an expansible currency and credit structure that will increase with the advance in civilization, the growth of industry and the accumulation of wealth; second, this structure must maintain a price level that is not subject to wide fluctuations and must be based on a monetary unit with a constant, unalterable, stable purchasing power; and, third, there must be a proper protection for those who now have gold or claims on gold.

The wealth of a nation consists of the products produced by man's energy, and the capital structure must, in some manner, rest upon the production of man. It should not be subject to the variations in the plenty or scarcity of gold. It should not be subject to the buoyancy or despondency of the mob. It should be subject to the initiative, resourcefulness, and energy of man. It should increase as the profits, or wealth, of the nation increases, and it should decrease as wealth is destroyed, either by war, famine, pestilence, or the wear and tear of time and the elements. The introduction of such a mechanism may seem impossible, and, even after its introduction its operation may seem beyond the control of man, unless a simple mechanism can be established that will to-day function with the financial structure that exists. I firmly believe that there can be, to-day, established such a mechanism: A structure that will continually and automatically absorb the surpluses of society as they are produced—will permit credit and capital to expand. Furthermore, a structure that will increase the medium of exchange as industry and commerce increase, will provide an expansible credit and currency. Lastly, a structure that will control the expansion, or contraction, of the credit and currency, will exercise a close control on the fluctuations of the price level.

The profits of society are the surpluses of society, and these are to-day in most instances disbursed as dividends. These dividends, under the present method, therefore at once become demands on gold. These profits, in turn, are, through the channels of finance, gathered together and used to produce a capital asset. These capital assets are represented by stocks, bonds, mortgages, deeds, and other financial forms of ownership or debt. A mechanism that will turn these profits directly into a capital asset, without the intermediate demand for gold, will eliminate that haunting specter, and will absorb the surpluses of society as they are produced. Unfortunately, profits are not entirely created from the surpluses of society. A certain proportion are obtained at the expense of a competitor, or the misfortune of an individual, or by the oppression of management. There is no definite method to determine the proper ratio between profits created by surpluses and profits created by other forms.

We can not, therefore, require that all dividends be turned into capital assets. A certain percentage only can be so absorbed. The balance must be returned into the streams of industry. The relative amount returned into the streams of industry will increase or decrease the medium of exchange, and will, consequently, "provide an expansible credit and currency." In fact, a proper control of the ratio between the amount devoted to capital absorption, and the amount returned to commerce, will have a powerful effect upon the price level. As the price level advances, more and more of the profits should be turned into capital assets, and, conversely, as the price level declines, more and more of the profits should be returned to commerce. However, as these profits returned-to-commerce originated in goods, they should be returned as demands on goods, and not as to-day, in the form of demands on gold. In this manner we shall create an expansible currency that will expand as profits increase and grow with the advance of civilization.

A corporation can be formed in the United States which will have two functions. (1) That of purchasing, or absorbing, instruments representing capital assets; and, (2) that of issuing certificates redeemable in goods. At its inception this will be formed with about 100 of the largest corporations (banks, insurance companies, industrials, etc.) as members. The members will deposit with this corporation a very small amount of cash, as the expenses of operating this corporation will be nominal. It will be agreed among the members, that all dividends declared will be payable in cash or bank credits into the treasury of the corporation. The corporation will disburse these dividends to the stockholders of the declaring company either in the form of certificates redeemable in goods, service, etc., of all the members, or in participation certificates in all the assets of the new corporation. The governing board will from time to time determine the ratio to be maintained between its two functions. For example: If a company declared a dividend, this would be paid into the treasury of the new corporation. If, at the time, the ratio established was—we shall assume—80 per cent, then 20 per cent would at once be used to purchase capital assets, and 80 per cent would be disbursed in demand for goods to the stockholders of the declaring company. At the same time, the 20 per cent would be disbursed to the same stockholders in the form of participation certificates in the new corporation.

All dividends payable in goods will be guaranteed by the corporation and each of its members. Since the actual cash for these is in the treasury of the corporation, the guarantee will be a matter of form only. Furthermore, membership will not be restricted. Anyone can become a member provided he will agree to disburse his profits, or dividends, into the treasury of the corporation. At the start of such an enterprise it, no doubt, will be advisable to have the certificates of the corporation redeamable at some premium over gold, an article selling at, say, one dollar in gold, purchasable for 98 cents worth of certificates. The object in setting such a premium is to create a desire so that at all times there will be an inducement to exchange these certificates for goods of the members.

Is such a mechanism sound? Will it accomplish the results so ardently desired by mankind? Will it tend to keep in balance the production of the four groups of society? Will it absorb the surpluses of each group, and will it continually expand as more capital, or wealth, is produced by the Nation?

The mechanism is sound because it concentrates the profits, or surpluses, of all groups into one system. And these surpluses are then turned into capital assets. As soon as they are devoted to these capital assets, they are at once disbursed to the people in the form of participation certificates in these assets. If these profits are not all created by surpluses, but are accumulated at the expense of any particular group, they will be automatically returned to the people in the form of certificates for demands on goods. It will tend to keep in balance the production of the four groups of society, because it will recruit more and more men into the group that produces capital assets, as conditions warrant.

As the price level advances, the corporation will divert more and more of the dividends received, into the purchase of capital assets, which represent the products of the group that produces capital goods.

It will continually expand as more capital, or wealth, is produced, because it is continually disbursing the capital accumulated in the form of participation certificates. These certificates are not demands on gold, and, consequently, our capital structure will expand as the wealth of the Nation increases, and will not be a structure resting on a relatively small base of gold. It must be borne in mind that it is the production of capital goods that determines whether or not a nation is advancing or declining.

A nation, or economic system, that can spare a great percentage of its people from the production of the necessities of life, and can turn these people into the production of capital goods, will be rich, will be prosperous, and will continually advance its civilization. The mechanism advocated can be operated to keep the proper balance between the people engaged in the production of the necessities of life and between the people devoted to the production of capital goods.

The transition is simple. The operation will not conflict with the present medium. Gold will land in its proper niche, and it will be the measuring stick of relative values, between the goods offered by the members. The scope of the plan is tremendous. It possibilities unlimited. And, if we allow our imagination full sway, its ultimate results will be a godsend to humanity. We shall eliminate the spectre of demand for gold, for the demand will be for goods; and man will be able to meet his obligations by his industry and enterprise, that is by his productivity. Our capital structure will expand as industry and profits expand. Each profit distribution will be either a share in the country's wealth, or at once call for more production. And, when all industry eventually becomes a member of this corporation, a capital structure will exist that has no limit to its power to expand, save only the productivity of man and his machines.

In reality, instead of, as to-day, profits being exchanged into cash and then declared as dividends, profits will be exchanged into demands for merchandise and then declared as dividends. The same safeguards, the same mechanism, in fact the identical financial structure will operate as heretofore.

The mechanism established for exchanging goods certificates of this corporation for currency, can be extremely simple. Exchanges can be formed which will buy these certificates for cash, and as these credits originate in dividends which are represented by cash deposited in the treasury of the corporation, and are guaranteed by the members of the corporation, they are practically cash. Furthermore, since they are issued at a premium over gold or currency, they will be in demand for the payment of merchandise of member organizations.

They will not be subject to inflation, because they originate as profits. If the productive facilities of the member organizations increase at a faster rate than their profits are disbursed, we can not have inflation. In fact, since they are profits, the productive facilities originated these profits, and the capital expansion based on these profits will keep pace with the increase in profits or wealth of the country.

It may, perhaps, be argued that the distribution of profits play a small part in the total commerce of the country. That is true. It is, however, the profits that are being continually turned into the wealth of the country. Stimulate profits and we increase wealth. Increase profits and we have a country that is advancing its civilization, increasing its prosperity and accumulating wealth. Profits are, in reality, the surpluses, and if we can turn these surpluses into the products of man's energy, the wealth of each individual will only be limited by the productive capacity of the nation.

Later, if it ever comes about, that all corporations are members of such a system, then these certificates will be universally exchangeable for goods. The certificates, from time to time, will buy varying quantities of gold, depending upon the scarcity or plenty of gold, and, consequently, inflation cannot occur as the holder of $1,000 worth of certificates will very reluctantly sell these for gold, at a large discount, when gold, or gold demand currency, can only procure the same or less goods of the country. Gold demand currency will simply be used for pay rolls, pocket money and the settlement of international balances.

An organization of such magnitude must necessarily be subject to the control of government. In fact, it should be originated by the Government. It might well become in character an adjunct of the Federal reserve system itself, controlled by a similar mechanism as today exists.

In the discussion of this plan, the arguments are presented: First, that no man will willingly receive as a return on his savings or investments, a medium of exchange that is not exchangeable universally for whatsoever he may desire, and he is therefore limited to the purchase of goods supplied by a selected few; second, that no man will willingly permit another group of individuals to determine for him in what kind of securities or enterprises, he shall invest his savings.

The pertinent fact that the dividends of each company are paid into the treasury of the corporation in cash or bank credit, at once makes these goods-certificates convertible into cash. In fact in order to strengthen the fact that they are convertible, they can read that they are redeemable in cash upon presentation to the corporation; or are redeemable in merchandise, goods or services of the members at some premium over cash. Most certainly, as they are redeemable in cash, they simply replace the customary dividend checks and can be handled as such. There is very little fundamental change under this method when compared with that which to-day exists.

We find to-day, that people are anxious to have others invest their savings for them. Otherwise we would not have the savings banks, the insurance companies, the mortgage companies, the investment trusts, etc. Even, at the present time, many corporations are declaring their dividends by two methods: a certain percentage in cash, and the remaining percentage in stock of the corporation. The stock dividend declared by the company is only a participation in one company, whereas under the method advocated, reinvesting a part of the dividend in a diversified group of industries, a much broader participation is obtained. In fact the stock dividend to-day very often increases the desirability of a corporation's securities.

Furthermore, the plan as here outlined may be still further amplified in some such manner as Doctor Eisler has presented in his article. Goods-certificates will be issued as has been suggested at a premium over cash. If this premium is adjusted weekly, by using the cost of living index as a multiplier, "the two functions of money—to serve as a medium of exchange (legal tender) and as a means of accumulating capital (purchasing power) or contractual income for future use—will henceforward be separated still more completely than now."

All bank deposits will be represented by goods-certificates and current money "will be exclusively used for small transactions between persons not sufficiently known to one another or not in possession of a bank account, especially for the payment of wages, transport fares and occasional retail purchases, while all other payments will be effected by means of bank-money, that is checks or traveler's checks or transfers of money banco" (that is good certificates).

The operation of such a system has been clearly presented by Doctor Eisler, and it is not necessary to present further discussions of its feasibility. The objection raised, "that the use of a money of account alongside current money is not a new invention, and that all previous attempts to introduce such a double standard have been failures, as is proved by the fact that it has always disappeared again after a short time," is overcome by the argument, that in the past, "moneys of account were and are, however, entirely dependent on the variable purchase power of gold and quite independent of the commodity price level of the country," whereas under this method money of account bears a definite relationship with any variation of the commodity price level.

If the reader will refer to Doctor Eisler's able presentation of this mechanism, any questions that might arise in his mind, will, I am sure, be satisfactorily answered.

In conclusion, it is only necessary to consider the part gold will play in the picture. It will be necessary to protect to the same degree as others, those who have "monetary claims in the shape of coined or uncoined gold."

"The depreciation of gold in terms of commodities through a rise in the general price level which is caused by any large scale addition to the world's fiduciary circulation is obviously due to the artificial legal fixation of a maximum gold price in terms of pounds sterling, dollars, French francs, and other freely convertible notes. Because the Bank of England was obliged by statute always to deliver standard ingots of gold at the price of £3 17s. 10½d. per ounce of fine gold, because the American Treasury is bound to sell for $1 gold certificate 23.22 grains of fine gold, etc., the purchase power of gold must be diminished as soon as the purchase power of the pound, dollar, or franc note is diminished through an additional issue of bank notes or an expansion of gold credits."

It is only necessary, then, to abolish the legal maximum price for gold, in order to protect properly those who have gold claims to-day. The Government bond or bank note issued as the basis for currency, as well as all other obligations of the United States, will promise to exchange these obligations against gold coin of 23.22 grains standard fineness at the gold market price of the day. The Treasury of the United States will buy gold at any time and in any quantity at the legal price of the ——— day, ——— month, ——— year (that is, the date on which such a statute went into effect), at $1 for 23.22 grains of gold.

Under the method advocated here, the price level stabilized within narrow limits, the scarcity or abundance of gold would have no effect on the domestic price level. A Government obligation "would henceforth buy variable weights of gold." It is not a distant step, then, for other governments to follow our procedure here and to stabilize their respective price levels in a similar manner.

The transition from the existing conditions to those outlined above naturally will be attended with some difficulty. Those who have claims on gold, realizing that gold will increase in value, will endeavor to procure all gold possible and convert their claims into the metal itself. However, the difficulties are not insurmountable, for if such a plan were adopted, the Government, itself, could easily become a big buyer of gold, accumulating this metal for its own account.

It would appear, therefore, that in order to rise from this present depression and in order to prevent a recurrence of a similar one, four major steps must be taken.

First, finding work for the vast army of unemployed; second, creating an expanding credit structure based on man's energy; third, stabilizing the price level; and fourth, adopting a plan whereby the fluctuations in the relative scarcity or plenty of gold will not affect the price level.

The first step can be taken by the Government borrowing and at once spending.

The second step can be taken by the formation of a corporation such as has been described.

The third step can be taken by varying the ratio of the amounts disbursed as dividends, and the amounts used to absorb or purchase capital assets.

The fourth step is the last step, and that can be taken by treating gold as any other commodity, its uses confined to the arts and international exchange.

A thorough examination of these plans will show that all are protected, the landlord, those living on income, the farmer, the producer, and the workingman. Capital will be safeguarded and the investments of the people will not be subject to the tremendous gyrations which now take place. The main desires of the

American citizen are: First, work, and second, security. Give the people work so that they can produce and then out of the savings of their industry give them security of those savings. Under the present system a rising or falling price level jeopardizes the security of all; and, furthermore, unbalance in the respective groups of civilization cause insecurity in the whole people. Control the price level and unbalanced production, and security will follow. Eliminate once and for all the variations in the accepted international medium of exchange, and the price levels throughout the world will be stabilized. Permit, under this method, other countries to participate and world-wide commerce will again open up, returning thousands to work, with the attending results of prosperity, contentment and security. It is not a distant dream to visualize, even without communism, socialism, or fascism, an enlightened civilization producing all that can be wished for, and replacing, in each man's heart and mind, the present great desire for gold, by a still greater desire, a desire for fertile fields, thriving cities, broad highways, pleasant dwellings, ample food and all the further amenities of life, with a sure knowledge tnat these things will continue for him in his old age and that his dependents and descendants will be secure in their enjoyment of these products of man's energy, at last devoted to the "pursuit of happiness," and peace.

A letter received from Mr. Robert H. Sexton is here printed in full as follows:

INTERNATIONAL ASSEMBLY OF TRADE, ART, TRAVEL,
*New York City, February 28, 1933.*

Hon. REED SMOOT,
*Chairman Senate Finance Committee, Washington, D. C.*

MY DEAR SENATOR SMOOT: In response to the invitation of the Senate Finance Committee to testify in connection with its economic investigation, I find that it will not be convenient for me to come to Washington after the recess of the committee and in the hope that it will save the time of the committee, I am submitting herewith my views and suggestions concerning the subjects under consideration.

A horizontal slash of 10 per cent in our duties on goods from countries similarly favoring us as proposed by Senator Cordell Hull, would be one of the ways to benefit quickly under a reciprocal tariff policy.

Let all nations jointly start in a spirit of "give and take" to remove the top layers of their tariff walls and it will not be long before goods of all kinds are again brought within buying reach of the masses everywhere.

The World Economic Conference is ideally suited for consideration of such a proposal if presented as an initial step in liberation of trade relations by the delegates from the United States.

Such a flat cut, once generally accepted at the conference, could be put into effect quickly to meet the emergency of to-day and aid in circulation of trade which is so necessary if jobs are to be restored on a large scale.

This step can readily be taken on the assumption that tariffs in all countries are too high and that a general reduction is warranted for the good of all.

To make the horizontal cut truly effective in stimulating a flow of commerce, it could be accompanied by an understanding for removal of quotas, embargoes, import, export, exchange, and other restrictions of an artificial character.

It would also be understood that any country now having most-favored-nation treaties and not ready or able to participate in this proposed horizontal cut, consent to forego its right to equal treatment as regards the particular concession of 10 per cent established in this manner.

It is further believed the proposal could be presented along this line without requiring termination of any existing treaties of the United States.

The directors of the World Trade League of which Mr. George F. Bauer is general chairman, and of which I am also a director, felt that such a horizontal cut could be made to serve as a preliminary step to a series of reciprocal tariff treaties progressively reducing the barriers to international trade and definitely helping to solve the world's debt and monetary problems.

It is in my opinion, of the utmost importance that immediate steps be taken to negotiate agreements to promote trade with other countries based on mutual tariff concessions, with a view of encouraging a maximum flow of 2-way traffic. I am also convinced that the United States delegates to the World Economic Conference should not be restricted or limited as to the discussions in which they may be called upon to take part for the relief of the menace and repression to which international trade has been subjected.

All previous prejudices should be set aside and every economic truth consistently pursued to its logical conclusion.

A revival of international trade in larger unit volume is the paramount world issue if unemployment and its attendant distressing economic and social consequences are to be minimized in every country including very importantly our own.

The stabilization of exchanges, the methods of effecting payments of international obligations, and the reestablishment of the gold standard internationally on a workable basis all as they are affected by existing impediments to international trade and for the bearing they have in themselves upon a freer interchange of goods and services, are the fundamental issues upon the solution of which world economical recovery is dependent.

Yours very truly,

ROBERT H. SEXTON.

Letter and brief submitted by Mr. Edward F. Harvey are here printed in full as follows:

RETAIL DISCOUNT ORGANIZATION,
*Gwynedd Valley, Pa., February 25, 1933.*

Hon. REED SMOOT,
*Chairman Committee on Finance, United States Senate,*
*Washington, D. C.*

MY DEAR SENATOR SMOOT: Confirming the receipt of your letter of the 8th instant and my reply of acceptance thereto, I now have the honor to inclose a brief digest of the subject matter I desire to lay before your committee.

May I add that the rapidly moving monetary situation seems undoubtedly to call for some very immediate and definite action to stall for time. In view of the fact that the development of a permanent policy must take time, as the problem is a fundamental one and requires far-reaching action, it seems clear from the actual course of events that temporary measures are now immediately necessary. These are made more urgent because of the lack of coordination and cooperative effort among the banks.

If the national bankers could be brought to examine the statistics of all loans and debts in their relation to the gross means of repayment, it would become plain to them that the constantly accruing debt charges and maturities far exceed any marginal of national income available to meet them

So that pending the general readjustment and revival of national activities that produce income, a general standstill agreement on certain types of debts and maturities would provide a breathing spell in which to develop and inaugurate the necessarily far-reaching policies which the situation calls for.

In 1931, I made an effort to get some local coordination of banking policy through the Philadelphia clearing house, without success because I was informed that no agreement could be reached. I attribute this to the fact that bankers do not view their profession from a fundamental standpoint.

The situation is now one of national concern, and in view of the financial forces working against recovery it can not be doubted that unless the flow of forced liquidation is held up, much worse things are in store for us.

If the national-bank leaders had realized in 1931 the avalanche that was impending and had then analyzed and coordinated their debt-credit policy, it is safe to say that the national Government would have been saved a great deal of serious commitment.

With the backing of the Reconstruction Finance Corporation, there is till time to meet the immediate situation in a constructive way, but it entails coordinated policy in regard to liquidation of debts, the first step of which should be a standstill agreement in regard to certain types of debts. Without this the internal dry rot must continue, and the national money destroyed.

Such a standstill agreement does not contemplate an official moratorium; which it would be designed to forestall. Sporadic efforts to bring it about locally are noticeable, but these can not be effective without quick and universal action.

This would save the gold standard from which it appears we are now being inevitable driven.

Faithfully yours,

EDWARD F. HARVEY.

## Brief Outlining Certain Financial Proposals Submitted to the Committee on Finance of the United States Senate

By Edward F. Harvey, Philadelphia, and Herbert Bruce Brougham, White Plains, N. Y.

This brief supports the definite claim that a monetary system which permits a variation, measured by months, in the negotiable or dollar wealth of the country amounting to billions of dollars entirely out of relation to the physical productive wealth of the Nation is an anomally and has created a situation that has become impossible.

A basic distinction is drawn between negotiable or dollar wealth, as now existing in the banking system and representing the medium of finance, and true physical productive wealth.

It is pointed out that while productive wealth has remained relatively stable on a moderately rising scale, negotiable or dollar wealth has fluctuated in the last 15 years upward and downward by hundreds of billions of dollars. It has created on the upswing a rigid debt structure which approaches, if it does not now actually equal, the capitalized productive value of all physical wealth.

In point of fact from 1915 to 1920 money wealth was inflated two and one-half times the value of all physical wealth in the country and was deflated by upwards of fifty per cent or to the extent of over two hundred billions of current dollars in the years following, leaving in its wake an intolerable debt structure which can only be ultimately liquidated by the most intense industrial activity.

It is submitted as self-evident that individual capitalism will not continue to exist under such conditions. Its influence on industrial and social life is destructive.

In the discussion and proposals which follow, the authors keep before them both the political and financial aspects of the existing national dilemna, and suggest means of meeting them.

They are based upon fundamental postulates which are expressed in the Constitution and take into account the following changes, which have accrued to the national life in recent years:

(1) The mechanization of industry and the incidence of mass production require for their success primarily a wide and dependable domestic market.

(2) Our population has learned to expect progress and to benefit individually therefrom. Failure to provide the means to this end is becoming a menace to our valued privileges as an individualistic, capitalistic state.

We recommend to the Finance Committee an exhaustive examination of

1. The principle of consumer credits (sometimes called social credits) as outlined by Maj. C. H. Douglas; their relation to the monetary system of the United States, in accordance with the implication of the Douglas A plus B theorem upon the future relation of finance to industry. (N. B.—For a short exposé of the A plus B theorem see appendix page 928 of this brief).

2. The potentiality inherent in this form of credit to meet the economic problems now existing, and its application in a form which will fit the present banking and competitive systems of business.

3. The opportunity it offers for reestablishing the issuance and flow of the Nation's money, consisting chiefly of circulating deposits, in harmony with the requirements of trade, and without any semblance of inflation. This may be done without interference with the currency, by the creation of a national commercial-credit account in strict relation of productive capacity to consumer demand.

4. The opportunity to couple with this system of reviving the much needed volume and speed of movement of commercial credits through the banking structure as the only continual source of debt liquidation, a definite control of the issuance of long-term investment credits and maintaining them in justifiable ratio to the flow of commercial credits.

5. The regulation of the issuance of new investment credits in harmony with the needs of technological advance, and a mitigating of the great swings of security and commodity prices on the exchange, which arise from the use of bank deposits as the base for loans on collateral, at prices far beyond the productive worth behind them

In short, we recommend a realignment of the money system to meet the constitutional requirement that the "Congress shall have power to coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures" (Art. I, sec. 8), together with the furrther provision that "No State shall coin money, emit bills of credit, make anything but gold and silver coin a tender in payment of debts"(Art. I, sec. 10). By these articles the States were deprived of power to issue or "regulate the value" of money, as interpreted by the Federal Supreme Court, so that perforce all private banking or other agencies were precluded from wielding such power. In this respect it seems evident that the issues of bank money by the private banking system, with their inevitable regulation of the value of all money, transcends its constitutional powers. It is distinctly understood that circulating deposits subject to check and at present within the control of private banks, constitute the major portion of the money used in the Nation's business.

The authors have worked out an adjustment of the various elements involved in the foregoing statement for the purpose of establishing a reasonably stable price structure and perpetuating a sound money and banking structure, suitable to the economic conditions imposed upon the Nation by the progressive power mechanization in which it is now involved.

Our method covers the establishment of a public discount on the sale of goods at retail, granted and financed by the Federal Government, and governed by the Douglas formula based on the indexes of retail volume, price and productive capacity. The result is a flow of money in complete harmony with the flow of goods.

It supplements this with a provision to limit the use of private bank deposits to a base for the issuance of credit to commercial loans; loans on industrial and public-utility investment securities to be limited in the same way that loans to private business concerns are limited, namely, by the earnings-physical assets ratios instead of the market price, which is very rarely a true reflection of intrinsic value on which to base the lending of money by expanding credit upon the reserve deposits of the public. It should be noted that monetary inflation under modern conditions is the result of inflation of security issues based on industrial expansions and consolidations too frequently unwarrnated by industrial needs.

We now summarize the general considerations on which we base the foregoing recommendations.

"Oscillations in the production rate," Dr. Walter Rautenstrauch observes, "as a consequence of the maladjustment of credit as one factor, appear with ever-increasing amplitude; the man-hours per units of production are rapidly decreasing," he continues, "and kilowatt-hours are being substituted for man-hours in many industrials at a very rapid rate," leading to "disorders of ever increasing magnitude and force." While total man-hours in manufacture are decreasing inversely with time, "debt is increasing faster than production and directly as the time," and "debt per capita * * * is increasing as the square of time."

The paradox of a ruinous increase of debt at a rate faster, even, than the enormous recent increase in capital assets, as evidenced by productive capacity, Doctor Rautenstrauch links with the failure of diminishing man-hours to win purchasing power in the form of wages sufficient to take away and consume the product that industry would pour out, if it had the orders, with increasing profusion.

That is, as the trend of employment goes downward the rate of potential production rises, while industry fails to get back its costs from the lessened purchasing power distributed through a relatively shrinking man-hour wage system. As the nation grows in physical wealth, therefore, industry borrows, and the whole body of consumers borrows as much as it can to fill the widening gap between purchasing power and price.

It is now generally admitted—

1. That the prime need is expansion of *ultimate* consumption for the purpose of—

(*a*) Restoring national income from the present level of about forty billions to a level of health and decency, say eighty to ninety billions of dollars (1927–1929 level).

(*b*) Restoring national revenue. A national revenue of four billions requires a tax rate of 10 per cent on the current income of forty billions, and only 5 per cent on the health-and-decency income of eighty billions.

(*c*) Restoring the flow of commercial credits (as distinct from investment credits) for consumption goods throughout the banking structure: and through the resulting profit margin of trade, which is the only source from which to liquidate the inflated debt-credit structure now existing; a process which is merely being postponed by the policy of the R. F. C. and other government agencies.

2. The establishment of a sound and freely circulating but noninflatable national-bank money system which will resist the impact of speculative impluses unduly to reexpand the debt-credit structure.

3. The governing of investment credits so as to avoid overbuilding for productive purposes and the overinflation of the current value of marketable securities.

4. Restoring the whole monetary system to its proper function as a medium of exchange, and curtailing the trading in money values, which does not add to productive wealth, but which, in its essence, is a glorified form of ticket scalping.

The money system now existing puts a premium on overexpansion of and speculation in money values and for buildings and equipment, the creation of which is not now coordinated with the reasonably expanding requirements of the population for consumption of goods.

The history of money shows that we have now reached a point in the credit and debt system requiring its revision. It is pointed out that money was orignially issued through private sources, such as private banks, private companies and individual business. The chaos resulting forced government to step in and take control of the medium of exchange and brought about the establishment of legal-tender national currency; this formed the chief medium of exchange, as distinguished from our modern privately controlled system of circulating deposits subject to check.

The expansion of population and industry has gradually necessitated the replacement of the major use of currency with bank credit in commercial processes; the circulating deposits subject to check being more convenient, rapid, and safe. But the important difficulty behind this needed change, a difficulty that may be removed by a reassertion of the Federal power, is that the major circulation of money and creation of that money (bank money) has now again reverted to private hands, and is being issued without proper relation to the production and circulation of goods.

Clearly, so long as the enormous overbuilt investment banking organization of this country can use the credit facilities of our private-credit system for underwriting and security manipulation, playing upon our ignorant and optimistic public, the monetary scalping process will continue, and the unsound ratio of long-term credits to short-term credits based upon the flow of trade will hold our banking system in a rigid grip.

Hence, in effect, the Nation is again back to a point which parallels that of the first national currency act. It must now take account of the fact that commerce has outgrown the use of currency money, and is again using privately created bank money with the same disastrous results.

National income should be restored by the control of both currency and credit through consumer demand, thus restoring income to a point where the margin of profit will suffice to meet the accruing charges on the great fixed-debt structure which has been erected during the past two decades, and thus lead to its eventual liquidation. This remedial measure must be taken, in addition to any step toward centralizing banking policy after the pattern of Great Britain and Canada, which might result merely in a narrow readjustment of the ratio of commercial to investment credits. In the circumstances this would be insufficient. The more comprehensive measure becomes increasingly essential with the constantly advancing volume of overhead charges and the decreasing volume of consumer purchasing power in the form of wages, salaries, and dividends on which industry relies to get back currently its total costs (as exemplified in the A plus B theorem). Because this stream of purchasing power is constantly shrinking in comparison to the rising volume of lagging overhead charges with the mechanization of industry, the rectifying measure must be applied directly at the point where the accumulated costs of industry are paid, namely, at retail.

It is worthy of note that all proposals to liquidate the debt credit structure heretofore advanced follow the ineffective idea of expanding private credits (and consequently debts) to stimulate consumption and raise prices. This method ignores two undeniable facts. One is that when production is stimulated, inventories must be built up before even the wages and salaries paid for them get into circulation. As these inventories amount in value to double the immediate purchasing power released in their production, an expansion of bank credit and carrying charges result, which are secured by stocks of merchandise, the outlet for which is not assured. This is an important factor in explaining the hesitation the banks now have in loaning money to their industrial customers. C. H. Douglas has reduced it to a concrete expression in his A plus B theorem.

The other fact is that rising prices curtail the potential purchasing power of the masses. Volume production should decresae costs and prices, rather than expand them, while still leaving the necessary profit margin.

In proceeding with the more comprehensive step, viz, by issuing credits through Government edict to consumers through a public discount to all buyer of goods at retail, our proposal adapts this principle to our present banking and individualistic, competitive system of business.

In fact, we make it the base of the money system of the country, so that the abuses previously enumerated are abolished, and by using circulating deposits in the manner outlined above, solely in accordance with the indexes of trade, we achieve a price structure in harmony with production-consumption costs. Instead of issuing inflated currency, we propose the issue of controlled credit, at the retail end of the costing cycle. In actuality, we propose the expansion of trade through consumption, instead of through monetary inflation of the channels of production. It is not a proposal to inflate, but to expand credits in step with expanding production and consumption.

In the long run the system we are proposing, with its support of our present democratic institution, offers a foundation on which to build a progressive State. Some points in relation to the general thesis may now be touched upon.

*Administration.*—At first sight the administration of discounts at retail appears colossal. If carefully studied it will appear that it does not entail as great or complex an organization or as much espionage as the collection of the income and nuisance taxes. It is, in effect, a reversal of this process, but as the bulk of the administration would be done through the banking system and as it is chiefly a matter of bookkeeping, it belongs in the same category as the usual handling of checks.

*Financing.*—The provision of Government debentures for use of trade discounts is in reality far sounder than the providing of funds for the Reconstruction Finance Corporation and like agencies. We base our claim in this respect on the ground that the financing of production primarily by means of consumer purchasing power in the form of the discount is the main source of sound bank credit. The liquidation of the credits issued to consumers comes about automatically from the increased revenues derived from restored national income.

We stress the importance of the periodical preparation of a national consolidated financial statement, summarizing all industrial activity and showing the relation of gross capital assets to gross indebtedness, following the form of the consolidated statements of the great corporations. If such statements had been in existence covering 20 years back, they would have furnished a warning against the present debt-credit impassé.

We also require that a clear-cut distinction be drawn between the national wealth represented by real productive capital assets and the negotiable or dollar wealth which is the fluctuating source of the debt-credit structure and the instability of the national money.

Proper recording of the above two factors is an essential to maintaining a sound price structure and balance between money and industry.

The relation of the foregoing proposals to such probelms as agriculture, the bonus, or technological unemployment is clearly to mitigate them. The consumption of agricultural products will come within reach of everyone. The farmer, while his market is broadened, buys his needs at reduced cost to him.

The increasing demands of consumers on the production organization will restore normal employment. After industry reaches capacity, a survey of the remaining unemployed will point the way to adjusting hours and conditions of employment so as to care for them.

The foregoing proposals are designed to achieve the following results:

(1) Revival of decent living conditions through the increased production-employment earnings cycle.

(2) A national monetary system which—

(*a*) Retains the gold standard as the base of ultimate settlements and backing for the currency.

(*b*) Prevents monetary and price inflation due to excessive issues of credit for unneeded and destructive overbuilding.

(*c*) Avoids interference with the currency which will continue to fill its present function undisturbed.

(*d*) Avoids the increase of prices to consumers. During the period of revival of trade it actually reduces living costs to them by reason of the discount on price.

(*e*) Puts industry upon a capacity basis, resulting in lowered costs and better earnings. At the same time it prevents the usual accompaniment to rising profits, namely, a flood of new flotations, which inflate money and prices.

(*f*) Open markets for securities and commodities remain, as an essential protection to legitimate business, but unwarranted speculation is restrained by the reduced percentage if that can be borrowed on speculative holdings.

(g) Government financing is done against consumers goods, instead of as now, supporting and inactive private debt structure. Government support of the private debt structure without establishing means of liquidating it must eventuate in State socialism. The means used must conform to modern economic conditions and social trends.

A strong flow of consumers goods is the only thing that can liquidate governments, banks, transporation, and industry, and at the same time keep the Nation busy, contented, and safe. Balancing of the Budget becomes automatically simplified.

The viewpoint that we stress is that normal national life can only be restored through adopting measures which impinge beneficially upon the whole population in such a way as to eliminate the harassing demands of sectionalists, the yielding to which can not, from an economic standpoint, meet the requirements of the whole Nation.

The effect of sectional demands on national politics is destructive of a unified policy. But a unified policy is the only one that can be effective, because it is the only way to achieve economic balance.

It is also believed that a study of this brief and the evidence the authors are prepared to supply indicates the meeting point of governmental and individualistic responsibility, and furnishes a guide to the limit that the former should go in organizing recovery. In other words, where Government responsibility should end and individual industrial effort begin.

It is designed to avoid three things which is it believed are not acceptable to normal national psychology, viz., Government in business, Government control of industry, and monetary inflation; in spite of the fact that there appears now to be a rapid drift in these directions.

Respectfully submitted.

EDWARD F. HARVEY.

APPENDIX

The following is a definition by Maj. C. H. Douglas of England of the A plus B theorem, which he developed as the result of observing the effect of war-time financing upon industrial production. This theorem has been before the world since 1919 and has never been refuted. Its implications are now the subject of study by several governments including Great Britain and Australia.

"A factory or other productive organization has, besides its economic function as a producer of goods, a purely financial aspect. It may be regarded on the one hand as a device for the distribution of purchasing power through the media of wages, salaries, and dividends, and on the other hand as a manufactory of prices—financial values. From this standpoint its payments may be divided into two groups:

"Group A. All payments made to individuals (wages, salaries, and dividends).

"Group B. All payments made to other organizations (raw materials, bank charges, and other external costs).

"Now the flow of purchasing power to individuals is represented by A, but since all payments go into price, the rate of flow of price can not be less than A plus B. Since A will not purchase A plus B a proportion of the product at least equivalent to B must be distributed by a form of purchasing power not comprised in the description grouped under A."

It should be noted that the deficiency in purchasing power of A has in recent years been made up by money created by the banks to finance capital production, thus bringing about our inflated debt-credit condition.

Further information can be obtained from the New Economics Group, 425 Fourth Avenue, New York.

Letter and brief submitted by Dr. Norman J. Silberling, Ph. D., San Francisco, Calif., are here printed in full as follows:

SILBERLING RESEARCH CORPORATION (LTD.),
*San Francisco, February 24, 1933.*

Hon. REED SMOOT
*Chairman Committee on Finance,*
*United States Senate, Washington, D. C.*

MY DEAR SENATOR SMOOT: In accordance with my recent letter to you, I am inclosing a memorandum to place before your committee on the subject of the depression and legislative remedies calculated to relieve it. The material here offered for your consideration is the result of intensive study of these problems over a period of years. Should the committee desire further elaboration of any of these points, it will be a pleasure to respond to your wishes.

Let me say again that I am sorry not to be able at this time to come personally before the Committee to present my views.

Sincerely yours,

NORMAN J. SILBERLING

## CAUSES OF THE ECONOMIC DEPRESSION AND SUGGESTED LEGISLATIVE REMEDIES

(Prepared for Committee on Finance, United States Senate, by Dr. Norman J. Silberling, Ph.D, Lecturer in Economics, University of California; President, Silberling Research Corporation (Ltd.), San Francisco)

There has been a general failure to comprehend that the current economic depression is a result of the war, is practically world-wide in its scope, and that both its severity and scope arise from the fact that international relationships are still essentially on a war basis. Many remedies and palliatives, superficial and localized, have been offered to deal with this crisis, but, failing to strike to the roots of it, they have been not only ineffective but positively harmful in prolonging and intensifying the trouble.

Before real remedies can be proposed there must be thorough understanding of the manner in which the World War affected business. From 1914 until 1920, roughly, the requirements of the war caused violent inflation of the price level, brought large areas of land, much of it marginal, into cultivation, and in general overexpanded our productive capacity in raw materials. After the temporary and inadequate readjustment in 1921 there came a second boom period lasting until 1928–29. This proceeded on the basis of continued foreign demands for capital goods to replace war losses, an ample gold and credit supply, an assumption that the treaty of Versailles marked the end of the World War and the beginning of European reconstruction, and the financing of European capital requirements by large loans. In this period of secondary boom, our plant capacity was greatly expanded; we entertained dreams of greatly developing export trade in manufactures, without realizing that the world was still at war; real estate and building were carried to extravagant heights of promotion; and on the basis of temporary industrial prosperity new capital flotations and activity in the security markets ultimately reached the proportions of wild inflation.

A large measure of this prosperity was due to temporary factors, and among these factors must be included artificial plans and schemes to liberalize credit far beyond sound limits, to expand the expenditures of governmental bodies, and to support prices and prevent an adjustment of the American price level to world conditions. More important still, the American people utterly failed to comprehend that European obligations owing to the United States as a result of the war could not indefinitely be discharged by advances of credit from this country, and in the end would either be repudiated or discharged in goods which would compete severely with American industries. In this period of the new era, the United States failed to realize that the continuance of an economic war throughout the world was having the effect of expanding productive acreage and industrial plant capacity simultaneously in many countries, which soon resulted in surpluses, falling prices, inability to maintain stable exchange between country and country, and ultimately the raising of barriers against international trade in every direction.

Essentially, therefore, the United States had 15 years of exceptional prosperity produced directly by the war, during which time productive capacity was greatly expanded while the outlet for products was being gradually contracted and forces were at work progressively lowering the basic level of prices. The crash in the security markets, for several years fed by cheap money owing to the liberal credit policies of the central banks, was the first signal of disaster. As the ensuing depression has continued the natural forces of recuperation have been persistently obstructed by the unsound philosophy of cheap money and by tinkering with symptoms rather than grappling with fundamental problems. Every important step in the depression—the rapid contraction in the foreign market for American raw materials; the distorted distribution of gold and the disturbances of international exchange; the suspension of the gold standard in England and other important countries; the depreciation of foreign investments; the boomerang effect of depreciating currency upon American gold prices; the seriously unbalanced capital structure of our railroads and their inability quickly to meet competitive conditions; the depreciation of capital values and the wholesale foreclosure of loans; and the obvious weaknesses in the American banking system in the meeting of this crisis—all have demonstrated over and over to those willing to look for causes the necessity of reaching to the roots of the disturbance in the international economic and financial system. Yet even now, at this later date, we are entertaining numerous proposals to tinker further with the price level by artificial monetary and credit schemes, and are losing every day the opportunities to assert the leadership in the international crisis which the position and power of the country, as well as our own stake in the matter, amply justify.

As matters now stand, the United States finds two alternatives: We must either withdraw entirely, isolate ourselves from the world, and undergo a prolonged process of readjusting our productive capacity to the narrowed limits of a domestic market, or we must take a definite and active part in cooperating with other countries in a program to place international obligations on a practical basis; to remove needless obstructions in the flow of trade; and thus to place international finances once more upon a stable gold basis, which in itself would powerfully operate to turn the word price level upward. This one objective would be the answer to many of the complex problems of deflation which now defy solution. Only by following the latter of these alternatives can the present alarming tendency toward resumption of international dispute be safely averted, and with it the threat of international competitive inflation of prices which might ultimately cause the ruin of the capitalistic system throughout the world.

Inasmuch as basic causes have been largely ignored, the present crisis calls for immediate relief measures. But these measures must be accompanied by a simultaneous attack upon the causes themselves. It is futile to introduce relief measures and then merely trust to blind luck that some good fortune will turn the tide and justify them. This has been exactly the policy of the last few years, and it has without question been ruinous.

(1) *The immediate problem is one of social relief.*—The Reconstruction Finance Corporation should be authorized progressively to curtail, and ultimately to abandon, its financial aid to institutions and to concentrate its work upon the granting of relief to the unemployed. This relief, if done through loans, should carry a low rate of interest, and it should not be delayed unnecessarily by being associated with public works. The situation calls for emergency help to the unemployed, not doles to the building industry and its price-fixing managements.

(2) *Immediate strengthening of the banking system.*—No progress can be made until the credit mechanism is protected from the dangers of too many small, weak banks; unnecessary restrictions upon branching within reasonably conceived areas are removed; and banking is redirected toward commercial, rather than fixed capital, financing.

(3) *Institute immediate changes in the viewpoint and policies of the Federal reserve system* to abandon at the earliest possible moment the false philosophy that cheap credit is the source of business prosperity. Remove also the dangerous connection between the Federal reserve system and the Treasury, which necessarily involves the raising of revenue rather than the financing of the Government by short-term loans from the Federal reserve. Let the Federal reserve system revert to its original province of being a bankers' bank and not a money-making device for the Treasury or an automatic "stabilizer" of the business cycle.

(4) *The debt problem.*—It is futile to approach this problem through general moratoria. The basic approach to this problem is to work toward a raising of commodity prices through removing restrictions upon trade and enterprise. The immediate passage of legislation provideing for arrangements between debtors and creditors which would hasten adjustments without the expenses and delays of ordinary receiverships and foreclosures, would remove the present confusion and its social aftermath of bitterness and waste.

(5) *Foreign debts.*—This country must face facts in connection with European debts and the tariff. It has been repeated over and over that debts can not be paid except in goods, and we shut out the goods. Instead of temporizing further, we must reduce debts and reduce tariffs to permit an adjustment of these claims, while at the same time not exposing Americzn industry to unnecessarily violent competitive forces. Underlying this must go cooperation on the part of the United States with the other leading powers looking toward a reversal of the present trend toward war preparations in the Orient and in Europe. The recognition of Russia and the inclusion of Russia in such agreements is imperative, not only from a commercial angle but as a means of reestablishing peaceful relations and the commerce which they promote. Immediate attention should be given to the working out of reciprocity agreements with individual nations.

(6) *Taxation must be revised.*—While the heavy local taxes weighing upon real estate, farms, and railroads must await local reforms, Federal financing demands

immediate change in taxes. So long as heavy expenditures must be made for past and future wars, the first essential is to reduce drastically payments to veterans other than those disabled in actual service; the restoration of revenue tariffs on imports in contrast with the present prohibitory tariffs, which merely keep the cost of living too high; the imposition of a general sales tax for a limited period. While the present crisis lasts the Federal Budget can not be fully balanced, but flotation of long-term securities should be initiated, as the prospect of it is a serious deterrent to stability in the general bond market. Furthermore, measures should be taken to remove the present provisions for exemption of Government securities from surtaxes. Congress must recognize that taxes can not be reduced and the Budget balanced at the same time, and as long as the Budget is unbalanced through continued borrowing the banking system and financial enterprises are threatened.

(7) *Railroads must be permitted to readjust their excessive capital structures* rather than artificially protected from reorganizations. The requirements of the country for economical and efficient transportation supersede the demands of the investment bankers and the holders of railroad bonds. At the same time the modernization of railroads should be promoted; Federal aid to waterways, highways, and other competing transportation systems should be abandoned; railroads should be encouraged to lower their rate structure in order to restore traffic; and plans for consolidation into larger systems rapidly carried forward. The recapture clause should be repealed.

(8) *Economies in Government.*—Economizing in Federal expenditures is impossible so long as large appropriations are necessary for war purposes. By contracting the advances of government through the Reconstruction Finance Corporation, through consolidation of departments, and through reduction in compensation to all public officials, savings can be made which will find their justification in the example they present to municipal and State authorities.

I am convinced that with concerted effort along these lines there will develop a natural recuperative tendency which would remove the threat of dangerous experiments and unsound stiumlants, such as monetary inflation, devaluation of the dollar, vast programs of unproductive public works, bonus plans for farmers, and a broad extension of public ownership and bureaucracy.

If the legislative and administrative forces of the country can be concentrated along the foregoing lines, and efforts focused upon a consistent program rather than frittered away upon haphazard plans and petty palliatives, the country will have demonstrated its ability to make the courageous decisions which originally made it great.

(A letter received from Herman Waldeck is here printed in full as follows:)

CONTINENTAL ILLINOIS NATIONAL BANK & TRUST CO.,
*Chicago, February 25, 1933.*

HON. REED SMOOT,
*United States Senate Committee on Finance, Washington, D. C.*

DEAR SENATOR: Referring to your communication of the 8th instant; I beg to submit the following:

The causes of the depression are so well known that to re-state them here seems unnecessary and futile.

As for the remedial measures to be adopted to overcome the crisis, I venture to suggest the following:

Restoration of confidence to be achieved by (*a*) A sincere and determined effort to balance the Budget.

(*b*) The early enactment of banking legislation calculated to supply the country with a banking system that will at once serve its purpose and command the confidence of the public.

(*c*) A prompt settlement of the war-debt question on a practical and realistic basis.

These, to my mind, are the problems, the solution of which would automically solve most of the other problems with which the country is afflicted to-day.

Trusting that the foregoing suggestions may prove of some service to your committee, I remain,

Respectfully yours,

H. WALDECK.

(Letter and statement submitted by Mr. W. F. Gephart, St. Louis, Mo., is here printed in full as follows:)

FIRST NATIONAL BANK,
*St. Louis, Mo., February 25, 1933.*

Hon. REED SMOOT,
*Chairman of the Senate Finance Committee, United States Senate, Washington, D. C.*

MY DEAR SENATOR SMOOT: Some time ago I accepted your invitation to appear before the Finance Committee to give testimony with respect to the present industrial and financial condition.

Owing to the seriousness of the general banking situation, I hesitate to leave my office, and in addition it has occurred to me that perhaps the members of your committee would be served quite as well if I sent to you a brief statement. I am, therefore, sending to you a number of copies which I should be very glad to have you give to the members of the committee. Needless to state, I should be very much pleased if you could find time to run through this 5-page statement.

Yours very truly,

W. F. GEPHART.

A STATEMENT BY REQUEST TO THE FINANCE COMMITTEE OF THE UNITED STATES SENATE ON AGRICULTURE AND ON PRICES, DOMESTIC DEBTS, AND INFLATION BY W. F. GEPHART, VICE PRESIDENT, FIRST NATIONAL BANK IN ST. LOUIS

INTRODUCTION

There are many explanations of the causes for the present world industrial depression, but after making all allowance for minor causes, the fundamental ones are to be found in the enormous destruction of capital occasioned by the war, the misdirected capital investment during and following the war, and finally the speculation engendered by the war.

War is one of the few ways that saved capital can be destroyed. Not only does it actually disappear but during the time of great wars there arises a great increase in demand for certain products with the resulting over-development of plant capacity in manufacturing lines as well as in the production of certain food and other basic commodities. The prosperity and the rising price level which accompanied the war led to a further increase in plant capacity after the war in the belief that high prices and profits would be a continuing phenomenon. This condition of overdevelopment and speculation affected almost all classes of industries with the result that we now find an ability to produce many kinds of commodities far beyond any present or prospective demand for them. Along with this has been a rapid development of technological progress, represented by improved machines, processes, and scientific discoveries which have culminated during the past quarter of a century, adding to the difficulties growing out of the stimulation to industry occasioned by the war and the succeeding period of speculation.

Then too, our commercial banking structure was weakened in the first instance by permitting the creation of commercial bank credit upon the basis of capital assets. In its initial stages, bank credit was expanded to meet governmental needs during the war. After the war its normal contraction was prevented. Additional bank credit was created on the basis of such capital goods as stocks, bonds, and real estate, and the credit so created was not self-liquidating. As capital goods have a longer cycle than consumers' goods they apparently maintained their values for a time in the face of the continually increasing supply of capital goods. Ultimately, however, they had to be subjected to the inevitable test of liquidity as they were supporting a commercial banking structure and when an attempt was made to apply this test the whole structure crumbled. No commercial banking system can have so substantial a portion of its outstanding credit, based on capital goods, as that of the United States, and expect to meet its obligations on demand or within thirty days. That fact probably more than any other single factor is largely responsible for the present plight of American commercial banking. While other countries have suffered even more than we from the effects of war, inflation and capital destruction, none have had a banking debacle comparable to ours, which has consisted of a gradual crumbling of the whole structure for over a decade. This basic defect in our banking structure can not be corrected by means of governmental credit grants without endangering the credit of the government itself. Even the United States Government can not perform a miracle and convert capital goods into self-liquidating commercial bank loans.

### AGRICULTURE

The present plight of agriculture is due basically to the fact that there has been during the past quarter of a century a very marked change in the demand for agricultural commodities without an adjustment on the part of the farming population of the world to these changed conditions. This change consists, first, in an enormous increase in acreage; second, a very decided decrease in the demand for what were originally the basic agricultural commodities; third, the climatic and other natural conditions which are beyond control and very greatly affect the production of agricultural commodities during any one season, and in the fourth place, to the fact that agriculture is such a highly individualized industry. It is an extremely difficult matter to get any co-operation of a wide scale among agricultural producers.

Taking 1880 as the basis, statistics show that by 1925 agricultural production in the United States had increased from 100 to 234. Crop land had increased from 100 to 200. (See Table I, appendix.)

If the people of the United States had known 50 years ago what the present situation of agriculture was to be, the public land policy of the United States would doubtless have been quite different. Millions of dollars have been spent in bringing new land into cultivation through irrigation and drainage projects which in view of what has occurred should never have been undertaken. Another aspect of the agricultural problem is the decrease in the foreign markets for agricultural commodities. This has resulted in part from our commercial policy but more particularly from the fact that there have been developed new centers of production in the world and many nations have become more self-sufficient in the production of food commodities.

Then too, not only because of the individualistic character of agriculture, but also because of the nature of the industry itself, it is difficult to reduce the agricultural population. It is very well to talk about the desirability of eliminating the marginal or submarginal land—that is, the marginal and submarginal farmers, but, as a matter of act, it is just these classes who are likely to continue longest in the industry. They earn no profit, no interest on the investment of the land, and not even good wages, but they persist in living on the land and eking out a bare existence.

The population of the United States in 1914 was 97,577,500 and in 1930 it was 122,775,046. This represents an increase in population of 36 per cent between the two dates, 1914 and 1930. Yet, at the same time, agricultural consumption statistics show that with this population increase of 36 per cent, there has been a decrease of 28 per cent in the consumption of corn; 7 per cent in the consumption of wheat; 25 per cent in the consumption of oats; 30 per cent in the consumption of potatoes, and only 1.1 per cent increase in the consumption of dressed meats. (See Table II, appendix.)

Another factor to be considered is the slowing up of the population increase, due to reduced immigration and the decrease in the birth rate. It is not probable that the people of the United States will, in the near future, adopt a more liberal immigration policy no more than is it likely that the birth rate will again be on the old level, and, therefore, the per capita consumption of agricultural products will not increase at the rate it did in the earlier time. The people of the United States are consuming larger quantities of fruits and vegetables and there is no longer the per capita demand for meat, bread, and potatoes.

The agricultural industry in America, like many other industries, has for 50 years been geared up on the assumption that there would be annually an increased market. But, with the present slowing down of the population increase and the overdeveloped plant capacity in so many lines, there has come about perhaps the most difficult industrial problem for the next ten years—namely, that of adjusting capital structure and plant capacity to prospective demand for goods.

The most pressing immediate problem for American agriculture is that of the mortgage debt. The farm mortgage debt is concentrated largely in the 12 North Central States, which in 1930 carried 59.5 per cent of the total. These States have 33 per cent of the total number of farms and 50 per cent of the value of all land and buildings in farms in the United States. The regional distribution of the remaining 40.5 per cent of the farm mortgage debt is: North Atlantic States, 6.8 per cent; South Atlantic States, 5.5; South Central, 13.7, and the Western States, 14.5.

The total farm mortgage debt increased 137 per cent from 1910 to 1920, principally during and immediately after the war years, a period in which the general price level and farm prices were nearly twice the pre-war average.

Distressing as the situation is at present, it should be noted that nearly 60 per cent of all farms in the United States are free of mortgage debt. In 1928, the peak year for farm mortgages, the total indebtedness rested on 40 per cent of all farms.

Of the total farm mortgage debt in 1930, the last year for which an estimate on this point is available, about 56 per cent was on farms operated by owners, 40 per cent on farms operated by tenants and 4 per cent on farms run by managers. Of all farms in the United States probably about 1 in 4 was mortgaged and operated by owners and about 1 in 7 mortgaged and operated by tenants.

The bulk of the present farm mortgage debt was incurred in years when the general price level was about twice, and the level of farm prices nearly four times as high as at the close of 1932. The creditor in most cases, therefore, lent about one-half of the purchasing power now owed him. To pay the debt under present prices, the farmer must part with about four times as many units of farm products.

The total mortgages held by each of various classes of creditors has not been definitely determined since January, 1928, when it was as follows:

| Classes of lenders: | Per cent |
|---|---|
| Federal land banks | 12.1 |
| Joint-stock land banks | 7.0 |
| Commercial banks | 10.8 |
| Mortgage companies | 10.4 |
| Insurance companies | 22.9 |
| Retired farmers | 10.6 |
| Active farmers | 3.6 |
| Other individuals | 15.4 |
| Other agencies | 7.2 |
| Total | 100.0 |

This table suggests that the creditors' side of the farm-mortgage problem is by no means simple. The individual creditors, who number nearly 750,000—including active farmers and retired farmers with the savings of a lifetime of toil invested in mortgages as their protection in old age—held in 1928 nearly $3,000,000,000 of farm mortgages, or about 30 per cent of the total. Retired farmers alone held a total volume of farm mortgages about as large as that of all commercial banks and nearly as large as that of the 12 Federal land banks.

Dollars were cheap when most of the present debtor-creditor relationship was established, compared with their value now. This is the central source of the farmer's debt problem and the main cause of stress and strain between debtor and creditor. In November, 1932, the buying power of the farmer's product was 51 as compared to 106 in 1910, due to the fact that the price of what he had to sell had decreased from 103 in 1910 to 54 in 1932, and the price of what he had to buy had increased from 98 in 1910 to 106 in 1932. (See Table III, appendix.)

For the immediate situation confronting agriculture, there needs to be, first, a refinancing of farm mortgages, and second, a relieving of the market from the surplus of certain basic agricultural commodities. To accomplish the second purpose, it is suggested that the Federal Government lease wheat and cotton land and in addition purchase a sufficient part of the extraordinary surplus cotton and hold it from the market for a period of three years.

If relief was brought to the producers of these two basic products, it would largely spread throughout the whole agricultural population. There is not presently or prospectively any such surplus of wheat as there is of cotton and the leasing of the wheat land would bring relief. But in the case of cotton, there needs to be not only the leasing of the cotton land but also the purchase of sufficient cotton to restore a fair price.

For the longer term agricultural relief, there must be taken permanently out of cultivation many millions of acres of marginal and submarginal land. In addition, there should be no more reclamation projects by the Federal Government. It is suggested that these two measures for emergency and long-term relief will place the agricultural industry of the United States on a reasonable basis of prosperity.

Agriculture will need to become more of a business and less of an occupation. The profits of agriculture in the United States, like in any new country, have come about largely from buying and selling land—that is, speculation in land rather than organizing and conducting farming as a business.

PRICES, DOMESTIC DEBTS, AND INFLATION

Much has been heard about magic recipes for restoring prosperity by governmental action. There are many who think that if we had an enormous inflation of the currency or credit this would correct the situation, because it would increase the price level, and many people believe that prosperity and high prices are synonymous. Inflation has its temporary merits, most of which are obvious. It is the easy way out, but it will exact a price to be paid later. The difficult way out is by acceptance of whatever rigors are required to balance budgets, by further adjustment of debt, by further corporation reorganizations, by further write-downs of fictitious values, all of which involve selective rather than blanket action. The latter course requires more immediate patience and application, but it involves fewer later dangers. It is desirable to look sharp and ponder well before drifting into inflation.

All of these inflation schemes are based on the erroneous assumption that there exists in the country a shortage of money and that if in some way more money could be pumped into circulation, prices would rise and thus all of our troubles be over.

Money is nothing more than a measure of wealth and services and increasing the units to measure wealth and services does not increase the actual wealth. The yardstick is the unit of linear measurement, but increasing the number of yardsticks in the world would not increase the number of yards of woolen and cotton cloth. Increasing the number of bushel measures in the world would not increase the number of bushels of wheat, and increasing the number of units to measure wealth, whether they are gold dollars, silver dollars, or paper dollars will not increase the actual wealth of the world, which consists of goods and services. As a matter of fact, there is no dearth of money or of money in circulation. There is just one way to increase the amount of money in circulation, and that is by increasing the purchases and sales of goods and services.

The average daily stock of gold in the United States was $4,207,000,000 in 1928 and $4,240,000,000 in 1932. Likewise, the average daily circulation of money in the United States in 1928 was $4,782,000,000, while in 1932 it was $5,615,000,000. It is, therefore, erroneous to argue that there is any need for more gold or more money in circulation. There has also been, during and since the war, a concentration of the world gold supply in the central banks and in the hands of the Government so that the gold of the world can be used more effectively as a basis for credit and as a reserve. (See Table IV, appendix.)

In assuming that existing low prices are the sole barrier to recovery the proponents of inflationary schemes are viewing only one phase of the problem and are neglecting a number of other important factors. It must always be realized that it is not alone low prices or high prices that necessarily handicap the normal flow of business. In industrial society, as it is at present organized, we have essentially a system based upon the exchange of goods and services for goods and services. As long as approximately the same volume and character of goods and services can be exchanged for a similar volume and character of other goods and services, the price factor is of itself not necessarily a disturbing element. One of the essential difficulties in the present situation is the change in the relationship that has taken place between various elements in the price structure. Prices of themselves are purely relative, and there can exist just as many inequalities and difficulties during a period of high prices as during a period of low prices if long established price relationships are thrown out of their customary relative trading position. This factor is well illustrated at the present time in the Department of Agriculture's calculation of the ratio of prices of farm products to prices of what the farmer can buy. In November of 1932 this index was 51 per cent of the pre-war average. In other words, at current prices for farm products the farmer can buy only about 50 per cent of what he could before the war. Thus, in considering inflationary schemes, through tinkering with the money mechanism, it should be realized that a mere general rise in prices as a result of such procedure would not necessarily enable the farmer to purchase any more at the higher price level than he could at the lower price level, unless the existing inequalities in his exchange position were corrected. Any deliberate attempt at inflation would create new and other aggravated dislocations in the general price structure and would prove beneficial solely to certain debtor groups.

Finally, the Government can only very indirectly, by act of legislation, help the situation. If it were possible to legislate prosperity and morality, we would soon create a Utopian world. The process of deflation, painful as it is, is progressing.

We have arrived at the third stage of the depression, which is a determination to face realities, and this always marks the first step of improvement. We realize that the boom days have passed and we begin, therefore, to order our personal, business, and governmental expenditures on a new basis. We have heard much talk recently about governments, Federal, State, and local balancing their budget. This is all very desirable, but it is also equally desirable that individuals and corporations also balance their budget which is nothing more or less than bringing their expenses in harmony with their present and prospective incomes.

The era of extravagance in personal and business expenditures has passed, and, therefore, all types of business are effecting economies. Business is eliminating many of the expenses which it incurred during the period of prosperity and which had very little or no relation to the profitable conduct of the business, and as a result, there is promised that business will be on a more healthy basis than it has been for many years.

Supplementary government aid to natural processes of recovery is desirable wherever it is effective, but there is a great temptation, as has been in part the case during the past several years, to continue to use palliatives and not to seek a remedy. We are arriving at the point where we need, so to speak, to use the surgeon's knife and lay aside the hypodermic. Doubtless, the Government can do something in the way of wisely extending credit as has been done in part by the activities of the Reconstruction Finance Corporation to certain deserved businesses. It can also aid by better bankruptcy law so that the railways and industrial corporations can more readily reduce their capital structure and enable many present creditors to write off their present claims and substitute for them a claim on the earnings of the business that will be possible in the future. But it is useless to go on loaning Government credit to banks, railroads, and other industries which have no hope and have had no hope for months that under the most favorable conditions they would ever be able to get a fair return on their present capital structures.

The solution of our problem lies primarily in permitting the natural corrective forces to operate as effectively and quickly as possible. Efforts to prevent the natural functioning of economic laws by attempting to maintain unsound economic relationships within the price structure by governmental action, such as through price fixing schemes, the bolstering of decayed capital structures, either railroad, industrial, banking, or agricultural, will only prolong and not cure the depression. The same thing is true in our economic life.

It is time to call upon the creditors of railroads, banks, farms, and other industries to assume their share of the burden of deflation and the reconstituting of their capital structure and not expect the people of the United States continuously, through taxation, to assume a burden which in large part belongs to the owners of the properties.

TABLE 1.—*Appendix*

| Year | Production | Crop land | Agricultural working population | Production per capita of agricultural working population |
|---|---|---|---|---|
| 1880 | 100 | 100 | 100 | 100 |
| 1890 | 136 | 132 | 110 | 115 |
| 1900 | 167 | 170 | 135 | 124 |
| 1910 | 207 | 181 | 172 | 120 |
| 1920 | 230 | 209 | 156 | 147 |
| 1925 | 234 | 200 | 141 | 161 |

(A letter received from Mr. Orlando F. Weber, New York City, is here printed in full as follows:)

NEW YORK, *February 17, 1933.*

HON. REED SMOOT,
*Chairman Committee on Finance,*
*United States Senate, Washington, D. C.*

DEAR SENATOR SMOOT: Upon my return to the office I find your letter of February 8.

I have noted in the newspapers the comments made by the various gentlemen who have appeared before the committee and find myself in sympathy with the thoughts already expressed before the committee as follows:

(1) The Budget should be balanced in order to maintain the Government credit structure.

(2) There should be no cancellation of foreign debts; to do so would not benefit the people of our country.

(3) The low price of farm commodities has had a real bearing on reduced industrial activities during the past two years, and has an important bearing on our present situation.

Burdened as the committee must be with the mass of opinions now being expressed before it, I would be pleased if this letter would be satisfactory in place of my personal appearance.

Very truly yours,

ORLANDO F. WEBER.

(A letter received from Rev. H. C. Morrison, D. D., Louisville, Ky., is here printed in full as follows:)

LAKELAND, FLA., *February 17, 1933.*

Senator REED SMOOT,
*United States Senate, Washington, D. C.*

MY DEAR SENATOR: Your letter of February 8, forwarded, has reached me. It is impossible for me to visit Washington City at this time.

Let me congratulate you on your long and faithful service which you have rendered to your country as a public servant.

Permit me to offer the following simple suggestions:

First, close the doors of this country tight against any immigration, except tourists and students.

Second, ship out of this country all foreigners with any sort of criminal record.

Third, keep a safe protective tariff over home products that can amply supply the needs of our people.

Fourth, discourage the wealthy people from taking hundreds of millions of dollars out of this country the coming summer and fall, as tourists to Europe.

Fifth, arrange for the Federal Government to unite with the State governments, the great cities, Red Cross, and wealthy philanthropists to get the millions of idle people of the cities onto the farms where they can make a comfortable living with a good degree of contentment.

Sixth, have the Government gather up the hundreds of thousands of idle boys and men who can not find employment, and put them into the military camps, the Government uniform them, give them rations and have them devote a certain part of each day to study, a part to physical culture, and a part to industry. They could do much in draining and preparing land for agriculture.

Seventh, if automobiles could be taught to eat corn and oats there would be a demand for all the products of the farm, and the vexed farm problem would be solved. Automobiles have led millions of people to mortgage their property in order to buy cars. They have wasted time and money running about the country. Less of the steering wheel and more of the hoe handle is one of our great needs.

Eighth, keep the country dry. Save the hungry, poor people from wasting that which would buy bread, for beer. Pass a resolution in the Senate calling upon ministers of the gospel to lead the people back to the Bible, to reverential fear and loving obedience to the God of the universe.

Respectfully,

H. C. MORRISON.

(A brief submitted by the Kiwanis Club of Elizabeth, N. J., is here printed in full:)

KIWANIS CLUB OF ELIZABETH

ELIZABETH, N. J.

The Kiwanis Club of Elizabeth realizes that conditions are rapidly getting worse, and that a united effort must be made at once if we are to avoid municipal insolvency and additional suffering. We have invited the various civic and taxpayers groups in Elizabeth to join us in the following program.:

1. To study local credit, municipal and industrial conditions.
2. To present a definite program for rehabilitation.
3. To offer our cooperation in putting the program in effect.

We believe that the most serious aspect of the depression is the mental state of our citizens, rather than the material losses we have suffered. We have an overabundance of food, clothing, shelter, and labor, but lack the will or the means to provide credit machinery for the interchange of these commodities.

It is quite evident to us that a plan to end the depression must first seek to raise the morale of our citizens, and, secondly, restore the credit machinery of the country. We also believe that a movement toward recovery need not and should not await the settlement of international problems. Men can not get back to work until credit gets back to work.

We are looking at our difficulties from a purely local viewpoint, and realize that we can not effect a permanent cure unless we have both State and Federal cooperation. The State may aid by using its credit to prevent wholesale municipal insolvency. The State may also provide a more equitable method of taxation to relieve industry and real estate of a disproportionate share of public expense. The Federal Government may aid by sponsoring a nation-wide organization to raise the morale of the people, and by liberalizing the policies of the Reconstruction Finance Corporation and the Federal home loan bank.

Elizabeth may be used as a typical example of conditions throughout the Nation. Elizabeth has a population of 115,000, of which nearly 30,000 are dependent on public relief. Probably 20,000 more are in dire distress, but are too proud to ask for help. Hundreds of homes are under foreclosure, and the number is increasing in leaps and bounds. Banks and building and loan associations are practically in a state of liquidation. Taxes are paid with difficulty or not at all, and the city must resort to borrowed money to pay operating expenses. City credit is impaired and bonds can not be sold. Owing to economies in city, county, and State government, unemployment is increasing. No concerted effort to provide work has yet been made. Large industries are demanding reduction of ratables on pain of closing plants. Increasing unrest and defiance of government.

PLAN SUGGESTED FOR ELIZABETH CITIZENS COMMITTEE

The Kiwanis Club believes that credit in one form or another is the main factor in the present situation. Start the machinery of credit to function in an orderly manner, and problems of unemployment, mortgage foreclosures, and municipal insolvency will no longer exist. We believe the 50 Elizabeth building and loan associations can be used as a lever to break the credit stalemate, and to that end have submitted plans to the department of banking and insurance.

The building and loan associations may aid in the following manner:

1. Pay off obligations to banks. This amount is in excess of $2,000,000. Banks have also loaned an additional $2,000,000 to shareholders on pledge of shares.

2. Extend loans to shareholders for relief or payment of taxes.
3. Use liquid reserve funds to purchase city bonds.
4. Collect taxes monthly as an aid to the city.
5. Loan money on bond and mortgage. A number of associations have surplus funds, but, through fear or caution, are not making loans. Other associations have not availed themselves of facilities offered by the Reconstruction Finance Corporation or Federal home-loan bank, to pay off obligations or to extend relief loans to shareholders. A substantial amount could probably be underwritten to finance new homes or repair programs.

The citizens committee may aid the city in the following manner:
1. Suggest the payment of taxes monthly and aid through publicity.
2. Encourage the prepayment of taxes.
3. Aid in the marketing of city bonds.
4. Suggest the building of public works as a relief to unemployment.
5. Suggest balancing of Budget and economy of government.
6. Suggest a remedy for burdensome taxes on real estate and industry.

SUGGESTIONS TO BE SUBMITTED TO THE SENATE FINANCE COMMITTEE

We believe that the most serious aspect of the depression is the mental state of our citizens, and that steps must be taken to improve our morale before there can be any betterment of credit or industrial conditions. We believe the suggestions below would be of tremendous benefit to Elizabeth, and possibly to the nation as well.

Plan in brief:

1. Appointment by the President of the United States or the Congress of a committee of outstanding leaders in industry and finance. Organization of State committees in every State in the Union. Appointment of local committees in every important city and town in the nation. The name of this organization might aptly be the "Prosperity council of the United States." The chief duty of the council and its various subdivisions would be to inspire confidence in Federal, State, and municipal Government; to advise local communities in municipal management; to mobilize banks and building and loan associations in measures to complete liquidation, and to set in motion local credit machinery; to encourage the building of public and private works.

2. Authorization by the Congress of a bond issue of $5,000,000,000 to be called the "Prosperity loan." This loan should be offered to the public in denominations as low as $50, with an interest rate of 3 per cent. Payment for bonds may be made in full or over a period of 50 weeks. Aside from the fact that the Federal Government will have the use of this money, it will serve the following purposes:

(*a*) Put back into circulation millions of hoarded dollars.
(*b*) Permit the use of excessive savings bank reserves.
(*c*) Encourage thrift.

It is important to note that, following the flotation of our last Liberty loan, the condition of our banks and citizens was better than any time in the history of the country. Nearly every family had one or more Liberty bonds which could be used as a basis of local credit. With wholesale retirement of Liberty bonds funds so released were put into stocks and building and loan shares, many of which are to-day either worthless or frozen. Our people would welcome an opportunity to buy Government bonds.

3. If the Federal home loan bank is to serve the public as intended by the Congress, important changes must be made in its policy. The Federal home loan bank is practically of little value as an emergency arm of the Government, nor are its inducements sufficiently attractive ro cause the thousands of building and loan associations to seek membership. As an aid to distressed home owners, the bank can be of little use unless a more liberal policy is adopted. A policy of loaning 60 per cent of present day values, instead of 40 per cent, would go far in stabilizing real estate and help to reestablish credit. The rate of interest charged is not of great importance. It should, however, be sufficiently high so that a loss or insurance fund of 1 per cent may be set up. If fire insurance companies can operate at a profit on charges of $1.80 per $1,000 of insurance, surely the home loan bank would cover all foreclosure losses by a 1 per cent rate.

4. The Reconstruction Finance Corporation can be of greater service to the country by exercising a more liberal policy to small banks and building and loan associations. New Jersey building and loan associations are empowered to borrow an amount equal to 25 per cent of their mortgages. It does not appear, however, that the Reconstruction Finance Corporation will make loans to the same extent.

There are many instances where associations have applied for loans; deposited sufficient collateral, and then, after months of delay, have been refused without explanation. Because of this condition many associations decline to apply for loans.

GENERAL

It appears to us that the problem of bank insolvencies is a major calamity, and that all the resources of the Government should be used if necessary to end this situation. The Elizabeth committee proposes to aid financial institutions in Elizabeth as far as our means permit. Similar movements throughout the Nation would go far in restoring confidence.

KIWANIS CLUB OF ELIZABETH.

FEBRUARY 21, 1933.

(A letter received from Mr. W. L. Clayton, Houston, Tex., is here printed in full as follows:)

HOUSTON, TEX., *February 18, 1933.*

Hon. REED SMOOT,
*Chairman Committee on Finance, United States Senate,*
*Washington, D. C.*

DEAR SENATOR SMOOT: I have your letter of February 8, and appreciate the suggestion that your committee may wish to invite me to come to Washington later on to give testimony regarding the causes of the present depression and possible legislative remedies.

I think I can cover in a short letter my views on this subject and I suggest that this letter be accepted by the committee in lieu of attendance in person and testimony.

I think the present economic disorder is the result, principally, of a speculative debauch, made possibly by a flagrant abuse of credit.

Nevertheless, I believe that the pricking of the bubble has disclosed to view certain grave defects in our national economy and in our international policies and that these defects must be corrected if we are to return to a condition of normal prosperity such as we enjoyed, for instance, before the Great War. The whole subject centers in the revolutionary change which came in our position among the nations of the world as a result of the war. I refer to our sudden transformation from a debtor nation to the chief creditor nation of the world.

If being the chief creditor nation of the world has any significance, it means that we must buy more goods from the rest of the world than we sell to the rest of the world, otherwise we must be prepared to drastically write down our foreign investments, and the debts, public and private, due to us from abroad, and to see our basic raw materials sell at such low prices as to destroy the buying power of millions of producers.

I would say that Congress can, and should, adopt the following measures, as a means of restoring normal prosperity:

1. Balance the Budget through a drastic reduction in the cost of Government.
2. Reduce the tariff in order to reopen the channels of international trade and thus restore value to our basic raw materials, such as cotton, wheat, tobacco, and copper, thus restoring the buying power of the producers of such commodities, quickening domestic commerce and putting people back to work.
3. Readjust the war debts on a realistic basis.
4. Have the Federal land banks rewrite farm mortgages, held by them, to a figure which represents some relationship to the present reasonable earning power of the land, in those States which provide by legislation for removal of a substantial part of the ad valorem tax on land substituting some other form of taxation. Insurance companies and other private holders of farm mortgages will be compelled, in their own interest and by public opinion, to follow the example thus set by the land banks.

If these measures are adopted, I believe confidence will be quickly restored and the country will get on its feet again within a reasonable time.

On the other hand, if Congress should further encourage and develop our drift toward a policy of isolation, or should adopt any measures of currency inflation, or should pass measures attempting artificially to advance prices of commodities, or should pass other legislation of similar character to that here mentioned, it is my belief that the depression will be deepened and prolonged.

Respectfully submitted.

W. L. CLAYTON.

(A letter from John G. Bullock and a copy of a radio address by Martin Dodge are here printed in full as follows:)

LOS ANGELES, *February 18, 1933.*

Hon. REED SMOOT,
*Chairman Committee on Finance, United States Senate,*
*Washington, D. C.*

MY DEAR SENATOR SMOOT: Answering your letter of February 8, I appreciate your consideration and that of the United States Finance Committee, and I regret that it will not be possible for me to be in Washington during the hearings of your committee.

Any action that can be taken to provide the work that is essential to recovery is constructive.

I am particularly of the belief that essential and delayed public works should proceed, particularly where they are self-liquidating.

It is my pleasure to send you in this mail a copy of paper No. 1—National Committee for Trade Recovery, 330 West Forty-second Street, New York City—which has appealed to me particularly as filled with sound suggestions.

It is entitled "The Effect of Public Works in Promoting Trade Recovery," by Martin Dodge, representing the banking and industrial committee of the second Federal reserve district, and is a radio address, delivered from station WOR, at 3.15 p. m. January 29, 1933. I submit it for your consideration.

Sincerely,

JOHN G. BULLOCK.

PAPER NO. 1.—NATIONAL COMMITTEE FOR TRADE RECOVERY

("The Effect of Public Works in Promoting Trade Recovery" by Martin Dodge, representing the banking and industrial committee of the second Federal reserve district)

RADIO ADDRESS

Station WOR 3.15 p. m., January 29, 1933. Under the auspices of the National Committee for Trade Recovery.

The banking and industrial committee of the second Federal reserve district, of which Mr. Owen D. Young, is chairman, is not an official or governmental agency, although it has a public character arising from its purpose. It was appointed last spring by the governor of New York Federal Reserve Bank for the purpose of considering methods of making the large funds released by the Federal reserve banks useful affirmatively in developing business.

Under the direction of a subcommittee, headed by Mr. Alfred P. Sloan, jr., the banking and industrial committee has promoted the resumption of work on sound and needed public projects, which might offer employment both directly and in the manufacture and transportation of needed materials and supplies. In this connection cooperation has been established with the National Committee for Trade Recovery, which ably represents the construction industry in all of its phases.

An expansion of public works construction is particularly appropriate at the present time. Much work needs to be done. Many worthy projects have been suspended because of the lack of funds or because of deliberate retrenchment supposedly in the interest of economy.

The decline in construction work has been drastic. In 1926 the total volume of construction, both public and private, was nearly $9,000,000,000. Disregarding the peak developed from 1927 to 1929, in 1930 it was still $8,000,000,000, but by 1932 it had shrunk to less than $3,000,000,000 for all construction work. Ordinarily $3,000,000,000 would be spent yearly for public work alone—this was approximately the amount spent in each of the six years preceding 1932. The amount of public work in 1932 was only about $1,500,000,000, or half the normal. The needed and worthy public projects abandoned during the past 18 months would be more than enough to restore the program to normal. When it is remembered that a large percentage of the abandoned or suspended projects represent necessary public improvements which will be carried out sooner or later, their resumption now, while costs are low and employment is in such great demand, is doubly important.

Several misconceptions prevail regarding the construction of public works as an aid in the present depression. For instance, it is said that no reasonable program of public works could possibly provide jobs for the ten or twelve million persons now out of work, so why bother with it at all. No one contends, of course, that the Government can supply jobs to ten or twelve million persons. It is equally true, however, that the Government can not permanently provide food, clothing, and shelter for these ten or twelve millions persons and their dependents. The only genuine relief for the unemployed is reemployment by business and industry. Every plan of relief, therefore, should be tested on the basis of whether or not it contributes to economic recovery, for if it does not then it can not offer genuine or permanent relief and must be looked upon as no more than a palliative. Public works construction by offering actual employment to large numbers of people and resulting in the stimulation of the heavy industries concerned with the production of machinery, buildings, and other capital goods offers one of the soundest methods for promoting economic recovery. Its merit lies not in the fact that it offers jobs for all, though it does offer jobs for many, but rather that it helps prime the pump of prosperity.

Another misconception arises from the belief that most of the funds used for public works construction go to the purchase of materials and, therefore, offer little direct aid for the unemployed. This is also incorrect. Engineering studies indicate that in subway construction, for instance, 79 per cent of the total cost of the work is spent for wages and salaries either on the job or in the manufacture and transportation of the materials necessary for the work; that in water works construction 91 per cent goes directly or indirectly for wages and salaries; that in road construction 77 per cent [1] goes for wages and salaries; and that on the average for all kinds of public construction about 80 per cent of the cost of the work goes directly and indirectly to wages and salaries.

A third misconception is the belief that public works mean public works by the National Government. The truth of the matter is that the bulk of public works construction has almost always been local or State, rather than national. Such projects as municipal water works, sewer systems, street and highway construction, bridges, tunnels, schools, and county and municipal buildings constitute by far the largest percentage of all public works construction.

Federal works, such as post offices contruction, reclamation projects, river and harbor improvements, etc., although large items in themselves, do not ordinarily constitute more than a minor part of all public works construction. Although Federal appropriations for public works have increased during the recent years, the significant volume of construction which will substantially affect employment and stimulate business recovery must come largely from the States, counties, cities, and towns. The local communities—that is, the cities and towns—are bearing the bulk of the burden of relief. Nearly three-quarters of the total relief funds spent throughout the country during the past two years have come out of municipal budgets. Just as the cost of relief is falling largely upon the local communities, the opportunities and the need for starting useful construction programs which might relieve relief, fortunately lie also with the local communities.

Our population has not stopped growing. We have not abandoned the idea of educating our children. Our streets have not stopped wearing out. We have found no adequate substitute for sewers. We have not graduated from the need for health, fire, and police protection. These are all things of which we need more, not less, if we are to provide our population with facilities necessary for reasonable decency andc omfort. Ruling out all faddist notions for made work and extravagant expenditures, there is still plenty to be done.

Can we afford it? Is it not inconsistent with present efforts toward tax reduction, economy, and retrenchment? These questions reflect a fourth misconception regarding public works as a means for stimulating business recovery. The answer here is that if we do not spend money in such a way as to provide employment we shall have to spend it for unemployment; that if economy means blind retrenchment it becomes extravagance, for instance, a wholesale suspension of public works, ostensibly to cut expenses, simply means transferring men from the employment roll to the relief roll, which costs money just the same but adds nothing to the public wealth and makes no contribution to business recovery. Direct relief in many cases is unavoidable, but from the economic standpoint it is also unproductive. It is money taken from the taxpayers and given to others, not for services rendered but for subsistence. It constitutes an uneconomic drain upon the public treasury, which may be necessary and will be continued to prevent starvation and distress, but which we can not afford on any other grounds.

So much emphasis is now being laid upon the subject of taxes and budgets

[1] U. S. Bureau of Public Roads shows 91 per cent for wages and salaries on concrete-road construction.

that misconceptions regarding this matter are not surprising. It is forgotten that taxes required to finance a program of public works will be negligible as compared with shrinkage of values and loss of earnings that result from the continuance of depressed business conditions. Such taxes will be equally negligible when paid out of the earnings of revived trade and industry. The prosperity of our cities is only a reflection of the prosperity of our citizenry. The balancing of city budgets must depend upon maintaining the earnings of the community, the ultimate source of all taxes. Budgets can not be balanced by methods that strike down the earning power of those who provide the revenues.

To undertake necessary and useful public works which will afford widespread employment, increase purchasing power, and stimulate numerous industries through the purchase of materials and supplies at a time when such enterprises can be undertaken at low cost, is not inconsistent with municipal economy but part and parcel of it. What is needed is not more spending but more intelligent spending.

Where will the money come from? It will come from budgetary reform. It will come from municipal house cleaning. When cities put their houses in order their credit problems will be largely solved. Budgetary reform will open the money markets. The process is dramatically illustrated by the case of New York City which has recently reduced its yearly expenditures by more than $100,000,000. Similar, even better, results can be achieved by other cities if they have the courage to cut their cloth to the measure of the times. With this done they can proceed to cash in on current low costs and provide their communities with permanent and needed facilities, the construction of which will further benefit them in stimulating business revival and relieving them of the burden of the dole.

With this in mind the Federal Government last July set up in the Reconstruction Finance Corporation a huge reservoir of public credit, to make capital available when it was not forthcoming from private sources. A billion and a half dollars was set aside for loans for self-liquidating projects; that is, projects which would be self-supporting and financially solvent, returning interest and amortization charges from their own revenues and independent of taxation, thereby laying no extra burden upon the taxpayer.

So far 56 projects in 22 States have been approved by the Reconstruction Finance Committee for loans, totaling $147,651,000, or about 10 per cent of the available fund. Of this amount only $17,663,000 has actually been disbursed. These results are obviously disappointing. It was expected that a large part of this money would be in use during the current winter. Cities and other agencies with eligible projects have been slow to appreciate the opportunities offered by the Reconstruction Finance Corporation.

Certain technical features of the act and its administration have also contributed to the delay. Amendments to the law now pending before Congress are designed to eliminate some of these difficulties. The more liberal policy recently adopted by the Reconstruction Finance Corporation in reference to interest rates should also help in speeding up the utilization of its funds. Meanwhile, funds are beginning to be made available again for capital improvement programs through normal banking channels.

In the latter category the recent action of the city of New York in appropriating about $7,000,000 to complete construction on three feeder lines of the independent subway system is conspicuous. Although no major project in the New York metropolitan district has so far been granted a loan by the Reconstruction Finance Corporation, several are being given consideration. Prominent among these are the proposed Midtown tunnel of the New York Port Authority, the Triborough bridge, and the water-front development of the Central District (Inc.) of Bayonne, N. J.

Construction of the Midtown tunnel alone would give direct employment to more than 3,000 men and result in orders for great quantities of materials, such as 100,000 tons of cast iron, 40,000 tons of structural steel, 400,000 barrels of cement, and 400,000 cubic yards of sand and gravel. These are orders which would start many wheels of industry running and put many more men to work.

They illustrate how an effective attack can be made on widespread unemployment and business stagnation. There is work to be done. Costs are low. Money rates are easy. These factors combined with courageous leadership in balancing budgets provide the formula for stimulating business recovery.

(A letter from Frederick B. Merkle and a copy of a report prepared by Charles F. Kingsley are here printed in full as follows:)

UNION LEAGUE CLUB OF BROOKLYN,
*February 18, 1933.*

Hon. REED SMOOT,
*Chairman of the Senate Finance Committee,*
*Senate Office Building, Washington, D. C.*

SIR: At the request of your committee for suggestions which might be helpful in aiding our country to recover from this abnormal depression, I am sending, on behalf of the Union League Club of Brooklyn, N. Y., two copies of a report made by the national affairs committee of the said club and prepared by Charles F. Kingsley of the New York Bar.

Very truly yours,

FREDERICK B. MERKLE, *Secretary.*

DECLARATION OF THE COMMITTEE ON NATIONAL AFFAIRS ON THE ECONOMIC CRISIS

(Union League Club of Brooklyn)

*To the honorable the committee on Finance of the Senate of the United States:*

Pursuant to the recent invitation of your honorable body addressed to all citizens for suggestions as to methods for dealing with the present depression, the national affairs committee of the Union League Club of Brooklyn respectfully submits the following:

Capitalism: It is not worth while discussing the contention that this is a transition period and that the capitalistic system must be scrapped and something else substituted for it. The chief objection to the capitalistic system is that while it has accumulated national wealth the distribution thereof has been inequitable and faulty to the extent of creating unnecessary poverty and misery. The remedy lies in a scientific readjustment of distribution, not in the destruction of the system. The practice of burning down the house in order to roast the pig was abandoned long ago. The question confronting us now is, "What is the best policy to follow in regard to specific efforts to bring about a revival, a restoration of confindence, renewed capital investment and a decrease in unemployment?"

Foreign debts and stable currencies: Foreign debts should be taken up with a determination to reach a conclusion and that determination should be effectuated. The whole foreign debt question should be settled. Preferably it should be settled in our interest, but in any event, it should be settled right away. The uncertainties, frictions, baitings, nose-thumbings, now going on should be ended as soon as possible. It is certain that we are to pay more than our fair share of the cost of the war. The conclusion is unescapable. Now that the war is fourteen years behind us, let us have the bitter truth to the last syllable and let us then proceed to something else. This is a counsel of reason, of expediency and good judgment. Let us wind up the debt question as best we may, but let us wind it up.

We do not believe, however, that a debtor should have the last word and the whole say in getting out of an obligation. If it be necessary for the safety of international trade, and it seems to be necessary, that there be an understanding with our principal debtors for the maintenance of a stable currency in order to protect the natural flow of commerce, such understanding should be acceptable to the beneficiaries of the negotiations—the debtors who prefer to use their resources to buy armament rather than pay what they owe. In this connection we quote from Sir Arthur Salter's book, "Recovery, The Second Effort," published last year in which he says, relative to stable currencies:

"The keystone of an ordered economic system is a money that fulfils its function. The world needs a satisfactory medium for the conduct of its trade and the conclusion of its contracts. It is not necessary to abandon different national currencies, pounds, dollars, francs; but if they are to serve the trade of the world they must always be convertible into each other at about the same rates, and must always, be able to purchase about the same amount of commodities. In other words, when we have returned to more normal conditions and prices we want exchange fluctuations to cease, except within narrow margins, and the general level of world prices to be approximately stable. If the principal countries of the world were determined to have such a money they could secure it" (pp. 334–335).

No inflation: Then there is the proposition to inflate, either by printing more money or reducing the content of the gold dollar—in effect much the same thing. We want nothing of it. Let us adhere to the policy which has made our credit the highest in the world. If one of the nations which is about to seek an adjustment of a debt incurred when her people were shuddering on the edge of an abyss has secured some apparent advantage by going off the gold standard, the next few weeks will show how futile and illusory that advantage is and will leave her to sweat out her own salvation as best she may. Neither debasing the national currency nor going off the gold standard is the American way of solving the problems of a depression. The example of the mother country is one to avoid. If we are to pare down debts in order to tide over the emergency, let us do so openly, candidly and in terms. We can ease the strain upon debtors by liberalizing the bankruptcy law, legalizing compromises with creditors, postponing collections by intelligent moratoria, reducing the rates of interest and forbidding the use of the mails to financial insitutions which refuse to follow the policy outlined by the Government in regard to these matters. It is easy to talk of a "controlled inflation" but hard to belive it possible. If the flood gates ever are opened they will not be closed. Printing presses are too handy, men are too willing to die over the day and let to-morrow take care of itself. There is such thing amid a diversity of counsels as a "controlled inflation." We must keep away from inflation altogether

Private capital in self-liquidating investments: Release of credit should be sought by every legitimate method. Self-liquidating investments should be encouraged and private capital should be urged to make them. Many important public works can be stimulated by Government and private capital induced to construct them if special provisions be made to insure their self liquidation. The list of such activities is a long one. There are bridges, tunnels, highways, hospitals, tenements, schools, airports, canals, which private capital, if benevolently protected, will build. This will furnish employment to large numbers not alone in construction, but also to an imposing extent in operation and maintenance. It is not necessary that the funds of the Government be employed in such enterprises beyond a limited extent. Capital if properly encouraged will carry them out and on.

Bonuses: The question of paying bonuses to veterans we leave to your discretion with the suggestion that one bonus should not be allowed to pave the way to another bonus. The country has neither the wealth nor the desire to embark on a policy of successive bonuses. A payment, bounty, premium, or bonus to farmers would be almost immediately disastrous. To tax a people in order that the money may be used to make the necessaries of life cost them more than they would have to pay if not taxed would constitute a monstrous injustice which could not survive one moment after its true nature became generally known. The proposition is not alone unconstitutional, it is absolutely inequitable and oppressive.

Control of agricultural production: Reduction of acreage can be started at once by the refusal of the Government to rent any of its own land for competition with the farmer. Increase of acreage can be opposed by the Government to the extent of refusing to expend any money for reclamation and irrigation in new projects. We have too much arable land just now. Reforestation should be made an extensive policy of Government both because of the direct and indirect influence it will have upon the situation. Controlled acreage is no more difficult than making up tax lists. Every government since Domesday Book has been efficient at making such lists. Every farmer should be informed by the Department of Agriculture just how many acres of his land should be cropped and what he should raise. Left to his own devices he will promptly increase the acreage suggested him in the hope that other farmers will do as they are advised, thus making a good market for him. If he knows when such advice is given him that it is given only to licensed farmers and that only licensed farmers can sell to licensed produce dealers and that his license is automatically voided if he disregards the instructions of the Department of Agriculture as to acreage, he will not run the risk of overcropping. Such a policy carefully worked out (it is not a big job) will put the farmer back on the road to prosperity, diminish his work, increase his income, make him a factor all around the ring in the purchasing market and do more to restore prosperity than anything and everything else so far suggested. With 22,000,000 farm people broke and out of the consuming market we can not hope to get prosperity back. Let them have something worth while for their work and their investment and they will restore the whole social fabric to solvency and prosperity. This can be accomplished by the comparatively simple plan we have indicated and the people of the cities and towns will not pay much, if anything, more than they do now for the products of the farm. It matters not whether wheat be 30 cents or $1 a bushel, the loaf costs practically the same at the baker's and the same is true in a less apparent degree in regard to other products. In any event, there is no one who begrudges the farmer a fair return upon his work and investment and everybody will rejoice if and when a plan for insuring them to him is worked out and adopted.

Embargo on dumped products: Authorize the Tariff Commission to put an embargo on the dumped imports of countries milking their creditors with a depreciated currency and throwing their products into our markets because of the cheap labor they are able to use and pay with their cheap money.

Let it be finally known that there is to be no inflation and there will be a prompt loosening of credit. Gold is now closely held. Doubters of this statement should try to get some and be convinced. In the event of inflation the banks holding the gold would pay off their depositors in depreciated currency and thus make an enormous profit and intensify the rigor of the situation. Their profits would be enormous. It may not be long before some of the "financiers" will be suggesting "controlled inflation" in order to make those profits. Scotch the snake of inflation with determination and credit will be loosened forthwith. That is the kind of expansion we want.

Lower rates of interest: It may be argued that the sanctity of contracts will forbid interference with rates of interest already established. If that is the case, then let a tax be put upon interest payments according to the amount charged. A tax absorbing all interest over 4 per cent would have the same effect as a valid law reducing rates from 6 to 4 per cent. As soon as the creditor would discover that all over 4 per cent of the interest collected by him would be taken by the government as a tax he would reduce the rate for the benefit of the debtor. Such a tax would ease the burdens of debtors generally, would obviate the disastrous expedient of inflation, would release credit and quicken the course of business.

Balancing the budget: We take it for granted that you will see the necessity for balancing the Budget and will do whatever is necessary to accomplish that desideratum. Bonuses, bounties, special favors in the way of appropriations will necessarily be avoided. No government can function successfully for long if it is so managed that it is constantly borrowing money to cover current expenditures and the United States is no exception. This does not mean the Budget is to be balanced upon the theory that there is no limit to the tax-paying ability of this people. It means a task which must be accomplished with a minimum increase of burden upon the taxpayer and a maximum of thought and intelligent economy on the part of Congress. Above all let us cease quoting a proposed beer tax as a financial panacea for all deficits. The beer tax, if and when levied, will be but a drop in the bucket against the deficits now steadily mounting. Statesmanship must suggest something more than a tax on beer.

Public unrest: Let us remember that in the midst of unexampled plenty this period of want and unemployment has developed. Why should men, of all animals, starve in the midst of a plenty created by their own industry—their own hands? There is no answer except profiteering, excessive indebtedness, high interest, distribution so faulty that it would be a cause for astonishment, contempt and laughter on our part if practiced by a community of squirrels. We, however, have sanctioned it by law and we maintain it by courts, policemen, and armies. If such a condition would be idiotic if developed by squirrels why is it sensible or permissible among men?

Your own daily mail shows you how acute your problem has become. Nobody ought to be better informed than the Members of Congress.

Machines, men, and science: The welter and confusion of the time are not machine made, but man made. This is an era of invention, machinery, and applied science, marvelous in vision and efficiency. Progress in the arts of civilization must be made a matter of rejoicing, not of regret. Never was there such an opportunity for the Nation to establish a permanent and satisfying prosperity. Every requirement for such a result is at hand. History never afforded such an opportunity for constructive statesmanship. We have an abundance of all things including the means of making it constant. Interest, debts excessive taxation, reckless expenditures, unbalanced budgets, worthless currency, must not be allowed to choke a fair distribution of that abundance nor dislocate and unbalance the prosperity it should guarantee.

We have spoken thus confidently on the matters brought to your attention because we have given them much attention during the past three years and they represent our matured conviction after much thought and discussion. None of us claims special ability for solving such problems as we here discuss, but when a man like the governor of the Bank of England says the case is beyond him, we have no hesitancy in expressing these views.

We recapitulate:

1. Capitalism—so called—will be retained.
2. Foreign debts should be settled at once and decisively.
3. We should not inflate either by printing money or by paring the dollar..
4. A controlled inflation is a snare and a delusion.
5. There should be no bonus to farmers.
6. Control of agricultural acreage and crops should be effected.
7. Dumping made possible by cheap money in other countries should be prevented by embargo.
8. Private capital should be encouraged to construct self-sustaining enterprises.
9. Inflation should be made so obviously impossible as to release credit.
10. A licensing system for acreage and marketing should be perfected so as to insure controlled acreage and production.
11. Interest should be cut down by direct law and by taxation upon the earnings of existing contracts.
12. Government should benevolently stimulate enterprises undertaken by private capital to the extent of granting special privileges to the end that self liquidation be insured.
13. Twenty-two million farm people should be brought back into the consuming market.
14. Balance the Budget.

We appreciate the opportunity you have afforded us to submit these recommendations.

COMMITTEE ON NATIONAL AFFAIRS, UNION LEAGUE CLUB OF BROOKLYN,

F. J. H. KRACKE, *President.*
FREDERICK B. MERKLE, *Secretary.*
CHARLES F. KINGSLEY, *Chairman.*

(A letter and brief submitted by Mr. A. E. Taylor, Stanford University, Calif., are here printed in full as follows:)

FOOD RESEARCH INSTITUTE,
*Stanford University, Calif., February 16, 1933.*

HON. REED SMOOT,
*Chairman, Committee on Finance, Senate Office Building,*
*Washington, D. C.*

MY DEAR SENATOR SMOOT: I acknowledge receipt of your invitation of February 8 to appear before the Senate Committee on Finance. I regret that at this distance it is not possible for me to appear in person. Therefore, I accept your invitation to present a brief, which is inclosed herewith.

Will you do us the favor to instruct your secretary to send to the Food Research Institute of Stanford University the printed reports of the Hearings on the Depression now under way.

Thanking you, I remain, very truly yours,

A. E. TAYLOR.

STATEMENT OF ALONZO E. TAYLOR, FOOD RESEARCH INSTITUTE, STANFORD UNIVERSITY, CALIF.

The present depression is not merely a severe instance of the recurring trade cycle; it is a drawn-out crisis unprecedented in characteristics, extent, and intensity. Under these circumstances, pride of opinion is parcticularly out of place, since no one person can hope to understand the entire problem. The views which follow are based primarily upon study of the commodity phases of industry, agriculture, and commerce.

I. The pressing difficulties of the time proceed from the low level of price and the high level of debt. The ultimate causes are to be found in the management of the World War and the mismanagement of postwar reconstruction. Low prices of commodities and the high fixed charges of heavy debts interact upon each other in a vicious circle. At the same time, low-price level and high-debt level have each their directly injurious effects. The low-price level of crucial importance is that of the primary raw materials. This is an international circumstance; in all countries the prices of raw materials (with few exceptions) are down to, or below, the low records of a century. Since the volume of debt is everywhere large—national and international, governmental and private—it follows that the disequilibrium between price level and debt level is universal. In the broad sense, recovery must be international if it is to be rapid, since we can not expect rapid recovery in one country with continuing depression in the others. It seems to be a favorite doctrine in Europe that the crisis began with raw materials and recovery will begin there.

The low price level of the primary raw materials is due mostly to (*a*) increase in the value of gold, and (*b*) contraction in the plane of living, using this term in its broad sense. The increase in the value of gold is not due to shortage of the metal; it is due to mismanagement and breakdown of the gold standard, weakness and inconsistence in central bank policy, flight of hoarded and sequestered capital from one country to another, governmental rationing of exchange and trade, and the all-too-familiar economic nationalism. The world stock of monetary gold is equivalent to $12,000,000,000. The outturn of new gold will exceed a half billion dollars in 1933. For special reasons, in different countries, hoarded gold is emerging to be joined to monetary gold. The gold stock and the rate of outturn of new gold are sufficient to support a reflation of the price level, whenever this gold is effectively set to work to influence commodity prices. Restoration of the gold standard in Great Britain (and in the numerous countries whose currencies are linked with sterling) and an improved program for gold working as metallic reserve throughout the world are essential for reflation of the price level of primary raw materials in terms of purchasing power.

II. Reflation may be aided within a country by a low rediscount rate, open-market purchase of securities by the central bank, and by a large governmental program of public improvements. Accomplishment in the direction of reflation in the United States through the use of these devices has been disappointing, though it is clearly too early to pass judgment since there is a lag in the effect of credit inflation on price. We have, indeed, very low bank rates, and our banks are filled with balances earning next to nothing. The banks fear to lend because they lack confidence in their depositors; business men do not borrow because they lack confidence in their ventures and in the buying public. Eventually distrust wears out, unless fed by new episodes of distress. Bankers get tired of bulging deposits and set out to find employment for money; business men tire of inaction and resolve to take the risks of endeavor. The influence of credit inflation on prices depends directly on confidence, on the use made of credit; and it is up to the public to make good the reflationary policies of the Federal Reserve System. In respect to a program of public construction, this country has made a lamentable showing, since public construction has declined during the depression instead of having been maintained to combat it.

III. Inflation of currency is to be condemned. If carried to a significant extent, under present conditions in the world, it would involve our departure from the gold standard. The hypothesis that the gold content of the dollar could be reduced to correspond with the price level and provoke a real increase in the price level fails to take account of the foreign situation. The foreign countries could always keep one jump ahead of us in currency inflation; therefore, our relative position could hardly be improved. To leave the gold standard would be to join the procession of depreciated currencies; in this depression the devil will get not merely the hindmost, but also the leaders. A world that can not manage currency under the gold standard surely can not manage without it. Inflation of the gold standard through free coinage of silver is now widely advocated in the Western States; but a comparison of the commodity relations of gold and silver does not support the hope that silver can raise gold to the support of inflation.

IV. The plane of living is contracted, more or less everywhere in the world, by lack of confidence in earnings and insecurity in possession of property. During this century (despite the war, but partly because of it) the plane of living has been significantly elevated. It has been elevated and expanded by the inclusion of comforts, luxuries, recreations, and cultural advantages, which involve services more than goods. The transition has been so recent and so rapid that we have not forgotten the simpler living. On provocation, through lack of confidence and insecurity, we are able substantially to contract our plane of living. In 1928 scarcely more than a third of the national income was expended for the goods and services which would have been called necessaries in the nineties; our expenditures for other goods and services are in 1933 much lower, in terms of the 1928 dollar. The rural folk are back to the simplest country living; the employed working classes reduce outlays in order still to save something; the unemployed are living on bare subsistence. Unemployment of workers in the so-called luxury trades is now a conspicuous fact. Consumer strikes, consumer resistance, consumer caution, consumer saving, as they may be called in different income groups, involve not merely self-denial but to a significant extent the substitution of cheaper for dearer goods. The net effect is widespread unemployment of capital and labor. Our unemployment of workers to-day consists of three fractions: technological unemployment, the unemployment of reduced exports, and the unemployment of reduced domestic consumption. The low price level of primary materials is not due to over-production, it is due to contraction of the plane of living—in short, to underconsumption. This underconsumption may indeed be relative and not absolute, but the effect on the price level is about the same. People will not return to the spending habits of prosperity until the income and security of prosperity are restored. Consumers' confidence must be restored before demand can be equated with supply in a higher price. Under usual circumstances, consumption expands with falling price: in pulling out of a depression, consumption expands with rising price. Maintenance of purchasing power is indispensable to recovery.

V. With respect to agriculture, much more might be said than finds place in a brief. Comment here will be limited to debt, taxation, price raising, acreage, and transportation. The farm mortgage debt aggregates $9,000,000,000. The most important part of this debt lies on the farms operated by their owners. Apparently about half of the owner-operated farms have mortgage debt. Those owners who have no mortgage debt have largely lost the advantage of this position, since their savings went mostly into mortgage loans to other farmers, purchase of stocks of country banks, and deposits in country banks, which have been wiped out to a large extent. No realist believes that the farm mortgage debt can be paid off at face value. It is necessary to reduce the face value of the gross farm debt by 40 or 50 per cent and reduce the rate of interest to something like 4 per cent. Such refunding ought to be done, whenever possible, directly between lender and borrower. But to the extent that lenders can not carry through such liquidation unaided, appropriate legislation should be enacted to distribute the risk and tide over the period of transition. A socially sound bankruptcy law would help greatly.

VI. The level of farm taxation is based on the commodity price level and the land value of 1928–29. A refunding of farm mortgage debt implies a reduction in the assessment. A reduction in the price level implies a lowering of the rate of taxation. The farmer, in the prospective future, can not carry the present dollar burden of taxation; and if a substantial reduction in public revenue derived from farm taxes leads to a curtailment of social services, then these will have to be relinquished by the urban and rural population. The time for tax-exempt securities is past; when these are appropriately taxed, the burdens on the land will be alleviated.

VII. Endeavors to raise the prices of farm produce by so-called farm-relief measures are everywhere disappointing except in net-importing countries. In a business depression, one can not purchase agricultural products and impound them in the hope of driving up the price. The hoped-for result does not transpire, as has been shown again in the failure of so-called stabilization by the Federal Farm Board. The farmer can not pull himself up by his bootstraps, and the lift is no different if Uncle Sam tugs at it. If valorization is to be of advantage, it must be done by buyers, not by producers. The farm allotment plan will prove a disappointment if it is enacted. If the operation were confined to wheat and cotton, this would introduce inequities between producers, curtailing consumption of wheat and cotton and increasing consumption of other products. Since processors would be unable to pass in full the increased prices to consumers, they would be compelled to reduce prices to producers, since processors could not absorb the taxes without inviting disaster. If the plan should initially work for wheat and cotton, the farmers raising the unassisted products, and compelled as consumers to pay their shares of the enhanced prices of wheat and cotton, would protest socially and politically. If the farm allotment plan were expanded to include other crops, which have as much right to price assistance as wheat and cotton, and thus become equitable for all, it would be unweildy and unworkable. From every technical point of view, the export debenture, applied on a sliding scale in respect to acreage, holds more promise in the positive sense, and shows less disadvantage in the negative sense than the farm allotment plan.

VIII. Export of farm produce has poor immediate prospects. High fixed charges, despite mechanization and rationalization of agriculture, prevent farmers in this country from bringing down production costs per unit low enough to enable us to export remuneratively in competition with countries where fixed charges are lower, costs of living lower, and currencies depreciated. Acreage must be reduced, but the farmer will not move to do it unless compensated. The simplest plan would be to lease acreage to lie fallow. A withdrawal of 50,000,000 acres now under tillage (most of it submarginal at present price level) would represent an approach to domestic requirements. Behind the tariff wall, contraction of acreage would lead to increase in the price level of farm products. The leasing cost would not be heavy, not over a quarter of a billion dollars; leasing land at $5 an acre, without expense to the farmer, ought to be acceptable as increase to gross farm income. Such a sum could be raised by a low tax on processing of farm products, so moderate that it could be passed on to the consumer.

IX. The prices farmers pay are disproportionately high. The excessive debts and inflated values in the cities will also need to be liquidated by refundings. Real estate mortgages in New York City are believed to equal in gross sum the farm mortgages of the entire country. The debts on the skyscrapers are higher than the number of stories. When the real estate and capital equipment of the cities are reduced to real values, this will be reflected in lowering of the price of finished goods, which will represent a saving to farmers on the articles purchased for the home and for the operation of the farm.

X. It costs too much to get farm products to market. While it is true that freight rates must bear a relation to cost of service, it is equally true that such rates must be related to what the traffic will bear. Freight rates on farm products are out of line with the price level, especially with the farm prices. Railways are under heavy taxation, much of which is reflected to the farmer. Railways have an overextended financial structure, based on obsolete practices of competition, with attendant waste and needless exaggeration of costs. It is socially important that the insurance companies be protected in their investments in railway bonds. It is not correspondingly important to protect the holders of railway stocks. It may eventuate that in future the railway share of the transportation of the country will pay out their bonds but not their stocks if freight costs are reduced to correspond to commodity values. Time was when radicals wanted the Government to take over the railways in order to obviate alleged exploitation; the time may come when the railways request the Government to take them over to absorb the losses on present financial structure. In any event, farm products can not continue to pay freight rates which are grossly out of line with the price level.

(A letter and a report submitted by R. U. Delapenha, New York City are here printed in full as follows:)

R. U. DELAPENHA & CO. (INC.)
*New York, February 16, 1933.*

Senator REED SMOOT,
*Senate Office Building, Washington, D. C.*

MY DEAR SENATOR: Realizing that I might have had to remain in Washington for several weeks to have had the opportunity of appearing in person before the committee, I deem it advisable to send to each member of the committee a copy of the report that I would have made had I appeared in person.

I ask that this be made a part of the record, and be printed with the oral statements made by those who will appear; and I also request that a copy of the hearings be sent to me as soon as they have been concluded and printed.

Thanking you for your usual courtesy, and happy to have seen you again, with kindest regards I remain,

Yours very sincerely,

R. U. DELAPENHA.

STATEMENT OF R. U. DELAPENHA, PRESIDENT OF R. U. DELAPENHA & CO. (INC.), A CORPORATION EXISTING UNDER THE LAWS OF THE STATE OF NEW YORK, MANUFACTURERS OF FOOD PRODUCTS, WITH TWO FACTORIES AT POUGHKEEPSIE, N. Y., AND IMPORTERS OF FOREIGN FOOD PRODUCTS

The various opinions are being expressed from day to day by professional politicians, statesmen, professors, leaders in industry, engineers, ministers of religion, and others on the causes of the present unprecedented period of depression through which our country is passing, and the suggested remedies that should be applied leave one's mind in a complete state of confusion and results in the seeming impossibility of suggesting a program that has for its object improving the present chaotic conditions that exist in almost every realm of endeavor throughout our Nation. It is my judgment that any attempts that are made to compare present figures either as to costs or quantities with those that existed in 1928 or 1929 is futile and erroneous. We shall have to completely eradicate from our minds the period beginning on August 1, 1914, to December 31, 1929.

There can be no comparison that would prove useful between periods that are both of them in a sense artificial.

The rate of production and the volume of business in 1928 and 1929 were brought about by a series of circumstances that created unusual demand by inflationary methods and that finally ended in disaster.

And because we keep thinking of the period which commenced in 1921 and ended in 1929, we are unconsciously hoping that some way will be found by which our country and its people will enjoy again the benefits that the period to which I have referred brought them.

It would seem as though the only valuable comparison would be to take the figures, both as to production and costs, that existed in 1913 and 1914, just before the world went mad, and the prices and costs that exist to-day, and see what relation they bear to one another.

In other words, the processes of recovery must come very slowly, and must begin with a natural improvement in agricultural prices and products of the mines.

It seems to me that if we can agree as to why we find ourselves in our present condition we shall have gone a long way towards endeavoring to find a remedy for our troubles.

There are those who argue that there can be no overproduction, but that what we are suffering from is underconsumption.

I take no such view of the situation, and no one who passed through the period from 1914 to 1929 can deny that the exigencies of the war brought about a continual demand for products of the fields and mines, as well as manufactured articles of all kinds. As the demand increased from day to day, so values increased in proportions, until our factories were working at capacity, and eventually became overburdened with excessive overhead, that when the crash came could no longer operate profitably; to which must be added the stock-jobbing operation and the building of new units to still further increase production during the post-period of the war that took place from 1920–21 to 1928–29. This situation then left our warehouses and factories with far more merchandise than could be consumed in the ordinary way, with the result that business has been shrinking; surpluses have been reduced, and in a large number of instances completely eliminated; bankruptcies have multiplied; banks have been forced to close their doors; and wherever you go, and to whomever you speak each has a particular formula of their own to create improvement.

Our Government has passed laws that are palliatives, but not remedies.

I do not speak of speculation, or gambling, or investments in stocks and bonds, the collapse in values leaving a trail of human misery that is unparalleled in our history.

So many people seem to regard the present period of depression as something that is recurring; something that our country has passed through before; something that will settle itself eventually as in other periods.

My contention is that this period can not be compared to any other through which our country has passed, because it is not a local condition, but is world-wide, and the reasons that it is felt to a greater extent by our people than those who live in other countries can be explained, I think, by the difference in our scale of extravagant living.

We business men, who are in the front-line trenches every day of our lives, can not help but recognize certain factors that are exceedingly dangerous if allowed to continue unbridled.

## PRICE CUTTER

I wish to particularly refer to the price cutter, the man who thinks that he can, by obtaining a temporary advantage, get away from the responsibilities and the dangers of the period through which we are passing, and who causes his competitor to take steps to protect himself and his wares, with the result that little by little, slowly but surely, industry has arrived at a point, where unless this destructive competition is controlled and stopped, a very large percentage of the manufacturers in our Nation will be forced out of business by complete collapse.

Manufacturers to-day are ruining one another by being forced to sell their products below the actual cost of production. This is a useless waste of capital that brings benefit to no one, and should be stopped at once.

I want to right here refer to a minority opinion in March, 1932, of Mr. Justice Louis Brandeis of the United States Supreme Court (with Mr. Justice Stone concurring):

"The people of the United States are now confronted with an emergency more serious than war. Misery is widespread in a time, not of scarcity, but of overabundance. The long-continued depression has brought unprecedented unemployment, a catastrophic fall in commodity prices, and a volume of economic losses which threatens our financial institutions. Some people believe that the existing conditions threaten even the stability of the capitalistic system. Economists are searching for the causes of this disorder and are reexamining the basis of our industrial structure. Business men are seeking possible remedies * * *. Many persons think that one of the major contributing causes has been unbridled competition. Increasingly, doubt is expressed whether it is economically wise or morally right that men should be permitted to add to the producing facilities of an industry which is already suffering from overcapacity * * * all agree that irregularity in employment—the greatest of our evils—can not be overcome unless production and consumption are more nearly balanced. Many insist there must be some form of economic control. There are plans for proration. There are many proposals for stabilization. And some thoughtful men of wide business experience insist that all projects for stabilization and proration must prove futile unless, in some way, the equivalent of the certificate of public convenience and necessity is made a prerequisite to embarking new capital in an industry in which the capacity already exceeds the production schedules."

And I also wish to quite from an address that was given by Mr. Julien Elfenbein, managing editor of Haire Business Publications, on January 17, 1933, wherein he states as follows:

"I wonder if Mr. Justice Brandeis may not be also prophetic? The law which denies the privilege to business men to conspire together to enhance their prices to the disadvantage of the public is a just and ethical law and it provides punishment for the offender. The law must also deny the privilege to cutthroats who severally or individually cut prices, by any method, for the manifest purpose of destroying the legitimate profits and legitimate business of their competitors. And it must provide punishment for these offenders. Let the public interest be the test of right or wrong."

NATIONAL EMERGENCY

It would seem to me that a state of national emergency exists, and that if Congress had the power to pass the law known as the Sherman Act that common sense should dictate that in this period of "national emergency" they should have the power to suspend the Sherman Act, at least until the emergency had passed, and which would permit manufacturers, with the advice and assistance of the Government, to regulate prices and stabilize a situation that has already reached a point where trading is almost impossible. No one is benefiting by selling merchandise of all kinds below the cost of production, but everybody is injured by this method, as little by little the quality of the merchandise is reduced until it gets to a point where even the ultimate consumer rebels at the class of products that she is asked to purchase.

PRICE FIXING

Price fixing does not necessarily mean robbing the public. The Government can see to it that the consumer is fully protected both as to quality and to price, but industry is entitled to a reasonable return on invested capital, and Congress should lend itself to finding a means of protecting both the consumer and capital as well.

Common sense also tells me that the government of any country is simply the larger individual. The individual is compelled by force of circumstances over which he has no control to limit his expenditures to his earnings, whether as an individual or a copartnership, or as the leading head of a corporation. In other words, unless one is prepared to accept the sacrifices that are necessary to permit him to continue in business, the only other alternative would be to go through the bankruptcy court.

Therefore, in view of this fact, it is my judgment that the Federal Government, irrespective of the pressure of political interference, should at once cut down Federal expenditures to a sum not exceeding $3,000,000,000, and by doing so insure the credit of the United States by balancing our Budget.

If this can be accomplished, and were I given the power, I should at once declare a 1 per cent consumers' sales tax and which every individual would pay, and which can be collected with less red tape than the present involved system of taxation, and which can be immediately put into operation and kept in operation during the period of the national emergecy that exists.

However objectionable it may be to our institutions to even refer to a dictatorship, it is my judgment that in a period of this time that if one business man that was qualified for his job, after a conference of the managers of industry in the United States, had full power given him to take decisions and to put them into force, confidence would be far more rapidly restored than by endless debate with all kinds of cures being suggested, some of them not bearing any relation whatsoever to our present situation.

It is my earnest opinion also that the currency of the country should remain sound, and should be kept in the gold basis. Any attempt towards reducing the value of the dollar, or any other method that would cheapen its present value would, in my judgment, end in complete collapse.

I want to repeat that common sense should be the guiding force, and no other.

(A letter and brief submitted by Mr. M. K. Graham, Graham, Tex., are here printed in full, as follows:)

GRAHAM TEX., *February 14, 1933.*

Senator REED SMOOT,
*Chairman Committee on Finance, Washington, D. C.*

DEAR SENATOR SMOOT: I thank you for your invitation to appear before your committee.

I am greatly interested in the subject, and I take pleasure in inclosing herewith my brief, which was prepared as new matter for my book, Continuous Prosperity, a copy of which I am sending you to-day.

I doubt if my appearance before the committee would aid materially until the matter now submitted is digested. Then, if you desire, I will be happy to comply,

With the hope that the work of your committee will prove fruitful,

Yours truly,

M. K. GRAHAM.

## AN ARGUMENT FOR DEVALUATION AS AN EMERGENCY REMEDY FOR THE PRESENT WORLD WIDE DEPRESSION

(By M. K. GRAHAM, Graham, Tex.)

### SOUND MONEY

One major political party declares for sound money, the other for the maintenance of the gold standard, and the writer proposes the abandonment of the gold standard, yet all three may be construed, without subterfuge, to mean much the same. Sound money and the maintenance of the gold standard both contemplate currency redeemable in gold, while it is proposed herein that the gold content of the dollar shall be reduced and that it shall then be stabilized, as nearly as can be, in terms of commodities. Thus the new dollar will also be a sound one on a gold base, equally as honest and unprincipled as the present one.

While credit expands, prosperity reigns; while credit contracts, depression. This is the cycle. There must be a rhythm, but its oscillations need not be catastrophic. After too much credit, depression must continue until the excess credit has been retired. To issue more credit, merely retards the recovery.

This excess credit during depression persistently endures as intolerable debt and fixed charges which can only be discharged in gold either by devaluation of the unit of payment or by long continued bankruptcies. We must choose one of these courses, remembering always that the present gold standard has not saved us from depression or tempered it or shortened it and that inaction is a vote for this standard, entailing sacrifices and hardships for years and possible revolution; whereas all other major nations have, in recent years, depreciated their currency once or twice with slight damage to their reputation and with benefit to their financial health.

### TOO MANY INCONSISTENCIES

The gold standard and central bank theory are inconsistent; the central bank relies upon a high bank rate to discourage credit issue whereas a high bank rate tends to attract gold and to make the member banks independent of the central bank. While the central bank's power is largely a negative one, a low rate tends to expand credit issue, yet a low rate also tends to expel gold and thus to decrease member banks' reserves and to contract credit. The gold standard and our protective tariff are also inconsistent: other countries with depreciated money are enabled to undersell us here, tariff included, and greatly to undersell us elsewhere.

The nations now on the gold standard have little business with each other, hence it is no longer a going international standard; and, especially since the gold standard interferes with central bank management, there is no likelihood of the other nations returning to the gold standard as long as gold is too valuable. Furthermore, since we will not permit payment in goods or services (if we can prevent it) and the consequent increased demand for gold increases yet more its value, our position as chief creditor Nation is made very difficult. Our gold standard has thus become an intolerable burden.

These inconsistencies should be reconciled. But, instead of doing so, we mismanage our money and credit as the rustic does his leaky roof. Domestic debtors are powerless to act; whereas creditors and salaried men, who are our leaders and could act, are silent. They say that all will work out for the best and that, anyway, nothing can be done about it. Yet decay spreads.

Our foreign debtors have managed better. Once before they had their debts revised by law in accordance with their ability to pay; and they are now demanding another revision downward, by law, to offset golds' inflated value under gold standard demands and practices. Shall there be legal revision of debts downward for the foreigner and no relief for the domestic debtor?

Gold should be retained as our monetary base but not as a standard; and its vagaries should be corrected. Devaluation of the dollar would automatically end the agitation for revision of both foreign and domestic debts and fixed charges. Our senseless support of gold's swollen value is retarding recovery everywhere.

### DEVALUATION OR NOTHING

With the world's intelligence as it is and its experience as it has been, no money can be considered sound unless it has a gold base. All other moneys are wholly managed and hence are undesirable because they are under suspicion. And no country can be partly gold and sufficiently greenback to inflate values appreciable any more than it can be partly free and partly slave. We solved both of these questions three generations ago. The choice must be gold or greenbacks because gold and greenbacks will not circulate together unless they are freely convertible and convertible currency (not bank deposits) normally has no effect on prices.

Anyway, both major political parties have declared for sound money so we could have fiat money only by revolution, yet we earnestly desire that our sound dollar's command over goods, be lessened. Clearly, the only way we can both keep our gold and attain this desire is either to lessen the value of gold or to lessen the quantity of gold in the dollar.

But we have done all we could think of to lessen the value of gold and yet retain it as our monetary base, and all to no avail because gold's real value is its world value and we alone are powerless to depress its value at will. Others must cooperate. We might possibly have held it down if it has not fallen too low.

There remains then only to devaluate the dollar—to lower its gold content. We can not compel the mountain to come to us but we can go to it.

Let no one argue that Congress has not the power to declare this lighter dollar to be legal tender for all domestic debts. Countries from time immemorial have exercised this right and to argue otherwise would be to argue that one Congress is superior to another and to destroy the supreme pardoning power which must always be vested somewhere. Suppose gold's value should rise to ten times its present value; what then?

Are its ethics questioned? Ordinarily, Peter should not be robbed to pay Paul. In defense, restitution is pleaded. The historic case of the pot versus the kettle is cited. And then the general plea of good intentions is offered. They who hold devaluation to be unethical, should recall what the man Joshua (Robespierre's exemplar?) did, by order, to the Jerichites and others.

### THE PROMISED LAND

The children of Israel came in sight of the promised land only to turn back and to wander aimlessly in the wilderness until their reactionary leaders had fallen by the way. And so with us, it seems. Now we want to get out of the depression; but, unless we know where and how we want to go, we shall wander in circles and get nowhere.

So let us decide definitely that our aim shall be to get back to that higher plateau of the "New Era" and to try to stay there. And, lest we wander, let us drive down stakes to direct us.

(1) We must have sound money, that is, money on a gold base.

(2) Sound money on a gold base means that all currency and deposit currency shall be freely redeemable in gold; and this means that all goods in the world market shall be valued in terms of gold.

(3) Gold is cosmopolitan and gold's value is its world value, the same the world over, place and time considered.

(4) One nation alone, with less than half the world's monetary stock of gold, can not, at once, materially change the value of gold. The cooperation of the other owners must be given. One nation, alone, might tend to decrease, within its limits, the value of gold in terms of its goods; but the consequence would certainly be to lose its base of gold to others who valued it more highly.

(5) Currency as such, on a gold base, normally has no influence on prices, because we have as much as there is any effective demand for and no more. We have a billion dollars more currency outstanding now, with prices and business scraping bottom, than we had in 1929. If more should be handed out as a soldier's bonus, this would stimulate trade temporarily but it would soon find its way to the banks and be retired; and more greenbacks or silver would simply retire an equal amount of Federal Reserve notes and render the currency less elastic. The same as to public works, financed by bond issues. The stimulation would be only temporary because the remedy could not raise world prices, including domestic prices, in terms of gold and hence could not remove the obstacle of debt and fixed charges.

(6) The road out of the depression must in some way get through the wall of debt and fixed charges which obstructs it or else follow along this wall until it can get through. We may wander on the wrong side of it for years to come.

(7) While we have no definite control over the value of gold in terms of goods, we do have a very definite control over gold, as regards our debts and fixed charges. By legislative decree that the dollar shall be devalued in terms of gold, the world price of goods in terms of gold would not at once be greatly changed, but the world price of goods in terms of the dollar would certainly be raised, thus easing the payment of debts and fixed charges. We should soon then regain the higher plateau of the "New Era," to dwell there as long as we should have enough intelligence to do so. The emergency operation of devaluation is a major one; but it is a definite one which need not again be necessary, if we shall be able to profit by experience.

## HOW DEVALUATION WORKS

Devaluation will do promptly and effectively what inaction will require years to accomplish. It will thaw out frozen debts, both domestic and foreign, and thus end failures. It will reduce to bearable proportions taxes and fixed charges. It will restore effectiveness to our tariffs. It will continue the work and pay of those now at work and will renew hope in men's hearts by saving their homes for them and by once more filling their dinner pails. It will hasten the return of the nations to a common standard of value and thus speed up the wheels of foreign trade.

Why all this? Because devaluation will definitely break the constrictive power of gold over America by decreasing the dollar's command over goods and this will, in turn, have a favorable international reaction. Since the devalued dollar would contain less gold, certainly it would buy fewer goods which is but to say that our goods would bring proportionately more dollars. Thus devaluation would tend promptly to remove the excess credit outstanding just as time, more slowly, will do, this unbalanced credit being the obstacle to recovery.

More in detail, referring to the Foreword and reversing the order, men owe debts and taxes which have been increased greatly beyond what they would, ordinarily, be required to pay. They can get money with which to discharge these only by exchanging their services or their goods for dollars. It is reasonable to suppose that they can demand, and reasonably expect to receive, more dollars for their goods and services if the dollars are made lighter in terms of gold; not at once, perhaps, but this will certainly be the tendency, both reasonable and urgent. Contrast this with the existing method of settlement: the debtor who can pay in full receives no concessions. The debtor who can not pay, receives only the concessions which his inability to pay demands. The creditor gets all he can; and he renews the balance, if there is any possibility of his collecting it later. The creditor compromises his claim only as his judgment, not his mercy, dictates.

The same may be said of mortgages in general. But bank closures differ in that they involve three elements: the debtors of the bank, the bank itself, and its depositors, who are its creditors. Here, the bank is ground between the upper and the nether millstones. The bank is compelled to negotiate with its debtors and to compromise with them as above; but, on the other hand, it is compelled to pay its own creditors (its depositors) in full on demand. Does any bank depositor ever consider making any allowance for the more valuable dollars received by him?

The insurance companies are much in the same position as are the banks. In order to pay their matured policies, or make loans on them as they have agreed to do, they must collect their annual premiums and their mortgages and cash their investments. These they are forced to do as best they can; but they are expected to pay their matured policies in full on demand. Has ever a policy holder demurred at receiving the more valuable dollars? Would he consider accepting fewer of them?

The railway case (and the public utilities, which have much the same financial set-up and control) differs yet again. Their physical plant was built for reasonable use and the slump in business, notwithstanding their efficiency in operation, has tended to extinguish their net profits. Again, here is a three-cornered relationship involving decreasing income and increasing fixed charges. Only the upturn in business which devaluation promises, can save very many of them from receivership, because the bondholders and the taxgatherers, as a matter of course, exact all they can get.

And who are the holier-than-thou reactionaries who scout devaluation? Of course, they are the ones who are licking the cream. They talk compromise but they compromise only when they must. The smaller salaried men and wage earners need not worry greatly about being paid in lighter dollars, since the tendency, under devaluation and reviving business, would be promptly to correct this; rather, they should worry, under inaction, as to how long their present wage or salary may continue at all.

These reactionary, old-fashioned, gold standpatters have been in control for many years. They may mean well but they will not learn. They have been warned continuously of their duty to stabilize the value of their gold and of the dangers of not doing so. But they have consistently disclaimed both this duty and their ability to discharge it. They did not foresee, certainly they did not forestall, October, 1929; and since then, under their guidance, the upturn has been, always, just around the corner; whereas, our course has been downward, always lower. They treat the symptoms instead of the disease. They seem to think that prices are set by God or should be left to chance.

PRICES AND GOODS

Price indices are essentially human phenomena, materially affected by nature only through the weather and the quantity of gold created and surrendered. Man does all the rest. In man's world, there may be goods without money or money without goods; but there can be prices only with both money and goods. Thus there are three variables in the equation of prices: Goods, money, and prices. Let either goods or money vary widely as regards each other and prices must vary widely. While a steady price level is desired, this is possible only on condition that money increase (or decrease) in the same proportion that goods increase (or decrease) (p. 12), supposing that the velocity of circulation of money is a matter of habit with monetary users and that this habit will remain fairly constant if profits, and thus habits in general, remain fairly constant.

Here has been introduced another variable, profits. Our objective, really, is not stable prices so much as an even flow of goods into consumption; and this even flow of goods can be induced only by fair prices while these in turn can be regulated, under our price and profit system, only through the profit accruing to producers. Too high prices, resulting in too great profit, call into being too many goods; while too low prices, with too small profit or even loss, produce too few. Only fair prices result in fair profit and induce the regular habits and the even, continuous flow of goods desired.

Thus while goods and money, normally, are both variables, they are in proper relationship only when their quantities vary together as indicated by a stable price level, the output of goods being increased or reduced by greater or less profit, this in turn being controlled by the amount of money (and credit) made available to the factors of production and to consumers (p. 104). Hence the price level should be the criterion, with the production ratio as an important aid (p. 13). The importance of considering both is exemplified by the recent boom period of 1925–1929, when the price level held fairly steady yet profits were too great, due to economy and efficiency in production, the excessive profits resulting in the too great production of all classes of goods. The production of the excess of goods was financed by the issue of too much credit for the base of savings and by the higher velocity of circulation of money induced. Had the importance, as a danger signal, of the excessive production ratio of goods been known and heeded, the crash might have been averted.

As a corollary from the above, those who undertake to predict future price levels by looking backwards at past price levels may lead astray, for future price levels need resemble past ones only with similar errors persisting as regards money, credit, profits, and goods.

## IN REVIEW

Much confusion results in human reasoning by our thoughts circling too widely and including too many details—by our thinking too generally. Let each consider his own affairs: He knows, of his own experience, that he will prosper only as his income exceeds his expenses, the excess being laid by as savings; that savings in money, as such, are unproductive but may become productive through investment; that this investment may, possibly, be increased by borrowing. He knows, furthermore, that loans to him will be made, in general, only as he has saved and that these loans can be made safely only as he invests wisely. And so, as a nation.

Our equation of prices included only three variable terms, while our reasoning has now been broadened to include profits, loans, savings, and investments; but this need not confuse because these latter are simply component parts of the former, all being included in either money or goods as may be and either entering into the totals or canceling out. As we look back on the years 1925–1929, each can now see for himself that, while our currency and deposit currency (bank money) may not have been greatly excessive, our loans of all kinds, both private and public, were greatly in excess of what they should conservatively have been, since they called into being too many goods of all kinds, and thus interrupted the even flow of goods desired (p. 41).

It may be argued that bank credit (p. 77) alone influences prices and that general credit does not, since here a loan at once becomes an investment, money being only an intermediary, and thus that the loans and investments cancel out. But there is more to it than this because of the basis on which the exchanges are made and are ultimately settled. If they were always made at only a fair profit and if the loans were reasonably well secured and were paid as demanded, unsettlement might not result; but, on the contrary, such trades are on a higher basis than when made for cash and, as business declines, the forced payment of the loans results in progressive disorder. Even bank loans and deposits become separated and their cancellation is thus rendered more difficult (p. 94). General credit certainly influences prices very greatly and must be reasonably controlled (p. 52), if the price-level is to be stabilized.

No bird ever wants or bothers to build for itself more than one nest at a time. The same is true of squirrels and bees. While these latter save for the future, they do so only in moderation. We are none of these but we might do well to learn from them this lesson of moderation. We have only to look about us to see the inequities and the disorders caused by greed, i. e., the insane desire for too many nests, too many nuts, and more honey than is good for us.

Christ preached moderation in all things. His teachings have stood through the centuries, not necessarily because they are revelations from heaven, but because they are fundamentally true of this earth and, being so, they are good economics as well as good morals.

## DANGER OF DEVALUATION

Devaluation is a strong stimulant, so potent that, unless we are men, we had better stay with our bread and milk.

It may seem simple, in present circumstances, to warn against the possibility, in the near future, of too great prosperity. But devaluation, effected properly and in order, might lead to a riot of prosperity, in that it would greatly increase potential bank reserves in dollars; it would invite the erection of a new credit structure on the base of savings, artificially restored by the reduction of debt and fixed charges; it would make possible the prompt restoration of a going international standard of value; and it would strongly tend to decrease the world value of gold.

The control of credit, then, if even a worse smash is to be prevented, would become imperative. Moderation must be the rule. To this end, devaluation, by all means, should be preceded by the unification of the banking system (pp. 64, 114); by authority to the central bank to increase the minimum reserve requirements (pp. 51, 112); and by the adoption of the price level and the production ratio as the criteria of credit control. Legislators and bankers must come to realize the vital importance of these measures.

Here is prosperity for the taking; and here is its danger. Weigh these against the world's present distress and then decide.

(A brief submitted by Mr. Norman Lombard, New York City, is here printed in full, as follows:)

SUGGESTIONS LOOKING TO THE CURE OF THE DEPRESSION AND TO CONTINUED BUSINESS, ECONOMIC AND SOCIAL STABILITY BASED UPON AN OUTLINE PREPARED FOR AMERICAN ENGINEERING COUNCIL, WASHINGTON, D. C.

*Classification.*—Business and economic stabilization through money and credit control.

*Objective.*—Promote that condition that will produce the maximum increment of goods and services and distribute them equitably to the members of society in proportion to the value of their contributions.

*Theory and principle.*—Such a condition is best approximated when the general level of prices is kept stable. Then production increases, wages rise, employment is obtainable by the efficient members of society at competitive rates, the great waste of idleness is at a minimum. The standard of living rises as reflected in more goods and more leisure time to enjoy them.

On the other hand, when the price level is permitted to fluctuate, production is reduced, waste of time and material is promoted, and wealth is redistributed without plan or purpose.

When the general level of prices is permitted to rise, creditors are injured; equities between the debtorlike and the creditorlike classes are distributed to the advantage of the former; undue business activity encourages uneconomic expansion of production facilities; extravagance, boom conditions, and inefficiency result.

When the general level of prices is permitted to fall, debtors are injured; the creditorlike classes profit at the expense of the debtorlike classes; dwindling consumption results in unemployment; wage and debt readjustments promote social and political unrest; factories lie idle; production, foreign trade, profits dwindle; failures, foreclosures increase.

The general level of prices is a reflection of the value of purchasing power ot money. When it rises, that means that money is falling in purchasing power. When it falls, that means that money is rising in purchasing power.

Money is subject to the law of supply and demand—too much of it, relative to need, and it falls in value; too little of it, relative to need, and it rises in value.

The principle, therefore, to be applied is to keep the total volume of money, credit, and moneylike instruments in effective circulation in any country in such balance with the varying needs of business that the general level of prices will be kept stable, letting changes in such volume compensate for variations of velocity, hoarding, banking fears, and optimism, changes in the volume of business and other uncontrollable factors of the equation.

To do this, it may be necessary for the monetary authorities to anticipate impending changes in the price level and to take steps to offset them (or the forces that produce them) before they become apparent statistically, just as a skillful engineer maintains a stable temperature in a cold-storage warehouse. To this end, their power should be plenary and their responsibility complete.

An index of prices of commodities at wholesale is preferred as the guide. Other indexes of the price level have much to recommend them and the use of almost any composite index would be better than to subject the whole economic and social structure to the strains due to fluctuations of one commodity, gold. Also, there are other proposed criteria of monetary policy than price level stabilization, any one of which would be preferable to none at all (which is the present condition in America) or to that of a fixed minimum gold reserve ratio.

The point at which the price level should be stabilized in the first instance (or after any great departure therefrom) should be determined by calculating "the center of gravity of the existing debt structure" as this will balance equally the benefits and injuries due to past fluctuations and work the minimum hardship on any group. That is, the new price level would be that found to have existed on the date that represents the weighted average of the dates when the existing obligations were contracted.

*Methods advocated.*—Strive for stabilization of the internal price level disregarding fluctuations of exchange or gold reserve ratios, but cooperate with foreign countries in stabilizing exchange as a secondary objective.

Machinery of control of money and credit exists in the central bank (in America, the Federal reserve), through its power—

(1) To raise or lower the rate of rediscount and thus discourage or encourage (*a*) borrowing and (*b*) gold exports.

(2) To buy or sell (*a*) eligible securities or (*b*) foreign exchange in the open market, thus: (*a*) Causing the commercial banks to expand or contract their loans or (*b*) discouraging or encouraging imports of merchandise. (Such action, of course, influences also the flow of services, remittances, credits, gold, and other factors of the international economic situation.)

(3) To influence banking policy through direct contact with commercial banks.

(4) To mold public and business opinion through announcements of its policy and of its reasons for taking action.

This does not, of course, exhaust the list of instruments of central bank control. Others in America include the power to call unpaid capital subscriptions, creation of new reserve cities, etc. Governor Strong mentioned 11 to Governor Norman. In England, the power to vary the fiduciary issue is important.

If its measures are taken in time, the central bank's control of the volume of money and credit (and, hence, of the price level) is absolute within the limits of restrictions imposed by legislation. If its measures are delayed, it may be necessary for the treasury to reinforce the efforts of the central bank, particularly when expansion is desired, thus encouraging business to make use of the facilities made available by the central bank (as by issuing legal tender, gold-reserve money in retirement of existing interest-bearing obligations, or in payment of government expenses or for public works.)

When the forces of expansion had thus been generated and it was clear that it would proceed to the extent desired, the purchase of securities should be discontinued or they should even be sold and the volume of money like instruments otherwise contracted in order to keep the general level of prices stable at the point determined.

In the present emergency further expansion of member bank loans and investments should be forced by increasing surplus reserves. To this end the Federal reserve should discontinue the recently announced policy of selling securities to keep these reserves at a "reasonable level" and should allow incoming gold and money returning from hoarding to have their natural expansive effect, even buying additional securities, if necessary. All this would tend to cause the member banks to lend, thus increasing the effective credit volume. If this proves ineffective an increase of the currency should be engineered by one of the more direct methods outlined.

The problem is political and technical rather than economic. That is, the problem is one of how to get governmental and banking authorities to do what should be done, rather than of knowing what they should do. Banking psychology largely controls monetary and central bank policy, and, at any given moment, the steps necessary to be taken in aid of price level stability through monetary control are likely to be in conflict with what the banker regards (correctly from the individualistic point of view) as "sound banking policy." Banks, moved by a desire for profit, loan freely and favor an expansive policy in a period of inflation, when loans should be contracted, and, moved by the wish to safeguard their depositors' funds, they strive for liquidity and favor a policy of contraction in a period of deflation, when the money volume should be expanded.

The onus rests not on the banking fraternity alone, although its responsibility is great, both because of the foregoing condition, and because its prestige, intellectual self-confidence and power to influence articulate opinion are great. Among other important factors are the lack of a national economic objective and the widespread ignorance of monetary economics.

Therefore, both in the interest of the public and to protect the banks from their own folly, there should be an international, nonpolitical, nongovernmental organization, liberally but privately endowed, devoted to the purpose of furthering the stabilization of the price level through (1) education of public opinion, (2) fathering and pressing legislation, (3) watching administration, and (4) encouraging research into matters on which there is need of further light.

An endowment seems essential to protect the staff against misinformed or interested financial pressure and to permit its prestige to grow through continued, constructive activity.

*Author's valuation.*—"Eternal vigilance is the price of stability," and no plan is any better than the intelligence and determination of those who have to administer it. Price level stabilization is more necessary than any other sort of social or governmental reform. In fact, the achievement of this reform might well remove all need for many others now proposed, most of which aim at symptoms, while this one aims at a root cause. Efforts toward international rapprochement, balancing of production and consumption, more equitable distribution of the proceeds of industry, reducing unemployment, farm relief, banking reform, must all prove futile unless the disturbances accompanying changes in the general level of prices are prevented.

*Status of plan.*—As relates to the organization of public sentiment, the situation is chaotic, the advocates of price-level stabilization, numerous and influential as they are, being without leadership or financial support.

As relates to cooperation between governments and central banks in the effort to secure stabilization of the price level: In England and some other countries it is in practical effect; in America it is sporadic and uncertain.

As relates to central banking controls: This is the philosophy recommended by the conference of 30 nations at Genoa in 1922. The period of stability in America from 1922 to 1928 was due to the more or less deliberate application of these principles under the leadership of Governor Strong, of the Federal Reserve Bank of New York. The Goldsborough bill, passed by an overwhelming majority by the House of Representatives in 1932, was a somewhat inadequate expression of the plan. It is, somewhat timorously, in force in England and a number of other countries and has been in successful deliberate operation in Sweden for over a year.

(A letter received from Mr. John Dewey, Washington, D. C., is here printed in full, as follows:)

THE PEOPLE'S LOBBY (INC.),
*Washington, D. C., February 10, 1933.*

Hon. REED SMOOT,
*Chairman Senate Finance Committee,*
*Washington, D. C.*

DEAR MR. CHAIRMAN: The investigation over which you are to preside, on the causes of the depression and measures which should be adopted to end it, as provided in the resolution of Senator Harrison, does not need to be protracted.

The American people have a right to assume that any party seeking their suffrage knows the causes which produce involuntary poverty and dares to end those causes.

The fact your committee has invited as witnesses several men who share responsibility for the present disaster, encourages the hope you propose to have them enter publicly a plea of guilty.

As you have asked for statements from those interested, we submit the following for your committee's consideration.

The chief causes of the depression in America are:

1. Speculation in land values and in natural resources, primarily due to the general practice of taxing buildings and other labor products instead of covering ground rents into public treasuries and of permitting private exploitation of natural resources.

2. Protective tariffs on manufactures and on farm products, which encourage inefficient and high-cost production and provide unconscionable profits for really efficient producers.

3. Our banking and credit system, which is run not primarily to foster needed production and investment, but to promote speculation and to make profits for the stockholders of banks through affiliates and similar devices.

4. Too rapid mechanization, illustrated by the fact that in the decade 1920 to 1930 one concern—The General Electric Co.—created machinery of 160,000,000 man power.

5. The failure of industry and employers generally to pay sufficient wages to enable consumption to keep pace with production out of current income. Business Week, a McGraw-Hill publication, states that in 1929, the peak year of our national income, which amounted to $89,585,000,000, the excess of expenditures over the income of individuals was $14,717,000,000.

6. The failure of governments, Federal, State, and local, to obtain their revenue from surplus incomes, and their policy of curtailing consumption by collecting at least half of the total governmental expenditures, about $7,000,000,000 in 1929, from those of small incomes, and reducing consumption to that extent.

Business Week reports that in 1927 savings of Americans were $10,054,000,000; in 1928, $12,650,000,000; in 1929, $12,543,000,000; and even in 1930, $7,892,000-000. This publication states that of the $12,543,000,000 savings in 1929, the 513 persons with incomes of $1,000,000 and over saved $1,045,000,000, or one-twelfth of the total; the 2,617 persons with incomes of $300,000 to $1,000,000 saved $1,085,000,000, or over one-twelfth; while the 47,212,000 persons with incomes of $5,000 or less, saved only $5,567,000,000, or less than one-half of the total; and it notes that the excess of expenditures over income of those with incomes under $5,000 was $10,442,000,000, or nearly twice their savings.

The recent report on Double Taxation, issued by the House Ways and Means Subcommittee, states that the greater part of the $5,266,000,000 collected from the general property tax is paid by persons with net incomes under $5,000.

7. Overcapitalization of public utilities, including power and electric energy development, and of many manufacturing concerns, fostered by high-pressure bond and stock salesmanship.

8. The irresponsible sale of foreign securities issued in boom times for speculative profit.

As measures for immediate improvement, we recommend:

(1) Appropriation of $1,000,000,000 by Congress for direct relief to be disbursed under the agency created by the Costigan-La Follette relief bill, which covers distressed farmers, as well as the unemployed in cities and their dependents. This will permit the withdrawal from gainful occupation also of a large part of the 4,400,000 under 17 and over 65 years of age who were gainfully employed in 1930.

(2) Liberalizing the provisions of the Reconstruction Finance Corporation with respect to loans, as to self-liquidating, and security, on the principles suggested by Senator Wagner, with larger credits for noncommercial profit housing, conditioned upon the exemption of all buildings from State and local taxes.

(3) Federal credit for an extensive program of public works, afforestation, roads, etc., to be assessed so far as practical on property improved thereby.

Repeal of most Federal taxes on consumption, a small reduction of the exemption from the income tax, a rapid increase in surtaxes, and in estate taxes—which should be retained for the Federal Government—taxation of income from Government securities as part of total income, and taxation of large corporation surpluses.

There is no possibility of any temporary or permanent improvement in economic conditions without a drastic redistribution of the national income which government alone can effect in time to prevent a collapse. Nearly every industry is overplanted. The Commercial and Financial Chronicle states that the total corporate new capital offerings during 1932 (with December figures preliminary) were only $318,000,000, compared with $8,639,000,000 in 1929 and $4,944,000,000 in 1930.

The Department of Commerce wrote us in December, 1932, that "capital investments in machinery, buildings, engineering projects, and the like approximated $15,000,000,000 in 1929, and for 1932 is probably running at less than 25 per cent of that huge total."

It is obvious that consumption must be increased through redistribution of the national income before there can be much increase in investment.

(4) Refunding the Federal debt at a much lower interest rate and retiring it as rapidly as possible.

(5) Writing down the principal of nongovernment debts to conform to the increased purchasing power of the dollar and reducing the rate of interest thereon.

(6) Creating a Government marketing corporation empowered to purchase farm products, process them, and sell them directly to consumers.

(7) Shortening the work week to 30 hours.

(8) Federal control of development of natural resources, such as the production and distribution of electrical energy.

These measures Congress can enact at once.

Congress can not compel State and local governments to transfer taxes from buildings to land values, so as to restore the former easy access to land and to reduce living costs, but it can restrict Federal credit to those taxing units which do this.

Yours sincerely,

JOHN DEWEY, *President.*

(A letter and an article received from Saunders Norvell, New York City, are here printed in full as follows:)

REMINGTON ARMS CO. (INC.),
*New York City, February 11, 1933.*

MR. REED SMOOT,
*Chairman Committee on Finance, United States Senate,*
*Washington, D. C.*

DEAR MR. SMOOT: Your circular letter of February 8 received. It is impossible for me just now to come to Washington to wait my turn to be called upon to express my views on the causes of the present depression and possible legislative remedies.

You suggest if we can not come to Washington that we send a brief. I happen to have an article I have just written with the idea of sending it to one of our trade publications. This article is not in the form of a serious brief, but it does cover some of the things that have led up to the present depression and it also suggests certain things that may help recovery. This article is written from the standpoint of the merchant.

In my judgment what we need from Washington is an entirely different view of business. When business is hard hit in this country everybody suffers. Even the farmer is a business man. This whole idea in Washington seems to be that the proper thing to do is to attack business instead of helping business. If business is wrong, in my judgment, they should be guided into the right channels. Business should not be blackjacked as it has been by the legal interpretation of the Sherman law and the Clayton Act. The Federal Trade Commission in my judgment has done far more harm to business than it has done good in protecting the people of the country. I mean if the harm and the good could be measured the harm will outweigh the good. Even the members of the Federal Trade Commission when practical questions come up of the effect of their actions upon business simply shrug their shoulders and say, "It is the law." These gentlemen on the commission see the futility and the absurdity of a lot of things that have been done and are still being done.

The business of the country is sick, very sick. It is flat on its back. Would anybody with common sense attempt to cure a patient in this condition by attacking him with a legal club?

Yours very truly,

S. NORVELL, *President.*

## SOCRATES DISCUSSES COMPETITION VS. COOPERATION

(By Saunders Norvell)

Scene: A garden surrounding a temple in ancient Athens. Large old trees. Carved marble benches. Walks.

A great powerful man with a face like a battered prize fighter is seen, covered by his robe, reclining at length on one of the benches. Enter: A younger man, tall, slim, athletic, carrying in his hand tablets and a stylus.

PLATO. It is a fine morning, Socrates. You are here early.

SOCRATES. I have been here all night. I did not go home. Xantippe has been in a devilish humor. I preferred to study the stars.

PLATO. There is much dissatisfaction among the merchants with the oil business. There is overproduction. There is cutting of prices. Many of the dealers are on the verge of bankruptcy.

SOCRATES. Yes, in my walks about town I have heard of these troubles. The basis of them is a lack of clear, simple, and logical thinking on tne part of the merchants. They are too shortsighted. They do not realize the welfare of one is the welfare of all, and that the destruction of one leads to the destruction of all.

PLATO. I have here some fruit. While we eat would it not be well for us to discuss the condition of the oil merchants?

SOCRATES. Nothing could be more delightful than to eat this luscious fruit, supplied so bountifully by nature, in this garden on this beautiful spring morning and discuss the troubles of the oil merchants.

PLATO. I suppose, Socrates, we will start our discussion by outlining all the facts that I have been able to obtain in regard to the conditions surrounding this oil industry here in Athens.

SOCRATES. Your plan, Plato, is most praiseworthy. Of all my disciples you have always been the most thorough in your study of facts. When you have gathered your facts correctly, when you have divided these facts in their relative bearing, one fact to another, usually the logical conclusion of the matter is simple. Most of our mistakes in logic come from our starting with the wrong facts.

PLATO. The great interest in our discussions, Socrates, is when we have laid our facts before you, how directly you apply to them fundamental principles that upon study immediately clear up our thinking on our problems.

SOCRATES. The great art of thinking is to eliminate immaterial details, to grasp the main problem. Therefore, Plato, while I peel and eat this orange outline to me the facts in connection with the present state of the oil dealers.

PLATO. Before our recent war our oil dealers were reasonably prosperous. The supply was about equal to the demand and profits were satisfactory. However, immediately upon the declaration of war, anticipating a reduction in the production of oil and a large increase in the consumption, merchants bid against each other for all the oil that was in sight. Oil rose to a very high price. As the war continued this stimulated the growing of olive trees. Manufacturers largely increased their manufacturing capacity. The Government was a heavy buyer. The entire oil industry received great stimulation. Many merchants rushed into the oil business. Fortunes were made and these fortunes were used to produce and sell more oil. These merchants acted as if in their judgment the war would last the rest of their lives. They never seemed to consider that the time would ever come when the war would be over and the demand for oil would be reduced.

SOCRATES. This is a delicious orange. Nothing is more beneficial than a diet of oranges. Do you know, Plato, that orange juice is one of our greatest builders of bone structure? Infants, when they are growing their teeth, should be given a liberal diet of orange juice. Yes, of course; you referred to the oil dealers, the war was at an end. There was a decline in the demand for oil. What happened next?

PLATO. Every maker of oil was now equipped to make oil on a war basis. The war demand had come to an end. However, each manufacturer decided by high-powered salesmanship to go out into the cities and capture the business of all of the oil dealers. Some of these manufacturers flattered themselves that their ability was so far superior to that of others that they could clean up the market.

SOCRATES. Poor short-sighted human nature. Will merchants never learn? Of course, Plato, as a result of this action there was a price war and profits of manufacturers, jobbers, and retailers were all sacrificed in the mad scramble of the leaders of the oil industry for volume.

PLATO. Why Socrates, what a mind! This is exactly what did happen.

SOCRATES. What else could be expected? Now, Plato, tell me about this price war. How was it conducted by these oil merchants?

PLATO. Not only did they cut prices on their products, change channels of trade, but having learned during the war the power of propaganda, all of their salesmen were instructed to use propaganda. They poisoned the minds of customers one against the other. Each manufacturer accused the other manufacturer of being the cause of all the troubles that had descended upon the trade.

SOCRATES. Just so, just so. All of this was naturally to be expected with human nature as it is.

PLATO. Now with the industry flat on its back our legislators, having largely increased the expenses of the Government, have issued an excessive tax on the sale of oil. One trouble in this industry has followed on the heels of another. Now the oil industry of the country having brought itself into a state of chaos is crying loudly for some way out of their troubles.

SOCRATES. Oh yeah! Oh yeah! This also always happens to homo sapiens. First they get into trouble and then they holler for help.

PLATO. Some of these manufacturers have now conceived the idea that one way out of their trouble is to consign oil to their customers. They will fill up their stocks and these oil dealers will only pay as they sell oil from month to month. By this method they think they can dodge taxes, concentrate the volume of purchases in a few manufacturers and bring stability to the industry. This, Socrates, is the present condition of these oil merchants. Therefore, I come to you to-day to lay these facts before you and ask you to reason with your usual logic on the situation.

SOCRATES. No, thank you. No more oranges. Enough is as good as a feast. More than enough is simply the cause of trouble, like the trouble these oil merchants are now suffering.

PLATO. Your other disciples have now gathered about us and as they are familiar with the condition of the oil merchants we pray your discourse on the matter.

SOCRATES. The trouble here is all simply one of overproduction. The capacity of the manufacturers of oil is too great. They could make enough oil in three months to last the country a year. Naturally, the result of overproduction always in every age has been price cutting. The end of price cutting is receiverships and bankruptcies. Then when the industry is cleaned up by this process a fresh start is made with many oil merchants eliminated, and a few controlling the trade.

All business must be conducted in either one way or the other. One way is free and unlimited competition. Some nations, and those nations supposed to be intelligent, have conceived the idea that unlimited competition was a great thing and tended to the welfare of their citizens. In my judgment unlimited competition will, in the end be disastrous to a country, to its manufacturers and to its merchants. It must not be forgotten that all progress, all culture, all art, all happiness in living must come out of fair and reasonable profits. Without such profits there follows nothing but a lowered standard of living, misery and unhappiness.

The other method of merchandising is cooperation, and by this I mean cooperation not only between competitors, but also between competitors, the Government and consumers of the product. Cooperation means a study of supply and demand in the industry and a regulation of manufacturing to consumption. Now, take the case of these oil merchants in a country such as ours, in times of peace only a certain maximum of oil will be used by the people. This maximum should be ascertained. Then if there are certain manufacturers in the field, there can only be stability to the industry if the amount of business to be had be divided among these manufacturers on a fair and equitable ratio. The Government, of course, should take a part in such divisions of business to see that the interests of all are protected. The government should assist merchants instead of handicapping them. The government should exist to serve the people, not to be served by them.

PLATO. So far, Socrates, your logic is clear, but by what method can this plan of division of the natural trade of the country on any article of merchandise be worked out? How, for instance, about this plan of consignment?

SOCRATES. We could dispose of this consignment plan in a few words. In the end it arrives nowhere. The problem is not one of consignment, but is one of production and consumption. Suppose, for instance, the manufacturers of oil should fill up all of their customers around in good credit and bad credit with oil on a consignment plan. Then every warehouse in the country will be full of oil. Now, oil consigned is not oil sold. All of this great consigned stock would have to wait for the natural course of consumption. In other words, oil is not off of the market until it is consumed. Therefore, those manufacturers who consign, unless they should work together in cooperation will soon find that they have simply transferred their oil from their own factories to the warehouses of their customers.

The time naturally will come when these stocks of oil will be so heavy that the merchants will only buy small quantities and the heavy stocks of consignment in the hands of all kinds of dealers, who had rushed into the business because it did not require any capital, would be a menace to the price structure. Under such conditions prices could not be maintained, and the cinsignment plan would in the end make conditions worse than in the beginning. Consignment is simply a postponement of trouble to a later day.

PLATO. You paint a very dismal picture, Socrates. What is the true answer to this problem of oil?

SOCRATES. The only answer is the regulation of production. Until production is regulated at the source with the manufacturers, and this regulation governed by the consumption there never can be any stability in any industry.

PLATO. Therefore, Socrates, you would advocate that in an enlightened government there should be studies made of the increase and decrease of consumption in oil and other lines and in conjunction with the government manufacturers would regulate production in line with the demand?

SOCRATES. That seems to me the only answer to the problem of the oil merchants. It all boils down to a simple formula—ascertain the amount of oil consumption of the country and then regulate the production of the manufacturers just to meet the requirements of this consumption. Then we will have stability.

If merchants can only obtain as much oil as they can sell there is no reason for any of them to cut prices.

When overproduction is the cause of the trouble there can be no cure until production is regulated.

(A letter received from Mr. W. T. Anderson, Macon, Ga., is here printed in full, as follows:)

THE MACON TELEGRAPH AND NEWS
*February 13, 1933.*

Hon. REED SMOOT,
*Chairman Committee on Finance, Washington, D. C.*

DEAR SENATOR SMOOT: I have your letter of February 8 asking for an expression of my views on the causes of the present depression and possible legislative remedies and suggesting personal appearance before your committee.

I am sorry that because of an accident a few days ago in which a small bone in my right leg was broken near the ankle, I shall be unable to travel for some time. However, my opinion about the depression is that these things come about every seven years, or multiples thereof, approximately speaking. It seems that seven years is about the period required for the complete impoverishment of the masses by the classes, universal bankruptcy is indulged, a new deal set up, and business resumes by reason of the restoration of buying power of the masses instead of debt paying, and everything is pretty for another seven years.

Ever since the seven fat years and seven lean years of ancient Egypt, it seems mankind has been afflicted with these cycles of depression. The most serious one of recent history was in 1873. Another one that we had which I think bore down with a great deal of weight was in 1893–94, which you will observe came on a multiple of seven. There were others in between these two dates, but they apparently did not make a very lasting impression.

The next one I know anything about was in 1907, when all our money went into hiding as it has done at the present time. We issued clearing house certificates, which were a form of inflation, and got along pretty well with it. We were right on the threshold of another depression in 1914 when the World War postponed it. Another arrived in 1921, and this last one came in the latter part of 1928–29, and it seems that this one is going to last the seven years, harking back to the days of ancient Egypt.

Mass insolvency replaces individual insolvency every seven years, and this apparently brings about the crisis. As soon as we have canceled or paid our debts down to where our creditors feel satisfied the remainder is safe and we debtors feel we can pay the interest on what remains and make nominal reduction in the principal, we again have some credit or margin with which to buy. Industry is thereby enabled to resume and we proceed on the lines of former prosperity and conditions.

Even in the present crisis and distress, we find ourselves confronted with more debt than any people have ever known in the history of the world. It is stated on good authority, I believe, that the people of America and the governments of this country at the present time owe $206,000,000,000. Thirty-six billion dollars of this is said to be owned by our governments, and $170,000,000,000 by the people. This is as much money as the entire United States was estimated to be worth in 1914. The interest on it at 6 per cent, which is probably average for individuals, et al., is $13,000,000,000 per annum, or over $1,000,000,000 per month. Our average income, or turnover, in industry is probably $45,000,000,000 to $35,000,000,000, although the peak was estimated at $95,000,000,000. Let us take $13,000,000,000 for interest out of the $45,000,000,000 to $$35,000,000,000, and another $15,000,000,000 to apply on principal, which is estimated to be the fact, and we see very readily that two-thirds to six-sevenths of our national turnover is going for debt.

This in itself leaves no spending money for anybody and with the effort to collect and the desire to pay, industry shuts down and unemployment runs rampant, every increasing the vicious circle.

We were able to get past the depression of 1914 and 1921 in very rapid fashion, primarily because of the War beginning in 1914, which put us on a credit basis throughout the world, and then in 1921 all the forms of government in this country were issuing bonds for every conceivable purpose, one of the major items being roads. When the universal insolvency due to losses of the war was brought up for adjustment in the cycle of 1928–29 and all of our government bonds besides private debts came around for handling, we shut down everything and we are still suffering with it.

I do not know any remedy except to grin and bear it. Let nature take its course. Of course we ought to be smart enough to devise some remedy that will help us solve the problem at an earlier date than that which naturally control under the recipe I have just set forth. but the fact that our master minds have not been able to do anything about it makes me feel that there is not but one thing, and that is as I have stated. We may be able to help nature, but be sure we don't try to supplant nature.

I think we are making a great mistake to be spending money as is being done to try to pump oxygen into the patient, especially when every tank of oxygen is going to cost more money, more investment and interest, and in all probablilty not speed the recovery of the patient by a single day.

The orgy of spending in Florida alone, for instance, is disturbing. I think 32 post offices are being built in Florida. One town, Clearwater, with 9,000 or 10,000 people I am told, is having erected a million dollar post office. I think the post office formerly used there cost the Government about $30 per month and the million dollar post office will increase the cost of government to at least $70,000 a year for interest and operation.

At Palm Beach and West Palm Beach there are two magnificent buildings being erected by the Government and figuratively speaking you can stand in the door of one post office and throw a rock into the door of the other. These are being erected at an enormous cost to the Government and a drain on the people. Pumping more oxygen.

All the efforts to help the farmer through Government loans are an absurdity, and intelligent, successful framers are earnestly protesting against it. One farmer writes in from Bushnell, Fla., that he and his neighbors had good prospect for Irish potatoes this year and expected or hoped to make money out of them if the acreage were held down. He pointed out that on account of the Government seed loans that numbers of his neighbors have planned to increase their potato acreage and this will so increase the supply of potatoes that none of them will be able to make any money, all through "Government aid." The Government on one hand is arguing to keep down acreage, and on the other hand has 7 to 10 agencies lending money to increase acreage and production.

The Government has an Agricultural Department in Washington with about $300,000,000 annually to spend. Approximately $100,000,000 of this is used for roads and other purposes, leaving $200,000,000 for county agents, agricultural colleges, and every scheme imaginable to teach and induce the farmer to increase his production. The State governments also have their agricultural departments and experiment stations and the amount of money spent on farm aid runs into hundreds of millions of dollars.

In 1910 the average production of corn per acre in Georgia was 7 bushels. Now it is about 18 bushels. The county agents have shown how to select soil and seed and the Government has supplied the money for buying seed, and all sorts of stimulants to try to help the farmer. The 11 bushels extra corn raised in Georgia in 1930 as compared with the 7 bushels produced in 1910 are in competition with the original 7 bushels, and this is the condition throughout the country. The Government on one hand is urging the farmer to reduce his acreage; on another hand the Government has 7 to 10 different agencies and loan schemes to lend the farmer money to increase his production; and on another hand we see the Government sitting down at the end of the sluice way trying to stop up and dam up the supply and hold it back off the market so as to raise the price.

Briefly stated, I think the United States Government should shut down rigidly on its orgy of reckless spending. There is no dollar lost by the Government but becomes a particular charge on humanity, and unless we have something substantial that will earn interest and repay the principal, Government money should be left in the pockets of the people where it will more readily reestablish normal conditions than any way I know of. Everything I have seen tried or proposed is the same old story of the man lifting himself by his bootstraps.

To add to the Government's troubles, the farmer has done the most toward destroying his own market. In the past 10 years he has done away with six and a quarter million mules and horses from the farm, besides the farm hands that he formerly used. These he was able to sustain and pay out of the produce of his farm without converting it into money. It requires four acres of land to sustain a work animal, to say nothing of labor, and this in itself means 25,000,000 acres of land taken off production of animal food and put on human food. And then we worry about the surplus. By the use of tractors, trucks, and other so-called labor-saving machinery, none of which can eat a bundle of fodder or an ear of corn, we have piled chaos on top of foolishness.

I am sure we are all desirous of seeing something done about the present situation, but I do not believe anything that has been tried will stand the test of a business analysis.

I believe the greatest aid that could be rendered industry would be to insure, or guarantee bank deposits. According to the National Industrial Conference Board 14 per cent of industry in this country is without any bank credit or connection of any kind, and this 14 per cent employs 47 per cent of the labor. Hence by reason of having to keep their paper liquid with the Federal reserve in the event of demands of depositors, banks have cut out the great bulk of perfectly good collateral because of its nonliquidity and nonrediscountability. Witness Dawes borrowing ninety million from Reconstruction Finance Corporation on good paper his banking brothers wouldn't touch. The banks are afraid of the depositors and the depositors are afraid of the banks and the greatest single factor that could be set up to overcome this would be to guarantee bank deposits. This would free more money and drive it into industrial and other legitimate channels than anything else that could be accomplished.

It is nonsense to talk of the impracticability of guaranteeing bank deposits. Through a period of 66 years the United States comptroller gives the losses to depositors through all national bank failures as one-sixtieth of 1 per cent.

To summarize, I should say that anything which will reduce debt, be it Government or individual, will hasten the end of the depression. And anything which increases debt will lengthen the depression. The reason this depression is hanging on longer than any we have ever experienced is because the world owes more money and we have got to reduce that debt, either by sacrifice and stinting through scaling down, or through outright bankruptcy, or some miracle. It would be better to abandon every unnecessary expenditure and go definitely on the dole system for the emergency period, until this liquidation has been accomplished. Liquidation has proved the only remedy for other depressions. It is the only remedy for this one.

Yours very truly,

W. J. Anderson.

(A letter and brief received from Mr. Victor S. Clark, Washington, D. C., are here printed in full as follows:)

Library of Congress,
*Washington, February 11, 1933.*

Hon. Reed Smoot,
*Senate Office Building, Washington, D. C.*

My Dear Senator Smoot: Possibly the inclosed extract from a letter which I wrote to Prof. Irving Fisher Thursday will be sufficient answer to your inquiry of February 8. I do not object to its being called a brief. At least it possesses the merit of relative brevity.

Respectifully,

Victor S. Clark,
*Consultant in Economics.*

---

February 11, 1933.

Our recent swing from excessive optimism to excessive pessimism seems to me to have about reached its limit. From now on we may gradually recover psychological equilibrium. Coincident with this will presumably come easier credit conditions, fuller utilization of our existing stock of money, freer buying, and steadying of prices.

Our price problem presents itself to me under two aspects: That of reestablishing a more or less fixed price ratio between different classes of commodities, and that of stabilizing the general price level. I am not convinced that these two aspects are necessarily interdependent. Unless that interdependence exists, stabilizing the general price level would remove only one difficulty, and the relation of farm incomes to other incomes, for example, would continue unsatisfactory.

My guess is that we shall worry slowly out of the present impassé by a process of trial and error involving many minor and local adjustments rather than by any single reform. In order of immediate urgency, measures to hasten recovery from the depression would seem to range themselves somewhat as follows:

1. Encouraging public confidence by a courageous policy of curtailing Government expenditures, cessation of borrowing beyond imperative emergency needs reducing taxation, and a minimum disturbance of the currency.

2. Readjusting private debt burdens to the present price level where this is necessary to keep business going, by judicial or arbitration procedures taking account of individual circumstances.

3. Stabilizing prices of export commodities by international agreement.

4. A more salutary distribution of the world's stock of monetary gold.

5. A settlement of the international debt problem. Personally I should favor accepting goods in payment for these debts, the character and ultimate distribution of these goods to be determined by the Government.

6. An investigation of the currency problem by an expert commission with a view to providing against future excessive price fluctuations.

VICTOR S. CLARK,
*Consultant in Economics.*

(A letter and brief submitted by Mr. Thomas H. Beck (brief prepared by Mr. Joseph P. Knapp) are here printed in full as follows:)

COLLIER'S, THE NATIONAL WEEKLY,
*New York, February 15, 1933.*

Hon. REED SMOOT,
*Chairman Senate Finance Committee, United States Senate,*
*Washington, D. C.*

MY DEAR SENATOR SMOOT: I have been very much interested in reading of the hearings your committee is holding concerning recovery plans.

Under the circumstances, it seems to me proper to send you herewith a rather carefully worked out plan written by Mr. Joseph P. Knapp, who is the principal owner of the Crowell Publishing Co., which publishes Collier's, the Woman's Home Companion, the American Magazine and the Country Home, and whose father was the founder of the Metropolitan Life Insurance Co., of which Mr. Knapp is a director.

Sincerely yours,

THOS. H. BECK.

---

The attached was written early in the spring of 1932 when there was much discussion concerning the "Swope Plan", which I felt sure would not appeal to businessmen because of their distrust of Federal interference. In his plan there were excellent labor insurance suggestions, but or life insurance statisticians tell us that unemployment is not and probably can never become a measurable and consequently insurable risk. So finally I wrote the attached to "get it off my chest."

It is probably unnecessary to state that it deals with a possible future and is no attempt to suggest a panacea for our present troubles.

It seems to differ from all other plans that I have read in resting upon—

1. Compulsory trade membership.
2. Minimum price.
3. Variable work week.

No one of these could be adopted without including all.

It proposes stablization but does not stifle American individualism nor introduce Government control.

It is the absolute reverse of the Sherman Act but provides a supreme court of industry (I am an ardent admirer of our Supreme Court as the greatest institution of our Government) to prevent exploitation.

It bids everyone get together, plan together to be prosperous but be careful not to gouge unless desirous of a jail sentence.

It was not written with the idea of publication.

If you find it interesting enough to read, an expression of your frank criticisms would be appreciated.

Fred Ecker said of it that it would be "Utopia," to which my reply was, "Then it must be a magnificent plan."

---

"Something is going to be done to eliminate depressions and the application of the planning principle is dictated by the experience of solving in private establishments problems identical in essence to those now confronting collective industry."—H. S. Person.

## Wise Planning

(Submitted as a suggestion by Joseph P. Knapp)

An astounding number of our ablest men are planning and endeavoring to find the road to a better future. This planning is generally termed stabilization.

It is well indeed that our "captains of industry" should thus progress and become scientists of industry. Just as the medical profession has in a brief half century wonderfully conquered pestilence, plagues, and contagion, so should our industrial leaders tackle in force the stabilization question with its innumerable problems.

An endeavor to solve as many of these problems as may be possible merits the closest attention and deepest concentration of our ablest industrial, financial, agricultural, banking, and economic leaders, men having both wide experience and vision.

Before you give expression to hasty opinions, it might be well to attempt a personal realization of the enormity of the problem; to examine carefully the more than a hundred questions, each of vital importance, now being considered by the United States Chamber of Commerce. These are set forth in The Job Ahead—the program for the forthcoming annual meeting to be held in May, 1932.

Get a copy of that program and read thoughtfully those 146 questions. To how many of them can you give the correct answer?

Because of the difficult and different problems that present themselves, it is well that groups of our most experienced leaders should be urged to "plan"—each group to plan for that industry in which its leaders have experience. No man living has the brains to alone conceive the complete plan in all its details.

We are in the midst of a world depression and of an unusually severe United States depression. We have had them before and have recovered. We will recover from this one.

With wise planning, however, it may be possible in the future to prevent serious depression—to have peaks less high and valleys not so deep. The attempt should surely and promptly be made, but it is well to be patient and not expect an immediate Utopia.

Let us remember that during the past decade there existed in this country a better standard of living for the great mass of our people than we ever had before—better than was ever known at any time in any country in the whole history of the world. What sound conditions caused it? Let us find out and bring back those conditions. Let us also now plan to keep those conditions ever with us and make our standard of living slowly, steadily, surely, conservatively better.

The following suggestions are diffidently offered in the hope that possibly they may be of assistance to leaders in their efforts to plan wisely. Some of the ideas we believe to be quite new and possibly of great stabilization value. They deserve most thoughtful consideration. They are not revolutionary because new.

Reason, common sense, practicability, cause and effect seem to indicate these conclusions as sound and frequently we have felt inclined to write Q. E. D. because 2 plus 2 still seems to equal 4.

Let us first set forth certain seemingly self-evident truths. In order to have continuous and regular prosperity, with reasonable living conditions, it is essential that there be—

*In industry.*—A full pay envelope, not alone weekly but yearly. The pay per day or per week is not important, be it high or low. The total wages received during the year is the vital point.

*In farming.*—A fair price paid regularly for farm products, enabling the small farmer of average industry and intelligence to get along comfortably.

Without these the great masses of our people can have neither proper living conditions, nor spending money, nor savings money. All of these are essential to general prosperity, not only theirs but everyone's prosperity.

Without them every industry slackens, unemployment and hardships begin and then spread as we slip into another depression.

The problem, therefore, is to find how to hand to the worker, with reasonable regularity, a full pay envelope and how to regularly pay the farmer a reasonably profitably reward for his industry, expressed in a fair price for his products.

To obtain these, to have regular instead of intermittent prosperity, it is evident that better stabilization of industry must be planned and obtained. In accomplishing this end—

1. The public must not be exploited.

2. Insane, ill-timed, forced competition must be recognized as disastrous to all in any and every industry.
3. All in any industry must confer through a trade organization for its improvement and stabilized operation.
4. The work week in an industry must be variable—shortened or lengthened as the demand for the product varies, with the same weekly pay roll, irrespective of hours of work—the hours worked per week varying from time to time, according to the then demand for the product.
5. Farmers must be shown how to similarly form their own local associations for cooperation in buying, selling, and such planting as is advisable in a given locality as promising to obtain the best return and intended to supply a given market. These associations must cooperate with larger and still larger groups. Such efforts are now being earnestly advocated and organized. The day should and also will come when every farmer must belong to his local organization and must cooperate.
6. Each of these items is considered in the following chapters. An improvement in stabilization will be beneficial to all of us. Prof. Henry P. Fairchild discerningly states: "Discover the way to restore purchasing power and you have discovered the remedy for the existing depression. Find out how to maintain purchasing power and you have found out how to prevent depressions in the future."

### THE PUBLIC MUST NOT BE "EXPLOITED"

In days of old a warrior bold fought the trusts and hence we have the Sherman Act.

Under its obsolete provisions, if those in a trade now confer and make wise regulations for the prosperity of that trade, the Federal prison awaits them. It is out of date, woefully behind the times. Repeal it. Kill it.

Substitute therefor a law advising all, compelling all, to form trade associations, one in each trade, to formulate regulations to stabilize the industry and to be binding on all in that industry. If an attempt be made to use this power to exploit the public, then is the time to send the culprit to jail.

A stabilized industry is of value to everyone in or out of the industry. Therefore encourage stabilization, compel it, and reserve the jail sentences for those who will not stabilize.

To discourage any attempt to exploit the public or to become graspingly monopolistic, arrange that a filed complaint—yours, mine, anyone's—shall be considered; first by the trade board of that industry; next and finally, say, by a supreme court of industry, functioning with all the dignity that surrounds our present Supreme Court.

When an industry is in doubt, as to what might be considered proper or construed as possible exploitation, make it possible for that trade to obtain a prompt decision from such supreme court—a decision clearly expressed, understandable to all, and not expressed in "weazel words." Do not leave the industrialist in doubt as to what he may or may not do. Let there be a clear-cut decision saying "Thou mayest" or "Thou shalt not."

### COMPETITION

Let there be established a minimum price, giving a fair profit and thus ensuring the payment of good wages.

If quotas of production are agreeable to all in an industry, let this be the practice of the trade, but why have quotas? Keep in mind American individualism. Remember that the small concern may be more efficiently managed than the big one and should have full opportunity for growth. Give to the better or more progressive management its opportunity. Let the competition, controlled by the minimum price, be in better ideas, better products, better manufacturing, and better merchandising.

But under this system, it may be asked, would there not be occasional overproduction? At present such product is eliminated by price cutting. What would be done in future with such goods?

The answer is that under the minimum-price rule such goods would remain in stock, unsold and the fool manufacturer, unless he soon learned wisdom, would "go broke". Careless optimists and unreasoning manufacturers are of no value to any industry or the workmen dependent upon such industry. The sooner they go broke the better.

The minimum price—charge as much more as your attractive goods can bring—eliminates inexorably the inefficient manufacturer who overproduces.

AN ASSOCIATION IN EVERY TRADE AND WITH COMPULSORY MEMBERSHIP

All in any industry must belong to its trade association. Nonmembers of a useful trade association reap all the benefits, bear none of the burdens, are untrammelled by its regulations and unguided by its statistical information. They are the wild "bulls in the china shop."

A few free lances of this sort on the outside can, as has been repeatedly proved, effectively injure the usefulness of any trade association. If they are sufficiently powerful, the association can not function effectively. If weak, they operate as parasites, working against instead of for the interests of the trade as a whole and consequently against public interest.

No real stabilization can be established without the membership of all and therefore that membership must be compulsory.

Economic history is so full of specific instances, known to all, that it is unnecessary to here describe the baneful effects produced by "outsiders"—those who will not do "team work."

It is unlikely that any trade association should be so short-sighted or so controlled as to discriminate unfavorably against the proper activities of its own members. Should this happen, he or they, unjustly treated, would promptly make complaint to the supreme court of industry.

THE VARIABLE WORK WEEK

"There is an approach to unanimity of opinion that right wages and the sustained high purchasing power of the great mass of our working people are essential to our economic well-being."—Committee of United States Chamber of Commerce.

The wage or other reward of industry to be paid should consequently be as high as possible but certainly regular and assured.

"An assured basis of earnings would place more adequate power as consumers in the hands of the masses of people."—Sidney Hillman.

The hours of labor, not to exceed eight per day, are unimportant, except in a few arduous occupations. It is important, however, that the total hours of employment during the year shall be sufficient to provide a yearly income insuring a comfortable scale of living, with reasonable purchasing power, and to enable savings or other protection against incapacity, old age, and family protection on death. Let us consider having a work week in each industry varying from 30 to 48 hours, the variation depending upon the demand from time to time for the products of that industry.

As the occasion arose and depending on the then demand, the trade association would announce the number of hours that constituted the then standard work week. That work week normally or on the average should be, say, 40 hours. If orders were plentiful, the work week would go up to 44 or 48 hours. If business should be slack, the work week might be only 36 or 30 hours.

Whatever the number of hours worked, the pay envelope would contain a full weekly wage, the same pay for 30, 36, 40, 44, or 48 hours.

Overtime should be discouraged through heavy excess wages. The cure for overtime should be a double or triple shift, providing additional employment, when demand exceeds an 8-hour capacity.

The manufacturer at this point asks: "How can I afford to pay a full week's wages for, say, 30 hours of labor?.

The answer is that the "minimum price" will cover the extra wage cost. The minimum price will naturally vary from time to time with the costs of production. Prices would rise should a depression be threatened and not be lowered as now with the incidental and insane cut-throat competition, which brings in its wake reduction in wages and unemployment.

Workmen at the end of such a full-pay work week would always have money to live, money to spend, money to save. That means prosperity for all.

And another answer is that probably under any such system—because the great mass of the people would have regularly that full pay envelope—there would be no depression, none would ever get started because there would be no shortage of money for making purchases and consequently the hours in the work week would run with great uniformity, probably in most trades averaging about 40 hours per week.

Is this plan possible in any and all industries?

Yes—or with variations suitable to the industry. Few industries operate under exactly similar conditions. Compel membership in the trade organizations and then leave each to iron out its own difficulties. Any group of intelligent leaders in any industry can find the smooth stabilized road to travel—can make it a permanent success, if permitted and encouraged to establish 100 per cent cooperation.

Employment under this plan should be normally assured with a full weekly pay check for, say, not less than 46 weeks per year.

If the exigencies of any trade make this impossible, because, say, of seasonable variations in production, then a substitute employment or the equivalent thereof must be found. Some way must be found to take care of that yearly income of reasonable amount and for every workman.

Why? In your interest, my interest, everyone's interest.

Because we can not have prosperity—not one of us— without that reasonably full yearly pay envelope for the workman, the farmer, and all of the masses.

And we can paste that sound and logical fact "in our hats."

### FARM PROBLEMS

It is not within the limits of this paper to fully discuss the farm problems.

The farmers are America's most confirmed individualists. If they insist on absolute individualism, without cooperation, then no Government aid can bring about their prosperity and happiness.

Far more than industrialists they must be shown how to form their own local associations, having objectives quite similar to those of the proposed trade organizations. There must be cooperation in information as to what should be planted and how. What—because they should be planting to supply a given market. How—because of better yield per acre.

There must be cooperation in buying supplies and in selling the product because of the enormous resultant economies.

These local associations must provide for compulsory membership and they must cooperate with larger groups, State and even nation-wide.

Through such monopolistic management, controlled by that same supreme court of industry, they must fix and obtain a fair price for their farm products.

The small farm, not suited for the big crop staples, must be continued if there is to be a life worth living for millions of Americans, unsuited to endure or survive in crowded urban life. The price to be paid for farm products by the town and city dweller need not increase, but to insure this, it is essential that farm efficiency shall improve. Finally all operations must be efficient and controlled and must lead to least handling from farm to consumer. Other uses than farming can be found, and must be, for marginal and submarginal farm lands on which now all too much labor is expended and from which no profitable productions can be expected.

In the proper solution of the farm question, it is quite—yes, entirely—possible that our farm helping agencies in Washington might be improved—vastly improved.

And it's about time that this improvement began.

An instance of minor importance but significant of the possibilities follows:

In one little county of 7,000 inhabitants, right management with some individually loaned cash capital, during the depressing year of 1930, brought to the farmers $60,000 of profit above normal—or about 18 per cent of total volume. The good management proved a life saver, and distress largely disappeared. The following year, 1931—the worst ever for farms—showed similar results.

And in these years the farmers of the immediately surrounding counties were "going broke" under truly deplorable and almost unbearable conditions. Why? No organization, no management, and no one to supply the small amount of initial necessary cash.

The cash capital requisite for such purpose was less than 15 per cent of the total annual crop sales in that county. This capital, loaned at the start, will later be accumulated over a period of years, and then be supplied by the farmers themselves, through retaining a small percentage on their sales, in profitable years. This will lead eventually to the farmers financing and owning their own cooperative associations.

The same plan is spreading slowly, surely—yes, gloriously.

Along these lines that $200,000,000 of farm money appropriated recently by Congress could be made to do truly effective work, and no one need get brain fever in finding out how.

GENERAL

*Individualism.*—All of the foregoing would seem quite possible without limitations of opportunity of any one or of all who are gifted and will work hard for success. There is no unwise check on American individualism. None is required or proposed unless it attempt to operate on the "Me und Gott" principle.

Business men properly dread governmental interference. Under this plan each and all are quite free to work without any interference (less than now under the Sherman Act)—work to make their own industries profitable.

They are told to paddle their own canoe but warned to play "clean ball" and absolutely not to make any attempt at exploitation.

*Banking.*—There were about 2,000 bank failures in 1930–31, and none in Great Britain and Canada in the same period. Think that over.

The writer, unversed in the strange convolutions of our dollar, does not attempt a solution. But our bankers should see that such happenings can not occur again. Mildly put, it's a national disgrace. Let the Federal Reserve Board lead in putting forth the plan that will prevent any repetition and make every bank safe. Let us have fewer banks, if necessary, with such requirements for operation as to make each safe. In future possibly they may have "frozen assets." They may even be compelled to close because of a run. But they must, if ever permitted to open and start operations as a bank, always eventually pay 100 cents on the dollar. If Great Britain and Canada can do it, so can the United States under proper banking laws.

Just one more banking thought. It is not necessary to spend effort or time in popularizing baby $25 bonds, although, of course, everyone should be interested in owning at least a small amount of Government bonds. Probably you do not know what you will receive should you hand in $1 (or any multiple) at any post office. Try it to-day. Do this now yourself, and thus learn of the solidity of the postal bank. Look at that fine baby $1 bond you will receive, solid as the rock of Gibraltar, on which is imprinted "The faith of the United States of America is solemnly pledged to the payment of deposits with accrued interest," and then let all of us insist that by proper and extensive publicity, every timid soul in our country shall be told all about the entire safety of Uncle Sam's postal savings bank, shall know it rests upon "the faith of the United States of America." That will forever end hoarding.

*Exports.*—These comprise about 10 per cent of our total business. Why not first give careful consideration to, and secure the stabilization of the 90 per cent domestically consumed? Common sense would seem to dictate that this big part of the whole is obviously of paramount importance and should first receive attention. Of course, we should not neglect the 10 per cent of exports, but this one-tenth of the whole is surely of secondary importance. Concentrate first on taking good care of the 90 per cent.

"A decline in foreign demand for American products seems likely to occur because of the rapid extension of foreign tariff barriers, which is already having a marked effect on our export trade."—Myron C. Taylor.

*Tariff.*—It should be flexible to give full protection to the American industries and workmen.

Action, if necessary, should be prompt and not await complete revision, as occurs from time to time with change of administration.

The tariff has long been conceded to be a nonpolitical question and should be treated as such.

We either want certain imports or do not. If the latter, there should be no difficulty in establishing prohibitive rates. If the former, the rates should be recommended from time to time to Congress by the Tariff Board on a few items at a time, and not leave Congress, within a single session lasting from say, two to six months, to attempt any such impossibility as to understandingly and wisely legislate on the entire list.

Rates having been thus approved, Congress may give such powers to the Tariff Board as it may deem wise, permitting it from time to time to lower or raise the rates on individual items.

*Transportation.*—The mass of our people are the "big owners" of our railroads. This is because of the enormous holdings of railroad bonds owned by the people, especially through the mutualized insurance companies. It totals not millions but $18,000,000,000. The welfare of the people is tied up in these investments. These investments, their own savings, depend upon the welfare of the railroads. Do not foolishly imagine that the rich own the railroads. They are practically owned by the masses of the people.

General Atterbury, of the Pennsylvania, proposed recently a fair method of viewing the whole proposition and visualized a bright future for our railroads which is essential to all of us. He evaluated competition by bus lines, pipe lines, and other competitors. He spoke wisely.

Would it not be advisable that the Interstate Commerce Commission listen most attentively and promptly to General Atterbury?

We need no modifications in present laws for immediate action along these lines.

### NATIONAL HARMONIZATION TO INSURE STABILITY

The National Economic Council, as proposed by Senator La Follette (bill is now before the Senate), would seem to have great merit. It is logically the first step. The value to the country of the services of that council—purely advisory—would depend entirely on the mentality, soundness, and experience of its members, and its members should be the wisest of our wise.

Are such men obtainable at the proposed remuneration of $15,000 per year? We think not. We believe, however, that they can be obtained for $1 per year and would esteem it a duty and an honor to thus act as "elder statesmen." Such "dollar a year" men should receive secretarial compenstion of, say, $15,000 per year, enabling them to engage men of high caliber who would be qualified to carry on much of the work connected with properly filling a membership in such council.

Would it not be wise, having established such a national economic council and the supreme court of industry, herein referred to, that these should have interlocking activities with other existing governmental bodies, such as Federal Reserve Board, Farm Board, and Interstate Commerce Commission?

The activities of any one of such five bodies should be carefully considered in connection with one or all of the others in order that the best results might be obtained and that there should be a harmonization, a synchronization of all efforts. It might therefore be advisable that one member from each of such bodies act on a "special synchronization board" or "committee."

### CONCLUSION

This would seem to be a summary of the complete plan. We would have—

1. A national economic conference to advise us—its members to be our acknowledged leaders—the wisests of our wise.
2. Laws with teeth compelling us, for the welfare of all, to "play ball" together and play it clean.
3. Thus there would be compulsory membership in trade, farm, bank, transportation, mining, insurance, and other organizations.
4. Universal adoption of the minimum price idea.
5. A reasonably well filled yearly pay envelope to all who are willing to industriously work reasonable hours, insured through the variable work week.
6. We are to concentrate first on the proper conduct of our domestic business and then may use remaining energy on exports.
7. There is to be a supreme court of industry—supreme—to drastically punish those who will not accept and obey orders to do teamwork; to curb those who worship self and know nothing of the golden rule.

Such a plan will in no way curb American individualism. The individual may still make all manner of glorious successes as well as inglorious failures. The latter, however, will react only on the individual or on one particular enterprise.

In this plan will be found nothing of Marxism, nothing of economic slavery, no solace for the unwise, the greedy, or the lazy. Reward will await those who do their fair share, and there will ever be room at the top for those especially gifted, those especially endowed by the Infinite Power.

A better way is possible and must be found. And it certainly would be well that our leaders now find the path and lead us into it.

It will be understood that this is a brief presentation of the broad triple idea plan—compulsory trade membership, variable work week, variable minimum price. Difficulties will suggest themselves in many trades or industries, especially, for example, those with great seasonal variations. But do not say "It can't be done in my trade", but rather "That's a good idea. Let's work it out in our trade." Start now.

(The Second Annual Report of the Committee on the Relation of Consumption, Production, and Distribution, to the American Engineering Council, which has been submitted by Mr. R. E. Flanders, as a supplement to his testimony of February 20 (see p. 427 of the hearings) is here printed in full as follows:)

SECOND PROGRESS REPORT OF THE COMMITTEE ON THE RELATION OF CONSUMPTION, PRODUCTION, AND DISTRIBUTION, TO AMERICAN ENGINEERING COUNCIL, JANUARY 13, 1933

[This report was submitted to the annual meeting of American Engineering Council January 13, 1933, which authorized its publication as a report of the committee]

## BALANCING ECONOMIC FORCES

Two years ago the American Engineering Council assigned to its committee on the relation of consumption, production, and distribution this commission:

"The selection and recommendation of such governmental, financial, and business policies as will maintain in the United States a standard of living that is high, broadly distributed, and free from severe fluctuations."

On January 16, 1932, the committee submitted to council its first progress report. That report outlined the method of attack which had been adopted, offered an hypothesis as to the occurrence of the existing business recession, and gave an outline of apparent causes which had contributed to that event. It also considered briefly a few of the remedies which had been proposed.

The first progress report was approved through letter ballot of the assembly early in February, 1932, and released for publication. The committee, acting under this approval and authorization, released the report to the technical and general press. It was widely distributed and freely commented upon in publications throughout the United States.

Nearly a thousand copies were sent to individuals with a request for critical review and report. A number of conferences were held between members of the committee and some of these reviewers, who in several instances formed discussion groups for this purpose.

Members of the committee and others also have used this report as the topic of meetings of engineering and other societies with the uniform result that generous comment and discussion were elicited. Furthermore, the report has been used as a text in several colleges and universities.

The two most constructive results obtained from the distribution of the first progress report are (1) a collection of over two hundred reviews, in many cases including extensive discussions, offered by eminent men engaged in a wide range of business and professional activities; and (2) a file of more than fifty suggested remedial plans.

These reviews, comprising criticisms, comments and suggestions, and the proposed plans for business stability, have been of major assistance to the committee in preparing this second progress report. For all this assistance, so generously and constructively offered, the commitete is deeply appreciative; and it takes this opportunity to acknowledge its indebtedness and to express its gratitude.

This second progress report is divided into two parts:

I. An analysis of 40 alleged causes of business instability, classified as primary, contributory, incidental, or doubtful.

II. An analysis of the theories, principles, and methods of a selected group of 23 plans offered to prevent or to minimize the effects of business recession.

## I. AN ANALYSIS OF 40 CAUSES OF BUSINESS INSTABILITY

The method of analysis of the alleged causes of business recession which was adopted was suggested by the problem assigned to the committee as stated in these three questions: What can be done to bring about—

(*a*) A decrease in the violence of the fluctuations in the volume of goods produced and consumed, that is, an increase in stability?

(b) An increase in the average rate of production and consumption, that is, a rise in the general scale of living?

(*c*) A wider distribution of goods produced?

(*a*) Business stability: The committee does not believe perfect stability, or a near approach to it, is possible of attainment. Nor is the committee even sure that such a state is a desirable objective, for there appear to be creative and rejuvenating forces in moderate, rhythmical variations in the volume of business. However, the present degree of variation is destructive, and must be brought under such a measure of control as will insure the safety of our social structure.

(*b*) Scale of living: A rise in the scale of living is physically possible of attainment to a degree little comprehended by those unfamiliar with the available productive mechanisms, processes and organizations. Except in occasional and unimportant instances these were not operating to their capacity during the peak of the last boom. The scale of living made possible by existing facilities and which is within easy reach, is that resulting from maximum production and not the mean of the variations of production.

(*c*) Distribution of goods: A wider and larger distribution of goods produced is in one respect a problem in social justice. However, it is here considered as an economic circumstance.

The committee believes a better distribution, that is, more to classes now enjoying few or almost no goods, is physically attainable without any substantial diminution in the share now obtained by those rendering useful services. The larger share of the possible increases in production should go to those who are able and willing to work, but who are now poorly served by the social mechanism.

In this connection attention is called to the lack of purchasing power of those having very small incomes, as agricultural workers, soft-coal miners and others, and those whose wages are now at, or close to, predepression levels, as building-trades workers, anthracite-coal miners, and railroad employees. The inability of those groups lacking purchasing power to procure a sufficient volume of the necessities and comforts of life presents a problem, not only of the current depression, but of continuing business operation.

## LIMITATIONS OF THIS REPORT

This report does not deal directly with questions of morals or of esthetics. The findings contained herein were not determined by abstract concepts of social justice, nor from the nature of human satisfactions. The committee took for granted that production and consumption should be less violent in their fluctuations, higher in their average amounts, and more evenly distributed. A self-imposed limitation was established that the problem assigned be studied as a national and not as an international question. While the committee has taken into account numerous international factors which affect the domestic problem, it has not sought to lay the foundation for international solutions.

There is a good reason for this decision; while certain elements of the economic problem are world-wide other ruling factors are purely national. The problem in the United States is simple in contrast with that of other nations. Here population is not pressing on subsistance. Our national propserity need not be dependent on the export of a substantial part of our total production. We need not divert our energies to the development of virgin resources, nor to the building up of manufacturing equipment. We are not divided into hostile political segments, but form one country, large in extent, varied and ample in natural resources and in the capacities and abilities of the people.

The assignment definitely limited the investigation to the long-time problem—no consideration was to be given in the first instance to emergency measures.

## ALLEGED CAUSES OF INSTABILITY

Numerous causes for economic instability have been alleged. A knowledge and evaluation of them is essential to an understadning of the problem with which the committee is dealing. The committee has grouped into seven general classes all alleged causes which have come to its attention. These calsses are: Psychological, technological, business performance, savings and investment, financial, agricultural, and governmental. Each alleged cause has been analyzed for the purpose of determinig whether it had a primary, contributory, incidental of doubtful effect upon (*a*) business stability, (*b*) scale of living, and (*c*) inequality of distribution.

## PSYCHOLOGICAL CAUSES

(1) It has been contended that the instability of business is primarily due to successions of states of mind. It is true that at times the business world is activated by a contagious hopefulness, then by speculation, then by fear, and finally by a lethargy of despair. This being true it is probably a potent factor in effecting the various changes in the business cycle. There are reasons for this series of emotions as will appear in other connections; and there is significance in the mechanisms by which the changes in emotion are effected. Both at the

peak of the boom and the bottom of the recession the psychological factors predominate in importance so far as the immediate situation is concerned.

One cause of the inhibiting emotions can be properly singled out for comment. It is the betrayal of trust. Far too many examples in both large and small business operations have become public during the current depression. Such revelations undermine public confidence, foster hoarding, breed suspicion, and unsettle business. No condemnation of such practices can be too severe.

Psychological factors in this analysis are classed as contributory, adversely affecting business stability. At the same time it is recognized that in certain stages of the business cycle certain of such factors may be properly classed as primary in their effect.

## TECHNOLOGICAL CAUSES

(2) Inefficiency in production resulting in costs so high as to make business unprofitable is charged with being a primary factor in business instability. As a matter of fact output per man-hour has increased and unit production costs have decreased, that is, efficiency has greatly increased in the manufacture of most staple products during the last decade, yet there has been a severe business depression. Depsite these facts there exists a vague feeling that if efficiency can be still further increased and wastes still further reduced, business will be on a firmer basis. This belief is due probably to a confusion in considering the evident advantages for the individual firm in an increase in efficiency with its possible temporary disadvantages in its general effect.

Inefficiency in production must be classed as a contributory cause of business instability and a hindrance to the wider distribution of goods, and as a primary bar to a rise in the scale of living.

(3) Inefficiency in distribution, for reasons which will be given under (5), is perhaps dependent upon efficiency in production. It is a doubtful cause of business instability and restriction of distribution, but is a contributory bar to a rise in the scale of living.

(4) General overproduction is frequently assigned as a disturbing result of the use of highly efficient machinery. There can be overproduction in special lines, particularly those of inelastic demand, such as staple food stuffs; but a survey of the scale of living of the majority of workers dispels the idea that there has been general overproduction. As a cause of business recession general overproduction, therefore, must be classed as a highly doubtful influence.

(5) Technological unemployment is claimed to accompany general overproduction. It is also claimed that improved efficiency in production displaces workers while increasing output. Apparently the assumption is that more is made, while purchasing power is not increased, or is even decreased. The answers to this point of view are two.

The first is this: Improved efficiency will result in a lowered price to the consumer, or an increased profit to the producer, or both. In the first instance consumption will be increased by the lowered price, and in the second the producer's profits will be expended in increased consumption, or the purchase of new capital goods. Doubts as to the beneficial effects of these processes are raised under (19), (20), and (21).

The second answer is that new processes, new occupations, and the various services required by new inventions, reemploy those displaced. There is evidence to support this point of view. Competent investigators have analyzed employment statistics and have found that there has been a steady net increase in the percentage of the total population gainfully employed. This conclusion, however, even if entirely correct, is not reassuring. An accepted estimate places the unemployables at some 1,500,000 in our country. The best that can be shown for the boom years is that unemployment did not greatly increase. At no time since the World War has there been a general dearth of labor, either skilled or unskilled. When the details of the process of finding new jobs are observed, as described under (6), the reemployment situation is doubly dubious.

Technological unemployment is a possible though doubtful unfavorable, primary factor in its influence on stability, scale of living and distribution. Its contributory effects are not subject to question.

(6) *Instability of occupation.*—Manufacturers have observed with dismay that improved efficiency in production is not easily translated into lower prices or higher profits. The concurrent growth in selling expense has frequently canceled the improvement in manufacturing cost. There is a growing suspicion that the two tendencies are not separate but are connected, perhaps in the following way:

When men are displaced either by machines or by more efficient selling, they tend to obtain reemployment in selling in one to two typical ways; they engage in house to house selling, or open service establishments, unneeded gas stations, for instance; or they may be employed by a manufacturer who is expanding his sales department under the pressure of necessity for output (see 8). An aspect of the latter situation is the need of educating the public to choose intelligently from among the great variety of manufactured articles offered, a process requiring more men in selling. In either case the reengaged worker is employed under more hazardous conditions than are those who remain in production activities—particularly those producing the staples of subsistance. Here is a probable element of unbalance, but also an undesirable, although effective way of maintaining a connection with the economic machine for large numbers who might otherwise be cast off.

There are other sources of occupational instability. As a result of improvements in production, a continuously smaller percentage of workers is concerned with the making of the more stable staples, while a growing percentage is dependent on the fluctuating demand for articles of taste and luxury. The production and distribution of necessities maintain only subsistence levels, while the avenue of business expansion is through the provision of luxury commodities and services. Except for its unbalancing effect this process is desirable; no solution of economic ills which decreases the distribution of constructive luxuries will serve. Our mechanical development is capable of furnishing articles of taste and luxury in large volume and variety, and mechanisms must be devised to permit their unobstructed flow into consumption.

Another variety of occupational instability is that concerned with the manufacture of capital goods—machinery, manufacturing and business buildings, engineering structures, etc. These industries, for obvious reasons, get the full impact due to the variations of the business cycle. It has been shown that the entire drop in consumption for the years 1930 and 1931 might be accounted for by the decrease in capital goods produced, and in consumer goods used by those dependent on capital goods production. This has importance in connection with (20) and (21).

The instability of sales and service, luxury and capital goods operations is certainly a contributory and perhaps a primary factor in all the elements of economic maladjustment.

(7) The shift from agriculture to industry remains the major factor in occupational instability. Except for floods, freezes, insect pests and droughts, agriculture on the subsistence basis is a relatively safe occupation. On the whole it provides only a low scale of living. Workers are attracted from this low scale, stable occupation in agriculture during periods of good business to unstable marginal occupations in industry. This shift is always present when the standard of living is rising. Were general business reasonably stabilized, this change would be desirable as adding both to the market for and production of manu factured goods, thus being a primary factor in advancing the scale of living and giving a more general distribution of wealth. But the existing instability of business acts with particular sensitiveness on these transplanted workers. Therefore the shift from agriculture to industry is a contributory cause of business instability.

(8) The reduction of profits at reduced plant output is greater when modern methods are employed, hence lowered output becomes an important cause of general business instability. Under modern operating conditions mechanical devices replace men in productive processes. As a result capital charges are a large proportion of manufacturing cost at full output, and these charges are constant and independent of the volume of output. The charges due to direct materials and labor are small, in comparison, and do vary with the volume of output. In contrast, under older methods in industry, capital charges were small, and direct labor was the largest item in manufacturing cost. Under these conditions as output decreased, the labor charge, an important proportion of cost, decreased in proportion. These conditions are illustrated in Figs. 1 and 2, which show simple forms of the "break-even" chart.

Figure 1 represents the older conditions of comparatively inexpensive machinery and high labor cost in a factory capable of producing \$100,000 worth of goods. Cost and profit are shown as vertical lines corresponding to production at various percentages of full capacity, as represented by the horizontal scale. The vertical lines represent corresponding output (or sales) in dollars and the cost factors, (*a*) two variable elements, labor and materials (each proportional to output), and (*b*) fixed charges, that is, taxes, insurance, interest on fixed investment, depreciation, and others. On the vertical line for the per cent capacity at which the plant may be operating the difference between the sales and the sum of the three cost items is the profit. Figure 1 shows that under the conditions which are there represented, the total cost and the sales are equal when the output is 25 per cent of plant capacity.

Figure 2 represents relationships in a modern plant in which the variable cost items, labor and material, are small, and the fixed charges are large. At full capacity the profit is greater than shown in Figure 1, but the break-even point where sales and cost are equal occurs at 50 per cent capacity, instead of at 25 per cent capacity as in Figure 1. The losses when operating below 50 per cent capacity become proportionately quite large as production is decreased. As a result there is a tremendous pressure on the business to maintain output, which tends to expand and elaborate the selling organization as discussed under (5) and (6). Furthermore, while profits at full capacity are large as compared with the condition of Figure 1, they vanish more quickly and turn into serious losses with comparatively small changes in demand for output. The chart represents the situation for a plant in which losses when idle equal the profit at full capacity.

(9) Unstable relations between price and supply of goods appear in a highly mechanized industrial economy. That is, the response of output to price changes is sluggish under modern methods where fixed charges are a relatively high proportion of cost.

This situation is made clear by a consideration of the theoretical extremes. If the whole cost was made up of the variable item wages, it would become unprofitable to operate so soon as the selling price dropped to the level of the cost. On the other hand, if the whole cost was made up of the nonvariable item of fixed charges, operation would be justified at any selling price. In this situation a low price that entails a loss is still a smaller loss than if the plant were shut down. Hence when fixed charges are high, as they are under modern methods of industrial operation, a reduction in selling price of product does not necessarily cause a shut down of even the least efficient plants.

These relationships have been plotted in Figures 3 and 4. The chart of Figure 3 presents the relations between variable cost, fixed charges, total cost and profit, all expressed in percentages of the unit sales price, for the conditions assumed for Figure 1, that is, for older methods of operation. Each vertical bar, A to G, indicates the cost and profit of one of a group of seven manufacturers, of whom A is the most efficient and G the least. All are making a profit at the unit selling price of $1 except G, who is just breaking even. If the price, due to a drop in demand, sinks to 80 cents, F and G will go out of production, E will continue because he is making something on his fixed expenses, D will break even and the others will continue to make lessened profit. If the price now drops to 60 cents, only A and B can remain in operation. Under these conditions price has a quick and sensitive control over output.

Figure 4 is a chart similar to Figure 3, but is based on the conditions shown in Figure 2 where the fixed charges of modern manufacturing have increased and variable costs have become of less importance. Here a drop in selling from $1 to 80 cents leaves all competitors operating, because those who are not making a profit are making something on fixed expenses. If the selling price per unit now drops to 60 cents, only the two least efficient, F and G cease operations.

Output is thus neither quickly nor proportionately responsive to price changes. Prices drop precipitately without much effect on the volume of goods marketed, and one of the primary governing elements of economic balance becomes sluggish and ineffective. The area of fixed cost in Figure 4 has been aptly characterized as the "area of cut-throat competition."

From the above considerations it would appear that the modern condition of heavy fixed charges is a primary source of business instability, without any apparent compensations.

(10) The substitution of power for human effort is believed by some to be a primary source of unbalance. Careful study of this viewpoint does not reveal important influences not previously considered under (4) to (9), inclusive. The substitution of mechanisms, the transfer of human skill to machinery and tools, rather than the increased amount of power applied, is the essential change. The elements of quantitative importance are the increase in fixed as compared with variable factors in the total cost of output, and the released man-hours due to increased productivity, the latter constituting the crux of the problem of technological balance. The substitution of mechanical power for man power is a favorable primary factor in raising the general scale of living.

Certain general considerations apply to factors (4) to (10) inclusive. As productive processes they become more mechanized, more efficient, and less dependent on direct labor, dependence on the rewards for productive operations as the primary means of distributing goods becomes less automatic and certain. There are perhaps other factors and relationships concealed within this situation which have not been isolated. The subject is of the utmost importance.

### BUSINESS PERFORMANCE CAUSES

(11) Failure of profits to appear at the height of a boom is the traditional cause for the collapse assigned by some of those who hold to the view that the disturbing causes are primarily due to credit inflation. (See (26) and (27).) The subject

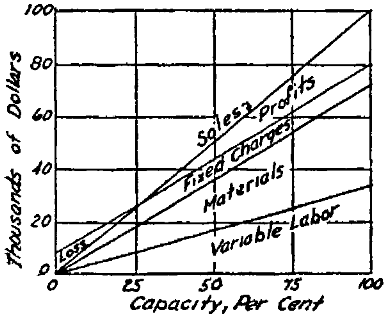

Fig. 1

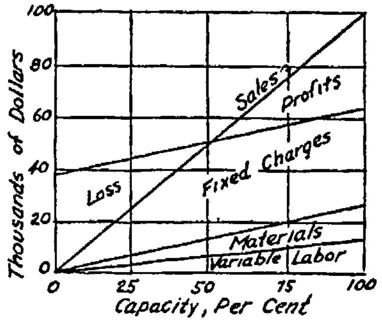

Fig. 2

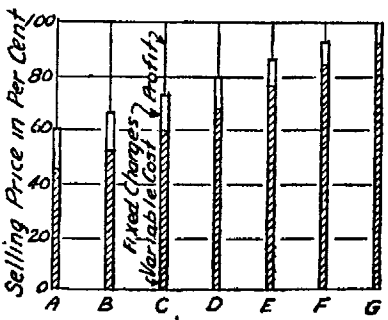

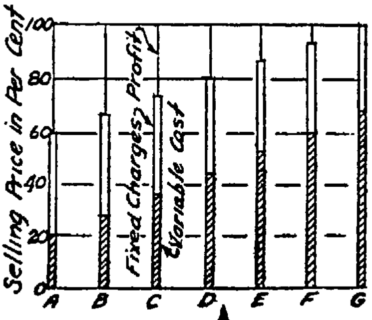

Seven manufacturing concerns with Total Production Costs ranging from 60¢ to $1.00 per unit

Fig. 3

Fig. 4

is considered at this point because of its relations with the preceding discussion of technological factors.

Modern productive processes tend to develop profits rapidly as production increases up to the point of diminishing returns. This tendency can be blocked by labor scarcity and consequent high labor costs due to high wages and overtime, by inefficient, marginal labor, and by scarcity of materials. However, none of these influences appeared in 1929, in any important class of goods. Prices generally tended downward, indicating an increased difficulty in disposing of output. The only expense element tending to increase was that of selling, for reason presented under (3), (6), and (8). The reports of taxable incomes for the boom years give no indication of an increasing difficulty during that period in making profits from business and speculative transactions as a whole.

Lack of profit is a factor of doubtful importance as affecting any element of the present business cycle. Fear of the lack of opportunity for making profit, however, has an unstabilizing influence as it precipitates business inactivity.

(12) False views as to the possibility of continuous profits affect business procedure adversely. In particular, there has been a tendency to consider net earnings of the most profitable period as being normal, and to pay them out in dividends on that assumption. Only in recent years has it become customary to adjust current policy to the movements of the cycle as a whole, recognizing that each industry has its characteristic history during the course of any cycle of business.

A full view of the business cycle would suggest the need of reserves for dividends in poor times, for wages and salaries to maintain the organization, for unemployment funds, for the development work and plant improvement which can be carried on most advantageously during depression, and for working capital when business again appears.

To the extent that a business does set up such reserves its operations become more unsteady and subject to wider fluctuations. If business in general follows this course, the total effect is to magnify the variations. This false view of continuing profits is a contributory cause of business instability.

(13) Natural rhythms in the operating performance of individual industries can be detected. When these chance to coincide in their maximum or minimum phases, the total volume of business is affected thereby.

This characteristic has been studied for four major industries, food, automobiles, textiles, and building construction. Of these all except food exhibit marked rhythms, based on replacement periods. Furthermore, these rhythms appeared to culminate synchronously in the events of 1929–30.

In view of all the other effective influences it is difficult to see how the natural rhythms of industry can do more than determine the timing of the cycle and affect its amplitude. They can not be charged with a major responsibility for its occurrence. They are classed as an incidental factor affecting business stability.

(14) Unbalanced relations between different branches of industry have been declared by some authorities to be the chief cause of business instability. As a major example the disturbed balance between agriculture and manufacturing has been cited.

This factor is uncertain as a primary cause. Analysis at once turns to discovering the reasons for the disturbance of relationship. Several elements have been cited which upset the traditional corrective reactions of price, profit and production, of supply and demand. The special factors depressing agriculture are discussed in (33) to (36). Except for agriculture this factor is at the most contributory. Its presentation even is a description of a situation rather than a statement of cause and effect.

(15) Attempts at price fixing and production control, private and governmental, are believed by some to have upset the natural economic compensations. Wheat and cotton stabilization, coffee, copper, and sugar control, the prorating of petroleum production, all are looked upon as introducing rigidity into an organism whose successful functioning depends upon flexibility and responsiveness.

There is no doubt as to the ultimate harmfulness of some of these projects, and all of them have dubious aspects. In general, rigid production control in this country, in commodities naturally or artificially protected from world competition, will lead inevitably to governmental price control There is therefore great need for examining the practical effect of price control There is little that is encouraging in its history. It appears to be most justifiable in the case of unreplaceable, natural resources, and only partly successful in the case of the major staples, as demonstrated by the checkered history of the continental cartels.

An example from current experience is afforded by copper in the United States. The price was fixed at 18 cents per pound. As a result overproduction of the metal and excessive speculation in stocks of the producing companies were encouraged, and substitutes for copper were freely adopted. Consumption decreased and the industry became demoralized. The price of the metal dropped to 5 cents per pound

Attempts at price fixing and production control, if not a primary cause of business instability, are a major contributory influence in the industries where they are practiced.

(16) Excessive size of industrial organizations is claimed to be a specific cause of general business unbalance. It is asserted that the ability required to aggre-

gate or consolidate a great unit of production and distribution is much less than that needed to operate it properly after it has been assembled.

This is a reasonable assumption, and is supported by the present tendency toward dissolution and decentralization in many large industries, in the difficulties which many mergers have found in making expected savings, and in the present-day realistic attitude toward the profit possibilities involved.

However, it is difficult to see how the history of the late boom and the present depression would have been greatly different if the largest industrial units had been smaller in size. There might have been a less painful history if there had not been a general opinion favorable to mergers which made stocks of holding companies and similar securities acceptable to investors and speculators. That aspect is discussed under (23) and (24).

The great size of industrial units is a doubtful causal factor in business instability, but it does affect the severity of depressions.

The viewpoint which gives importance to the items under (11) to (16) inclusive demands attention. The basic assumption is that the illness of business as a whole is merely the sum of the ills of its parts. This assumption leads to remedies affecting individual industries, trade associations, etc. Many of these remedies appear to be useful and desirable, but there is good reason for questioning the basic assumption. This point of view is developed under the headings immediately following.

### CAUSES RELATING TO SAVINGS AND INVESTMENT

(17) Inequality in the distribution of wealth is often advanced as a factor affecting business stability and the scale of living. The contention is that the failure to control the distribution of the standard of living reacts unfavorably on its degree and its stability, besides being undesirable in itself.

Those who specially held this viewpoint are usually disturbed with the manner in which wealth is accumulated, as well as with its total volume.

Lending for interest has often been attacked and, more recently, profit as distinguished from payment under free competition for personal services rendered.

So far as these contentions are based on concepts of justice, they are outside the province of this report. Their presentation here is concerned with their effect on business stability and the general scale of living. (See (18) following.)

(18) Private ownership of natural resources, or of artificial monopolies, was the particular concern of Henry George. He questioned the justice and wisdom of permitting such ownership, whether of mineral deposits, fertility and site value, or franchises. He contended that the owner was permitted to exact rent from the community through his ability to withhold such resources from use, rather than from rendering of actual service; and, in addition, any increase in productive activity by his neighbors enabled him to increase his returns without effort on his part.

It is apparent that the most unjust types of social organization are not necessarily unstable. For conditions to which it is economically adapted slavery is stable as an institution and permits of a stabilized rate of production and consumption. The same may be said of robbery even, at least in such institutionalized forms as that enjoyed by the mediaeval barons of the Rhine.

Under more civilized conditions it does not necessarily clog the economic processes to have large accumulations of wealth. If the few large recipients actually spend their income as freely as would a larger number of small recipients totalling the same income, the impersonal objectives of the economic process are served, even though human ends are neglected. In particular if large sums are thus disbursed for personal service—servants, gardeners, chauffeurs, grooms, yacht crews, and the like, the rich act as distributing channels for the social income.[1] As is indicated under (19) and (20) there is more question of the effects of the savings and investments of the wealthy than of their expenditures.

The effect of concentrated income, as such, on stability seems to be doubtful. The retaining of workers for personal service, if they are withdrawn from industry when there needed, affects the general scale of living adversely. If they are recruited from those otherwise unemployed, the effect on both the scale of living and distribution of wealth would seem to be favorable, though incidental.

(19) Oversaving has been urged as the primary cause of business instability. Briefly the theory is this:

[1] For a contrary view, but based largely on ethical grounds, see Thorsten Veblen's Theory of the Leisure Classes.

In times when industry and commerce as a whole are operating on an even keel, neither expanding nor contracting, and neither adding to nor drawing on their surpluses, the acts of extraction, manufacture, and distribution of goods finance their purchase by the general public. The receipts from the monthly sales are all paid out in wages, salaries, and dividends, for materials and supplies, repair and replacement of equipment, taxes, insurance, and other services. If the firms and individuals to whom these sums are paid are likewise neither saving nor drawing on savings, but spending all they receive, the whole process is completely self-supporting. This is a commonplace of classic economics. Furthermore, expansion of activity can take place without upsetting the balance, which may thus be dynamic rather than static. For if, instead of paying out dividends, a company finds it expedient to spend its profits expanding its plant and making additional expenditures for more material and increased labor for a larger work-in-process account, the increased expenditures go into the general pool of purchasing power to finance the initial purchase of the increased output, which then balances as before, but at a higher level. All this, of course supposes that the product is salable and that increased labor hours are available. These are purely ideal conditions.

Many departures from ideal conditions come to mind. The most serious of them is the necessity for saving. Sad experience in an uncertain world has taught firms and individuals that they must save if they are to survive. But the act of saving withholds immediate purchasing power so that society, to the extent of its aggregate saving, does not buy goods it has made.

These statements require qualification. The amount of "money", and the purchasing power which it represents, are not fixed, but variable. See particularly (26), (27), (29), and (30). Money varies both in nominal amount and in purchasing power per unit with the activities of the Federal reserve banks; and in the form of "credit" it is expanded every time a bank makes a loan, and is contracted when the loan is repaid.

Another qualification, and an even more important one, relates to the use made of savings. If savings are not hoarded, but banked, they normally find their way into new investment, and this is their proper use. If this takes place, they are ultimately used to buy materials and equipment and to pay wages. When so used, they restore the balance of purchasing power. In this case the only harmful effect is in the time lag between saving and investment, which is minimized by the banking mechanism. As savings increase in amount, their rate of inflow may be conceivably too great for the outlets furnished by obviously profitable investment, as described under (20) and (21). Uninvestable savings would then build up. This increase would aggravate the difficulty of selling the goods made.

The correctness of this theory as concerns the present depression, hinges on two points. As a matter of fact, was there any failure in purchasing power previous to the collapse of September, 1929? As a matter of theory or fact, is it possible for funds which have been banked and thereafter loaned out for any purpose whatsoever to escape an ultimate use in the purchase of goods and services of some sort?

In answer to the first question reference is made to the index of Volume of Manufacturing Production as determined by the Federal Reserve Board. Production fell off in May, 1929, largely due to the drop in automobile output. Other industries did not follow until August and September. That the drop in output was not compensated for by a rise in prices is shown by the index of the United States Bureau of Labor Statistics. The peak of prices occurred in 1928, with a rapid drop commencing in 1929 about the time of the drop in production. The coincident drop in price and volume points toward an increased difficulty in disposing of output and is favorable to the oversaving theory.

On the other hand, it is not so clear that savings entrusted to banks can escape use in the purchase of goods or services, unless they are held idly in reserves. In 1929 funds were not hoarded, but banked, and loaned by the banks.

In the first progress report of this committee (February, 1932) it was contended that funds loaned on the money market were in part at least withdrawn from purchasing power. This contention has been denied by Professor Cassel. The countervailing arguments presented by Professor Eitemann appear to be convincing.

No opinion in regard to this theory is given. The matter is left indeterminate and set apart for further study. Business experience appears to support it. Theoretical analysis makes it appear untenable.

(20) Overinvestment would appear to be possible, even if it can be shown that all funds saved find an ultimate destination in the purchase of goods and services.

Oversaving may still be effective in the sense that it leads to an undue expansion of productive equipment without generation of a corresponding purchasing power to dispose of the output of that equipment. This theory has been convincingly stated by J. A. Hobson.[2] Business experience and available data tend to support the theory. Funds do appear to have gone unduly into physical investment in plant, office buildings and hotels before and during the height of the boom, though the strictly productive investment appears to have declined before the peak. (See (23).) So far as the productive plant is concerned the overcapacity at the peak of several important industries has been investigated by the U. S. Department of Commerce.[3] These studies indicate that in all major industries there existed at the peak of production an unused capacity varying from 10 to 30 per cent. It can not be claimed that this unused capacity was the most efficient, but it is clear that the recent peak marginal productive capacity was not used to the extent customary in previous booms.

There are, then, evidences of overinvestment or unwise investment in capital facilities as compared with the volume of production which consumers are able or wish to purchase. That it was a question of ability of consumers rather than their desire was argued under (4). It does not clearly appear, however, that this excess productive capacity, resulting from overinvestment, necessarily slows up the flow of business. Why are not the production and sale of capital goods as effective as consumer goods in financing purchasing power? An abandoned automobile or factory would seem to be in the same category. Each employed men and materials in its production, and in varying degrees in its later use.

The most evident difference lies in the fact that the now unneeded factory had formerly attracted workers, some from other factories, others from agriculture and the ranks of the unemployed. Industry was unable to sustain these workers so they were compelled to make new connections or be unemployed. At least, therefore, there is involved a social dislocation which is not easily or quickly adjusted; and during the process of adjustment there is a failure of purchasing power.

It is clear that unneeded capacity decreases the general scale of living. It turns productive activity into impersonally wasteful uses. Overinvestment seems at first sight to be a much more direct and serious cause of economic evil than it proves to be on careful analysis. Possibly there are elements involved which have not been clearly distinguished.

Overinvestment, or unwise investment, is a probable primary cause of instability and certainly a contributory bar to an increase in the general scale of living. Finally, the resulting destruction of capital is a clumsy and wasteful method of regaining balance.

(21) A slackening in the opportunity for profitable investment has been suggested as a present or imminent condition either on a temporary or a permanent basis.

The discussion under (18), (19), and (20) indicates the desirability of a balance between savings and profitable investment. That the ratio between the rate of savings and the rate of investment is highly significant is becoming generally recognized.[4] It may be expected that anything which diminishes the opportunity for profitable opportunities for investment will have a harmful effect. Its nature was indicated in connection with fluctuations in the equipment industries discussed under (6).

That there has been a permanent slackening in opportunity for profitable investment is a highly dubious conclusion but is worthy of thought, nevertheless. An obvious factor is the slackening of population growth, due to the curtailment of immigration and the inevitable flattening of the curve of natural increase. Such a large increase of investment in the future will not be needed to care for increased population.

Another evident factor is the approach to complete development of our natural resources and the rapid development of competing resources in more recently explored parts of the earth.

Allusion has been made to a serious and significant fact which lends weight to these speculations. This last boom was the first major one in which industry as a whole did not receive orders in excess of its capacity. Deliveries were not

---

[2] See, for instance, his rationalization and unemployment problem. Read also the picturesque and uncompromising pamphlet by David S. Coyle, Business v. Finance, published by the author at 101 Park Avenue, New York City.

[3] See bulletin of the Taylor Society for June, 1932.

[4] The 2-volume work on Money, by J. M. Keynes, is largely an exposition of this thesis.

greatly delayed at the peak. It was a "buyers' market." For the first time there was ample equipment and labor with which to meet the extreme demands of unrestrained business enthusiasm.

There is one large and hopeful chance for a renewed demand for physical investment. This will become a reality if our economy is recast to provide increased purchasing power for the millions who are able and willing to render effective service, but who either temporarily or permanently can not secure employment. An important factor in providing this increased purchasing power will be the higher wages which will prevail so soon as it becomes economically sound to pay them.

If overinvestment in enterprises for the production of consumer goods is a factor tending toward business instability and disturbance of the scale of living, any considerable permanent slackening in the opportunity for such investment would have an identical effect.

(22) Economies through managerial efficiency are particularly upsetting to the balance between production and purchasing power.

While great changes in production methods took place in the last generation they were commonly dependent on the development of new and more expensive equipment. This industrial progress furnished a continuing use in investment for the savings derived from that progress Frederick W. Taylor who initiated the industrial efficiency movement in the nineties made full use of the latest improvements in mechanism and apparatus. However, he was particularly concerned with the great efficiencies to be obtained by the rational use of existing mechanisms. His principles have had their most rapid expansion in the last decade, during which time there has been a great increase in efficiency, resulting in corresponding profits. To the extent the profits resulted from improvements or change in management policies, they did not generate an outlet for savings in any corresponding volume of new physical investment.

Improvement in managerial efficiency appears to be a contributory cause of unbalance, a primary beneficial factor in a possible rise in the scale of living, and of doubtful effect on the distribution of wealth.

The factors (17) to (22), relating to the accumulation of savings and their flow into investment are of great importance. Inequality in wealth in itself is not so determinative as the way in which it is used, whether in consumption, social expenditures, physical investment, or speculation. (See (23).) Much of the importance in the question hinges on future trends which are not clearly defined. An unrestrained profit system works most effectively in the situation of virgin territory with undeveloped resources, or, with less certainty, when rapid technological advances require new investment. Secular changes in these elements, in world industrialization, and in population growth will severely tax the profit mechanism in its present form.

These factors probably affect stability primarily and adversely, contribute to delay in a rise in the general scale of living, and affect primarily and adversely the distribution of wealth.

### FINANCIAL CAUSES

(23) Speculation is a commonly assigned cause of business and economic troubles. It is a conspicuous feature in every business boom. Indeed, speculative fever and high business activity are so inseparable that they have tended to become identic from the practical point of view. With regard to this situation two questions may properly be asked. Business activity and speculation have always gone together, but need they be joined? Is speculation itself a cause of collapse or only a symptom of more fundamental disorders?

The first question may be resolved into the more basic inquiry as to whether there was anything essentially speculative in the physical volume of business during the years 1928 and 1929. So far as concerns goods for human consumption and enjoyment this query may be answered unhesitatingly in the negative. There are two ultimate limitations on the economically justifiable production of material goods: The requirements that unreplaceable natural resources must not be squandered, and that enjoyable leisure must not be sacrificed by producing products to be wastefully consumed.

As regards the first limitation, it may be asserted with confidence that, as a whole, our resources are not being squandered. Some are replaceable, others exist in larger quantities than has hitherto been realized, and present or imminent technological advance has relieved the anxiety about others. With appropriate development and conservation there need be no crisis even on a broader scale of production.

The second limitation, that of leisure versus goods, is primarily a question of values, and so is in part outside the present field of discussion. It may properly be noted, however, that even with business at its best there were millions of American citizens existing on a very low scale of living. (See (4).) Among those earning so-called good wages, certain standards, such as housing and furnishing, for instance, were inadequate.

As a whole, the people did not make more goods than could be properly enjoyed, nor were they made on such a scale as to tax unduly our natural resources nor the energies of the population.

The second question, whether speculation is a cause or a symptom, is more difficult to analyze.

From the business and industrial point of view the history of the last boom may be stated as follows: The unparalleled improvements in machinery, processes and management methods in the period since the war resulted in a large increase in productivity of existing manufacturing establishments whose profitable operation encouraged the building of additional plants. For a time the provision of the improved and additional equipment absorbed the large available profits, furnished employment in the production of capital goods in new investment for labor otherwise displaced, and thus offered a market for the increased flow of consumer goods.

As the provision of new equipment approached saturation, however, the situation changed. Increased output was maintained and profits were high, but there had been no proportionately increased returns to labor and to those in the lower salaried positions during this period of expansion. Nor did those receiving dividends and the higher salaries choose to spend in consumption the full amounts received. They sought further investment instead. There was thus a failure in purchasing power to match the increased production of consumer goods. This situation was masked for a time by the rapid expansion of installment buying (see (28)), but became evident when its source of credit had been stretched to its limit.

The evident adequacy of existing plants, and the temporarily high returns from their operation, led to a condition in which the purchase of the securities of established enterprises was much more attractive than the building of new ones. This process was stimulated and expanded by the desire to deal in securities as commodities, as something to be bought and sold at a profit. Thus vast accumulations of savings, both large and small, were directed into speculation instead of new investment. This stimulated the real estate market and the investment-banking business and led to the floating of immense and valueless issues which represented no physical expansion whatever, but merely revaluation of properties at highly inflated levels, based on expected earnings. Speculation is thus seen to be an almost inevitable result of the assumed oversaving and overinvestment described under (19) and (20).

The speculation, however, did not focus on material goods or on documentary titles to them. Stock and bond prices soared far above the physical equities which they represented. The primary expectation of earning power was based on the expectation of a higher scale of living to match the new productivity. To this extent speculation was a result, not a cause. Its foundation was weakened by the failure to provide directly in wages and salaries for purchasing power. Furthermore, the investment transactions involved soon left their foundation in savings and soared aloft on the flimsy wings of credit inflation. (See (27).)

Speculation is always latent in our social structure. In its recent outbreak it was, in the first instance, a result of other causes, but it quickly became an enormously exaggerated unbalancing factor on its own account. As such it destroyed business stability.

(24) Investment banking has been subjected to much criticism for the part it has played in unsettling business. It is charged with misleading the public through the sale of worthless securities. Its relationships are sufficiently described in the preceeding paragraphs. The extent to which responsibility can be placed upon it and accepted by it, or the degree and kind of control which can and should be imposed, are matters relating to remedies rather than causes and will therefore be left for later consideration.

(25) Commercial banking policy in general may be an unstable element. Unfavorable effects may result from policies customary in business and permitted by legislation or from those forced upon it by governmental regulation. In either event legislative control appears to be a necessary factor, even though at times it may be unwisely applied.

Certain governmental provisions have, or may have, a primary stabilizing effect. Among these are the semiofficial functions of the Federal reserve banks, which supply credit for business uses (see (26)), inspect operations of all member banks, and mobilize resources for the support of member banks during periods in which failures are liable to occur. These provisions, however, apply only to member banks.

Unfavorable elements of governmental regulation are seen by many in State legislation against branch banking, which tends in some States to foster the growth of weak local institutions in small communities. While hundreds of such banks have failed during the current depression, a number of large institutions have also closed their doors.

Still a third class of governmental effect is seen in the laxity of laws in some States. The operations of banking are too vital to the maintenance of individual and general prosperity, too tempting in their profit possibilities to the inexperienced and to the dishonest, and partake so closely of the nature of a social trust, that they can not be left open to free competition and initiative, nor are they completely so left in any civilized country.

There are other banking practices of a recognized sort, some optional, others inescapable, which act as elements of unbalance.

Chief among the apparently inescapable factors is the necessity for selling securities by the banks during and after the collapse of a boom to "maintain a liquid position," so that the bank can meet the lawful demands for cash on the part of its depositors. Such selling embarrasses individual borrowers and lowers security prices. Both practices tend to hasten and accentuate the collapse as much as speculation hastens and accentuates the boom.

The most effective act of commercial banking practice is the control of credit, involving the defensive act of contraction described above in one of its forms—and the more positive acts of expansion and inflation, which are referred to under (26) and (27).

In general, banking policies, whether resulting from the practices of the business, or from governmental regulation or its absence, have a serious primary effect on business stability.

(26) Credit expansion and contraction is a normal banking function, whose proper and easy performance was the original purpose of the Federal reserve banking system. Credit expansion actually adds to the funds available to business of the process by making loans. A bank with a satisfactory surplus loans a depositor against commercial paper, credits the paper to itself, and charges the borrower. The latter leaves the funds in his account for a time, but checks them out sooner or later, transferring the funds to other accounts in the same bank or in other banks. But as a whole, to the extent that the account is checked out, other accounts similarly originated in other banks are being checked in, so that the net result is an increase of funds for business without a corresponding decrease in resources for the banks. Since the paper employed is usually of a self-liquidating character, the amounts demanded are paid on the completion of the business transaction which the loans were originally made to finance.

To facilitate this normal process, the Federal reserve system arranges for the pooling of the reserves of the member banks, and also for the rediscounting of the paper on which its loans are based. The latter act, in particular, greatly increases the ability of a bank to make loans, as it promptly receives the amount of the principal back from the Federal reserve bank, as well as enjoying the increased deposits resulting from the loan.

It is evident that the total effect of individual banking policies in making or refusing loans at lower or higher rates has a marked effect on business expansion and contraction. It is furthermore evident that the rediscount rate of the Federal reserve bank has a still more fundamental and controllable effect of the same sort.

That this effect is not directly proportional to the numerical values of the pooled reserves or of the discount rate is evident from the present situation. Psychological factors (see (1)), are effective also. Even that more technical branch of economics called finance must be classed as a "social science," with all of the implications which that term comprehends.

Banking policy with reference to credit expension and contraction has primary effect on the expansion and contraction of business, and thus on its stability. That it is a direct cause of speculation, and maintains that fever after it is generated, is undoubted. That it exaggerates speculation, which itself exaggerates original business instability, likewise seems clear.

(27) Credit inflation is a term hitherto applied to credit expansion carried to an extreme. Recently it has been proposed to assign to it a more definite and measurable meaning to distinguish it from normal expansion and contraction.[5]

In considering these concepts, it should be borne in mind that the short term loans, discussed in (26), usually reappear in checking accounts. To the extent that business operations are financed by such self-liquidating loans these two elements should tend to balance each other, or at least to rise and fall with a measurably consistent difference, considering the operation of banking as a whole. It is likewise asserted that the time deposits of all banks, which represent savings, should show an equality with the long-time paper, mortgages, stocks, bonds, and the like. This is a reappearance, from a new angle, of the principle that savings should equal investment, which is briefly treated under (19) and (20). It is more fully discussed in Keynes treatise on money.

According to older viewpoint—here Keynes must be included—credit expansion and contraction are relative factors. All bank loaning operations represent its existence in some degree, and it would never sink to zero except on the extinction of all business not done on a barter or gold basis. The reason for the existence of the banking system would vanish with its extinction.

Harwood contends that it is desirable to keep credit expansion based on investment-type assets as near zero as possible. When so kept it would appear that: (*a*) The rate of saving is equal to the rate of investment, i. e., investments are just absorbing savings; (*b*) there is no debt structure being built up on overvalued assets to become top-heavy and later crash and require painful liquidation; (*c*) speculative profits and losses losses are currently wiping each other out, leaving the returns from industry to be distributed more nearly on the basis of competitive reward for services rendered, whether by management, labor, or capital;[6] (*d*) the general price level would permanently adjust itself to the slowly changing gold level, undisturbed by credit inflation; and (*e*) the growth of security prices would be a measure of the actual saving of physical goods and their application to physical investment. Under present conditions the increase in values represents principally the inflation of funds available for their purchase.

In this view, any cumulative excess of investment over savings is a fallacious and an unstable condition, self-generative of further inflation, and only to be arrested by its approach to the limit of gold reserves, as in 1920, or by a general recognition of its top-heaviness, as in 1919.

While the general position taken by Harwood seems to be useful, his statistical work has been criticized. Credit inflation is one of the first factors affecting business stability which needs control. It can not be maintained, however, that it is the only cause of business instability.

(28) Installment buying is classed among the financial causes because on any large scale it depends ultimately on the extension of banking support through credit corporations or otherwise. The crucial aspect is the method of financing. If bank credit is employed, it may be unfortunate in its effects, for it provides purchasing power that has neither been earned nor saved. If, however, the credit represents savings, the situation may be sound.

In this analysis (see (23)), it appears as an indication of maldistribution of purchasing power, of a diversion of an undue proportion of the returns of industry from the purchase of consumer goods. Its application to the purchase of capital goods is of considerable proportions.

Its expansion, as inflation approaches its climax, appears as an exaggerating effect on unbalance. It conceals the deficiency in purchasing power for consumer goods, maintains an appearance of stability when foundations are seriously impaired, makes the collapse more serious, and delays recovery by requiring consumers to pay for past purchases before they can apply earnings in full to the purchase of current consumption.

It is a primary factor in delaying the return to stability, with no apparent permanent effects on the scale of living or equality of distribution.

(29) Monetary factors are of evident importance in economic disturbances. They manifest themselves through variations in the general price level; that is, through changes in the value of the dollar. These changes are due in part to the factor of credit inflation and deflation, already described, and in part to the relative value of gold on which our currency is based.

While no technical description of the theory of prices, on which experts disagree, is given, it is still clear that prices must be some function of the total funds avail-

[5] See particularly Cause and Control of the Business Cycle, E. C. Harwood, Financial Publishing Co.

[6] The return to capital will approximate the "natural rate" of interest. There would seem to be no effect on the returns from natural and artificial monopolies, discussed under (18).

able, and that these funds are composed of credit in various forms, on the one hand, and of currency, on the other. The currency is for the most part gold based. Credit is gold limited, but not gold based.

A part of the difficulty surrounding the subject arises from the fact that the factors of currency and credit have not been separated, and that there are differences of opinion as to the nature of the credit factor.

There is no dispute as to the seriousness of extreme variations in the price level. As the level rises, persons with fixed incomes suffer hardship, creditors are paid in money of lower purchasing power than that which they lent, and wages tend to lag behind prices, though employment is good. On the decline, debtors find it hard or even impossible to pay in costly dollars debts incurred during inflation. On the other hand, creditors who are paid gain thereby, those with fixed incomes enjoy an advantage for a time and prices tend to fall faster than wages, though employment is scarce.

On the whole, the variation in the price level tends to enrich the more astute of the investing class, who are accustomed to reckon on and adjust themselves to its variations. In its extreme variations, as in the drop of 1920–21, and again from 1929 to the present, the creditor class becomes involved in the distresses of the debtors and no one profits.

If credit inflation could be controlled, and the price level maintained by the relationship between the productive costs of gold as a commodity and other commodities, changes in the price level would not be as serious as they are now. The prime advantage of gold as a currency base lies in the large volume of permanent monetary supply as compared with annual accretions. Price fluctuations based on this factor alone would therefore probably be of such slow effect that all classes of society could adjust themselves to it without hardship.

The monetary factor is a primary cause of business instability, and a contributory cause of an unsatisfactory scale of living and of inequality in distribution.

(30) War inflation is by all odds the most serious form of monetary disturbance. It is primarily a credit factor, and only secondarily a gold phenomenon. No great war has been financed without credit inflation, and until some other way is found there is a grave question as to whether the distresses of the succeeding deflation do not in their sum exceed the physical and spiritual miseries of the armed conflict.

If we would avoid this greatest cause of instability, of reduced scales of living below the attainable standards, and of unfortunate spreads in the distribution of wealth, war must be prevented with its accompanying inflation and its inevitable deflation.

(31) The burden of debt is a factor whose effect is obvious and directly felt, but whose elements are more numerous than appear at first sight. The total of public and private debt in the United States is enormous; a recent estimate places the total of industrial indebtedness (bonds, mortgages, bank loans, etc.) at over $200,000,000,000. While such sums are very great, their significance can be exaggerated. In substance, they state the total of a certain form of evidence of ownership, the property itself being under the management of others than the owners with the expectation that they can "service the loans" (pay interest and pay installments on the purchase of the property) and still have something left over.

This situation might not be unmanageable except as the change in the value of the dollar makes it so. Most of these obligations were undertaken at a much higher price level. It is the variation in the monetary factor which makes the burden unendurable.

Indebtedness under these conditions has one effect of its own as well. It makes it difficult or impossible to come to a profit basis during a depression by reducing wages, salaries, and other variable expenses. The compelling reason for these reductions is to make operation less difficult. This has been indicated under (8). The burden of debt is an important element of fixed expenses in many industries.

In general, the burden of debt has the same effects as deflation under the monetary factor. (See (29).)

(32) Foreign debts are a disturbing factor, whether in the operations by which they are incurred, their continued existence, or the attempts made to service and collect them. But their effects appear to be different from purely domestic ones, in that they operate through the mechanism of international exchange, and affect or are affected by direct political considerations.

The normal difficulties of war debt payment have been accentuated by the drop in the price level, the same as for private domestic debts. Nations as well as individuals have bound themselves to pay in dear money obligations which were incurred in cheap money. This is reflected in part by drops in exchange value of those nations which have gone off the gold standard.

The difficulties of repayment are partly political and partly economic, aside from the change in values. We have no mechanism for receiving large payments. We can not be paid in gold, we are unwilling to receive the equivalent in an excess of imports on account of its effect on domestic industry, and foreign credits or even currency are useless except as they can be exchanged for gold or goods, or absorbed into the "invisible items" of the international balance sheet. This subject is only touched upon; here the concern is primarily with domestic questions.

There is no doubt that the collapse of the European financial structure in 1931, after this country had made unwise loans to support it, had a serious effect on our own condition and possibilities of recovery.

During the war we loaned our allies goods, primarily, taking paper in return. In the periods since the war our net export of goods has tended to vary with our net export of capital. Fundamentally this means that the producers of exported goods are paid by the domestic buyers of foreign loans. Viewed in this way it is a domestic transaction, but with the purchaser holding title to future payments instead of consuming the goods. The process is reversed when, as and if loans can be paid for by an excess of imports. In that case the domestic purchasers and consumers of foreign goods reimburse the holders of foreign bonds, which are thus retired. To the extent that this normal procedure is followed, the transaction still remains a domestic one.

But this normal method of repayment is almost impossible for us, both politically and practically. The repayment and servicing of large scale foreign loans requires changes in the balance between our domestic and foreign sources of supply which we are unwilling, and may be unable, to make. The net result of the difficulty in repayment is therefore a domestic shift in wealth distribution from the American lender to the American producer of export goods, and since these goods were consumed abroad, they are subtracted from the possible total of domestic consumption.

From the above considerations it is evident that foreign indebtedness is an important contributory cause of instability, and a primary cause of some degree of lowering in the scale of living. It also appears as an agent in the redistribution of wealth as between the investing and the manufacturing classes.

The financial causes and factors are of primary importance. While the business and profits, and the savings and investment factors, set the stage, credit inflation furnishes the energy for destructive speculation, and unwise banking weakens the structure and broadens the collapse.

### AGRICULTURAL CAUSES

(33) The postwar deflation (see (30) and (31)) bears with special severity on agriculture, particularly that devoted to the staple cereals.

During the war the collapse of European production stimulated our own. The prices of farm products were artificially set to prevent excessive profiteering. At the same time official encouragement was given, particularly to the production of foodstuffs. As a consequence younger and more enterprising farmers took over larger and larger acreages from the older owners, usually on mortgages at the prevailing inflated prices. This policy was spectacularly effective in its immediate results, but has left the farmers with an undue proportion of that burden of debt already described. As investors, in farm mortgages banks and insurance companies are sharing in the burden.

The results of war inflation in agriculture are a primary cause of instability, of a lowering of the scale of living and thus of an inequality in distribution as between agricultural and other classes who were less directly affected.

(34) New producing territories and new productive methods have played a part in agricultural distress, although the per capita production of farm products in the United States has been decreasing since 1915.

Wheat is not only feeling the impact of the expansion of new territories, in Canada and Russia, but also that of new varieties and processes. The new processes, largely mechanical, result in a great increase in both acreage and production per acre. They also make possible a satisfactory extension of the industry into more arid regions than had before been thought usable.

The same extension of areas applies to cotton. In foreign countries there is Egypt, the Sudan, and Turkestan; in the United States the climatic and other conditions of the new cotton fields of northwestern Texas have led to improved and more economical methods of production. This increase in output has met a decrease in demand due to the introduction of rayon and the vagaries of fashion.

These circumstances and conditions are among the causes responsible for present economic conditions in this country.

(35) Crop surpluses have been another disturbing factor. For the years 1927 to 1930 the annual production, in general, of the great staple crops has been high, although not the largest crops on record. In wheat, however, the average world production for these four years was over 4,600,000,000 bushels per year, as compared with an average of less than 4,000,000,000 bushels annually for the preceding six years. The production of the Union of Socialist Soviet Republics is included in these figures. The principal causes of the surpluses in the United States are the reduction of consumption and loss of exports.

(36) Agriculture as a business has certain difficulties of its own. It is burdened with too high land values, it has been injured by loss of exports, it has suffered since 1929 from low prices for its products, it must operate under a wide range of production costs, the spread being between those of the most efficient and least efficient production. In the case of foodstuffs it meets a comparatively inelastic market. Production can not be accurately gaged in advance, due to the uncertainties of weather and crop influencing conditions. Agricultural output is under control through only one factor, and but once a year, at planting time which is many months before harvest. During the growing period conditions may and do arise which indicate quite different acreages than those planted, provided they could have been foreseen. Staple agriculture is essentially unstable.

Agricultural methods of operation are so complicated and under the best of conditions so completely mechanized that farming can not absorb the unemployed released from industrial occupations, except on the basis of subsistence farming, a standard of living which would tend to destroy everything desirable in our social structure. To be a source of national strength agriculture must be treated as a manufacturing industry.

By its very size agriculture is a preponderating factor in the market for goods, and, for that reason, its well being is vital to national prosperity. However, it is inherently unstable, and further, because of its peculiar exposure to the evils resulting from war financing and war production policies, it is in a situation of distress which is a primary cause of the lowering of the attainable standard of living, and in the uneven distribution of wealth.

## GOVERNMENTAL CAUSES

(37) Tariffs interfere with the free flow of goods from country to country, and are thus an element in preventing the attainment of a natural, world-wide equilibrium. It is commonly assumed that such an equilibrium is desirable. But equilibrium assumes a tendency toward the leveling of the scale of living in proportion as special advantages of different areas tend to diminish, as is the case at the present time. At this particular stage of industrial development and of the diffusion of techniques and mechanisms, the first result of ideal free trade conditions would appear to be the emergence of the scale of living to the position of being the decisive element in world competition. In such a situation our own scale of living would be inevitably depressed below what is physically attainable.

World forces in actual effect at the moment tend to put a new aspect on the tariff question. It is appearing as a tool of conscious social control, rather than as a support for special interests. In proportion as this change can be recognized and assisted, this factor may be made a primary element of stability, and contribute to a raised scale of living.

(38) Restraint of business by Government interferes with free adjustments internally as do tariffs externally. Among the governmental interferences may be mentioned the antitrust laws, railroad rate and other forms of control by the Interstate Commerce Commission, and the attempts to control prices of commodities artificially, as wheat and cotton prices by the Farm Board.

Of these examples the control of railroad rates has been undoubtedly the most complete and effective. It is also illustrative of the difficulties of arbitrary economic management in a complex industrial society. The rate structure is of such complication and of such delicate balance that no changes can be made except after much study and with great care. It is doubtful if as satisfactory a structure could have been built up by conscious design as was originally developed by free competition. The evils of that competition were obvious, but its services are no less so.

As to the control of prices, when the Government seeks to fix the price of any commodity, that very attempt prevents the setting of proper prices, except under conditions of national emergency, such as war.

Other forms of governmental authority have pointed to similar complexities in the exercise of arbitrary control and give support to the view that such policies, even when unavoidable, are at least contributory causes of unbalance. This cause was discussed from another angle under (15).

(39) The burden of taxation is annoying in prosperity, but scarcely endurable in times of depression. Inpart it is a reflex of the tendency to spend a growing proportion of our income in various forms of social expenditure, instead of in personal consumption. To the extent that this choice is consciously made and the expenditures are economically administered, the increased taxation is not only inevitable but desirable.

In part the present burden of taxation is derived from war financing and war obligations. To the extent that these were necessary and inescapable the burden is justified. A considerable portion of them were unnecessary and at present escapable, and this portion is classed by many as an unjustifiable burden.

Finally, the burden of taxation has been multiplied by the deflation since the war, as represented by the expenses of servicing and retiring the national indebtedness in dearer money than that originally borrowed. In this aspect the burden of taxation is one of the incidences of the burden of debt.

Under the present fiscal ideals which endeavor to equalize the volume of taxation over good times and bad (though with little success) taxation during the depression is a handicap to recovery so far as the psychology of recovery requires the attainment of profit conditions.

The burden of taxation would appear to be a contributory cause of business unbalance and a factor in the distribution of wealth. It affects the average scale of living in the sense that it may divert purchasing power from personal to social, consumption which may or may not be preferred.

(40) Public construction in its total volume of municipal, county, State, and Federal undertakings is of a magnitude which can only be roughly estimated. It is clear that the volume is sufficient to make ti an important element in the total volume of business. To the extent that the fluctuations of public construction coincide with those of private business, it would appear to add to those fluctuations. To the extent that the two classes are out of phase they will tend to diminish the amplitude of the total variations. This is merely the obvious, primary effect. There are doubtless important secondary effects not clearly recognized.

The present coincidence of the variations in public and private activity accentuates as well the fluctuations in employment, and concentrates public expenditures in the period when costs are highest.

It is evident that any method of improving this situation will have to take into account the favorable period for taxation, and provide some as yet unapplied means for carrying over funds from prosperous to depression periods, when they can be employed most effectively and economically. This problem lies rather in the category of remedies than of causes, and is not discussed further.

The various governmental acts bring serious forces to bear on the economic problem, but in so diverse a way that it is not possible to evaluate them.

By way of summary, the committee restates the fact that the causes of business instability naturally fall into the seven groups presented in this report, and on the whole, the items in each group are so related as to lead to the surmise that the effective remedies may be more or less in common; that is, the rational structure presented by the causes suggests a corresponding structure of appropriate remedies. The second part of this Second Progress Report, which now follows, is given over to an analysis of a selected group of suggested remedial plans and programs.

## II. An Analysis of 23 Plans for Business Stabilization

From the more than 50 plans and programs presented to your committee as remedies for business instability, 23 have been selected for analysis and inclusion in this report. The criterion of selection has been to give through the group a cross section of the theories, principles, and methods now being actively advocated. Plans of similar origin and content with those selected were omitted because they did not contribute additional fundamental thought or method.

The committee does not indorse or condemn or even express an opinion favorable or unfavorable toward any of these plans. They are presented as Part II of this Second Progress Report to show the type and quality of thinking being given to the problem of business instability, and to indicate suggested remedies and cures.

A uniform topical schedule of analysis was adopted with these headings: Classification, Author and Origin; Objective; Theory or Principle; Methods Advocated: Author's Evaluation; Status of Plan; Supporting Comments; Objecting Comments. So far as practicable, each analysis has been condensed to a single page.

PLAN OF A. L. APPLETON

Classification: Wider distribution of national income.

Author and origin: Allen L. Appleton, article in Springfield Republican, September 20, 1932.

Objective: An automatic business stabilizer, and eventually a better distribution of national income—not a revenue-producing measure.

Theory or principle: To tax savings instead of income, thus preventing accumulation of capital and capital investments.

Method advocated: Would establish a Federal graduated tax on personal savings exempting modest savings. Savings defined as that portion of one's annual income which is retained in liquid form, i. e., cash or credits, or as invested. High surtaxes with exemptions including everything except reinvestment.

Author's evaluation: Such a tax on annual savings will result in wealthy spending more for services, luxuries, and travel, and less for investment in securities of unneeded and overexpanded industries. The result would be to put funds into the hands of the consuming masses, increase corporation earnings making bond interest safer, restoring dividends, and increasing the taxes derived from corporation earnings.

Anxious to avoid taxation for increasing funds for Government disbursement.

Status of Plan: Proposal only.

PLAN OF ADELBERT AMES, JR.

Classification: A philosophic examination of our industrial system.

Author and origin: Adelbert Ames, jr., trained in law, art, science. Research professor in Dartmouth College. Plan published as a supplement to the Dartmouth Alumni Magazine, January, 1932.

Objective: To restore and continue prosperity.

Theory or principle: The essence of life is becomingness and development, economically, socially, culturally, and spiritually. Well-being depends not on the absolute economic level, but upon a proper increase or growth. A steady flow of new developments is therefore imperative. He establishes two interesting and instructive human activity classes, consumable and nonconsumable. Thus clothing, heat, food are consumable, while religion, art, research are nonconsumable. Labor-saving developments will liberate labor for the nonconsumable activities. With the proper allocation of labor in these groups, modern productive methods present opportunity for well being of individual and society as never existed before.

Methods advocated: To increase the flow of new developments in both the consumable and noncomsumable activity fields, he cites influence of personal and foundation benefactions and the properly directed influence of the Department of Commerce. To this he adds the possibility of new laws that would assist, through exemption from taxation all nonconsumable activities, as is the case with churches and colleges. The increase of labor-saving developments in the field of consumable activities must be accompanied by expansion of activities in the nonconsumable field, to be accomplished by a continuously evolving program of government, state, and municipal aid, plus action by individuals and privately owned industries, to increase the numbers employed in nonconsumable activities.

PLAN OF CHARLES A. BEARD

Classification: A national economic plan, or, a 5-year plan for America.

Author and origin: Charles A. Beard, writer and editor, New Milford, Conn.

Objective: To provide national control of production and distribution not by communistic methods, but by control exercised through representatives of fundamental industries.

Theory and method advocated: A national economic council authorized by Congress representing the fundamental industries.

Repeal of the Sherman and Clayton Antitrust Acts; industries affiliated with the council and others approaching a high degree of concentration, to be declared national public service enterprises subject to principles of prudent investment and fair returns.

A board of strategy and planning to survey resourcse and productive facilities and forecast the production of consumers' and capital goods, allocating production not only to secure maximum of output within limits of increasing demand, but also to raise the standard of living by increasing wages and reducing prices.

The Bureau of Standards to be strengthened by concentration of industrial research agencies to coordinate research, eliminate duplication of effort, and standardize essential commodities produced under the jurisdiction of the national economic council.

Each industry associated with the national economic council to become a syndicate of affiliated corporations, in the form of a holding company, with large directorial and service powers; each syndicate to have a board of strategy and planning, geared into the grand board; the syndicate to be divided into divisional or geographic corporations to be operated by corporation managers.

A separate agricultural syndicate to survey fertile regions, reforest sections now devoted to futile cultivation, plan new roads and power lines; to develop the most productive parts of the country. Large-scale corporate farming to be introduced where the old methods of farming are not profitable.

A marketing syndicate under the national economic council to eliminate waste in haulage and handling, to curtail the profits of middle men by establishing great storage houses and refrigeration plants, with branches.

A syndicate of exporting and importing corporations to direct trade with foreign countries to secure goods needed by the United States, control issue of foreign securites in the United States, stop the reckless habits of financiers in making loans to irresponsible governments for unproductive enterprises. Through this syndicate a consistent influence in diplomacy could be wielded by means of economic pressure.

American diplomacy to proceed on the basis of the Kellogg pact, recommending adherence to the World Court, full cooperation in the economic conferences and councils of the League of Nations, and cancellation of European war debts on condition that the armed forces of the world be reduced to a police basis.

Author's evaluation: Believes nothing but a "planned economy" can in any way cope with our present ills.

Status of plan: Proposal only.

### PLAN OF CLARK-SMITH-SMITH-SOULE

Classification: Long-range planning for the regularization of industry.

Authors and origin: J. M. Clark, chairman, J. Russell Smith, Edwin S. Smith and George Soule, subcommittee of the committee on unemployment and industrial stabilization of the national progressive conference.

Objective: "Regularization of industry" through increase of total production; increase of proportion of income going to majority of lower income ranges; raising the lowest wage rates; improving or eliminating the highest cost concerns; use of reserve or insurance against unemployment; balancing productive equipment and demand; avoidance of wasteful duplication of existing facilities; maintenance of balance between, and stabilizating of, flow of savings and capital expenditures; prevention of concentrations of capital construction and inventory growth from causing basic production and sales to fluctuate unequally; stabilization of price levels; and canvassing of possibilities of latent as well as actual demand.

Theory or principle: The introduction of "collective planning into our existing system." The making of "the best possible use of our resources," "representation of all interests involved."

Method advocated: National economic board to make nation-wide statistical fact-finding survey; initiate organizing councils for setting up permanent organizations in the various major branches of production and distribution, including finance; cooperate in process of organization, approve, disapprove, amend proposed plans, recommend new legislation and national policies affecting economic system.

Authors' evaluation: Hopes "to mitigate or curb features of the economic system which cause disturbances to spread and intensify cumulatively; to prevent business from getting into such top-heavy condition that outside disturbances will start it on a long downward slide * * *."

Status of plan: Presented to committee on unemployment and industrial stabilization of the national progressive conference. Printed in the New Republic January 13, 1932.

Supporting comments: Gives business a chance to rescue itself "with a reasonably free choice of means and methods * * * under reasonable safeguards."

Objecting comments: No absolute certainty in advance that the plan proposed will develop power enough to overcome disturbances which shake the economic system, but there is fair prospect of partial success.

PLAN OF H. C. DICKINSON

Classification: Business stabilization.

Author and origin: H. C. Dickinson, chief, division of heat and power, United States Bureau of Standards, Washington, D. C.

Objective: (1) To end the depression; and (2) to stabilize a normal condition of prosperity and industrial development.

Theory or principle: Crises result from an unstable relationship between capital goods and consumables. A trend away from the normal either towards inflation or depression, is cumulative in effect. Three conditions occur:

(*a*) Inflation, when capital goods sell for more than their normal value based on current or probable earnings.

(*b*) Panic when capital goods sell for less than their normal value based on current or probable earnings.

(*c*) Chronic depression when there is serious unemployment, reduced income and low prices, with capital goods selling at prices which may or may not be in line with the greatly reduced earnings.

Method advocated: Condition (*a*) always ends in panic if uncontrolled and can be controlled by the Government through diverting to consumables a portion of the unearned increment of capital representing the excess of selling price over its normal value based on earnings.

Condition (*b*) can be controlled by borrowing, on short-time notes, using the proceeds to increase employment and buying power and thus allay popular fears, retiring the short-term notes by a levy against the resulting increase in value of securities.

Condition (*c*) can be controlled partly or wholly by the foregoing process combined, if necessary, with a universal nonselective tax used to retire the notes if the levy on increase in security prices is too onerous.

If the proposed tax is truly nonselective, by which we mean levied against all the population in porportion to their participation in the benefits of recovery, each taxpayer will have received in advance more than the amount of the tax in increased income through the process of recovery, before he is called upon to pay.

Each of these processes requires the emergency expenditure of funds for consumable goods and services, either by the Government or by private interests under governmental control. The most effective means is to keep all normal employees, governmental and others, at work through expenditures for wages or for goods and services. The next is to create useful new employment of maximum value to the public, such as roads, parks, hospitals, education, and research. Relief of want and suffering should be provided from this source with the proper regard to social reaction.

It is estimated that a maximum of $5,000,000,000 would be required under condition (*c*) to actuate recovery under present conditions. This is equivalent only to the present loss of net national income for 40 days as compared with 1928–29.

It would require not over 10 per cent of the total resulting rise in security values for the next two or three years to pay the cost or part of this might be assessed in the form of a nonselective tax on increased incomes.

Author's evaluation: The results, both economic and social, which would follow the proposed stabilization, offer promise for national welfare far beyond that yet attained with any degree of permanence.

Status of plan: Suggestion of an individual.

PLAN OF WILLIAM B. DICKSON

Classification: Control of industrial operation and distribution of wages, salaries, and dividends. Democracy in industry.

Author and origin: William B. Dickson, retired. Formerly vice president, United States Steel Corporation and Midvale Steel & Ordnance Co.

Objective: Decentralization of control of American industries. "This nation can not endure permanently, politically democratic and industrially autocratic."

Theory or principle: (*a*) Industrial workers are economically dependent. They differ from the founders of our nation:

(1) "In that they have no voice in the consideration of questions which affect the continuity of their employment;

(2) "When confronted by unemployment, they lack both the ability and the opportunity to find any means of providing for the maintenance of their families."
(b) "Decentralization of control of American industries by organized labor is as essential to the public welfare as decentralization of control by organized capital."

Methods advocated: (a) Incorporation of labor organization, preferably company associations, with membership limited to employees of a corporation, company association, through shop committees, of elected delegates, confer frequently with the management concerning mutual relations. Employees have equal representation on the board of directors.
(b) Establish by law "unemployment insurance funds" contributed by employer and employee.
(c) By Federal law require each corporation to maintain modern approved accounting system—covering all hazards as fire, depreciation, bad debts, etc., and an ample reserve for each. "Surplus" item by law should be made to read "Excess of Assets over Liabilities, as stated above."
(d) The principal accounting item will be the amount paid as salaries and wages. These should be at current rates for similar service.
(e) Include in total cost of products the amount due capital partner, as current capital wages. This wage should be 4 per cent on actual capital invested.
(f) "* * * profits, if any, should be divided as follows: Stockholders, 4 per cent in addition to the 4 per cent wage; balance remaining, one-half to stock-holders and one-half to officers and employees."

Author's evaluation: The plan will give each of the three, capital, management, and labor "a voice in all decisions which affect vitally the general welfare of all." The worker will secure economic independence through definite plans for participation in profits and unemployment insurance.

Status of plan: Proposal only.

### PLAN OF FRANK D. GRAHAM

Classification: Abolition of unemployment.

Author and origin: Prof. Frank D. Graham, professor of economics, Princeton University.

Objective: Prevent unemployment during depressions by cooperative devices.

Theory or principle: Establish an emergency production board and an emergency distributing board under the auspices of say the National Chamber of Commerce or the Industrial Conference Board. The boards would furnish employment and distribute products. They would operate without profit. The unemployed would produce their needs using existing equipment. The medium of exchange would be consumption-certificates—unit value one hour of unskilled labor.

Author's evaluation: "It is possible to deal effectively with unemployment as distinct from the broader problem of business depression on the basis of present knowledge." That is, he thinks the problem of unemployment can be segregated from surrounding conditions and cured independently, although he admits the difficulties.

Does not believe in planned economy and says that nothing short of that now operating in Russia can be effective in preventing depressions.

Status of plan: Suggestion of an individual.

### PLAN OF WILLIAM GREEN

Classification: Economic planning, worker security, unemployment relief, and unemployment insurance.

Author and origin: William F. Green, president, American Federation of Labor, through the annual report of the executive council of the American Federation of Labor, submitted to the annual meeting of the federation November 21, 1932.

Objectives: To check wholesale destruction of human personalities and redirect energies to restore sanity and balance in economic life, and provide permanent channels for sustained progress.

Payment, in the right proportion, of wages, salaries, and dividends by each individual operation unit.

Advance Federal and local programs to be made promptly effective for unemployment relief.

An unemployment insurance plan which will provide for the payment of weekly benefits to unemployed workers.

Theory or principle: Economic planning: Fundamental changes in the technique of work and living have eliminated time and space as barriers to human intercourse and have placed the limiting factor in production outside the individual producing ability. * * * The basis of organization for activity in various fields must be shifted from the individual to the groups through which the individual functions. * * * Plans for maintaining economic balance must grow out of a unified basic philosophy and coordinated procedure to advance human well being. National economic planning should aim at raising standards of living for lagging groups and not at a program of limitation of production with price fixing. We need to find out how best to use our capacity to produce.

Worker security: Work is the source of our wealth. Those who invest the the work of their hands and minds have a right to claim a good living from the proceeds of their investment. What every worker wants is a job and the sense of security that comes from having a dependable source of income. Life and living, in the full meaning of that term, are inseparably associated with employment, wages, work security, the possession of a job and the exercise of the right to work.

Unemployment relief: Whatever degree of benefits we may derive from stabilization, we shall need to be prepared to relieve the unemployed for years to come. To meet the tragedy of unemployment in any way but giving work is failure. The lesson of the present depression shows us that we must establish adequate relief machinery.

Unemployment insurance: The economic facts arising out of the unemployment situation make it absolutely necessary to develop and put into practice through the enactment of appropriate legislation, and unemployment insurance plan which will provide for the payment of weekly benefits to unemployed workers.

Methods advocated: Economic planning: Plans for maintaining economic balance should involve the following: Steeply graduated income and inheritance taxes; constructive control of credit to finance production; recognition of the equities of workers in the industries in which they work and at least protection equal to that given financial investments; Federal agency to collect and collate data on man-hours and wage-earner income, necessary to appraise producing workers participation in industrial progress (such an agency would provide the standards for determining economic balance); Federal licenses for corporations operating on an interstate scope, with specific requirements as to accounting; all accounts available to those interested and protective service for investors; organization of wage earners to advance their interests intelligently within industry and other relationships; legalize normal functions of trade associations.

As essential to the development of agencies for national economic planning, recommend as first step calling of a representative national economic conference to outline the initial steps.

Worker security: As steps toward worker security, the following is proposed: Organization of the job market through a system of State employment services under Federal coordination; wage earners organized into unions of their own choosing and under their own control; distribution of man-hours so that all may have an opportunity to earn a living (when workers have been added to the producing staff, none should be laid off until the hours for all have been reduced at least to 30 per week); higher wages (consumer buying power should expand proportionately to increases in production and services available to raise standards of living); vocational counsel and restraining; larger aspects of unemployment prevention through national economic planning.

Unemployment relief: Advance planning of public works; use of national credit for self-liquidating projects, for building homes for workers and other small-income groups, for slum reclamation, etc.

Unemployment insurance: It would be desirable, were it possible, to press for the enactment of one uniform measure for unemployment insurance applicable throughout the United States. Since this is practically impossible due to existing provisions, limitation, and regulations, the federation advocates the passage of unemployment insurance legislation in each State, and the supplementing of such State legislation by Federal enactments. Underlying objective of insurance legislation: (a) Stimulation of more regular employment and (b) payment of unemployment compensation to those who are temporarily out of work.

Status of plan: Approved by the fifty-second annual convention of the American Federation of Labor.

### PLAN OF VERNE LEROY HAVENS

Classification: Payment of international debts.

Author and origin: Verne Leroy Havens, consulting engineer, New York City.

Objective: Reduce demand (and apparent high price) for gold by utilizing all available means to facilitate direct or triangular payments to us of all foreign debts in media other than gold, although referred to gold as a price standard; dampening gold shipments; reducing raids on our gold supply; blocking fall of real low prices of goods and services; reestablish credit margins and resume normal trade relations.

Theory or principle: Gold is wealth only as it is useful in the arts. Its capital utility is as a price standard. Its primary function is as a reserve to maintain par value of currencies, lessen gaps between domestic and world prices, and to meet international balance of payments Debts can not be paid in gold. They can be paid only by men at work. The proof of maladministration of debts is that when the world is most anxious to liquidate national and commercial obligations some 60,000,000 men are relieved from employment.

Methods advocated: The first essentials are (1) commercialize intergovernment debts; (2) forget gold as a medium of settlements while maintaining it as a standard of prices; (3) set up a commercial settlements corporation functioning as a clearing house through the medium of bank credits; (4) establish contact with central authorities of thirty-three (or more) different countries where no commodity, negotiable document, person, service or thing crosses the frontier without special consent of authorities.

Author's evaluation: This is a basic problem, simple in principle, structure and solution with small capital. It is a big job but not so big as to frighten us.

### PLAN OF FREDERICK W. KELLEY

Classification: Regulation of competition.

Author and origin: Frederick W. Kelley, late president North American Cement Corporation, Albany, N. Y.

Objective: Maintenance of minimum prices at cost.

Theory or principle: "Problem is to preserve the advantageous features of competition but to adapt it to modern conditions of mutual, social, and economic interdependence."

"Competition must be made constructive, not destructive."

Method advocated: Each industry to have a trade association vested with a large responsibility for sound practices and conditions within the industry.

"Unfair competition" to be eliminated by declaring the initiation of prices in an industry "at less than cost" to be unfair, together with the enforcement of corrective measures through suitable policing.

Deny the right to anyone to lower his initiated price below that of a competitor, he may meet the price but not beat it. A lowered price may be initiated if warranted by lowering cost.

Author's evaluation: Would give the most efficient members of an industry a fair and reasonable profit.

Under this plan there would be no necessity for control of entrance to an industry.

Status of plan: Proposal only.

Supporting comment: The intended suppression or minimizing of cut-throat competition will contribute in large degree to the stabilizing of industry with its resultant iorning out of the valleys and peaks.

The fixing of minimum prices at cost will tend to discourage the unwarranted entry of newcomers in overbuilt industries.

Objecting comment: The fixing of costs offers problems difficult to solve, such as the fair valuation of properties; the treatment of varying circumstances in different localities as affecting rates of return on capital, salaries, bonuses, wages, working conditions, etc., the fair allocation of overhead costs amongst a multiplicity of products in a given industry.

The stabilizing of prices holds forth the danger of promoting monopoly and of discouraging lessened costs to consumers.

### PLAN OF F. J. KUNNECKE

Classification: Business and financial stability and way out of depression.

Author and origin: Prof. F. J. Kunnecke, University of Dayton, Dayton, Ohio.

Objective: To pull us out of depression, prevent future depressions; to stabilize business, finance, agriculture, labor.

Theory or principle: Depressions primarily caused by purchasing power reduction due to excessive use of profits for extension of productive properties; by so speeding up rpoduction men early become incapacitated, thus compelling industry, through charity, to carry large numbers without purchasing power; the speed of machinery should be divided among labor, but with full wages to all.

The farmers have suffered from too many middle men, too much speculation on farm products, insufficient credit, lack of purchasing power among the industrial class and a defficiency in knowledge as to demand for their product, resulting in overproduction.

Methods advocated: For industry (1) dividends declared out of profits to labor and capital to maintain balance between production power and consumption buying power; (2) reduction in speed in industrial operations to capacity of men of 50 years age to extend earning time, or share work with full wages.

For agriculture, regulate the number of middle men; prohibit speculation in farm products; extend longer credit; furnish accurate information for demand for farm products.

For finance, regulation of interest in any form; governmental control of the credit element of our monetary system; establishment of an honest dollar through the principle of multiple tender.

For the immediate depression, confer large emergency powers upon the President, who shall direct operations through the Federal Reserve Board and the Federal Trade Board; boards to be reconstituted to include economists and business representatives; their decisions to be supported by prompt action of the Department of Justice. Author would insitute many reforms, such as stop all issue by banks and other financial institutions of present currency, and replace this same by short time currency issued to financial institutions, secured by deposits of actual currency; close stock exchanges temporarily; prohibit temporarily foreclosures and liquidation, because this tends to concentration of wealth.

As concerns business during the emergency: enforced agreement among producers of similar product to apportion types of product among themselves; salaries of officers at lower scale than prevailing; limit further investment and replacement of equipment; order the wheels of industry to move and force banks, by taxation upon unnecessarily retained currency, to loan capital for the operation of industry.

Author's evaluation: Application of plan would lead the Nation out of this depression and ward off future repetition.

### PLAN OF JOHN S. LENNOX

Classification: Maintenance of purchasing power by monetary means.

Author and origin: John S. Lennox, engineer, General Electric Co., Pittsfield, Mass., in book, The Cause and Cure of Unemployment.

Objective: To maintain purchasing power for the full output of the productive mechanism for such a period of hours as men wish to devote to work.

Theory or principle: Under the gold standard, when credit is being expanded (that is, when debts are increasing), spending and income increase in a self-generating cycle When the time comes that credit expansion ceases (that is, that debts are paid up as fast or faster than they are incurred) there is initiated a self-generating cycle of diminishing expenditure and income.

Method advocated: A new monetary system the "Public works standard" under which 100 per cent employment would be assured by always maintaining a surplus of tenders for public works to be paid for with new money which would be retired (amortized) out of taxes as the works depreciated.

Positive Federal control of the commodity price index is provided with local planning of public improvements.

Author's evaluation: Necessity for large debt structure eliminated; national income stabilized; current debts paid out of earnings; international debts paid in goods; commodity price level premanently stabilized without price fixing; absolutely individualistic; can be started instantly by any one nation and become effective in a few months.

Status of plan: Proposal only.

### PLAN OF EMANUEL LISSNER

Classification: Industrial stabilization.

Author and origin: Emanuel Lissner, engineer, San Pedro, Calif. Published in January and February, 1933, issues of the American Engineer.

Objective: My preventive will not perpetuate such feverish boom times as we had at the start of the year 1929, when we were on the brink of a precipice without knowing it. It will render impossible such periods of overexpansion, just as it will the periods of depression. It is designed to flatten the peaks of the charted line of business activity as well as to level the hollows.

Theory or principle: The outstanding cause of the present depression has been the overexpansion of our productive facilities, not only in manufacturing, but also in agriculture, mining, transportation, merchandising, communications, real estate, entertainment, and other similar lines. Until very lately the quality of thrift has been accorded undiluted praise, but to-day it comes in for a share of criticism. The old idea has been that thrift, by providing funds for investment, creates additional employment; the new one is that it actually cuts down employment by limiting consumption. The truth lies somewhere between these two theories.

Method advocated: For every industry an association under a dictator who would have two main duties: (1) Prohibit unnecessary expansion; (2) when expansion was warranted, allocate it among members of the association. He would also fix selling prices, diversion of markets, and make decisions about dividends, wages, and working hours.

Author's evaluation: Money now lost in overexpansion will be used for consumers' commodities. Corporations will reduce their surpluses by distributions among officials, stockholders, and employees. A portion will be placed in pension and unemployment funds. To be a success trade associations must provide practically continuous employment for all wage earners. This probably involves a reduction in working hours.

Status of plan: Proposal only.

## PLAN OF NORMAN LOMBARD

Classification: Business and economic stabilization through money and credit control.

Author and origin: Norman Lombard, former executive vice president of the Stable Money Association, New York.

Objective: Promote condition which will yield maximum increment of goods and services and distribute them equitably in proportion to the value of contribution made.

Theory and principle: Condition best approximated when general level of prices is kept stable. Production, wages, and employment increase at competitive rates. Living standard rises as reflected in more goods and leisure. Fluctuating prices reduce production, promote waste, redistribute wealth without plan or purpose.

When general price level rises creditors are injured; equities between debtors and creditors are disturbed to advantage of former; undue business activity encourages uneconomic expansion; extravagance, boom conditions, ineffiiency.

When general price level falls debtors are injured; creditors profit; reduced consumption and employment result; wage and debt readjustments promote social and political unrest.

The general level of prices reflects value or purchasing power of money. When it rises, money falls in purchasing power. When it falls money rises in purchasing power. Money is subject to the law of supply and demand.

Total volume of credit, money and money-like instruments should be kept in effective circulation in such balance with the varying needs of business that the general level of prices will be kept stable, letting changes in such volume compensate for variations of velocity, hoarding, banking fears and other factors of the equation.

To do this it may be necessary for monetary authorities to anticipate impending changes in the price level and to take steps to offset them before they become apparent statistically. Their power should be plenary and responsibility complete.

Methods advocated: Stabilization of internal price level disregarding fluctuations of exchange or gold reserve ratios, cooperate with foreign countries in stabilizing exchange as a secondary objective.

Machinery of control of money and credit exists in the Federal reserve through its power (1) to raise or lower the rate of rediscount; (2) to buy or sell (*a*) eligible securities, (*b*) foreign exchange in the open market; (3) influence banking policy through direct contact; (4) mold public and business opinion through announcements of its policy and of its reasons for taking action.

In the present emergency, further expansion of member bank loans and investments should be forced by increasing surplus reserves. Therefore the Federal reserve should discontinue selling securities to keep reserves at a "reasonable level" and allow incoming gold and money returning from hoarding to have its natural expansive effect, thus tending to cause lending by member banks, thus increasing effective credit volume.

The problem is political and technical rather than economic. In the public interest, and to protect banks from their own folly, there should be an international, nonpolitical, nongovernmental, organization, devoted to furthering the stabilization of the price level.

Author's evaluation: Eternal vigilance is the price of stability. Price level stabilization is more necessary than any other social or governmental reform.

Status of plan: As relates to the organization of public sentiment—The situation is chaotic, the advocates of price level stabilization, numerous and influential as they are, being without leadership or financial support.

As to cooperation between governments and central banks: In England and some other countries it is complete; in America it is completely lacking.

As to central banking controls: This philosophy recommended by conference of 30 nations in 1922. The period of stability in America from 1922 to 1928 was due to the more or less deliberate application of these principles.

### PLAN OF LEWIS L. LORWIN

Classification: Industrial stability and economic advance.

Author and origin: Dr. Lewis L. Lorwin, member of the council of the Brookings Institution, Washington, D. C.

Objective: Adjustment of a progressively growing productive mechanism with a progressively rising standard of living.

Theory or principle: Social progressive planning as distinguished from other types, namely, state socialist, nationalistic, and business planning.

Definition: A planned economy is a scheme of economic organization in which individual and separate plants, enterprises, and industries are treated as coordinated units of a single system for the purpose of utilizing all available resources to achieve the maximum satisfaction of the people's needs within a given time.

Essential features: (1) Interdependence of all production units; (2) adjustment of a progressively growing productive mechanism with a progressively rising standard of living; (3) existence of some unifying center to direct the system consciously toward these nationally recognized ends; (4) planning is a synthesis of the ideas of dynamics and order, of science and immagination. It is a new mode of feeling life and of living.

Method advocated: Social progressive planning implies redistribution of income (through an annual wage, 5-day week, 6-hour day, utilization of leisure), an extension of the demand side of economic life, a variation of the range of return in relation to social service, and methods for directing the flow of capital.

This type of planning, while rejecting dictatorial methods, demands some control through a central unifying agency—a national economic council—which is expected to bring into life boards and commissions which, working together with the Federal Reserve Board, the Farm Board, the Interstate Commerce Commission, etc., could guide the course of our national economy. Management, labor, technicians, and scientists should come together to supply both the planning and the administrative machinery for carrying out plans. Planning must have a national character and a measure of governmental authority.

The author presented to the Amsterdam Congress on Social Economic World Planning (I. R. I., August 1931), what might be called a 5-year world plan, based on the following: (1) A general 5-year moratorium on all war debts and reparations payments, with a presumption in favor of final cancellation if the effects of the moratorium warranted it. (2) A series of international loans carried through the cooperation of the chief lending countries and revised in such way as to promote productive resources in the most promising areas and increase world purchasing power. (This might be done through a world industrial bank.) This would also offer an opportunity to affect and modify commercial policies through agreements by which credit would be extended on condition that a tariff truce be observed or that tariff schedules specially detrimental to trade be modified (3) A series of international agreements for the division and control of the world market by producers of raw materials and of some manufactured goods.

### PLAN OF FREDERICK H. M'DONALD

Classification: A plan to stabilize the business structure through individual corporate "stabilization reserve funds."

Author and origin: Frederick H. McDonald, consulting engineer, Atlanta, Ga.

Objective: To equalize the business curve by using reserves accumulated during prosperity to maintain in lean periods a minimum level of operations and income; to maintain and widely distribute purchasing power; to direct overinvestment from the production of consumer goods or services toward community facilities or public works at proper periods; and to avoid revolutionary changes by providing acceptable evolution of the present business structure.

Theory or principle: Author assumes that fluctuations in business activity are inevitable, and plans to mitigate the severity of national variations through the cumulative effect of tempered variations in individual enterprise.

Method advocated: Legally require profit-making enterprises to establish a segregated reserve fund by withholding distribution of all earnings in excess of legal rate of interest on capital invested until minimum reserve is attained; fund to be trusteed. After completion of minimum reserve, future excess earnings to be distributed on voluntarily agreed basis between labor, management, and owners. In lean periods, reserve fund to be used to maintain minimum levels of wages, salaries, and dividend payments, based on fair rates of average income agreed for considerable periods between owners and employees. Fiscal policies to be based on decades rather than limited annual status. Reserve funds to be invested primarily in obligations of local governmental bodies for public-works construction, through central or Federal investment channels. No State or governmental infringement or regulation of business operation except to insure compliance with law through annual public reports to State.

Author's evaluation: By these means the bulges and depressions of business can be leveled as they would reduce excess activity, unregulated expansion, excessive or premature disbursement of profits, overinvestment in industry, distribute purchasing power during active times, and care for resulting minor unemployment and loss of income in dull periods.

Status of plan: A series of articles in current issues of Review of Reviews and World's Work. In the October issue, 1932, is a discussion of the advantages and disadvantages of the plan.

### PLAN OF CHARLES A. ROBERTS

Classification: Governmental taxation and construction policies.

Author and origin: Charles A. Roberts, member of New York bar. Paper reprinted from Tax Magazine, December, 1931.

Objective: Preventing industrial expansion which is not supported by purchasing power and also increasing purchasing power.

Theory or principle: (1) World tends persistently toward overproduction. With cyclical regularity the aggregate of goods and services produced becomes too great for the stream of money to move it. Too much income is devoted to new production, and too little to maintaining the continuous flow of expenditure by consumers.

(2) Income tax puts a wholesome brake on the growth of productive facilities, and furnishes (through governmental expenditures and through increased expenditures by business men for advertising, etc.), a needed accelerator to the public's buying power.

(3) A taxpayer's costs can not be increased indirectly by reason of the imposition of income taxes on his suppliers.

(4) Income remaining after current expenditures and income taxes is the sum available for reinvestment.

(5) Two variables fluctuate in direct proportion. The "clear income" (the net effective addition which can be made to the invested capital of the community) must vary strictly in accordance with the rate of growth in the buying power of the public.

Methods advocated: (1) The personal exemption from income tax should be increased from \$1,500–\$3,000 to say \$4,000–\$8,000. This change would eliminate two-thirds of the 4,000,000 individual tax returns.

(2) The normal tax should be reduced to 1 per cent flat.

(3) In lieu of exempting dividends from normal tax, every stockholder should be given a credit, against his total tax, equal to 15 per cent of all dividends received by him.

(4) The corporation income tax rate should be raised.

(5) A credit against the Federal income tax (and not, as at present, a mere deduction from income) should be granted for income taxes paid to the States.

Author's evaluation: Net effect the foregoing proposals would likely increase the revenue by some $300,000,000. In anticipation of such additional revenue plans should be made for its prompt disbursement, otherwise than for debt retirement.

Status of plan: Proposal only. See O'Connor bill (H. R. 12643), pending in Congress, January, 1933.

### PLAN OF JOHN WILLARD ROBERTS

Classification: To cure unemployment through income taxes distributed as old-age pensions.

Author: John Willard Roberts, New York City.

Objective: Prevent business cycles through balanced production and consumption.

Theory or principle: Overmechanization is the cause of unemployment and overproduction, and destroys the values of capital goods through oversupply. This destruction of values can only be avoided by controlling the degree of mechanization. Measures to meet the situation by perfecting currency and credit institutions are futile before the overwhelming forces exerted by overmechanization. Mechanization arises from investment, which in turn arises from savings. To regulate mechanization we must regulate savings, diverting purchasing power out of the hands of those who invest it so as to run to excess the creation of capital goods and into the hands of those who will spend it on living. At the same time we must reduce the urgency of the need for savings.

Methods advocated: Revision of income tax laws to make income tax more effective and productive by proper adjustment between corporation and individual rates.

Author's evaluation (summarized): Would avoid bureaucratic dictation of business details, conserve incentives of effort and initiative which have constructed marvelous productive powers.

Stabilize industry while permitting rapid growth; by preventing overproduction, would prevent depressions; if recession appeared would provide immediate remedy by increasing pensions and taxes.

Would maintain the demand for workers, freeing them from fear and enabling them to claim good wages and working conditions.

Would care for the superannuated.

Would maintain the value of investments, and the independence and self-respect of citizenry, thus conducive to better government.

Would relieve the pressure for making foreign loans and pushing exports into unwilling countries; would not prevent a large foreign trade, but would make it a less desperate competition, and thereby improve international relations to a marked degree.

Although its effectiveness would reach its greatest development by world-wide application, it does not need to wait for unanimous adoption by many nations. If one nation, such as the United States, should adopt it, the others, seeing its beneficent effects, would soon follow suit.

### PLAN OF M. C. RORTY

Classification: Stimulation of business activity.

Author and origin: M. C. Rorty, formerly vice president, International Telephone & Telegraph Corporation, New York.

Objective: Immediate relief of unemployment, with ultimate development to control business fluctuations.

Theory or principle: Supplementing of other measures for economic stabilization by increased stabilization of construction, reconstruction, and other new capital operations. Special stimulation of reconstruction, reequipment, and other Capital activities in times of extreme depression, through use of a relatively small volume of public funds to induce much greater expenditure of private funds.

Methods advocated: Payment of direct premiums out of Federal funds to encourage private initiative in construction, reconstruction, and other capital operations.

Advertise for bids for the initiation of the new activities. Such bids shall be in terms of the required percentages to be paid as premiums upon certified and audited amounts disbursed for wages and materials, the awards of premiums to be made in the order of the lowness of such bids, after allowing for certain preferentials to reconstruction and other preferred operations. Self supporting State and municipal works to be eligible for premiums.

Initial funds to be furnished by advances from Federal Government, to be repaid from proceeds of special taxes assessed for the purpose.

Author's evaluation: "The real cost of even a moderate business depression is, perhaps, not less than $10,000,000,000 * * * cost of present depression will very probably exceed $50,000,000,000 * * * the maximum cost of stabilization, per business cycle, in excess construction and new capital investments, should very certainly be less than $2,000,000,000."

Status of plan: Presented to Institute of Public Affairs, University of Virginia. Printed as supplement to April, 1932, issue of Harvard Business Review. Has been presented to Federal administration. May be proposed in modified form to next Congress, primarily as a measure of immediate unemployment relief.

Supporting comments of author: "* * * majority of students of the business cycle are prepared to admit that the plan * * * has the power to produce results and that it probably could be made effective in the hands of an intelligent economic czar."

Objecting comments of author: Even under present conditions, some premiums might be paid for operations that would be started without such payments and some work delayed in expectation of premiums. Initial operations would have to be restricted mainly to reconstruction and rehabilitation projects, and noncompetitive construction. Plan would require ample administrative authority, and ultimate applications for general economic stabilization should await results of experience as emergency measure.

### PLAN OF CHARLES R. STEVENSON

Classification: Business and manufacturing stabilization.

Author and origin: Charles R. Stevenson, of Stevenson, Jordan & Harrison, management engineers.

Objective: To secure balanced production and comsunption.

Theory or principle: Balance production and consumption by reducing competition through rearrangement of industry (mutual trade agreements); limit freedom of individual to engage in industry as he sees fit; hours of labor are matters for national and not state legislation.

Method advocated: (1) Modification of antitrust laws; (2) grant the right of any industry, if 85 per cent of capital invested desires, to organize in a definite way; (3) create a commission to regulate such organized groups of industries; (4) give Congress power to regulate hours and wages; (5) set up a labor commission to regulate and enforce items under (4).

Author's evaluation: These adjustments would provide work and adequate earning power for everyone who wished to work; would provide security of employment, increased earning power for the worker, and security of capital and return for the investor in industrial securities.

Status of plan: Proposal only.

### PLAN OF GERARD SWOPE

Classification: Industrial stabilization.

Author and origin: Gerard Swope, president General Electric Co., based on experience with unemployment allowance plan in effect in his company for some two years.

Objective: " * * * industry must evolve and make effective those measures which will first ameliorate (unemployment) and ultimately eliminate it. * * *"

Theory or principle: (1) Every effort should be made to stabilize industry and thereby stabilize employment to give to the worker regularity and continuity of employment, and when this is impracticable, unemployment insurance should be provided.

(2) Organized industry should take the lead, recognizing its responsibility to its employees, to the public, and to its stockholders, rather than that democratic society should act through its government. If the various States act, industry will be confronted with different solutions, lacking uniformity and imposing varying burdens, making competition on a national scale difficult. If either the individual States or the Federal Government act, the power of taxation has no economic restraints.

(3) There should be standardized forms of reports so that stockholders may be properly informed.

(4) Production and consumption should be coordinated on a broader and more intelligent basis thus tending to regularize employment and thereby removing fear from the minds of the workers as to continuity of employment; as to their surviving dependents in case of death; and as to old age.

(5) If organized industry is to undertake this work, every effort should be made to preserve the benefits of individual originality, initiative, and enterprise, and to see that the public is assured that its interests will be protected, and this can be done most effectively by working through the agency of the Federal Government.

Methods advocated: (1) All industrial and commercial companies (including subsidiaries) with 50 or more employees, and doing an interstate business, may form a trade association which shall be under the supervision of a Federal body referred to later.

(2) These trade associations may outline trade practices, business ethics, methods of standard accounting and cost practice, standard forms of balance sheet and earnings statement, etc., and may collect and distribute information on volume of business transacted, inventories of merchandise on hand, simplification and standardization of products, stabilization of prices, and all matters which may arise from time to time relating to the growth and development of industry and commerce in order to promote stabilization of employment and give the best service to the public. Much of this sort of exchange of information and data is already being carried on by trade associations now in existence. A great deal more valuable work of this character is possible.

(3) The public interest shall be protected by the supervision of companies and trade associations by the Federal Trade Commissioner or by a bureau of the Department of Commerce or by some federal supervisory body specially constituted.

(4) All companies within the scope of this plan shall be required to adopt standard accounting and cost systems and standardized forms of balance sheet and earnings statement. These systems and forms may differ for the different industries, but will follow a uniform plan for each industry as adopted by the trade association and approved by the Federal supervisory body.

(5) All companies with participants or stockholders numbering 25 or more, and living in more than one State, shall send to its participants or stockholders and to the supervisory body at least once each quarter a statement of their business and earnings in the prescribed form. At least once each year they shall send to the participants or stockholders and to the supervisory body a complete balance sheet and earnings statement in the prescribed form.

(6) The Federal supervisory body shall cooperate with the Internal Revenue Department and the trade associations in developing for each industry standardized forms of balance sheet and income statement, depending upon the character of the business, for the purpose of reconciling methods of reporting assets and income with the basis of values and income calculated for Federal tax purpose.

(7) All of the companies of the character described herein may immediately adopt the provisions of this plan but shall be required to do so within three years unless the time is extended by the Federal supervisory body. Similar companies formed after the plan becomes effective may come in at once but shall be required to come in before the expiration of three years from the date of their organization unless the time is extended by the Federal supervisory body.

(8) For the protection of employees, the following plans shall be adopted by all of these companies: A workman's compensation act; life and disability insurance; pension; unemployment insurance.

Author's evaluation: "By this method American industry can discharge its obligation to its employees and, by holding its position in the markets of the world, bring additional work to America."

Status of the plan: Presented to the National Electrical Manufacturers Association, September 16, 1931. The board of governors of the association passed resolutions commending Mr. Swope for preparing a completely formulated plan; expressing the belief that a plan of stabilization of industry would be of aid to all concerned; recommending that the policies division of the National Electrical Manufacturers Association through a special committee make a careful study and develop, in cooperation with trade associations, a constructive program contemplating stabilization of industry with adequate protection for all elements involved.

### PLAN OF UNITED STATES CHAMBER OF COMMERCE

Classification: Suggestions for stabilizing industry through voluntary action of business men.

Author and origin: A report of the committee on continuity of business and employment of United States Chamber of Commerce, Henry I. Harriman, of Boston, chairman. Printed copies distributed to constituent members and made publicly available October 30, 1931.

Objective: To secure better balance between production and distribution.

Theory or principle: Advocates limited amendment of antitrust laws, the setting up of a national economic council; the voluntary adoption by employers of unemployment reserve plans, the voluntary development of uniform plans for protection against unemployment, old age, sickness, and accidents by trade associations. These and other topics are presented under three headings: (1) Causes of Depression and Unemployment; (2) Long-time Measures for Lessening Effect of Depression; (3) Means for Meeting Immediate Unemployment Conditions.

Cites as causes of the depression, wars, undue expansion, and speculation. Does not believe that technological advance is the main cause of the depression but admits there is a problem to be solved. Expresses belief that gradual shortening of hours of labor should continue in the future.

Methods advocated: Advocates modification of antitrust laws to legalize voluntary agreements designed to keep production related to consumption, such agreements to be under supervision of a governmental agency. Advocates industrial planning by representative trade associations and national planning through a national economic council. Proposes a national economic council of three to five members of highest standing and representative of the country as a whole, privately organized and sufficiently financed so that it could employ highest grade of economists, etc.

Status of plan: Acceptance by general referendum of chamber.

### PLAN OF ERNEST J. WOLFE

Classification: Unemployment relief.

Author and origin: Ernest J. Wolfe, instructor in economics, Columbia University. Plan "has been developed through an exchange of communications with students, professors of economics, and State and Federal Government officials."

Objective: To alleviate unemployment.

Theory or principle: "A conservative principle underlying this plan is that we should prepare in periods of prosperity for periods of depression." Financing of plan is to be jointly by workers and the Government.

Methods advocated: "It is proposed that units be established for the production and distribution of commodities, and provision made for the rendering of services adequate to maintain a comfortable level of living." Among the commodities that are to be produced are: The various economical cuts of beef, veal, mutton, lamb, and pork, fresh fish, salt fish, chickens, eggs, lard, butter, milk, wheat flour, cornmeal, potatoes, cheese, vinegar, molasses, dry beans, prunes, evaporated apples, and rice, the commonly used items of men's, women's, and children's clothing, various forms of fuel, furniture, tobacco, and the commonly used building materials.

"Each unit, or the several units in a community, shall be organized as a corporation. A holding corporation is also to be organized, which is to hold the stock of all the productive and distributive units.

"The United States Government is to own all the stock of the holding corporation, and is to hold this stock in trust for the workers of the United States."

There are to be two types of workers, "Those who constitute the permanent staff, and those who are employed only until there are positions available to them in private industry."

"* * * output shall be restricted to amounts required by the personnel both during normal and emergency times." Workers not needed for this production "shall be employed in public projects."

"In the first year of the operation of this plan, and until such time as an adequate reserve has been accumulated, a graduated tax of 1 to 5 per cent shall be levied on all incomes in excess of $1,200 derived from wages and salaries of all workers in the United States."

Author's evaluation: "* * * the plan is thoroughgoing." "It is clearly realized that this proposal is not an attempt to solve all our economic problems."

Status of plan: Proposal only.

CLOSURE

The preceding list of causes or possible causes of economic dislocations and business instability, and the assay of plans, programs, and remedies, are representative of the thinking of the past year. To the extent that the causes are recognized as valid and the remedies as feasible, the presentation is, on the one hand, impressive, and, on the other, discouraging. These points of view are distinctly those emphasized by the material as a whole which has reached your committee in the study which has yielded this report.

The single finding which the committee is willing to support at this time, drawn from the presentation of causes and remedies, is that no one all-inclusive cause can be designated as the forerunner of business recession, nor can any one all-inclusive remedy be found as a preventative or cure.

The situation that this finding presents should occasion neither surprise nor discouragement. Emphasis is merely given to the accepted fact of the complexity of our business and industrial structure, and to the interaction of economic forces.

The problem of social and economic control is of such magnitude that its solution will be a major event in the history of civilization. The project can not, and must not, be approached from any inferior estimate of difficulty or extent.

This second progress report should be considered as superseding its predecessor of a year ago for the reason that it indicates the direction and quality of thinking of a year of intense business stress. The next effort of the committee may well be to select and present those elements of remedial programs which seem feasible and practicable and which promise to integrate into a program of social and economic control. This integration will only be attained through a slow evolutionary process.

(A letter received from Mr. H. A. Willis and an article submitted therewith are here printed in full as follows:)

THE UNIVERSITY OF CHICAGO,
*February 27, 1933.*

Hon. REED SMOOT,
*Chairman Senate Committee on Finance, Washington, D. C.*

DEAR SIR: My work incidental to the unemployment situation in Illinois is so pressing that I can not appear before the Committee on Finance to present such views as I have concerning the "causes of the present depression and possible legislative remedies." I do, however, accept your invitation to submit some of these views in writing.

I submit herewith a printed copy of a memorandum on Balancing the Budget: Federal Fiscal Policy During Depression. As indicated by the title page, the memorandum was the product of a series of round-table discussions, these meetings being called by me. It expresses the views of the 11 economists, political scientists, and leaders in public administration who formulated and signed it.

A few observations may be made on this memorandum. (1) The chief objective we had was to define what is meant by balancing the budget, in an effort to correct erroneous views as to the problem. Capital expenditures and certain other charges have no rightful place in the ordinary budget which is to be balanced. (2) The opportunities for reducing Federal expenditures was discussed. I wish to add to the statement occurring near the bottom of page 13, reading, "Expenditures for veterans include allowances for disabilities and hospitalization arising from injuries not connected with military service. Until the Federal Government undertakes the relief of destitution for all persons, these allowances appear to constitute merely a bid for political support to a privileged group." Here is an opportunity that should be embraced to save $400,000,000 or $500,000,000 per year in 1933–34 and a much larger amount later on by amending existing legislation and returning to sound principles. (3) The Wagner bill (S. 5336) should be passed at the earliest possible moment in order to make possible the prosecution of urgent and desirable public works the States and local government have planned to prosecute but can not finance at this time.

Developing this last point, I may say that here in Illinois, and the situation is not untypical of the situation in the industrial States generally, a very large percentage of the working people are unemployed; an increasing and very large number of them have become public charges; the cost of public aid in the State is several million dollars per month; an increase in the volume of employment is imperative; there is a considerable volume of public work that might be done, some of it urgent, some of it highly useful in the years to come. Of course, public work involving bond issues calls for taxation to pay interest and sinking fund charges, and hence raises the question of whether or not it is wise to prosecute public works at this time. In my opinion, it is wiser to borrow money for needed public works than to borrow money for mere relief of the destitute, and the condition of the finances of the county of Cook and of the State is such that borrowing will inevitably be resorted to for work or for relief. While perhaps a given sum of money will go somewhat further in financing relief than in placing men at work and thus minimizing relief, I am convinced of the value of employing men on needed public works at this time. Relief involves great risk of developing the spirit of dependency; work makes for independence and self-reliance. Relief is accompanied by deteriorated efficiency; work under conditions as nearly normal as they can be made, maintains efficiency. Mere relief leaves nothing behind except a record of money spent; employment on needed public works results in tangible things which will serve the needs of the community for years to come. And more than that. Good drainage, good water supply, good highways, decent schools facilities are helpful in restoring values and in affording a good place in which to live and to do business. Finally, constructing public works ought to have cumulative effects in the employment situation, increase consuming power, and improve the opportunity to do business.

Being of these opinions and of the further opinion that the existing situation calls for vigorous action, even action involving some risk, I have been interested in finding an answer to the question how needed local public works can be financed at this time. Few of them can be financed out of current local or State revenues. In Cook County, at least, they can not be financed by local bond issues, for the bonds can not be sold except at ruinously low prices. They can not be financed by State bond issues, because of the procedure required by the Constitution. The one answer I have found, in so far as most of the approved public works are concerned, is in loans that might be granted by the Reconstruction Finance Corporation, were the act of 1932 amended and liberalized. Perhaps the credit of the Federal Government remains strong enough to lend some support.

Public works would minimize relief and, if carefully proceeded with, should be helpful in toning up the business situation. But in so far as business is concerned they would serve only as a tonic. The big problem is to bring about the necessary balance in our economic system so that business may go ahead. That will involve time and many things.

A few of these things may be noted. I am convinced that direct inflation would be inadvisable. A forced increase in prices, assuming that it could be effected, would now involve more harm than good. Now that deflation has proceeded so far, it should be permitted to proceed farther—at needed points. The Reconstruction Finance Corporation should cease giving support to railway and other corporations in order to keep alive obligations no longer representing active capital. Excessive valuations and excessive overhead must come down, along with wages, which, with exceptions, have been heavily deflated. Many public-utility rates and other service charges are excessive, in the new, changed situation.

The position of the United States in the world situation is substantially different from what it was in pre-war times. Some of our policies must be changed and adapted to the new situation. A more liberal policy with reference to foreign trade must be adopted. The question of debt settlement must be disposed of definitely.

To mention only one more point, something must be done about agriculture. Agriculture is so important in our economy that the country can not expect a good degree of prosperity while the plight of the farmer remains unsolved. And, unfortunately, it is extremely difficult to do much about that problem because it is largely a part of a world problem. The allotment plan is based upon a bad principle, and as it would be worked out in practice, any scheme would likely be worse than the principle. But one thing sorely needed is to alleviate the farm mortgage situation. Otherwise the farm situation will be revolutionized—for the worse. What specific measures might best be used to this end, I am not prepared to say.

Sincerely yours,

H. A. Willis,
*Professor of Economics.*

# BALANCING THE BUDGET

## Federal Fiscal Policy During Depression: A Statement by A University of Chicago Round Table

### INTRODUCTION BY THE EDITOR

For many months there has been much discussion of balancing the Federal Budget. Unfortunately, most of those who have participated in the discussion have not been careful to define what they mean by balancing the Budget or to analyze fully the problems involved. Evidently not a few have assumed that all outlays, whether for ordinary operating expenses, capital investments, loans, or emergency relief, should be covered by tax and miscellaneous revenues for the year. Informal discussion of the subject by some of the signers of this memorandum led to the formation of a round table which, beginning early in November last, held a series of meetings. A committee of three drafted a memorandum; this was considered by five economists who have specialized in Government finance, a number of political scientists, and an equally large number of experts officially connected with associations in the field of public administration. A somewhat revised memorandum was then prepared and another meeting held. Working in this way, the statement herewith printed was evolved by the 11 persons who have signed it.

This is the first of a series of public policy pamphlets which the University of Chicago Press is planning to publish. Frequently the scholarly journals give no attention at all to problems that have an acute but temporary interest, while the ordinary magazines can print little but superficial comment. The university might well perform a valuable public service by making available to the public whatever special training and information it may have at its disposal. The continuation of such a series will, of course, depend upon its reception by the public.

Perhaps it goes without saying that the authors of these pamphlets are individually responsible for their views and that they in no way involve the responsibility of the University of Chicago.

Harry D. Gideonse.

January 16, 1933.

### Federal Budgetary Policy During A Depression

Few problems confronting the American public transcend in importance that of Federal financial policy. There appears to be grave danger that in balancing its Budget the Federal Government may adopt policies, the inevitable consequence of which will be the retardation of business recovery and the impairment of the social usefulness of government. These evil consequences can be avoided.

In determining its fiscal policy for the coming year the Federal Government is faced with these major questions:

1. How should the Budget be balanced?
2. Should expenditures be reduced?
3. What taxation policies and devices should be adopted?
4. What should be the debt policy of the National Government in the near future?

The purpose of this memorandum is to shed light on these questions and to make such constructive suggestions as appear to be in point.

The determination of policies to be followed in dealing with governmental budgets concerns State and local units as well as the Federal Government. Though the principles to be observed are almost identical, they are capable of wider application to Federal finances than to the finances of the State and local governments. In one important respect there is a vital difference between the fiscal operations of the national and those of other political units. For the Federal Government has control over the monetary system of the country, and its fiscal policies can and should be controlled with reference to the monetary and credit situation of the Nation. The activities of the National Government are of greater importance in reference to the swings of the business cycle than are those of State and local governments. Although this memorandum is primarily concerned with the issues of policy confronting the Federal Government, some of the fundamental principles herein discussed may find proper application in the financial programs of other governmental bodies.

The present economic depression did not materially affect the fiscal operations of the Federal Government until the year 1931.[1] Beginning in 1920 and extending to 1930 a series of annual surpluses accrued to the Treasury. At the end of the fiscal year 1930 the surplus approximated $184,000,000, but the fiscal year 1931 closed with a deficit of over $903,000,000. At the end of the fiscal year on June 30, 1932, the annual deficit had grown to $2,473,000,000, exclusive of debt retirement charges. To prevent a recurrence of deficits in 1933, expenditures were pruned and additional taxes were imposed; but these measures have not prevented the recurrence of a fiscal deficit. In his Budget message to Congress, President Hoover estimated that the deficit for the fiscal year 1933 would be approximately $1,146,000,000 exclusive of public debt retirements, which now may be affected by the failure of some of the European countries to make payments on account of their war debts. These payments have hitherto been devoted primarily to the retirement of the national public debt, and the consequences of their reduction or discontinuance must be faced in developing the Federal fiscal policy.

## I

## Balancing the Budget

Should the 1934 Budget be balanced? If so, how? These questions can be answered only by getting a clear idea of the nature of the Budget and of precisely what is to be balanced.

### NATURE OF BUDGET

The Federal Budget for 1933-34 was presented to Congress by the President on December 8, 1932. It outlined a program of expenditures and presented revenue estimates presumed to be sufficient to carry into execution the activities indicated during the next fiscal year, except such as will be covered in the ever recurrent deficiency bill. The Executive Budget recommends to Congress a program of activities, but the sums made available by Congress for expenditure during the ensuing year remain partially within the control of the Executive. The amounts made available by appropriation need not necessarily be spent. Frequently, by Executive order, as in the case of the naval limitations agreements affecting battleship construction, sums designated in the Budget are "salvaged" or "recaptured."

On the revenue side of the Budget, the power of the Government is somewhat more limited. The Budget should present honest estimates of probable income; but whatever the degree of care with which estimates are made, errors are inevitable. Apart from providing an efficient administrative and collection system, the Government can not control the payment of taxes, which will depend upon the ability, and to some extent on the will, of taxpayers to pay taxes. The recent decline in Federal revenues, particularly from personal income taxes, reflects clearly the impairment of the economic circumstances of taxpayers.

### BALANCING THE BUDGET

"Balancing the Budget" should be used to mean the attempt to secure sufficient revenue to defray the expenditures of Government. That portion of the Budget not covered by revenues may be considered as unbalanced. Funds to meet the fiscal requirements of the unbalanced portion can be secured (1) by short-term borrowings, (2) by long-term funding, or (3) by issuance of fiat money. Given an expenditure program, the question Congress faces is: How much of the needed revenues should be obtained by taxation and how much by borrowing?

This question can be answered only after the expenditure program of the Federal Government is carefully analyzed. It is often erroneously assumed that every item of expenditure, regardless of its nature, should be covered by revenues derived exclusively from current taxation and miscellaneous current sources. Certain types of expenditures which ordinarily should be financed by current taxation may properly be financed by borrowing during a depression period.

Those expenditures which should be financed from current revenues can best be seen by the listing of items which need not be so financed. Among the types of expenditure which in this emergency should not be financed from current taxation are the following:

1. Nonrecurrent emergency expenditures.

---

[1] Unless otherwise specified, all references to years are to fiscal years ending June 30 of the year specified.

2. Loans and investments.
3. Expenditures for public works.
4. Permanent appropriations not to be spent during the current fiscal year.
5. Public debt retirements.

With the foregoing items excluded, the aim of the Treasury for the fiscal year 1934 should be to finance only normal operating expenses from current revenues. Relief, investments, loans, and public works should be financed from borrowings; and the Federal debt during the next fiscal year should be increased by a sum not less than the amounts so expended.

In a period of prosperity some of the items for which borrowing should now be resorted to may properly be financed by taxation. In a deep depression the injury inflicted upon taxpayers by requiring them to defray the cost of every governmental activity by current taxation in order to avoid increasing the public debt appears to be greater than can be justified. Of course, it is necessary to avoid borrowing to such an extent that the credit of the Government becomes seriously impaired. But the credit strength of the Government can be maintained without resort to taxation measures of such severity as to threaten to prolong the existing depression.

### NONRECURRENT EMERGENCY EXPENDITURES

The public should not be called upon at this time to furnish funds by taxation to finance nonrecurrent emergency expenditures. The burden of normal taxation has already been made severe by the shrunken incomes and losses of the depression, to which have been added the weight of emergency taxes enacted by the last Congress. It is not desirable that relief from unforeseen disasters or flood, for example, should under existing circumstances be provided by current taxation.

### LOANS AND INVESTMENTS

It is also inappropriate at this time to raise funds by taxation for investment and loan purposes. Subscription to the stock of Government-owned corporations is a practice almost as old as the Republic, dating back to the formation of the Bank of North America in 1781. Among the other corporations to which the Government has subscribed capital are the Panama Railroad Co., the United States Shipping Board, the Federal land bank the Federal intermediate credit banks, and the Reconstruction Finance Corporation. In some instances these subscriptions resemble other governmental expenditures, being only a method of financing particular services; in other cases they resemble ordinary investments or loans of Government credit. The sums so advanced have often been returned to the Treasury, some of them yielding substantial profits, others huge losses. In the fiscal year 1932 the Treasury subscribed $500,000,000 to the Reconstruction Finance Corporation and $125,000,000 to the Federal land banks. Similar advances do not appear to have been included in the 1934 Budget; but should additions to the capital of these agencies become necessary, or should similar plans be adopted by Congress during the present emergency, the funds should be secured by borrowing, provision being made from current revenues for the creation of reserves for such losses of capital as may now reasonably be anticipated.

That many of these advances are merely loans of Government credit is apparent from the operations of the Reconstruction Finance Corporation. Created with a capital of $500,000,000 supplied by the Treasury, with potential resources aggregating $3,800,000,000, of which $3,300,000,000 was to be provided by the issue and sale of Federal credit instruments, this arm of the Government from February 2, 1932, up to the close of business on November 30, 1932, had authorized loans amounting to $1,542,000,000 and had advanced in cash $1,502,000,000, of which $283,000,000 had been repaid. Loans to banks, trust companies, and financial institutions (including livestock and agricultural credit corporations) aggregated $1,088,000,000, of which $898,000,000 was for banks, trust companies, and their receivers; $75,000,000 was advanced to the Secretary of Agriculture for the relief of agriculture, out of which loans aggregating $64,000,000 had been made;[1] $328,000,000 in loans was authorized for railroads. Loans approximating $146,000,000 were authorized for "self-liquidating" projects up to December 23, 1932, but the cash advances in aid of these projects up to December 31 amounted to only $15,597,000. In addition, relief loans to States and cities, up to January 1, 1933, amounted to $103,705,000. In his latest report the Secretary of the Treas-

[1] Of the $75,000,000 so advanced, the Secretary of Agriculture has returned $15,000,000 (November 30, 1932).

ury recognized that "these funds are represented by loans made by the corporation on security and will, at a not too distant date, be returned to the Treasury." During the continuance of this depression, capital for investment or reloaning operations should be secured by the Federal Government by borrowing rather than by taxation.

### PUBLIC WORKS EXPENDITURES

Outlays for public works undertaken to stimulate employment are essentially capital investments which in this emergency should be financed by loans. These outlays are made to acquire permanent improvements, the life of which will extend over many budgetary periods. If sound practices of private businesses were followed, sums expended for such purposes might properly be distributed over the period of the useful life of the property, the original outlay being financed by the issuance of bonds.

It has been regarded as sound financial practice among larger units of government (as well as among corporations) to finance a certain amount of constantly recurring capital expenditures from current revenues. The Federal Government has not only done this but has financed through taxation over a long period of years many non-recurrent outlays. In times of prosperity this policy was the proper one for the Government to pursue. In this depression, even some of the recurrent outlays should be financed from proceeds of loans. The financing of recurrent outlays by borrowing can, however, be justified only as a depression measure, and should be abandoned as soon as the country is well on the road to recovery.

### PERMANENT APPROPRIATIONS BALANCES

Another type of budget item, commonly referred to as "continuing" or "permanent" appropriations, should not be financed entirely by the revenues of a single year, especially during a depression. Whereas unexpended balances in other appropriations usually revert to the general fund at the close of the fiscal year, these authorizations are exempt from lapsing or transfer, so that expenditures against them may continue until the sums initially appropriated are exhausted. To the extent that the taxation program is governed by the Budget for expenditures, the inclusion in that budget of provision for permanent appropriations not to be expended during the fiscal year necessitates an increase in present tax burdens to provide for future expenditures. To the extent that the taxation program is not made to depend upon the budget for expenditures, balances not to be spent currently only add to the apparent (but not the real) difficulties of balancing the budget. Unused balances in appropriation accounts are to be expected; and, so far as they accrue, they lessen the need for providing current revenues or they make possible increased expenditures or further debt retirements. The Budget for each fiscal year should contain definite appropriations only for that fiscal year. To the extent that permanent appropriations are financed by borrowing, the funds required are not borrowed until needed. The same practice should be followed as to expenditures financed by taxation. Funds should not be raised by taxation except in the fiscal year for which they are required, provision being made in prosperous times, however, for the acceleration of public debt retirements. The exclusion from the Budget for any current year of expenditures continuing beyond such year will measurably reduce the apparent difficulty of the task of balancing the budget.

To assure the efficient execution of projects whose completion is impossible or undesirable during a single fiscal year, provision should be made for charges against future budgets. This can best be done by long-range financial planning—that is, by the preparation of long-term budgets into which annual budgets may be fitted.

### PUBLIC DEBT RETIREMENTS

While the present depression lasts, no expenditures for the amortization of the Federal debt should be made. Where specific requirements in the contract do not prevent, the retirement of the debt should be postponed to more prosperous times. In the 1934 Budget the President, in estimating the Treasury deficit, deducted from the amounts payable by the Treasury public debt retirements schedules for the next fiscal year, amounting to $534,070,300.[2] This measurably

| | |
|---|---|
| [2] Total payable from Treasury | $3,790,425,200 |
| Deduct public debt retirements | 534,070,300 |
| Total other expenditures | 3,256,354,900 |
| Receipts | 2,949,162,713 |
| Excess of expenditures | 307,192,187 |

lessened the apparent difficulty of balancing the Federal Budget, leaving, according to the President's estimate, a prospective deficit of $307,000,000, to meet which special taxes were recommended.[3]

By not including public debt retirement allowances among expenditures to be covered by current revenues, the President gave partial recognition to the budgetary principles here being advanced. It would be useless, save for the purpose of creating certain psychological impressions, to continue to levy taxes to amortize the public debt at a time when the oustanding debt was being substantially increased. On the assumption that receipts and expenditures were not otherwise changed, the result of the continuance of amortization payments would be an increase in the annual fiscal deficit accompanied by an increase in new indebtedness. In the present emergency the President's treatment of public debt retirements is sound.

The implications of this policy logically extend to nonrecurrent emergency expenditures, to loans and investments, and to expenditures for public works—all of which in this depression should be financed by borrowing rather than by increased taxation, to the extent that the credit of the Government permits. Current revenues should now be provided to cover not more than the ordinary operating expenses of government.

### SHOULD THE BUDGET BE BALANCED ANNUALLY?

It is by no means axiomatic that the Federal Government should annually collect revenues sufficient to cover even its ordinary operating expenses. This, of course, should be an aim of the Treasury; but if this policy involves too great hardship from the imposition of burdensome taxes, the Government is justified in borrowing for a few years in order to meet deficits from current operations. As the Secretary of the Treasury said in his annual report presented to Congress, December 8, 1932:

"In a period of deep depression with the income of the people greatly reduced, with their buying power drastically curtailed and with millions deprived of their earning capacity, it is not only unwise but impossible to bridge the gap in the Budget entirely by increased taxation."

A historical survey of Treasury finances shows that deficits are a recurring phenomenon. These deficits are defensible if in accordance with deliberate and well-designed long-range planning. The planless character of past fiscal policy has made governmental burdens during this depression unduly severe.

The balancing of budgets should be regarded as a series of long-term operations in which deficits will be incurred and debts increased during years of economic adversity while Treasury surpluses and the rapid retirement of the public debt will be planned for during years of prosperity. When a series of annual budgets is thus put together, the result is the balancing of the long-term Budget with reference to economic cycle periods. The equilibrium between revenue and expenditures is thus intentionally struck over a period of years rather than annually.

Balancing the Budget on an annual basis is ordinarily not an impossibility; but if practiced during a severe depression, such a procedure, requiring as it does a heavy load of taxation at a peculiarly inappropriate period, will tend to prolong the depression. On the other hand, the failure to take advantage of a period of prosperity to build up financial reserves will tend to make inflationary and speculative booms the more pronounced. The more rapidly the debt is retired during prosperous times the greater will be the credit reserve during an economic emergency.

### RELATION OF FEDERAL FINANCES TO THE CURRENCY SYSTEM

The repercussions of the ordinary fiscal operations of the Federal Government on the Nation's currency system must not be ignored. The flow of funds in industry and commerce is favorably affected by the volume of public expenditures, if such expenditures are not financed by taxes falling directly or indirectly upon business. Taxation, on the contrary, by reducing the profit margin of business, tends to cut down both the volume of credit created and its rate of use. It appears all the more desirable, therefore, for the government to finance emergency expenditures, loans, investments, and public works by borrowing instead of taxation. Such borrowings may be justified until a desirable degree of credit expansion has been secured or until the level of business activity has otherwise been brought back to an approach to a normal position.

[3] The amount of this deficit will be increased by the failure of some of the European countries to make payments on account of their war debts.

## II

## The Reduction of Public Expenditures

Should public expenditures be reduced? Can substantial reductions be made?

Every opportunity should be seized to reduce the cost of rendering public services. Citizens demand of government the efficient performance of certain functions at the lowest reasonable unit cost. They do not demand the expenditures of given sums of money. The unit cost of providing public services can and should be reduced.

The reduction of expenditures should not be confused with the curtailment of activities. It may be doubted whether citizens desire the curtailment of government functions; they have rather, for the most part, insisted upon their extension. The demand for economy properly considered is a demand for the reduction of unit costs rather than a demand for the curtailment of necessary and beneficial public services.

### REDUCTION OF UNIT COSTS

If a will to effect economies exists, many savings can be accomplished without impairment of services. The political system upon which American Governments rest exacts a heavy toll in the form of patronage. The Post Office Department, for example, has notoriously been manned at the top by spoilsmen. Many of the 15,032 presidential postmasters have been selected for political, rather than for service, qualifications. The collectors of customs, the internal-revenue collectors, and many other officers outside the civil service represent to a large extent political overhead which could be eliminated in the interest of economy and efficiency. Expenditures for veterans include allowances for disabilities and hospitalization arising from injuries not connected with military service. Until the Federal Government undertakes the relief of destitution for all citizens, these allowances appear to constitute merely a bid for political support to a privileged group. Limitations of space prevent the multiplication of examples.

Efforts should be made to eliminate waste and inefficiency as fully as possible from the Federal service. Party patronage and spoils should be replaced by a merit service fully protected from partisan influences. The reorganizations of bureaus and departments to eliminate duplication should be undertaken at once. Improved and more economical methods of rendering services should be adopted. The efficient and economical performance of public business may well prove to constitute a more effective appeal for political support than the wasteful methods of the past.

### ECONOMIES MADE POSSIBLE BY THE DEPRESSION

The depression has brought with it many realizable economies in governmental operations. Prices of commodities and materials have declined to 67.8 per cent of their 1929 level.[1] Governments are thus able to purchase materials more economically than a few years ago. In addition, wage levels have decreased. A horizontal cut of 8⅓ per cent in the salaries of all Federal employees receiving over $1,000 per year was accomplished by a month's furlough without pay. In his message to Congress on December 6, 1932, the President recommended the continuance of this furlough system and the further reduction of salaries by 11 per cent, producing a saving estimated at $55,382,000. It is difficult to imagine a worse method of reducing salaries than that involved in the furlough system. It constitutes an implication of excess personnel in the Federal service or the performance of functions which can be immediately curtailed.

### SALARY REDUCTIONS

Salaries should not be further cut unless steps are taken at the same time to accomplish all the other possible economies in the public service. Personnel surveys should be made, and their findings should be used immediately as a basis for the separation from pay rolls of superfluous and inefficient employees, and for any cuts in wages which may be decided upon. Where horizontal cuts alone are employed, the service is not purged of the incompetents nor of political "hangers-on." The "horizontal" method of retrenchment is an easy means

[1] Yearly average index of wholesale prices computed by Bureau of Labor Statistics for 1929 was 96.5 (1926=100). Average for first nine months of 1932 was 65.4. Decline is 32.3 per cent from 1929 level.

for meeting the demand for economy, and only slightly reduces the cost of political patronage. In retrenchment the principle to be followed is to reduce expenditures and curtail operations where they will do the least social damage. No discrimination as to consequences is possible when horizontal or uniform percentage reductions are followed.

For those employees who are discharged from the Federal service, adequate unemployment relief or employment in emergency services should be provided. These adjustments in personnel should be a phase of the reorganization of Federal administrative departments now being considered by Congress.

### POSTPONEMENT OF EXPENDITURES

Modest reductions in expenditures may be achieved by the postponement or complete elimination of certain projects included in the Budget. For example, the surplus of agricultural land now under cultivation justifies the curtailment and postponement of expenditures for land reclamation and irrigation, save perhaps to the extent of salvaging capital already sunk in such projects. Substantial economies can be realized from the postponement of naval construction. The 1934 Budget estimates for vessel construction are about $21,000,000 in excess of appropriations for 1933. The modernization of battleships also calls for the expenditure of $9,450,000. The total amount available for naval construction during 1934 is estimated by the President at $53,380,000. Further reduction in expenditures may be achieved by postponing the acquisition of land and improvements not immediately needed. In the 1933 Budget, for example, reductions in appropriations for the Dpartment of Agriculture were accomplished, in part, by a reduction of $1,750,000 in the estimate for the purchase of additional forest lands. Such savings as these may be used either to reduce total expenditures or to make possible the increase in appropriations for more pressing needs.

### CURTAILMENT OF SPECIAL SERVICES

Likewise, services undertaken primarily for the benefit of particular individuals and conferring little or no advantage upon the citizens as a whole should either be dropped completely from the Budget or placed upon a self-supporting basis by the collection of charges for services rendered. Many activities of the Department of Commerce are illustrations in point; notably, the foreign services of the Bureau of Domestic and Foreign Commerce. Moreover, these duplicate, in part, the activities of the consular service.

### SUBSIDIES

Subsidies to special interests should also be speedily withdrawn. Some of these subsidies are disguised by excess payments for services. The least that can be asked is that such subsidies as are retained should be clearly designated as such in the Budget. The postal deficit for 1934 is estimated at $97,000,000, substantial portions of which are due to losses on parcel post and second-class mail, to the continuance of rural free delivery routes laid out for horse and buggy delivery, to excess rentals, and to excessive, as well as uneconomic, subsidies to steamships and air lines carrying mail. Economies can be effected here, without impairment of the quality of service.

### OBSTACLES TO EXPENDITURE REDUCTION

In the pursuit of any program of expenditure reduction numerous obstacles will be encountered. A survey of the Budget discloses the fact that the reducible [2] portion of appropriations is small indeed. The 1934 Budget called for appropriations totaling $4,248,160,731,[3] which were reduced by additional recommendations in the President's "Budget message" to $4,218,808,344. Of this latter total (except for slight adjustments in amounts for specific items in the body of the Budget to bring them into harmony with the modifications in the Budget message), $1,628,517,319 is for military functions (38.60 per cent); fixed debt charges take $1,259,070,321 (29.84 per cent); public improvements call for $122,108,690 (2.89 per cent); the postal deficit exacts $97,000,000 (2.29 per cent); refunds call for $85,238,800 (2.02 per cent); the construction and general Government buildings is to receive $69,060,000 (1.64 per cent); and $42,458,590 is estimated as the

[2] "Reducible" has reference to expenditures not called "nonreducible."

[3] Trust funds not included in this total; if they are included, appropriations amount to $4,403,178,032 as stated in Budget message.

cost of governing the District of Columbia and other territories[4] (1.01 per cent). These so-called "nonreducible" items call for the expenditure of $3,303,453,720, or 78.30 per cent of the aggregate appropriations proposed for 1934. Included in the percentage just given are certain items referred to in the Budget statements as "fixed charges" representing interest, pensions, retirement salaries, annuities, and World War allowances, together with subsidies, grants, and contributions,[5] which amount to $1,723,436,793, or 40.85 per cent of proposed total appropriations Unless curtailments are made in these items, improperly designated "nonreducible," substantial reduction of ordinary expenditures can be accomplished only with serious loss to the community.

### INCREASED DEMANDS

The depression, it must be recognized, has brought with it an increased demand for Federal services Upward of 11,000,000 people are out of employment through no fault of their own. The resources of State and local governments, together with private philanthropy, have been unable to provide adequate relief. During the present winter the Federal Government probably will be forced to provide direct aid—not loans of its credit to States and cities—in order to mitigate human suffering. Yet in the 1934 Budget the President provided only $18,000 for relief expenditures, as compared with $40,018,000 appropriated for the fiscal year 1933 and $461,651,000 for 1932.[6] Of this latter sum $450,000,000 was represented by a subscription of that amount to the capital stock of the Reconstruction Finance Corporation, while the remaining subscription of $50,000,000 to the capital stock of that body was charged to the promotion and regulation of argiculture. However, from the total resources of the Reconstruction Finance Corporation only $300,000,000 was "to be used in furnishing relief and work relief to needy and distressed people and in relieving the hardship resulting from unemployment." In addition a curtailment of building construction and public-works projects is recommended for 1934. Appropriations for general Government buildings were $212,638,000 in 1933, but only $69,060,000 is recommended for 1934. Public improvements—roads, rivers, and harbors; flood control and others—received appropriations of $402,482,000 in 1933, while only $122,108,690 is proposed for 1934. The President did not deem "further building at this time in the public interest." It is doubtful whether the volume of useful public works should now be curtailed. Business recovery has not sufficiently advanced to warrant this retrenchment. Likewise, generous Federal appropriations for the direct relief of the unemployed are recommended.

### AID TO CITIES AND STATES

Another phase of the problem relates to financial aid to cities and States not by way of loans but through the direct sharing of public revenues. Local government revenues have especially been drained during the past two winters to provide unemployment relief The depression has demoralized many State and local revenue systems whose chief reliance has been the property tax. The collapse of real-estate values has been accompanied by unprecedented tax delinquency; and while revenues have dwindled, relief demands have prevented substantial reductions in expenditures and taxes. The constitutions of many States prevent any ready modernization of revenue systems or extension of borrowings. Hence the National Government will soon be confronted with the problem of keeping the State and local governments functioning as well as solvent. The Federal Government can not afford to allow its political subdivisions to cease to function. Curtailment of their functions will decrease the volume of social services needed during this emergency; will reduce the demand for labor and materials when they should be increased. If the subdivisions default on the payment of substantial amounts of bonds and other obligations, this may react unfavorably on the credit of the National Government. Such defaults will tend to restrict the flow of funds in trade and commerce, and will undoubtedly restrict the volume of credit with which business is being transacted. Such consequences the government is endeavoring to prevent through the banking and currency system. Increased lending of credit to State and local governments and an increase in grants for

[4] Total for District of Columbia, $39,743,270, of which only $7,775,000 is directly appropriated from United States Treasury. The remainder comes from the combined revenues of the District of Columbia.

[5] See message of the President of the United States transmitting "The Budget for the Service of the Fiscal Year Ending June 30, 1934," Seventy-second Congress, second session, House Document No 439, Budget Statement No. 10, p. A183.

[6] Ibid., p. A176.

their use would materially aid the efforts toward recovery which have already been made.

#### REDUCTION OF AGGREGATE EXPENDITURES

There finally arises the question: "Should the aggregate of public expenditures be reduced? This question should not be confused with the reduction of unit costs and the reallocation of appropriations among the items of expenditure. After all reasonable adjustments to effect economies and promote efficiency have been made, this question must still be faced.

What is needed to-day is an increase in the circulation of money and credit, an increase in the volume of purchases, more employment, larger aggregate pay rolls, and an improvement in the morale of the people. The reduction of aggregate public expenditures, except as and if accompanied by reduction of current excise-tax rates, will influence these factors in exactly the wrong direction. But if the government decreases the unit cost of providing present services as lower prices and wages enable it so to do, and if it eliminates all elements of waste in its operations, it should be encouraged to undertake such additional activities involving expenditures as the prevailing emergency makes urgent.

## III

## THE REVENUE PROBLEM

The major tax problem of the Federal Government during this depression is to find additional sources of revenue. The yield of existing taxes has declined and taxpayers resist the imposition of new taxes, so that additional productive sources of revenue can be found only with difficulty. In endeavoring to develop new sources of revenue, the Government should avoid the adoption of taxes which tend to increase costs of production for private business or to reduce employment or production. If private business activity is not to be retarded, taxes falling on the margin between production costs and prices should be avoided. Sales, transaction, and production taxes have these untoward effects. Yet the President has proposed to balance the 1934 Budget (or avoid increasing the public debt) by the continuance of the 1-cent Federal tax on gasoline and the adoption of a general uniform sales tax of 2¼ per cent on all commodities except food and certain grades of clothing.

#### SALES TAX

Such a sales tax is objectionable at all times but is especially dangerous when the country is in a severe depression. If such a tax when passed on to consumers by increasing the prices of goods, the volume of sales of many commodities would be decreased. Costs of living would be made higher; and since the tax applies to expenditures rather than to incomes or the surplus above minimum living costs, it would fall with greater severity upon the poor than upon the more wealthy. It would tend to increase with the necessity for expenditure rather than in proportion to ability to pay. The number of dependents to be supported would be an important factor determining the weight of the citizen's tax. The regressivity of sales taxation is enough to condemn the President's proposal. But if the tax could not be shifted forward to consumers, it would fall in an uncertain and arbitrary manner upon industries and businesses and would still further reduce the already narrow excess of prices above costs—and in many cases convert this excess into a deficit—thus leading to a further curtailment of business activity. Such a tax might easily bring about the suspension of many enterprises, particularly if sales should dwindle following an attempt to raise prices so as to absorb the tax.

The present popularity of the sales tax, in certain quarters, is due to the mistaken belief of many business men that such taxes can always be passed on to consumers. Administrators look with favor upon it because it is easy of administration. Others favor it because they are exempt from its provisions or hope to secure reductions in other forms of taxation if a sales tax is adopted. These considerations are far outweighed by the regressive character and the business-disturbing propensities of general sales taxes.

Sales taxes are all the more objectionable if they are employed by both the Federal Government and the various States. Under such circumstances the pyramiding of taxes may be expected; but with business largely national in character, cumulative taxes upon sales will disastrously affect business recovery. Gasoline taxes are now found in every State; gross income taxes on some or all classes of public utilities are found in 43 States and the District of Columbia;

severance taxes measured by sales are found in 14 States; taxes on chain stores are found in 12 States; and either general or selective sales taxes, or both, are found in 35 States. General sales taxes are found in Connecticut, Delaware, Georgia, Kentucky, Mississippi, North Carolina, Pennsylvania, Virginia, and West Virginia. Many of the State rates are low, but pressure is being exerted to bring about their increase and the more general adoption of this method of taxation. Products sold at wholesale in Pennsylvania, for example, are subject to the State mercantile license of one-twentieth of 1 per cent; and if sold at retail, to a similar tax of one-tenth of 1 per cent, to which is added the State emergency relief sales tax of 1 per cent. If a Federal levy of 2¼ per cent were also added, the combined rates would equal 3.4 per cent. In Mississippi the State wholesale and retail sales taxes equal 2⅛ per cent; and if the proposed Federal levy were added, the combined rate would reach 4.37 per cent, with no allowance for pyramiding. The Federal Government should not adopt a sales-tax program in reckless indifference to existing State taxes and to the effect of both upon trade.

If there must be such a tax, then, in order to avoid undesired economic consequences resulting from the cumulation of sales taxes, the Federal Government should impose the tax and divide the revenue with the States, the sharing to be made conditional upon the repeal or avoidance of sales taxes by the States. The Federal law should be so drafted as not to interfere with the operation of State gasoline, tobacco, malt, and, perhaps, sumptuary taxes.

In advancing this and other proposals, it can not be too strongly emphasized that there is urgent need for the coordination and integration of Federal and State tax systems. A complete and thoroughgoing revision of the revenue systems of all levels of government is needed. The inability of the various tax systems to meet the present crisis is evidence of this need.

## INCOME TAXES

Income taxes generally do not directly affect production or prices, although the impingement of taxes on incomes may reduce consumption—an effect which must be considered when the weight of taxation is increased. Objection is occasionally raised against income taxes as the principal source of Federal revenues because their yield declines in times of depression, but it is rather one of the virtues of this form of taxation that its burdens automatically decrease when the economic circumstances of the taxpayer are adversely affected. The desirable degree of elasticity in the Federal revenue system should be secured by the proper use of public credit.

In times of depression public credit should be expanded in order that tax burdens may be lessened. In times of prosperity the levels of taxation should be maintained or increased. If the income tax is progressive, a more than proportional increase in revenues will automatically follow any increase in incomes. With proper brackets and rates the income tax will not need adjustment at every session of Congress but can be stabilized over a period of years. In prosperous years the revenue system should yield a surplus of revenues to the Treasury, to be devoted preferably to debt retirement rather than to the accumulation of reserves, so as to provide no temptation for its dissipation by profligate expenditure. In such times the burden of income taxation should not be lessened so long as any public debt remains unpaid. The time to lower tax rates is during a depression. Instead, governments have at such times too readily increased tax burdens, thereby augmenting tax delinquency, increasing the costs of living and of doing business, and postponing the improvement of economic conditions.

In searching for new sources of revenue with which to balance the 1934 Budget, the Treasury has made no recommendations looking toward the improvement of income taxes. At the present time it is doubtful whether the rates in the higher brackets of the Federal income tax can be increased without adversely affecting the productivity of the tax. The degree of progression may be modified somewhat by changing the limits of certain brackets and by reducing exemptions, all of which would be designed to secure increased payments from those in the lower-income levels. These changes would doubtless increase Treasury receipts. In comparison with taxes paid by Europeans, the American rates appear to be moderate; yet it must be recognized that substantial increases in tax levels can be achieved only gradually and that so long as State governments likewise tax incomes and exact other tax payments, many of which fall upon income, there are limitations upon the freedom with which the Federal Government can modify its practices in taxing the smaller incomes. In any case a closer integration of Federal and State revenue systems is desirable. Similar changes might be effected in the Federal estate tax. The gift tax can also be made more productive. The immediate revenue possibilities from changes in these taxes should be explored.

### REVENUE TARIFF

A marked reduction in American tariffs would probably increase, instead of decrease, revenues from customs duties Lower tariffs will also make possible the payment of a greater portion of the war debts—if they are not completely canceled or repudiated. A revival of trade following a world-wide reduction of tariffs would not only directly increase customs receipts but would also increase the yield of income and other taxes which reflect the degree of business prosperity. Enlightened self-interest necessitates the reduction of tariffs

Substantial revenues can be secured by the imposition of emergency customs duties on tea, coffee, and cocoa. These commodities are not commercially produced in the United States and only in nominal amounts in our insular possessions, Moderate revenue duties upon them will not affect their domestic production. The productivity of these duties should be substantial They are easy of administration, can be collected by existing officials, and are distinctly preferable to general sales taxes or to levies on specially selected manufactured articles. The objection to them is that they are regressive in operation and make impossible "a free breakfast table."

Teas were subject to relatively heavy taxation in the early days of the Republic and during the Civil War. During the period from 1898 to 1903 a tariff of 10 cents per pound on tea was in effect. To-day there is no duty on such imports. In 1901 the tea tax produced $8,300,000 in revenue. To-day the revenue from a similar tax should be about the same In 1929, approximately 89,393,000 pounds of tea were imported—sufficient to produce a revenue of $8,939,000 if taxed at 10 cents per pound, and if consumption did not fall because of the tax

Coffee has been on the free list continuously since 1872. Prior to that date all tariff acts, except the tariff of 1832, imposed duties on coffee ranging from 2½ to 5 cents per pound From 1926 to 1929 the importation of coffee averaged over 1,466,000,000 pounds per year, sufficient at 5 cents per pound to produce an annual revenue of more than $70,000,000, with no allowance for curtailment of consumption caused by the imposition of the tax

Cocoa beans (or unprepared cocoa) have been on the free list since 1872, while prepared cocoa has been dutiable almost continuously since 1789. The duty on cocoa beans, prior to 1872, ranged from 1 to 4 cents per pound. In 1931, 418,159,000 pounds of cocoa beans were imported. If these imports had been taxed at 2 cents per pound, the revenue produced would have been $8,363,000

Revenue duties on tea, coffee, and cocoa at the rates suggested could thus be relied on to produce at least $75,000,000 per year.

### BEER TAX

Substantial revenues should also be secured from the taxation of the sale of beer and wine if, as, and when the liquor prohibition laws are modified.

All of the foregoing proposals combined would have fewer deleterious effects upon trade and the revival of business than the proposed Federal sales tax. Their combined productivity should amply care for the President's estimated Budget deficiency of $307,000,000, but probably would not cover additional deficiencies arising from the nonpayment or postponement of war-debt obligations. Yet, if the method of balancing the Budget suggested in this memorandum were adopted, it is not unreasonable to believe that the entire deficit could be covered.

## IV

## Public Debts

Throughout this memorandum it has been emphasized that the Federal Government should make use of extensive borrowing to assist in financing the operations of government during an economic crisis. It has been maintained that loans should be resorted to in order to finance emergency expenditures, public works, and loans or investments. Temporary borrowing to defray the cost of necessary services is also justifiable during an emergency. But, if the public debt were now expanded, steps should be taken quickly to reduce it during the next period of prosperity. The alternate expansion and contraction of the public debt with reference to the business cycle would not only help to minimize the swings of these cycles but would also give to the Federal revenue system a desirable degree of elasticity.

These borrowings could now be undertaken on the basis of short-time loans in order to secure the advantage of extremely low rates of interest. This policy has recently been followed by the Treasury Department. On December 15, 1932, the Treasury borrowed $250,000,000 on 1-year certificates at an interest rate of three-fourths of 1 per cent—one of the lowest interest rates ever paid. This issue was nominally oversubscribed sixteen times. At the same time, $350,000,000 was borrowed on 4-year notes bearing 2¾ per cent interest. This offering was nominally oversubscribed nearly twenty times At present, therefore, there appears to be an ample market for Federal loans. The one problem confronting the Treasury in its short-time borrowing is so to arrange maturities that the Government does not become embarrassed in their payment or conversion when due. Too large a floating debt may make conversion into long-term indebtedness a difficult task.

As things now stand, there are limited possibilities for refunding a portion of the outstanding public debt. The average annual interest charge on this debt has been steadily declining since 1922, and a portion of the obligations is callable at the option of the Treasury. For example, the fourth Liberty loan of over $6,000,000,000 is callable after October 15, 1933. The interest rate of 4¼ per cent carried by these bonds is greater than the rates now being paid. A substantial amount of outstanding bonds might also be exchanged voluntarily for new issues, provided that ancillary inducements were offered. At any rate, the example of England in its recent refunding operations indicates what might be accomplished by the United States, particularly if a public subscription drive were inaugurated. The economies realizable through moderate refunding should be carefully explored

## V

### Summary of Suggestions

In summary the following suggestions are presented by the signers of this statement:

1. We suggest that Congress, in undertaking the task of balancing the Federal Budget, should finance expenditures for relief, investments, loans, and public works from borrowings, and that the Federal debt during the next fiscal year be increased by a sum not less than the amounts so expended.

2. We suggest that funds from current taxation should be applied to pay the ordinary operating expenses of government; that so far as these expenses can not be defrayed from taxation they should be covered by temporary emergency borrowings.

3 We suggest that funds should not be raised by taxation (or borrowing) except in the fiscal year for which they are required; that the Budget should limit appropriations at this time to sums to be expended during the next fiscal year

4 We suggest that Congress, after making provision for discharging contractual obligations, should adopt the policy of not appropriating funds for the amortization of the Federal debt during 1934, as proposed by the President in his Budget message.

5. We suggest that Congress and the President should adopt the policy of balancing the Budget over a period of years, taking account of the swings of the business cycle, rather than attempt to balance each annual Budget without reference to the effects of such policy on business and social welfare.

6. We suggest that every opportunity should be seized to reduce the cost of rendering public services; that political patronage be completely eliminated from the Federal services; that every possible effort be made to reduce waste and inefficiency to a minimum; that the reorganization of departments should be speeded; that improved methods and procedures should be adopted wherever possible.

7. We suggest that salaries should not be further cut unless steps are taken at the same time to accomplish all other possible economies in the public service, that personnel surveys be made and that the findings be used immediately as a basis for the separation from pay rolls of superfluous and inefficient employees and for any cuts in wages which may be made.

8. We suggest that, in developing its retrenchment policy, Congress should not blindly follow arbitrary rules but should make reductions and curtailments after weighing the value and importance of each activity.

9 We suggest that services undertaken primarily for the benefit of particular individuals or groups and conferring little advantage to citizens as a whole should be curtailed and put on a self-supporting basis; we suggest that subsidies to special interests should be withdrawn.

10. We suggest that the volume of public-works expenditures should not be curtailed during the fiscal year 1934.

11. We suggest that Federal appropriations should be made at once for the direct relief of the unemployed.

12. We question whether the total of Federal expenditures should be reduced lest the demand for goods and services be curtailed as a result of the restriction of Government purchases and wage payments.

13. We assert that in developing new sources of revenue the Federal Government should avoid the adoption of taxes, such as the sales tax, which tend to increase costs of production and diminish the volume of production and employment.

14. If any new taxes are to be levied, we suggest first an increase in income, estate, and gift taxes, then the adoption of revenue duties on tea, coffee, and cocoa, together with a material reduction in existing tariffs, so that increased revenues may be secured from customs duties.

15. We suggest that taxes be imposed on the sale of beer and wine if the prohibition acts are modified.

16. We recommend that elasticity in Federal revenues should be sought in the future by the planned control of the Federal debt—that the Federal debt should be permitted to increase in times of depression and be rapidly retired during prosperous times; that the borrowings for 1934 should be not less than the sums required to finance emergency relief, loans, investments, and public works

It is our belief that if these suggestions are adopted the 1934 Budget will be adequately balanced; that the general welfare will be enchanced; and that Congress will, by its action, hasten the return of better times

(An article submitted by Mr. Frank B. Cook, Salt Lake City, is here printed in full, as follows:)

## The Economic Importance of Silver

(By Frank B. Cook, Salt Lake City, Utah, January 3, 1933)

"All truth is safe and nothing else is safe; and he who keeps back the truth, or withholds it from men, from motives of expediency, is either a coward or a criminal or both."—Max Muller.

Much has been written and much said on the subject of silver since its fall in price, as measured by gold, and since the latter was made the sole unit of value in the United States in 1873. But a surprisingly small number of people take the trouble to study the subject from an economic standpoint, considering its importance to every man, woman, and child in every walk of life.

Present conditions the world over are deplorable, to express it mildly, and still many earnest men in endeavoring to find a solution of our difficulties in the United States have concluded overproduction of commodities and manufactured goods is the answer and in order to cure this, advocate all kinds of remedies from the 5-hour day and the 6-day week to plowing up every third row of cotton, technocracy, buying silver and issuing currency against it without fixed ratio, and the same old monkey wrench they have been throwing into the machinery since 1875, international conferences on bimetalism.

There has been authority for such a conference (sec. 312), for 36 years; but no such conference has been called. It is as follows:

"312 INTERNATIONAL MONETARY CONFERENCE COMMISSIONERS

"Whenever the President of the United States shall determine that the United States should be represented at any international conference called by the United States or any other country with a view to securing by international agreement a fixity of relative value between gold and silver as money by means of a common ratio between these metals, with free mintage at such ratio, he may appoint five or more commissioners to such international conference; and for compensation of said commissioners, and for all reasonable expenses connected therewith, to be approved by the Secretary of State, including the proportion to be paid by the United States of the joint expenses of any such conference, the sum of $100,000, or so much thereof as may be necessary, is appropriated. (March 3, 1897, c. 376, sec. 1, 29 Stat. 624.)"

There is no overproduction of food stuffs so long as there is a hungry human being to be fed and no surplus of goods to clothe the people so long as there are men, women, and children inadequately clothed.

As illustrating that this idea of overproduction is not new, in 1844 Henry L. Ellsworth, at that time United States Commissioner of Patents, stated:

"The advancement of the arts, from year to year, taxes our credulity and seems to presage the arrival of that period when human improvement must end"

One would be excused for wondering what Mr. Ellsworth would conclude if he could review at this time the "improvements" which have passed through the Patent Office since 1844.

Hon. Carroll D Wright, the first Commissioner of Labor and an economist of note, after a careful study, stated in his report issued in 1886:

"Industry has been enormously developed, cities have been transformed, distances covered, and a new set of economic tools has been given in profusion to rich countries and in a more reasonable amount to poorer ones What is strictly necessary has been done often times to superfluity. This full supply of economic tools to meet the wants of nearly all branches of commerce and industry is the most important factor in the present industrial depression. It is true that the discovery of new processes of manufacture, will undoubtedly continue, and this will act as an ameliorating influence; but it will not leave room for marked extension, such as has been witnessed during the last 50 years, or afford a remunerative employment of the vast amount of capital which has been created during that period. The day of large profits is probably passed. There may be room for further intensive but not extensive development of industry in the present era of civilization Supplying themselves with full facilities for industry and commerce will give to each of the great nations of Europe and America something to do, but the part of each in this work, will be small and far from enough to insure more than temporary activity."

These quotations are not given for the purpose of criticizing, but to show that the theory of overproduction because of mechanical improvements is not new. A review of conditions since the periods quoted is all that should be necessary in the way of comment.

What then is the answer? What is it that is fundamentally wrong? Why is it that we have a condition throughout the country which is trying men's souls, breaking the hearts of women and causing millions of little children to go to bed hungry?

Why did 1,800 human beings commit suicide in one of our cities last year, and why do we see millions of honest men tramping through the country whose only hope, which may soon be a demand, is that they be given an opportunity to work?

The administration at Washington continues to loan money which can not be profitably employed, in the hope of keeping the large corporations, banks, and insurance companies out of receivership and the Congress continues to try to find new ways to tax an already over-taxed people, while the people themselves try to find ways to earn enough to pay taxes already levied. At the same time 11,000,000 or 12,000,000 men are wondering where they and their families are going to get the next loaf of bread.

There are world debts according to estimates by statisticians of $750,000,000,000. In this country the debts of the Government, the States and their subdivisions, together with all forms of corporate and personal obligations are estimated at more than $200,000,000,000. Sums so vast that the human mind can not comprehend them. In order that we may have some idea of what they mean, it would take more than 1,400 years to liquidate the former without interest and 381 years the latter at the rate of $1,000 per minute. Of the debts in the United States farm mortgages alone are estimated at $9,500,000,000. In addition to an annual interest charge of $600,000,000 on these mortgages paid by the farmers, their direct tax amounts to nearly one thousand million dollars annually. These debts are payable in terms of gold and of gold there is available in the world, for monetary purposes, $11,500,000,000. They are payable in terms of gold because, whether so written in the bond or not, the producer must pay at prices expressed in gold. Commodity prices have not fallen when measured with other commodities. You may trade one commodity for another and find each bears approximately the same relationship to the other that it did four years ago. It is only when measured by gold that the difference is apparent. In other words, gold has appreciated. It will require from two to three times as much of the products of the soil or of the mine to buy a gold dollar to-day as it would have taken four years ago. The only remedy suggested is to lend more money when no one can produce enough to pay taxes and interest on what is already owing.

John Stewart Mill has said:

"There is such a thing as a general rise in prices. All commodities may rise in their money price but there can not be a general rise in values. It is a contradiction in terms. 'A' can only rise in value by exchanging for a greater quantity of 'B' and 'C'; in which case these must exchange for a smaller quantity of 'A'. All things can not rise relatively to one another. If one-half of the commodities in the market rise in exchange value the very terms implies a fall of the other half; and reciprocally the fall implies a rise. Things which are exchanged for one another can no more all fall, or all rise, than a dozen runners can each outrun all the rest, or a hundred trees all over-top one another"

Also, "that the money prices of all things should rise or fall, provided they all rise or fall equally, is, in itself, and apart from existing contracts, of no consequence. It affects nobody's wages, profits, or rent Everyone gets more money in the one case and less in the other; but of all that is to be bought with money they get neither more onr less than before. It makes no other difference than that of using more or fewer counters to reckon by. The only thing which in this case is really altered in value, is money; and the only persons who either gain or lose are the holders of money, or those who have to receive or to pay fixed sums of it There is a difference to annuitants and to creditors the one way, and to those who are burthened with annuities, or with debts, the contrary way. There is a disturbance, in short, of fixed money contracts; and this is an evil, whether it takes place in the debtor's favor or in the creditor's."

President E. Benjamin Andrews of Brown University, a recognized authority on the subject, stated in 1895 in reviewing conditions at that time:

"Appreciating money is occasioning injustice in case of every one of these obligations. The business friction proceeding from this source I mention presently; here I hold up to view the fraud of the system; how increase in the value of money robs debtors. It forces every one of them to pay more than he covenanted to pay, not more dollars but more value, the given number of dollars embodying greater value at the date of payment than at date of contract. In these days debtors must struggle hard to be able to pay what they honestly owe. A money system which forces them to pay from 10 to 50 per cent blood money is devilish indeed." and,

"That a very great fall in general prices has occurred since 1873 is uncontested; but the baneful effect of that fall is not so widely seen. Some, indeed, deny that fall in prices is an evil, and deem it an advantage instead. Such people confuse falling prices with falling costs, two things which are perfectly distinct The amount of labor necessary to produce the great commodities of life may be lessening from year to year, and yet the prices, the money value of those things, be increasing. Costs and prices may rise or fall together or one may rise as the other falls. The costs of things were falling in the sixteenth century, when American silver was first getting distributed in Europe; but prices were then rapidly rising. Likewise between 1850 and 1873 costs were falling more rapidly than now, but prices were not falling; they were rising. Even when the two movements coincide, as at the present time, they are not to be identified. The lowering of the costs of things is always advantageous, meaning an easier living for mankind. A fall of general prices is always a curse. I desire also to emphasize the fact that it is the fall which is mischievous, and not the lowness of the prices after they have fallen. While, during its progress, a general fall of prices, however caused, is always unfortunate, and while the effects of such fall may be grievous and continue long, yet a low range of prices when attained, considered apart fromthe causes which made it low, may be as desirable as a high range of prices. In what I shall say, therefore, I have in mind falling prices, not falling costs, and falling prices instead of low prices; and my immediate purpose is to set forth how unfortunately in many ways a fall in general prices works. I say, first, that falling prices, such as are now occurring throughout the gold-using world, work outrageous injustice." And, "falling prices (appreciating money) set up a special, positive motive for abstaining from productive industry. This is the impulse to hoard. Appreciation of money tempts holders of money and of titles certain to be paid in money to cling to these and not invest in industry." And, "In this risk to industry from having to produce against a falling market, this bondholder instinct, and this hoarding motive or impulse to clutch at gold-paying paper and not let go save when return in kind is sure, we see the reason why our banks overflow with funds which they can not loan and our streets with hungry men willing to work, but unable to find strong employers who have heart for productive enterprises. The first victims to falling prices are producers of the weakest class. These are the farmers—weakest because possessing the least capital and unable either to combine or to stop producing. Hence the agrarian distress in every farming country and section of the gold-using world."

According to Sauerbeck, prices in 1873 averaged higher than in 1867 to 1877. The index number for that year being 111; in 1874 prices 102 and the index number of silver 95.8; in 1895 prices 62 and silver 49.1; in April, 1896, prices 60.3 and silver 51 1.

The London Economist reported a fall in (world) prices January 1, 1890, to January 1, 1896, of 10 per cent. Mr. Sauerbeck showed a fall of 14 per cent from 1891 to 1895.

The London Statist at that time stated that while the cash value of imports in 1895 was 416,687,000 pounds, on the basis of 1890 prices their cash value would have been 507,100,000 pounds. The benefit to England being for that year 90,400,000 pounds

It was by reason of such conditions that the money question was raised in the campaign of 1896; the same conditions, only less severe, than exist to-day.

I quote some opinions of that period.

Senator Sherman in 1869.

"The contraction of the currency is a far more distressing operation than Senators suppose. Our own and other nations have gone through that operation before. It is not possible to take that voyage without the sorest distress. To every person except a capitalist out of debt or a salaried officer or annuitant, it is a period of loss, danger, lassitude of trade, fall of wages, suspension of enterprise, bankruptcy, and disaster. It means ruin to all dealers whose debts are twice their business capital though one-third less than their actual property. It means the fall of all agricultural production without any great reduction of taxes What prudent man would dare to build a railroad, a factory, or a barn with this certain fact before him?"

In 1878, in discussing the Blaine-Allison Act in Congress, James G. Blaine said:

"The people do not want a single gold standard, they want both gold and silver, in equal honor, in whatever abundance the bountiful earth will yield them to the searching eye of science and to the hard hand of labor. The two metals have existed side by side in a harmonious, honorable companionship as money ever since intelligent trade was known among men." And, "I believe the struggle now going on in this country and in other countries for a single gold standard would, if successful, produce wide spread disaster in and throughout the commercial world. The destruction of silver as money and establishing gold as the sole unit of value must have a ruinous effect on all forms of property except those investments which yield a fixed return in money. These would be enormously enhanced in value, and would gain a disproportionate and unfair advantage over every other species of property." Also,

"I believe gold and silver coin to be the money of the Constitution; indeed the money of the American people, anterior to the Constitution which the great organic law recognized as quite independent of its own existence. No power was conferred on Congress to declare either metal should not be money. Congress has, therefore, in my judgment, no power to demonetize silver any more than to demonetize gold."

Mr. Balfour:

"Let Germany, India, and United States try a gold currency and a tremor seizes every one of our commercial magnates. They look forward, in the immediate future, to catastrophe, and feel that the ultimate result may be a slow appreciation of the standard of value, which is perhaps the most deadening and benumbing influence that can touch the enterprise of a nation."

Mr. Goschen:

"If, however, other States were to carry on a propaganda in favor of a gold standard and the demonetization of silver, the Indian Government would be obliged to reconsider its position and might be forced by events to take measures similar to those taken elsewhere. In that case the scramble to get rid of silver might provoke one of the greatest crises ever undergone by commerce. One or two states might demonetize silver without serious results, but if all demonetize there would be no buyers, and silver would fall in alarming proportions. If all

States should resolve on the adoption of a gold standard, the question, would there be sufficient gold for the purpose, without a tremendous crisis? There would be a fear on the one hand of a depreciation of silver, and on the other of a rise in the value of gold, and a corresponding fall in the prices of all commodities."

William Jennings Bryan:

"There is a class of people whose interest in financial legislation is too often overlooked. The money-loaner has just as much interest in the rise in the value of his product—money—as farmers and miners have in the increased price of their products "

John G. Carlisle:

"The destruction by legislation of silver would ultimately entail more misery on the human race than all the wars, pestilences, and famines that ever occured in the history of the world." Also, "mankind will be fortunate indeed if the annual production of gold coin shall keep pace with the annual increase of population, commerce, and industry."

John J. Ingalls:

"I assert that the American people, and especially those of the West, demand the free and unlimited coinage of silver."

Senator Teller, in his farewell address to the Republican convention in 1896:

"I have said enough to convice you that I think this is not a question of policy but a question of principle. It is not a mere idle thing, but one on which hangs the happiness, the prosperity, the morality, and the independence of American labor and the American producers."

An opinion of an earlier date is also worth noting.

Daniel Webster:

"I am clearly of the opinion that gold and silver, in ratio fixed by Congress, constitute the legal standard of value in this country and that neither Congress nor any State has authority to establish any other standard or to displace this standard."

Following 1896, however, the condition complained of, the need of more basic money, was corrected to some extent by new gold discoveries and heavier production from those already discovered. The Rand, which was first talked of in 1885, by 1899 produced 3,637,713 ounces of gold; the Klondike began to send millions from the North in 1897; the cyanide process in 1899 enabled operators to work ores not previously possible; Cripple Creek in 1900, although this was several years after discoverv; western Australia 1901, and Goldfield 1904. It is interesting to note that the first of these, the Rand, is still producing and furnishing at this time more than 50 per cent of the world production. This new production, although large, has not kept pace with the increase of commerce and trade and increase in population, and we now have a condition brought about by those factors, and in addition an enormous increase in all forms of debt as the result of the last great war.

Lord Bradbourne, chairman of South Africa Consolidated Goldfields Co , said (1931):

"The supply of gold is even now insufficient to meet the world's credit requirements."

And "In ten years time the present gold production of $415,000,000 to $425,000,000, of which South Africa now contributes about one-half, will have fallen to about $275,000,000, while in 15 years the South African production will not exceed $50,000,000."

In the report (1931) of the joint committee of the Federation of British Industries and the Empire Economic Union on Empire Monetary and Financial Policy, they say, with reference to future supply of gold:

"Moreover, there remains the fact that the existing and prospective gold supply in the world, even if more evenly distributed, is likely to prove seriously inadequate to world needs. The total output is likely to go down from 83,000,000 pounds in 1930 to about 76,000,000 pounds in 1940. The now monetary demand is slowly increasing and is calculated to rise from 37,000,000 to 41,000,000 pounds by 1940. The new gold available to meet the growing monetary needs of the world will thus fall from 46,000,000 in 1930 to under 35,000,000 pounds in 1940 On the other hand, the world need for increased currency to meet its growing production was estimated by the gold delegation of the financial committee of the League of Nations in their first interim report at either 2 or 3 per cent per annum. It is the latter figure which is confirmed as necessary to maintain price stability, by the very careful analysis of gold production and prices over the period since 1851, which has been carried out by the Industrial Institute. On this basis and assuming the retention of the present conventional 40 per cent gold cover for notes in most gold standard countries, there is already a shortage on the annual supply, rising from 16,300,000 pounds in 1930 to an estimated 48,900,000 pounds in 1940. Even if the gold cover were reduced to 33 per cent and the rate of increase required taken at the lower figure of 2 per cent, there would only be a small margin to-day converted into a small but steadily increasing shortage after 1937. In these circumstances it would appear that the possibility of supplementing the metallic basis of credit by the restoration, in some measure or other, of silver to a place in the world's monetary system deserves serious consideration."

Financial committee of the League of Nations:

"But as a result of its (the delegation) analysis of the large mass of statistical data collected, the delegation has reached the conclusion that the inadequacy of the supply of new gold available for new money is likely at no very distant date to exercise its influence in depressing prices—a danger which, as the delegation points out, would be aggravated were gold coin to be put once more into circulation." The delegation itself states: "It is obvious that, when, throughout any period, there is a long-term tendency of prices to fall owing to a scarcity of gold, the difficulties in periods of depression will be increased, more especially for certain countries, if for any reason there is a distribution of the gold stocks which limits their efficiency."

"And the demand for currency is naturally dependent upon the volume of production and trade and the monetary transactions to which such trade gives rise The demand for gold which forms the basis of currency in all gold-using countries will, in the absence of any important changes in currency systems, be determined by these factors. We may reasonably expect, therefore, that the future requirements of gold, as long as methods of payments do not undergo important changes, will tend to increase as production and trade expand."

Mr. H. A. Kursell in his paper: "Gold Production and Its Future," 1930, gives the gold production since 1493 as 1,042,850,000 ounces of which 542,850,000 ounces have been absorbed by industry, lost or disappeared by hoarding, leaving about 48 per cent for monetary uses. He states:

"The consensus of more balanced opinion, however, seems to be that if the Rand Mines continues crushing on an annual basis of 30,000,000 to 32,000,000 tons the Rand production will remain more or less stable around 10,000,000 ounces for the next four or five years, but by 1936 a decline of 30 per cent is to be expected."

In conclusion Mr. Kursell states:

"It seems logical to expect that between 1935 and 1940 the available gold supply for the latter purpose (coinage), will not exceed 5,000,000 to 6,000,000 ounces per annum, i e , about one-half what it is at present."

Sir Robert Kotze, engineer for the South African Government, has said:

"A decline of 48 per cent in Rand production by 1936, which is likely to increase gradually, as the present probable and prospective ore reserves will be exhausted by 1947."

In the statement given out by the Federal Reserve Board, December 23, 1932, it was stated:

"The principal stocks of gold were held by the following countries:

| | | | |
|---|---|---|---|
| United States | $4,340,000,000 | Belgium | $362,000,000 |
| France | 3,266,000,000 | The Netherlands | 415,000,000 |
| England | 678,000,000 | Switzerland | 493,000,000 |
| Germany | 195,000,000 | | |
| Italy | 306,000,000 | Total | 10,055,000,000" |

Leaving approximately one and one-half billion for all the balance of the world including many important European countries, Japan, and all of central and South America.

It is this question of the inadequacy of gold to support the commerce and credit needs of the world that is of the greatest importance. The commerce of the world is estimated at $400,000,000,000. The average annual increase is estimated at from 3 to 3½ per cent. The gold supply during the past year, although it will show considerable increase, will fall short of supplying monetary needs by at least $90,000,000, without taking into consideration the accumulated deficiency.

It is generally conceded that no permanent improvement can be had until the present commodity price level is higher. Numerous proposals have been made to bring this about; the one most discussed being inflation and the question to be decided, if this is to be the remedy, what form of inflation is to be had. Will we follow the example of Germany with the printing press and all its accompanying evils or shall we return to the plan of our forefathers and open our mints to the free coinage of silver? In the first instance we use a machine which has no limit; in the second, we are limited by a very well known quantity of the metal, estimated by competent authorities to not exceed 8,000,000,000 ounces or at our present coinage ratio $10,343,200,000 for the world. This would be less dollars in silver than dollars in gold. Paper money expansion would no doubt have the effect of raising the price level in this country, but would not have any effect whatever on world prices. The opening of our mints to silver, however, would affect prices throughout the world and would increase the buying power of more than one-half of the population of the world. This is important for a large share of our exports are those which may be classed as basic commodities; such as cotton, wheat, corn, copper, etc.

Some who are opposed to bimetalism say we would be flooded by silver should we open our mints to that metal. In a pamphlet, recently issued, it was stated:

"The present price of silver is 30 cents per ounce and obviously, every speculator in the world would buy silver in all sorts of manufactured forms such as spoons and vases and would seek out stores of silver in India, China, and elsewhere so long as it could be bought for $1 an ounce (the discussion was on coinage ratio at 20 to 1 which would be $1.03 per ounce), less the cost of collecting and some margin of profits."

Shortly after the World War silver sold at $1.37 in New York and as high as $1.72 in London, the difference being explained by the difference in exchange, but no one will tell you of any old spoons or vases coming on the market. On the contrary, it was found necessary for this Government to sell to the British Government 200,000,000 ounces of our silver to enable her to meet her India obligations. Also, no one has adequately explained why and by what authority this Government entered into a contract with New York bankers to break the price at that time and furnished those bankers with silver from the United States Treasury for that purpose, as will be seen from the following:

I quote from an article, by former Senator Charles S. Thomas, printed in the issue of March, 1932, of Money:

"Secretary Houston's brief recital of this incident in his report for the fiscal year 1920, beginning on page 182, reads as follows:

" 'The price of silver rose with considerable regularity after the beginning of the fiscal year 1920 until a price surpassing all definitely known records was reached in New York on November 25, 1919, the price being from $1.08 to $1.38¼. The maximum price in London, 89½ pence, was reached on February 11, 1920, and it is understood that sales were made as high as $1.42 per ounce in San Francisco.

" 'The coining value of silver for United States dollars is $1.29+ per ounce, and for United States subsidiary silver coins $1.38+ per ounce. For a time, therefore, the price of silver was sufficiently high to menace the silver circulation.

" 'At about this time the Treasury, acting in cooperation with the Federal Reserve Board and the Federal reserve banks, arranged to release free standard silver dollars to be employed in regulating our exchanges with countries having silver monetary standards, and pursuant to these arrangements about 13,000,000 of silver dollars went to the Orient in addition to some 16,000,000 silver dollars which went through other sources between November, 1919, and May, 1920.

" 'A copy of the public announcement issued by the Federal Reserve Board in this connection, under date of December 6, 1919, appears on page 596 of this report.

" 'The price of silver remained above the melting point for dollars until early in March, 1920, when it gradually began to recede until in May it went below the price of $1 fixed in the Pittman Act for the purchase of silver bullion, to replace the standard silver dollars melted under the act.'

"The announcement of the Federal Reserve Board of December 6 referred to is also appended:

" 'Announcement was made to-day that under arrangements made between the Treasury and the Federal Reserve Board standard silver dollars that are free in the Treasury will until further notice be delivered against other forms of money to the division of foreign exchange of the Federal Reserve Board, which will, through the Federal Reserve Bank of New York, cooperating with the branches of American banks in the Orient, employ such dollars in regulating our exchanges with silver-using countries. This arrangement does not, of course, affect the redemption of outstanding silver certificates in standard silver dollars.'

"In that connection the Secretary says that the price of silver 'reached the point where our principal metallic circulation medium was menaced by the prospect of going to the melting pot for realization to the holder thereof of the profit incident at a greater bullion value than face value.'

"'At this time the Treasury, acting in cooperation with the Federal Reserve Board and the Federal reserve banks, arranged to release silver dollars to be employed in regulating our exchanges with countries having a silver monetary standard.' He then states that 'about 13,000,000 of silver dollars went to the Orient under these arrangements, while from November, 1919, to May, 1920, the silver dollars leaving the country totaled over 29,000,000.'

"In 1925 I made every possible effort to ascertain the facts regarding the export to the Orient of the 16,000,000 silver dollars thus referred to; but I was unable to secure any information other than the bare recital of the fact.

"I have no doubt the circumstances were as unwarranted as was the transaction relating to the remaining 13,000,000 dollars. Before detailing them, it should be stated that the danger menacing our silver circulation had been created by the Treasury officials.

"It is true that the bullion price of silver at the time exceeded the monetary value of our silver circulation, but the export either of silver coin or silver bullion had been prohibited both by the President's order enforcing subsection (b) of section 5 of the trading with the enemy act of October 6, 1917, and also by title 7 of the espionage act of 1917, both of which were by section 19 of the Pittman Act of April 23, 1918, declared continued in force until the amount of silver bullion required by that act should have been purchased as therein provided, and that has never been done. Of course, with this triple embargo upon exportations of silver in full force, the bullion price of the metal could not operate to deprive the country of any of its metallic coins, especially as the design of the precaution in the Pittman Act was not only to safeguard but to insure the silver purchases, therein provided for at $1 per ounce, which exportation might interfere with either, by lowering or raising market values. Hence, the menace apprehended by the Treasury Department was imaginary until created by its own action.

"Sometime, however, in the fall of 1919 and in the face of a rapid advance in the market value of silver bullion, the Treasury Department assumed the authority to set aside these statutory barriers to the export of silver bullion when they must have known that it would be at once followed by the melting of our silver coins and the sale of the resulting bullion in the market.

"In other words, when this prohibition was most needed, it was disregarded. This, of course, created the menace which served as the department's excuse for its subsequent action in the premises.

"Events now followed in rapid succession.

"On November 14, 1919, the vice governor of the Federal Reserve Board suggested to the Assistant Secretary that the department should prohibit the export of standard silver dollars 'while making it plain that no prohibition exists against the export of bullion obtained by melting them.' This prompted the reply that 'our standard silver dollars form a first-line trench which will stop the present movement,' the movement being the upward trend of silver bullion values.

"Having destroyed the statutory prohibitions, these 'trench defenses' became the Treasury's protection. After further discussions, the vice governor of the Federal Reserve Board reported, on November 26, a conference with the officers of the Asia Banking Corporation, 'regarding the protection of subsidiary coinage and removal of discrimination, exercised by British banks in the Orient against dollar drafts'; on November 28, two days afterwards, the Federal Reserve Board announced 'that in order to protect subsidiary coinage with silver selling above $1.30 per ounce, it is necessary to regulate exchanges with silver standard countries, arrangements for which have been made by the employment therefor of the foreign branches of American banks in these countries'. To do this effectively, it was decided that for the time silver dollars would be subject to redemption only with the standing silver certificates, except in the foreign exchange division of the Federal reserve bank, where they would be delivered against other forms of money on the conditions: First, that such dollars are intended for immediate export to be melted either before export or immediately upon their arrival abroad, and second, that the proceeds of the exported silver will be employed only in the purchase of dollar exchange.

"The only law which could possibly justify this transaction was the well-known Pittman Act. That it did so is very doubtful, but any silver dollars melted under that act emphatically required the purchase of an equivalent amount of silver bullion for domestic protection at a dollar per ounce, something which as to this incident the Treasury Department never pretended to do.

"On December 6, 1919, the Asia Banking Corporation, the International Banking Corporation, and the Park Union Foreign Banking Corporation of New York formally proposed in writing to the division of foreign exchange of the Federal reserve bank in that city, subject to the approval of the Federal Reserve Board and of the Secretary of the Treasury, that 'with the purpose to prevent the price of silver from rising above the point at which the subsidiary coinage of the United States will be exported, and to benefit and protect the position of American dollar exchange in the Orient market,' they would agree that for any dollars so furnished to use the same with the approval of the Board to protect, so far as possible, the subsidiary coinage from export by not premitting silver to advance in the Orient to a point which would endanger it; that they would turn over to the division of foreign exchange the net profits on silver dollars so furnished them after deducting enumerated items of expense, including a commission of not to exceed one-fourth of 1 per cent on the face amount of silver dollars so delivered; that all risk in the transaction should be borne by the banks and that the interest of the Federal Reserve Board is in the profit only without risk of loss; that the arrangement, if consumated, might be terminated at any time by the foreign exchange division, subject to its obligation to provide silver dollars against current funds in amounts sufficient to liquidate outstanding contracts, and lastly, that the total obligation of the said division of foreign exchange should not exceed the aggregate amount of 20,000,000 silver dollars. The three bank corporations above named were foreign branches of American banks located in New York.

"Their proposal was accepted on December 8, and immediately approved by the Federal Reserve Board and the Secretary of the Treasury.

"Instructions were at once wired to all reserve banks to send to the Treasury 'any silver certificates which may be spared in order to prevent other withdrawals of silver dollars from the Treasury while the agreement was in operation', thus giving the three banks as agents of the Government, the exclusive privilege of breaking the silver market in Asia through the agency of a law by its title expressly designed 'to stabilize the price and encourage the production of silver.'

"This arrangement was in no sense one for the sale of silver dollars to the banks. That word or its equivalent does not appear in it. The banks were to be 'furnished' the coin against current funds; as Government agencies they were to sell the bullion to Asiatic consumers and the Government was to receive the profit less a commission. The history of its performance confirms this assertion.

"Although not so designed, it was a conspiracy against the prosperity of the world.

"The banks were furnished, on December 18, 1919, with 3,000,000; January 23, 1920, with 7,000,000 and February 11, 1920, with 3,000,000 or a total of 13,000,000 silver dollars, mostly against their acceptances rather than 'against current funds or other forms of money as expressly stipulated.' These acceptances in the form of drafts by one of the banks upon a second with the indorsement of the third, were discounted by the Federal reserve bank to enable the private banks to complete the enterprise.

"In this way the Reserve Board supplied its banking agents both with silver dollars and with funds to secure them.

"Finally, the banks protested against the melting requirement, which was formally waived by the board on February 26, 1920, the Secretary of the Treasury having previously left the subject to the board's discretion. Some time afterward the board reported that, with the exception of the first million, the 13,000,000 silver dollars had been melted in Shanghai followed by sales of the bullion; but if additional silver dollars had been 'furnished' subsequent to the waiver of the melting requirement, they would have been so used in disregard of the provisions of the Pittman Act. The last consignment of February 11, however, with the added 16,000,000 silver dollars which the Secretary says were 'released' for the same purpose, but to whom is a mystery, were sufficient to break the world market and force the price of silver below $1 an ounce, since which time it has steadily declined.

"It will be remembered that these dollars were taken from the Federal Treasury and dumped upon Asia for the avowed purpose of 'protecting our subsidiary coinage from export.' Moreover, the Federal Reserve Board so informed James W. Gerard on January 9, 1920.

"On January 2, 1920, acting Governor Straus went further in a memorandum of that date to Governor Harding, which recites: 'There is no authority in the Treasury to finance the movement directly, and the transaction is absolutely essential for the protection of our silver coins,' such protection, as before stated, having been made necessary by the action of the Treasury in setting aside three statutes then in force prohibiting exports of coin or bullion.

"By April, 1920, the plan was accomplished and silver was forced from $1.38 to $0.608 per ounce, a decline of 66 per cent, and disaster confronted the industrial world.

"When the eastern markets responded to these attacks of the Treasury, its contract with the banks was abandoned. The net profit arising from the transaction was $190,937.47, which was divided among the 12 Federal reserve banks in proportion to their combined capital and surplus. This circumstance confirms the assertion that the enterprise was that of the Government operating through the banks and using them as screen to camouflage its activities."

No material decline in the market price of silver has ever occurred except as the result of some legislative act or the official act of some country.

Silver served as a basic money for all the world until England, under Lord Liverpool, made gold the sole unit of value in that country in 1816. Whether this was because England was ambitious to become an industrial nation and hoped by this act to buy her raw materials in cheaper markets, or because she was the great creditor nation of the world, although she had a large internal debt, 845,900,000 pounds, as the result of the Napoleonic wars, is not known. No price change in silver resulted from the action of England at that time. The record shows there was no time of which we have record up until 1873 that the commercial ratio fell to the United States coinage ratio except in two years when it was 16.11 in 1812 and 16.25 in 1813, and this was before England demonetized silver.

Germany, after collecting $1,000,000,000 from France as a war indemnity, which at that time was nearly one-third of the monetary gold of the world, adopted the gold standard in 1871, and in 1873 proceeded to sell her silver, and did sell 85,000,000 ounces from 1873 to 1878.

In 1873 the United States followed the example of Germany, and then began the fall in price as measured by gold which has continued to the present time.

France adopted the gold standard followed by the balance of the Latin Union in 1876.

The Congress of the United States attempted to stem the tide in 1878 by the passage of the Bland-Allison Act, and later in 1890 by the passage of the Sherman Act, which latter increased the amount to be purchased.

In 1893 the Indian Government closed its mints to silver, and the United States at the insistence of President Cleveland repealed the Sherman Act.

Following the closing of the India mints in June, 1893, the price dropped 19 cents per ounce in three days.

The position France maintained with reference to silver was much different from that of England and the United States. Instead of endeavoring to promote the price of the metal through purchase as we have done, she paid either metal at her option. At the annual banquet of New York Bankers, 1914, M. Robert Masson explained:

"I need not recall the remarkable role played by the Bank of France under the leadership of its very distinguished governor, Mr. Pallain, during critical periods such as 1907, when that institution succeeded in keeping the French discount rate on an exceptionally moderate level, while giving valuable and effective aid, at the same time, to the London market. How is this successful policy of the Bank of France materially possible? Precisely because it has the option to pay in silver as well as in gold. When the situation is such that withdrawals of yellow metal are to be feared the bank quotes a premium on gold. At present, for instance, the quotation is about one-tenth of 1 per cent premium—that is to say, you only get $999 in gold against $1,000 in notes. If you want to get $1,000 cash you can get them but in silver."

In 1920 England reduced the amount of silver in her subsidiary coins from 0.925 fine to 0.500. The excess silver from this operation was sold on the market and it is estimated these sales amounted to in excess of 75,000,000 ounces in 1921 and 1922. In 1929, 10,000,000 ounces were sold. Germany, Poland, France, Belgium, Italy and Switzerland followed the example of England and Indo-China sold large amounts derived from the same source in 1929.

We may pass the return to the gold standard of the different countries, at the close of the war, and consider the next step directly bearing on the market price—the action of the Royal Commission on Indian Currency and Finance appointed in August, 1925, to examine and report on Indian exchange and currency. The plan proposed was for a gold standard for India with gold circulation, silver to be limited as legal tender to 50 rupees and a gold reserve of 103,000,000 pounds was suggested to support this, and to melt rupees to the extent, if necessary, of

687,000,000 ounces of silver in order to build up the anticipated gold reserve. It is well to remember that for years India had absorbed gold in the world markets at the rate of more than $100,000,000 per annum and in that year, 1925, she took more than twice that amount. This is hoarded gold.

The result of the menace of this large amount of silver coming on the market and the later selling which took place, had a depressing effect as was anticipated.

India continued to be a purchaser of silver notwithstanding government selling and an import duty.

The commission's final decision was for the establishment of a gold standard:

"It is possible (they reported) to have a true gold standard under which the currency is based on gold both in reality and in a manner that is conspicuously visible, without putting gold in circulation."

Further, they reported:

"The people of India have from time immemorial placed their trust in silver as the medium of exchange and as their store of value. They are deeply interested in the value of silver bullion, and it is contrary to their interests to depreciate it. The present proposals would inflict heavy losses on the poorer classes, who have put their savings into silver ornaments, and who would find their stores of value depreciated by perhaps 50 per cent by the action of the government."

The final result of their deliberations was that the amount of silver to be sold be reduced to 206,000,000 ounces over a period of 10 years During the period 1927 to 1931, inclusive, the sales by the government amounted to 126,000,000 ounces of which twenty-one and one-half million were taken by the domestic market. During this time the Indian Government has not been a buyer but private purchases have been at the rate of about 100,000,000 ounces per year which is proof of the abiding faith of the Indian people in the white metal

The London Times commenting on the report of the commission at that time said:

"An unsettled feeling has been caused in the market for bar silver by certain of the recommendations of the currency commission. The price has fallen to the neighborhood of 28½ pence per ounce, the lowest point for several years past"

Is it not clear, as has been stated, that the price of silver (in gold) is the result of legislation or official acts of governments?

The following are some short quotations from authorities on the subject.

John Locke, referring to silver, says: "The money of account and measure of treade all through the world"

Jevons: "If all nations of the globe were suddenly and simultaneously to demonetize silver and require gold money, a revolution in the value of gold would be inevitable."

Giffin: "The prime offender in the matter perhaps, was Germany, which made a mistake, as I believe, in substituting gold for silver as the standard of money of the country. No doubt the pressure on gold would have been more severe than it has been if the United States had not passed the Bland coinage law."

Schuster: "Overvaluation of gold is the calamity from which the world is suffering today." He also stated:

"Unless the status of gold is placed in its proper perspective in world finance one of two results must happen—either the whole present economic system will collapse or all the currencies of the world will have to be detached from gold."

J. F. Darling: "The country that takes steps to rehabilitate silver values will have immediately 'sold' itself to the whole eastern world with its teeming population, for, with silver currencies stabilized, India, China and the whole East will have an enormously increased purchasing power to divert to the nations which will bring about its urgently needed reform." Again, "A return to bimetallism is the one and only remedy for economic ills, which if unchecked, will rapidly bring decay and dissolution to the fabric of international commerce."

Arthur Brisbane: "Ninety per cent of the world's nations and people, now off the gold standard, must have some kind of money, better than imaginary paper values. They will be compelled to use silver which nature and industry furnish uniformly about thirteen times as plentiful as gold. At present gold is almost seventy times as expensive as silver. More than seventeen hundred million human beings haven't got any gold and therefore have got no real money. They will use silver and the conspiracy against silver, ingenuously managed by those that have wanted to control the world's money, and have succeeded too well, will come to an end." Also, "Two things this country needs, could, and should have—wheat at $1 per bushel and silver at $1 per ounce."

William E. Borah: "Unless we can adopt some program which will bring back the purchasing power of some 800,000,000 people throughout the world, we shall not very soon, if ever, be free from the depression which we are now experiencing." Also, "In treating the silver question as a part of the great economical problem of the world, every effort ought to be made to restore this metal to its right place. I think under bold leadership it can be done. But, the leadership ought to be taken by the United States."

Mark Sullivan: "The world-wide drop in the price of silver has not been discussed noticeably in any prominent public place as an explanation of recent events and trends in American business. It is fairly certain there will soon be a good deal of such discussion. A few thoughtful persons believe that the drop in the price of silver accounts for at least as much as any one factor The meaning of the drop, to American business, takes into account the use of silver as currency in China and as a basis of purchasing power everywhere in Asia."

Sir Arthur Meighen: "The remedy lies in the restoration of silver as currency on a basis of 20 to 1 with gold. This suggestion has been made by Sir John Darling, bank director of London, and many other able economists. If this were done there would be no danger of any disproportionate amount of silver in the vaults of the British Empire I think Mr. Darling is correct in saying that the proportion of silver that would come into the banks would be very small and the rate of income would be very slow. The remedy for the industrial depression of the world is in the restoration of silver as a currency on a basis of 20 to 1 with gold, or on some other ratio that will be fair to both metals The exclusive gold standard is a mistake and the sooner we remedy our mistake the better for the entire world."

B C. Forbes: "The average American can not begin to grasp the ramifications of the injury to the world commerce caused by the tragic drop in silver from above 50 cents to approximately 25 cents per ounce So accustomed are Americans of the present generation to the gold standard that it comes as a shock to them to learn that fully one-half the human race depend on silver as their currency. Halving the purchasing power of one and one-half billions of people has naturally aggravated inordinately the current depression throughout the world, even though the silver-using nations consume much less per capita than the more advanced nations using gold."

Sir Josiah Charles Stamp: "If we do not solve this gold problem we shall all go bankrupt in Europe" Also, "What is universally called the fall in commodity prices might just as correctly be called the rise in the price of gold"

Sir Henry Deterding: "For no reason whatever other than ease and quick realization of the idea—but certainly not upon mature consideration—the world has been advised by great money theorists to the general adoption of gold as the only standard for fixing relative values for everything. This is an unreality which must be righted in time." Also, "That the money trade tends now to restrict itself to the gold-using countries to the exclusion of those with a silver currency. This barring of silver from the world's money markets is undoubtedly one of the main causes of the restriction of trade throughout the world to-day.

Lord d'Abernon: "Nonpayments and bankruptcies throughout the world will result, unless measures are taken to achieve a fall in the price of gold." He is quoted further: "The gold standard of the world has become unstable due to the increasing deficiency in the supply of gold in relation to increased post-war volume of production." Also, "Unless effective measures are taken, the result will be a world-wide catastrophe, both economic and political."

Mr. S. A. Knapp quotes a letter from Mr. F. L. Harden, Shanghai, dated November 28, 1930, as follows: "The teeming millions of Asia need every product of the Americans. They can not buy because international 'experts' and frenzied financiers have robbed their honest metallic currency of its purchasing power. To-day Asia has retired behind her traditional wall, is purchasing nothing and has become a competing manufacturer. Oriental labor as we have here will eventually wreck Occidental civilization. Unless Asiatic standards are improved, which can only be done through stabilization of silver upon an equitable basis, Asia will drag Europe and America down to her own level of existence."

Frank J. Cannon: "The advocates of the single gold standard have assumed that the issuance of credit based upon gold would sustain the commerce of the world. Their tragic mistake is now demonstrated in the misery of millions, including many of our own. The falacious idea of substituting, under the authority of small and interested groups, gold credit for a sufficiency of money ought now to be beyond dispute."

Jonathan Bourne: "The enactment of the Wheeler bill (S. 2487) would restore the honest dollar of our forefathers and establish an honest financial yardstick in our domestic and international trade."

Charles S. Thomas: "For purchasing power is the equivalent of a sound and abundant monetary system, endowed with the unqualified function of legal tender and safeguarded against undue inflation, yet capable of expansion under the operation of natural laws, in response to the increasing demands of human activity. This can be effected by a return to the old and time-tested system of bimetallism, whereby the monetary standard rests upon both gold and silver."

Premier MacDonald: "Is finance to be based upon one certain metal? Is credit to be controlled by the supply, demand and distribution of that particular metal? Is the policy, theory and practice which we accept and express in our coinage to thwart our commercial welfare?"

William H. King: "It is obvious that as gold diminishes in quantity it appreciates in price or value measured by commodities." And, "The level of prices of commodities is determined by the number of units of purchasing power, hence if the number of units of purchasing power are reduced, each unit immediately possesses greater value expressed in commodity prices and the prices of commodities measured by the monetary unit fall."

John A. Simpson: "Another thing, three-fourths of the world uses silver as a basis money, and if we were to remonetize silver it would open up avenues of trade with millions of people that we can not deal with now because we are on a gold standard. It is my firm belief that the remonetization of silver would double the prices of wheat, cotton, beef, and all other farm products within 60 days."

Burton K. Wheeler: "The remonetization of silver would raise and stabilize the price of wheat and cotton on the world market without resorting to unsound methods and without cost of $1 to the Federal Government." And, "This is not primarily a question concerning the price of silver but a monetary question vitally related, in the most direct fashion, to unemployment and the depression through which we are now passing."

The function of money is too little understood even by those who deal in it from day to day. The merchant who exchanges for it those things which he has to sell, it would appear, would be the one to appreciate that he has received a symbol of the value of what he has sold and of what he must himself again purchase in order that he may continue to sell. The man who acquires money in payment for labor performed does not stop to think, as he pays it out, that what he is paying represents the labor he has exhanged for something he can divide into smaller units in order that he may purchase his necessities. The banker who receives it from his clients and rents it to other clients for a consideration also payable in money thinks of it only as something which by handling as often as possible he can gain profits from. All are likely to forget, if they ever knew, that money is something established by legislation for the convenience of people that they may exchange what they have to sell for what they want to buy. A measure of value, a medium of exchange, a standard of comparison, a token.

It is important then that this token of to-day shall represent the same things that it did, for instance, four years ago, or will represent the same things four years hence, or at any period in the future to which may run a contract now in force.

If the farmer four years ago entered into a contract to pay certain sums which have now become due, he should be able to pay with the same number of bales of cotton, pounds of beef or mutton or pork, or bushels of wheat or corn. This he can not do. He not only finds he must deliver nearly three times as much of what he has, in order to meet his obligation, but he finds that when he has disposed of what he has raised, he has nothing left above the cost of production. Not only must he default on his principal, but he has not enough left to pay his interest or his taxes. The farmer is used for illustration because his is a basic industry. The same statements will apply to other lines of endeavor. In fact, the national income has fallen in almost exact proportion to that of the farmer. As indicating this, farmers and national gross income are estimated for the years quoted as follows:

All farmers, United States:

| | |
|---|---|
| 1929 | $12,000,000,000 |
| 1930 | 9,300,000,000 |
| 1931 | 6,900,000,000 |
| 1932 | 5,000,000,000 |
| 1932 (estimated) | 5,000,000,000 |

All income:

| | Per cent |
|---|---|
| $89,500,000,000 | 13.4 |
| $65,600,000,000 | 14.1 |
| $52,400,000,000 | 13.1 |
| $35,000,000,000 | 14.2 |

It will be seen that the farmers' gross income remains fairly constant in its relation to that of the whole

To quote Hon. James H. Teller: "Whether or not a thing is money, is to be determined, not by its substance, but by the functions it performs. The value of money is its purchasing power."

Honest money, therefore, is money which can be had or can be exchanged for as nearly as possible, the same amount of commodities or labor as at the time an obligation was entered into. The assumption that a gold dollar is an honest dollar is a fallacy easily demonstrated; for no dollar is an honest dollar which will buy two or three times as much of the necessities of life, or one-half or one third as much, in the course of four years.

Again quoting Judge Teller: "The prime requisite, the absolutely essential quality of honest money, is stability in value, in other words, unchanging purchasing power."

It is frequently stated by unthinking persons that the price of gold never changes. One often hears the statement that gold is always worth $20.67 an ounce. But payable in what? Itself? Is it with labor, or the products of the farm or the mines or the factories? In any of these an ounce of gold is surely worth $20.67 and much more. It is so valuable that no one can acquire it from savings or profits. Nothing could be further from the truth than that gold has an unchanging value.

Leonard Courtney, a member of the Royal Commission on Gold and Silver, said: "It is a dream to suppose that gold is stable in value."

Professor Jevons said: "We are accustomed to look upon the value of gold as a fixed datum line in commerce, but in reality it is a very variable thing."

The Statist, an authority on finance: "It is a mistake to suppose that gold is more stable in value than silver."

It has been stated many times that the reason silver was demonetized was because of the flood of silver coming on the market from mine production. This is not true. It is important to keep in mind, in considering production, that it is the relative amount of the two metals which is important. In 1873 the United States adopted as our unit of value 23.22 grains of fine gold or 25.8 grains of standard gold. The average world production for the 5-year period, 1871 to 1875, inclusive, was 5,591,014 ounces of fine gold and 63,317,014 ounces of fine silver; a ratio of 11.32. Nor can it be said that there was any market drop in the price of silver at that time. The average London price in 1872 was $1.322 and in 1873, following demonetization, $1.29769. As has been noted, there was no time of which we have record that silver was quoted on the London market as low as our coinage ratio of 16 to 1 except in the two years preceding the change in the English unit—1816.

For the 440 years following the discovery of America the ratio of production has averaged about 14 of silver to 1 of gold. To make plain that production had no bearing on price, so long as the mints were open to free coinage of both metals, it should be remembered that there was great variation in the production of one or the other metal in different years. In 1850 the United States produced 2,418,750 ounces of gold and 38,700 ounces of silver, a ratio of more than sixty-two times as much gold as silver by weight. In 1871 the world production was 8.7 of silver to 1 of gold. In 1872 between 12 and 13 to 1; at the time that England adopted bimetallism during the reign of Queen Elizabeth, production ratio varied from 26 to 56 of silver to 1 of gold.

The following is from the report of the United States Monetary Commission, 1876:

"At the Christian era the metallic money of the Roman Empire amounted to $1,800,000,000. By the end of the fifteenth century it had shrunk to $200,000,000. (Adam Smith informs us that in 1445 the price of wheat in England was 2 pence per bushel.) Population dwindled, and commerce, art, wealth, and freedom all but disappeared. The people were reduced by poverty and misery to the most degraded conditions of serfdom and slavery. The disintegration of society was almost complete. History records no such disastrous transition as that from the Roman Empire to the Dark Ages. The discovery of the new world by Columbus, restored the volume of precious metals, brought with it rising prices, enabled society to reunite its shattered links, shake off the shackles of feudalism, and to relight and uplift the almost extinguished torch of civilization."

During the period covered by our own history, production ratio has varied from 4.6 to 1, for the years 1851–1860, to 50.3 to 1 for years 1801–1810. Still for all this time, until the United States closed its mints to the free coinage of the white metal, there was no appreciable change in the price ratio. In 1873 the world production ratio was 13.6 and the highest since that year was in 1890, when it was 21.9; the lowest in 1915, 7.6; and the average for the period 1873 to 1929, 13.6. The past year has probably been about 8 to 1.

Much has been said about ratios and much left unsaid. It is proposed central banks be permitted to hold 4 per cent of their reserve in silver at not to exceed 50 cents per ounce. Among other proposals are to establish a ratio varying by periods from 1 to 50, to 1 to 25. Others have proposed 20 to 1 and 30 to 1. It is important that the ratio established shall be neither too high nor too low; but it is of even more importance that whatever is done will not only fix a ratio but provide that silver shall be a basic money. Our circulation per capita in silver in 1873 for instance was only 44 cents, because the Latin Union ratio was 15½ to 1 and ours 16 to 1, which made it profitable to export silver from this country. If we now establish a ratio of 20 or 30 to 1 and the commercial ratio should rise above that point, the result would be the melting of coins and the sale of the resulting bullion.

The earliest mention of silver we find in Genesis XXLLI–16:

"And Abraham harkened unto Ephron: and Abraham weighed to Ephron the silver, which he had named in the audience of the sons of Heth, four hundred sheckels of silver, current money with the merchant."

It is interesting to know that the ratio in Babylon, more than 1,000 years before the Christian era, was 13½ to 1, and this was the ratio in Greece before the time of Alexander and 9 to 1 at the time of Julius Ceasar. The lowest was when Portugal fixed it at 16 to 1 in 1688. Spain raised it to 15½ to 1 in 1775 and France in 1785. Alexander Hamilton, after long and careful study of the subject, decided on 15 to 1, and it must be conceded, in the light of data we now have, that he was the nearest to the average production ratio. At the time of making his decision, he said:

"I agree with you, Mr. Jefferson, that the unit of value should rest upon both metals." Also, "To annul the use of either gold or silver as money is to abridge the quantity of the circulating medium, and is liable to all the objections that arise from the comparison of the benefits of a full with the evils of a scant circulation."

The statement that a double standard is comparable to two yardsticks of different lengths is absurd. There is no similarity between a measure of goods and a measure of value. One is a fixed quantity and remains the same no matter how many yards are to be measured or how many yardsticks there are to measure it with. As has been noted, value is relative. The yardstick is not a measure of value but of things to be measured. By increase or decrease of the number of dollars, the relative value of a dollar in terms of what that dollar is to be exchanged for, rises or falls. The dollar in this case is the expression of value, not value itself.

Another argument, that we might as well try to fix the price of other commodities, as the price of silver, by establishing its ratio to gold. In the report on Empire Monetary and Financial Policy by a joint committee of the Federation of British Industries and the Empire Economic Union October 14, 1931, they state:

"In spite of the nonparticipation of this country, which had gone on a purely gold standard in 1816, the support of the European nations and the United States had proved amply sufficient up to 1873 to maintain the successful working of a bimetallic system which not only afforded a stable basis of exchange between gold and silver using countries, but also provided an adequate total supply of metallic currency for world needs. In 1873 Germany placed, by the unexpectedly rapid payment of the French War indemnity of 200,000,000 pounds, in a position of having a great surplus of currency, decided, in imitation of England, then at the height of its prosperity, to go onto the gold standard and proceeded to sell off large quantities of silver. For this the normal market was the French mint and those of Belgium and other countries of the Latin Union."

The Eighth Royal Commission (1888), after exhaustive study, reported: "So long as that system was in force (bimetallism), we think that, notwithstanding the changes in production and use of the precious metals, it kept the market price of silver approximately steady at the ratio fixed by law between them, namely 15½ to 1."

Mr. Courtney, a member of the commission, stated at that time: "The Royal Commissioners found as an uncontested and uncontestable fact that the price of silver measured in gold had remained wonderfully steady from the beginning of the century down to the year 1873, the average price oscillating about 60 pence per ounce, 59 pence being the lowest point and 61⅝ being the highest." And continued: "They believed a stable ratio could be maintained because they found that it had been maintained."

It might be questioned at this point, which of the two metals oscillated. Was it gold or was it silver? Was it the price of gold measured in silver which was, at that period of which Mr. Courtney was speaking, the money base of much more than one-half of the people of the world and the part money base of nearly all the balance, or was it silver measured by gold, at that time the money base of England only?

Another cry of the gold men is that the demand for free coinage of silver is simply a scheme of silver-mine owners to enrich themselves at the expense of the people. The greatest world production of silver in any one year was 262,598,000 ounces in 1929. Of this, the mines of the United States and the Philippines furnished 60,938,000 ounces. The average price for that year was $0.53306 per ounce, or a gold money price total for the United States of $32,483,610.28. If they had received the United States ratio price of $1.2929, they would have received $46,303,129.92 additional to what they did receive. If the contention that bimetallism will raise the commodity prices in exact proportion to the price of silver is correct, then the farm products of the United States, which were valued at $12,000,000,000 in 1929, would have sold for $29,040,000,000. To put it more simply, based on the present price of silver and wheat, if the price of silver should be $1.2929, wheat would be about $2.10 per bushel. The increase to the Kansas farmer for his wheat crop alone for the year 1931 would have been $158,000,000. The silver miner was naturally one of the first to inquire why the price of his product has fallen and learning the effect on world commodities was quick to call attention to the situation as affecting world commerce and trade. He is entitled to the thanks of the country for doing so; but his benefit from correction of present conditions would be small when compared with the country as a whole.

To the statement that no country ever had practical bimetallism and that from 1834 to 1878 we had no silver circulation, it is only necessary to recall what has already been said. We could not retain silver in this country because our mints placed a lower price on it than other countries and so it left us. After it began to fall as measured in gold as the result of legislation, and sold as a commodity only, we could retain what we were pleased to buy.

The English pound is at present quoted around $3.30 in gold; but in England the paper pound will buy approximately what it would buy before England discarded the gold standard. It is true that if we wished to purchase in England the same article we might buy in the United States, we can buy it for less in gold dollars than formerly; but the Englishman can alsosell to other countries as well as to us, at a less price than we can after converting the so-called depreciated currency into gold dollars. A gold dollar looks the same to-day as yesterday and to-morrow. Physically it is the same, comparatively it is not. It may buy a bushel of wheat to-day and 2 or 3 bushels to-morrow, but the average man or woman still thinks of it as the same dollar. It is not an honest dollar to the laborer if it buys less, unless his wage has been raised in proportion, or to the farmer or other producer if it will buy more.

It has been asserted many times that we do not need more metallic money because so large a proportion of our business is done with checks—bank money. Jevons has said with respect to this:

"Prices temporarily may rise or fall independently of the quantity of gold in the country; ultimately they must be governed by this quantity. Credit gives a certain latitude without rendering prices ultimately independent of gold."

Colonel Ayers, of the Cleveland Trust Co., has shown that bank credit was less than $100 per capita in 1900, but in the fall of 1929 had reached over $500 per capita. All of this, $60,000,000,000, was payable in terms of gold.

Ricardo has said: "The value of money is determined by the amount existing."

John Stewart Mill: "We have seen, however, that even in the case of metallic currency, the immediate agency in determining its value is its quantity." And "Alterations in the cost of production of the precious metals do not act upon the value of money except just in proportion as they increase or diminish its quantity."

The argument is advanced that the man who receives $3 per day is as well off as when he received $5, if prices have fallen in proportion. His life and fire insurance premiums remain the same at the $3 wage as at the $5 wage. His interest rate has not been lowered and he is lucky if his tax rate has not been raised. It may be answered that this particular man has no debt and pays no taxes; but every man pays both interest and taxes in some form. If he rents the house he lives in, he pays taxes in terms of rent, for his landlord must consider taxes and interest in fixing that rent. He must pay his proportion of the public debt and its interest, which must be added by not only the merchant from whom he buys but the wholesaler, manufacturer, and producer. The only class of society not affected by the general lowering of wages are those receiving salaries from Government.

The supply of money and the low rate of interest at which it is offered is another argument often quoted to contradict the statement of the bimetallist that the supply of money of ultimate redemption (primary money) should be increased. It is true the banks are full of money, or at least the large banks in centers of population are, and that interest rates were never so low. This is so because money can not be profitably employed in any line of endeavor. No thinking man or woman will borrow money for any new enterprise, or old one, with the evidence before them that they can not employ it profitably. What the bimetallist does claim is that commerce and trade have increased, the world debt has increased, and the population has increased beyond the ability of gold alone to sustain them. The population of all Europe, for instance, 16 years before England demonetized silver and 89 years before the United States did so, was estimated at 180,000,000 and in 1914 at 460,000,000. During the interim also, many millions had emigrated from Europe to the United States and Central and South America.

Judge Teller has quoted Sir W. H. Houldsworth as having said: "A scarcity of water in a river is not disproved by the fact that there is a large reserve of water stored up in a mill dam. Under ordinary circumstances a low rate of discount leads to the dispersion of excessive bank reserves, and this dispersion leads to a rise in prices."

Gold has been adopted as the standard of the leading nations. The probable reason for England and Germany adopting a gold standard has been recited. France did so to protect herself against sales of silver by Germany. But no one has yet explained why the United States did so. We have a record of the gold standard covering 60 years. Of these 60 years, except those in which some important nation has been engaged in war, and excepting the influx of gold from important gold discoveries already referred to, we have had falling prices of commodities. The though that under bimetallism conditions would have been better during this 60-year period can not be proven; but we may at least reason from cause to effect.

In 1871, two years before the United States demonetized silver, Ernest Seyd stated:

"It is a great mistake to suppose that the adoption of the gold valuation by other states besides England will be beneficial. It will only lead to the destruction of the monetary equilibrium hitherto existing, and cause a fall in the value of silver, from which England's trade and the Indian silver valuation will suffer more than all other interests, grievous as the general decline of prosperity all over the world will be. The strong doctrinism existing in England as regards the gold valuation is so blind that, when the time of depression sets in, there will be this special feature; the economical authorities of the country will refuse to listen to the cause here foreshadowed; every possible attempt will be made to prove that the decline of commerce is due to all sorts of causes and irreconcilable matters. The workman and his strikes will be the first convenient target; then speculation and overtrading will have their turn. Later on, when foreign nations, unable to pay in silver, have recourse to protection; when a number of other secondary causes develop themselves, then many would-be wise men will have the opportunity of pointing to specific reasons which in their eyes account for the falling off in every branch of trade. Many other allegations will be made; totally irrelevant to the real issue, but satisfactory to the moralizing tendency of financial writers."

The foregoing is a remarkable forecast made 60 years ago by an Englishman and one who was recognized as an authority on the subject.

The claim that we would become the dumping ground for silver if we alone of the nations adopted it, because we were at that time a debtor nation, made during the campaign of 1896, could not be advanced to-day. As a matter of fact, the only stock of silver which is potentially for sale to-day is that which may be sold by the Indian Government. But it is highly improbable that any government or any individual would rush in to sell silver at any price below the coinage price set by our government when the demand is unlimited. If some silver from other countries were offered for coinage and that coinage or its equivalent in paper currency exchanged for gold, it would not be harmful. It might be quite beneficial in helping to adjust more equitably the supply of gold and let those countries benefit which need it.

A good illustration of demand affecting price was had on passage of the Sherman Act in 1890 when the Secretary of the Treasury was directed to purchase 4,500,000 ounces monthly. The average London quotation for 1,000 fine in 1889 was 0.93511 and in 1890 was 1.04634. If an unlimited demand at a stated ratio price had been had at that time, can any one doubt that the price would have been established in every country and maintained? No country in the world to-day, including India, can afford to lose any of the silver they now have. They need it all and more, and so far as melting up silver plates, spoons, and vases as has been suggested, it is not likely that anyone having articles either ornamental or useful would be inclined to melt them and sell the resulting metal, when they would be destroying their greatest value, the manufacturing cost, by doing so.

The question of how much the silver dollar certificate has behind it is sometimes asked, and many will tell you the other paper currency has gold behind it. As a fact, Federal reserve notes have no less than 40 per cent; but how much has a national-bank note and how much have United States notes? It is true that by act of Congress the Secretary of the Treasury is instructed to maintain all forms of money issued by the United States at parity with gold, and this applies to a silver certificate as well as other forms, but it does not mean that the Government has to have, or does have, sufficient gold for the redemption of all of its issues.

Complaint is often heard that silver dollars are of too much weight for convenient handling. It is not contemplated that people would carry considerable sums of silver in their pocket any more than they now carry gold. If our mints were open to the coinage of silver, that silver would circulate in the form of paper money the same as our gold now circulates.

The term "intrinsic" is frequently used in connection with both gold and silver. The Standard Dictionary defines intrinsic as: "Pertaining to a thing or person; inherent; real; true." And, "Contained or being within." In other words, having value within itself. Let us see—we will agree that either metal has exchangeable value but can not agree either has value "contained or being within." That is to say, value within itself. Suppose we imagine the man who becomes lost on the desert. He has no food left, he has no water—neither is it possible for him to survive long enough to reach the one or the other; but he has his pockets filled with gold nuggets. How much intrinsic value has his gold? The gold can not sustain life. He can not exchange it for food or water, for none is to be had.

Under date of December 31, 1932, the papers carried an item quoting the Department of Agriculture as saying: "Drastic retrenchment in expenditures was advanced to-day as the farmers' main defense under present economic conditions."

Gone is the third row of plowing.

Under date of January 3, 1933, the papers carried the information from the Department of Agriculture that the farm price index number December 15 was 52 per cent of the pre-war figure and back to the low point of last June. New low levels were recorded for corn, oats, wheat, rye, hay, hogs, cattle, calves, and chickens. Compared with prices one year ago dairy products were down 23 points; grain, 16 points; fruit and vegetables, 9 points; and cotton and cotton seed, 2 points. This seems to answer the question of the efficiency of raising prices by Federal loaning, no matter to whom.

A prominent Chinese official was quoted in 1930 as saying he could not understand why the American Farm Board should go to the expense of buying wheat if they wished to raise the price of wheat when if they had used one-tenth of the money to buy silver they would have raised the wheat price higher.

Some European economist had predicted that if we continued to accumulate gold, the result would be inflation in this country—high prices of commodities in terms of gold or a depreciated gold dollar. So eminent an authority as George E. Roberts said in an address before the Investment Bankers Association December 10, 1918, in discussing foreign loans and interest payments:

"And even if these governments were able to relinquish from their present holdings sufficient gold to make a few payments, the effect of adding gold to our already large reserves would be to raise the level of prices in this country and to maintain prices here above those in the rest of the world, which would place us at a disadvantage with our competitors in world trade. It would make this the best country in the world to sell goods in and the poorest country in the world to sell goods from We couldn't afford to take their gold with such results."

The condition suggested by Mr. Roberts, so far as accumulating gold is concerned, has been brought about but from a different angle—ourselves staying with the gold standard while other countries abandon it The gold has been received but we do not have the inflation predicted. We do find ourselves in the position of being "the best country in the world to sell goods in and the poorest country in the world to sell goods from," but from a different cause—that is, appreciation of that same gold in purchasing power.

In June, 1931, a delegation called upon President Hoover to present their views on the silver question and were referred to Eugene Meyer, of the Federal Reserve Board One of the delegation, when asked what Mr. Meyer said, replied that he (Meyer) stated: "The silver industry was but one-fifth as important as the potato industry, and that if silver had to be stabilized why not do the same for potatoes."

We are not asking that silver be stabilized. We are asking that silver be permitted to resume its natural function as a part of the metallic money base. But it should not be forgotten that if restored to that position, Mr Meyer would not need to be concerned for the price of potatoes, if he is, for potatoes with every other commodity would advance in price.

To summarize:

Silver has been used as money since time immemorial.

Experience has clearly proven that the ratio of silver production for over 400 years has been less than 15 to 1.

When basis money is inadequate, civilization becomes distressed.

Price of silver has never declined to any extent except through acts of governments. Such acts are usually based on selfishness.

Bimetallism had operated successfully in the United States for 80 years and in the world for centuries.

With gold and silver used as basic money, it would be quite impossible for international bankers to control it, and impossible to have maldistribution as exists to-day.

The United States and the world sorely need commodity price increase. Remonetization of silver would quickly bring this about.

Increase in price of silver would not result in dumping of silver or melting of silver articles.

The United States is now a creditor nation and can with safety remonetize silver.

World price of silver would immediately rise to coinage ratio adopted by the United States.

Printing-press inflation is disastrous.

Restoration of silver to its rightful place as money would create an honest dollar for the debtor as well as the creditor The standard of value (gold) which to-day favors the creditor, is as dishonest as the printing-press dollar was and would be which favors the debtor.

No proper proof can be produced to indicate that the world supply of gold is sufficient for world commerce and credit.

Acceptance of silver as a basis money will not cause undue inflation.

Let us reason together, with no selfish interest to be served, but with the hope that we may have understanding; and having that, do what our understanding and conscience dictates in the interest, not of the few, but of the many. To-day the country stands in as great danger as ever threatened by war. The service which the Congress can give is as great. When war threatens there are no parties—there should be no partisan question in this emergency. If the solution of the economic questions involved are contained in bimetallism, then let us have the courage to open our mints to silver, trade with the world, and see that productive effort receives its just reward.

(A letter and statement received from Mr. Max Liebeskind, New York City, is here printed in full as follows:)

DU PONT HOLDING CORPORATION,
*New York, February 13, 1933.*

Senator REED SMOOT,
*Chairman Finance Committee of United States Senate,*
*Washington, D. C.*

MY DEAR SENATOR SMOOT: I am in receipt of your letter acknowledging my letter of February 6, wherein I requested the opportunity to testify before your committee in connection with the plan I have in mind relative to the relief of the unemployment situation.

I exceedingly regret that you find it impossible to grant me this request, stating that you find the calendar of the committee completely filled. Nevertheless, I am inclosing herewith, a resume of my plan and would ask that you kindly submit same to the committee.

I will appreciate it if you will inform me of their opinion.

Very truly yours,

MAX LIEBESKIND, *President.*

My program relative to the relief of the unemployment situation is as follows:

To present the plan to manufacturers and industrialists throughout the entire country, whose plants have been either idle or working at low capacity, due to existing economic conditions.

Many of them have heretofore employed hundreds and perhaps thousands. My plan is to suggest to them the following program to be worked out in the following manner:

Take a plant that had in normal times employed a thousand people. This plant has been idle for some time or is working at low capacity due to nonexisting buying power. Naturally it has not made any money, but, on the contrary, lost money. The overhead charges go on continuously. To start the plant in operation with 500 employees. The employees to agree on the following:

To accept half of their wages weekly, and, for the other half, participate in the funds of the company, to be distributed every six months. The employer shall not earn any profit, but charge only for actual overhead expenses. This should assure the employees the payment of the other half of their salary at the end of six months. I believe that the unemployed would be more willing to work on a participating plan as outlined, than to work shorter hours or part time.

I am sure that this program will meet with the approval of the industrialists throughout the country, for it is reasonable to assume that they would rather have their plants going at a fair capacity than to remain idle, with continual loss.

This program should in no way conflict with the labor organizations or scale of wages. It is merely a common-sense business proposition for the immediate return to work of a good part of the 12,000,000 people now unemployed. For this reason, I am confident, that this plan will meet with the approval of the labor organizations.

This plan can also be favorably adopted by the smaller manufacturer, and even the storekeeper throughout the country. Let us take the vast group of small manufacturers and storekeepers who have been compelled to give up their business. Don't you think it would be an incentive for them to go back into business, if they are to receive the cooperation of the employees, as outlined in this plan?

I am sure that this program will immediately stop the daily increase of unemployment.

The employer may bring up the question of financing, for the first few months for the outlay of material and wages. If he has been in good standing, isn't it only fair that the Reconstruction Finance Corporation lend money to the bank in the locality where the plant is located and with the proper check up by the bank; lend the manufacturer the necessary amount of money to cover the cost of operation of the plant for the first few months, after which period, bills receivable would be due for merchandise sold, and part of the loan should be repaid. This plan will in no way put the Government in business.

Now the question may arise, How is all the merchandise that is manufactured, going to be disposed of? I maintain that you must cover the situation of the unemployment first, before buying power can be created. Surely, if a man approaches you on the street and says, "Brother, can you spare a dime." What is he going to do with the dime. Is he going to the bank and deposit the dime or is he going to the coffee shop and get a cup of coffee. So the same thing applies to the wage earner. Soon after the wage earner gets employment, being out of employment for quite some time, he begins to realize that his shoes have outworn their usefulness and his clothes are in rags and the same thing applies to the woman. Do you think that when she receives her first week's salary it will be banked? Yes, part of it may, but the greater part will be to replenish her old clothes. So there is where you will get immediate increased buying power and the consequent increase in consumption.

We are all aware of the fact that the wage earner creates the buying power.

(Letters and articles received from Prof. Charles S. Tippetts are here printed in full as follows:)

THE UNIVERSITY OF BUFFALO,
*February 12, 1933.*

The honorable REED SMOOT,
*Washington, D. C.*

DEAR SENATOR SMOOT: I appreciated your letter of last week very much. I shall be unable to appear in person before the committee, as my finances will not permit it.

I am inclosing several copies of a summary I wrote about a year ago. This deals with causes rather than cures. I am uncertain as to cures, but shall send you shortly a brief of my suggestions.

I do not contend that the short article I am sending tells the entire story. Who can assume he knows enough to feel confident? Perhaps it has more truth than error. That is all I can hope.

Most respectfully,

CHARLES S. TIPPETTS,
*Professor of Economics.*

SUPPLEMENT—STATISTICAL SURVEY—THE UNIVERSITY OF BUFFALO BUREAU OF BUSINESS AND SOCIAL RESEARCH

(Causes of the Depression of 1930–1932, by Charles S. Tippetts)

In a brief analysis of the causes of the present business depression I can not hope to present all of the factors which may have been responsible, but only those which must bear the major part of the blame. These are international in character, although there are in individual countries situations which have made the breakdown more serious than it otherwise would have been.

During the past 40 years there has appeared a constantly growing volume of literature upon the subject of the business cycle. A close perusal of the conclusions reached by eminent authorities reveals that, on the whole, there is more agreement among them than there is difference of opinion. Where there is disagreement, it has to do, primarily, with the relative importance which should be ascribed to a certain factor. It is reassuring to find one of America's foremost authorities on industrial fluctuations, Prof. Alvin H. Hansen of the University of Minnesota, stating in the preface to his Business Cycle Theory, "There is a surprisingly large measure of agreement among the leading business-cycle theorists, despite the apparent irreconcilable antagonism which is often met."

But, what about the severe depression in which we now find ourselves? Have we not been told that it is different, that no one has an explanation of its causes? Have we not also been informed that it is peculiar in that it is world-wide in nature? To begin with, for the last hundred years most major depressions have been world-wide in character. In his recent volume Economic Stabilization In An Unbalanced World, Professor Hansen states (p. 112): "The current depression constitutes one link in the long chain of major depressions. It requires, in so far, no explanation other than the general theory of the business cycle as such. The exceptional severity of the depression, however, is to be explained partly by the drastic deflation of prices, partly by certain structural changes in the capitalistic system * * * and partly by a special combination of circumstances growing out of the postwar readjustments."

The business cycle is, fundamentally, a cycle in the production of all kinds of fixed capital, the creation of productive capacity. In other words, the prosperity phase of the cycle is coextensive with the investment of large sums in all types of construction, not only of factories, plants and machinery, but of public utility, transportation and highway projects. Public buildings as well as offices, apartments and residences would come under this category, if it is broadly interpreted. The enlargement of productive capacity for agricultural and raw material products must also be included. The funds to make such expansion possible come from the savings of investors, "ploughing back of earnings" and the extension of loans by banks. The driving force behind the expansion is the expectation of profit making, a driving force which is to the highest degree individualistic, and is the antithesis of collective planning.

Sooner or later there comes a time when it is realized that the possibilities of profit making from further expansion must decline. This may be due to the fact that the products turned out by the additional capacity can not be sold without cutting prices. Or, it may result from a decline in available funds seeking investment. Again, banks may find it necessary to curtail loans, because of declining bank reserves, thereby restricting purchasing power and causing a decline in prices.

If there is any thread which we can follow through the maze of recent events it is probably this: The enlargement of all kinds of productive capacity, partly by the process of debt creation, is largely responsible for what we term prosperity. The creditors are, for the most part, investors and banks. In looking for the cause of the present breakdown we must discover why the amount of funds being loaned or seeking investment declined, thereby bringing about a decrease in the flow of purchasing power through industries into the hands of final consumers. This, probably, is the central point of attack, since the result was a collapse in the world price level. This collapse wrecked profit-making possibilities, and eventually made the burden of debt payments an almost impossible one to bear.

Let us then look for the causes of the catastrophic decline in world prices. Prices, in the last analysis, are a result of the impact of commodities against available purchasing power. If the total purchasing power, which has its source in the incomes received by individuals, does not keep pace with the flow of commodities to the market, the price level falls. In gold-standard countries the amount of purchasing power available depends upon the supply of gold in bank reserves, for these reserves set the limit to which bank credit may be expanded. When banks make loans and investments they really create purchasing power in the form of deposits and bank-note issues. If gold is, for any reason, drained out of the banks, the country involved must, if it wishes to remain on the gold standard, suffer a decline in purchasing power, for the banks must contract deposits and note issues. Prices, therefore, must fall.

Prior to 1929 the United States had been furnishing nations all over the world with purchasing power in the form of loans. From 1921 to 1929 our investors purchased securities of foreign corporations and governments and invested directly in industries in these countries to such an extent that they became indebted to us in the amount of over $15,000,000,000. This was in addition to the loans made by our Government during the war, the present worth of which is estimated at nearly $8,000,000,000. Indirectly, by this method we furnished Germany with the means of paying reparations, and other nations with the means of buying goods from us and also of repaying war debts as well as meeting interest payments. Just so long as American funds flowed out all over the world in this manner business activity continued at a high level. It had long been realized by a large number of American economists that if anything happened to stop this process of lending by the United States trouble would shortly follow. It did.

American lending began to decline rapidly in 1928 for several reasons. One was that in a number of countries part of the borrowings had been used to create additional productive capacity of all kinds. But by 1928 it was becoming evident that further opportunities for profitable investment were declining. While a large portion of the loans had been used for purposes which were economically sound, a minor part had not been so wisely utilized. In other words, the amount of investment had become so large that it became harder and harder to find justifiable uses for additional American funds.

With this gradual stoppage of the flow of purchasing power from this country to others they began to feel the growing burden of debt payments. Their obligations to us could be met in one of three ways: (1) By shipping gold, (2) by selling us commodities or services, or (3) by further borrowing. Further borrowing in large amounts from us was temporarily impossible. Had we been more willing to receive payment in the form of commodities there would have been a partial solution. But our high tariff wall made this difficult. We were not the only sinners in this respect, for since the war the rise of economic nationalism all over the world has led to the erection of higher and higher tariff barriers. All countries seem to wish to sell, but few wish freely to buy. But America's position as a great creditor nation made our tariff policy particularly destructive to world prosperity. Our debtors, as a result of their efforts to pay us, were forced to see the exchange rates rise to the gold export point and their gold flow out to us.

Previous to 1928 we had already received large amounts of gold from other countries. One by one, following the war, most of the important nations had returned to some form of the gold standard. Many of them, however, remained in a precarious position. When gold again began to be received by the United States in large amounts in 1928 most of the nations exporting it were forced to contract bank credit. France, because of a favorable balance of payments, also received large sums in gold from her debtors. Except in the United States and France, and for a short time in Germany, prices had been slowly drifting downward since 1925. In 1929 they began to fall more rapidly. France had kept her prices up partly by an inflation of bank-note issues, and partly by stabilizing the franc at a point which forced prices up. Our large imports of gold following the war had made it possible to erect such a pyramid of bank credit that our prices remained above those in most European countries. As a matter of fact, prices rose in the United States from 1927 until early in 1929 when in most of the other nations they were falling. It was the tremendous growth of bank credit in the United States based upon gold imports that had created a large part of our ability to make foreign loans.

Speculation on the New York Stock Exchange gave the final blow. As the desire to buy securities swept like mad from one end of this country to another, our new investments abroad diminished almost to the vanishing point. Then, many foreign speculators entered the fray. They began to buy stocks in New York, an additional weight was thrown upon their foreign exchanges, and more gold came to us. Interest rates rose rapidly not only in New York but in every important money center in the world. Where there were some remaining projects for expansion in other countries which might have been feasible, the rapid rise in the rate of interest which had to be paid to secure funds practically compelled the suspension of further construction.

The price decline evident in all European countries except France continued with gradually increasing force. What has now come to be called maldistribution of the world's gold supply was showing its malevolent hand. Most foreign countries found bank credit contraction necessary if they were to remain on gold, since their gold base was now smaller. Our large export balance had been supported by foreign loans; now the loans had decreased. Heavy expenditures by American tourists abroad, the last sustaining force, decreased greatly in 1931 and the collapse of the world price level was accelerated.

The higher price level of American goods also caused a decrease in demand for our products abroad. Our high tariff lessened greatly the ability of other countries to sell to us. By preventing large imports we prevented large exports. Our prices also collapsed. Having made it most difficult for our debtors to pay us, we naturally have ceased to collect a large part of our debts. Finally, in 1930, we added the final touch in the form of the Smoot-Hawley Tariff Act. No competent economist advocates a sudden adoption of free trade, but a lowering, rather than a raising, of the tariff was the step indicated by sound economic principles.

It is clear now that the stock market crash in October, 1929, was not the primary cause of the depression. The crash was largely an effect of a decline in business activity already under way, and the pressure of long continued high interest rates, which destroyed profit-making possibilities in stock speculation on a market driven to almost unbelievably high levels. Losses suffered by speculators, however, destroyed a portion of their buying power. While this was offset in large part by profits made by others, what happened was a shift in demand which had almost as detrimental an effect as a total decline in buying power would have brought about.

Additional causes of the depression may be mentioned. In many areas the productive capacity devoted to raising agricultural and raw material products had increased greatly. Part of this increase was due to various restrictive measures which attempted to keep up prices of coffee, rubber, tin, or other commodities by limiting the amount exported or produced. By sustaining prices in controlled areas, production in uncontrolled areas grew rapidly and helped to break the market. Cartels, combines, and international agreements with regard to prices and output covering other commodities also had the same effect. Artificially high prices, therefore, led to a growth in production, and prices were subjected to drastic pressure.

Once business activity started on its downward course in the United States, other weaknesses became evident. The overdevelopment of installment selling became a depressing influence. Consumers had mortgaged such a large part of their future income that current buying power suffered. A number of American industries had expanded their productive capacity to a greater extent than had been realized. Other industries suffered from a decline in their export market. Bank failures, already large in the period from 1921 to 1928, increased greatly in numbers. The tying up of billions of deposits destroyed large amounts of purchasing power and deepened the depression. The burden of debt payments became gradually heavier. The Smoot-Hawley tariff intensified this problem for foreign countries. A severe international financial crisis, beginning in Austria and spreading to Germany and England, developed in the summer of 1931. Most of the leading nations were forced to suspend gold payments.

Then a breakdown of confidence in American banking led to extensive hoarding. The rush for liquidity on the part of individual banks brought about a severe contraction in loans and investments. The individual bank feels that it has no other course open to it if it is to be in a position to meet the sudden demands of frightened depositors. But the concentrated effect of such a deflationary policy has been to deepen and prolong the depression. This is a good example of how conditions which are the effects of the early progress of a depression may become causal factors increasing the severity of the decline.

The present depression resembles, in many respects, the long depressions of the forties and the seventies. Each of these lasted from five to six years, and from each of them eventually we recovered. What is needed now is a change in banking policy directed toward an expansion of bank credit. In a competitive banking system it is difficult to bring this about except by a very gradual process of restoration of confidence. Courageous leadership by prominent bankers, business men, and the Federal reserve banks was, until lately, decidedly lacking. The Reconstruction Finance Corporation act and the Glass-Steagall Banking Act were helpful measures. The increase in the purchases of Government securities by the reserve banks during recent months may constitute the turning point in the depression in the United States, if the surplus bank reserves thus created are wisely and effectively utilized.

It is frequently stated that there is, now, little or no demand for bank credit. This, however, would appear to be an exaggeration. The tests applied for the extension of bank credit at the present time are such that many borrowers simply can not meet these rigorous requirements under present conditions. What is needed is more willingness on the part of banks and other lenders to assume some risk. An expansion of bank credit leading to some rise in the price level would do much to restore greater business activity, and lessen the burden of debt payments. If bankers are unable to bring this about, the proposal to permit the Reconstruction Finance Corporation to lend to private corporations must be adopted. The unwarranted hysteria over the balancing of the Federal Budget is now subsiding. An intelligent program for public construction (the amount proposed in the Wagner bill represents the minimum which would be beneficial) could be of some assistance in initiating recovery. Large exports of gold from this country since last September may eventually lead to an expansion of bank credit in European countries with the result that recovery may first become evident there.

With regard to the international situation certain steps are imperative. Tariffs which all over the world are throttling trade between nations must be lowered. The reparations and war debts obligations must again be revised downwards, and a moratorium of at least five years duration should be declared on these payments. Loans to other countries for useful purposes must again be granted. We must get ready to receive a surplus of merchandise imports, for we are now a mature creditor nation. Cooperation between central banks must be encouraged, for the world is an economic unit. Economic isolation is not desirable or possible.

Finally, for the future, those who administer the Federal reserve system must be willing to exercise leadership. They must develop a central banking policy whose object is control and not mere passivity. Individual bankers and Federal reserve banks must apply more rigorous checks on the expansion and use of bank credit during a period of prosperity. A program for prevention of future crises must center around this point of attack.

---

THE UNIVERSITY OF BUFFALO,
*February 18, 1933.*

Hon. REED SMOOT,
*Chairman Finance Committee,*
*United States Senate, Washington, D. C.*

DEAR SENATOR SMOOT: As I promised in my recent letter, I am sending several published comments of mine on the depression. The two newspaper articles may present a somewhat different point of view from some opinions expressed before your committee. When people criticize congress and the Senate for not doing more they should remember that so much advice has been given that our representatives would have to be supergeniuses to distinguish between sound and false suggestions. I should like to see what a congress of 500 leading financiers and business men would accomplish. I doubt whether they could do one bit better, if as well.

I have no desire to add to the confusion, and I am submitting the accompanying comments for what they may be worth. From reading newspaper reports of the suggestions made before your committee I doubt whether you have received much real assistance so far.

I can not see that merely balancing the Budget is going to start recovery. The remedies should, it seems to me, center around methods of getting more buying power into the hands of the consumers. Ordinarily, bank loans are the chief source of buying power, but with the Michigan experience in everyone's mind I doubt whether bankers will feel like increasing their loans for some time to come. If we could stand still long enough in one place we might get the forces of recovery started. But just when we think we have achieved stability, something blows up somewhere, and down we go again.

Nearly everyone seems to wish prices to rise, but the usual method of bringing this about (by expansion of bank loans) seems to be impossible to rely upon. I am driven to the conclusion that we shall have to use drastic methods. It is true that we may, if we wish, force reduction of the debt burden, and ultimately get to a point where we can recover. But this process may drag on for years. The result is not pleasant to contemplate.

Someone, somehow, somewhere must either buy or make it possible for others to buy. About the only agency which can do this is the Government or the Reconstruction Finance Corporation. That is why, as a last resort, I have concluded that inflationary measures are necessary, as I wrote Senator Thomas. If inflation can not be controlled, and I would not favor it otherwise, then I can see no alternative but a long, slow, painful process of deflation, hoping that somewhere we shall reach a bottom. The growing feeling that we should now drag down everything that is still up to the level of everything at the bottom seems to me a counsel of despair.

If we can start prices up, profit making possibilities will emerge, and employment and incomes will increase. Governmental revenues will likewise increase and budgets will again approach a balance. Profit-making possibilities constitute the central explanation of what has been happening, and these fluctuate with prices. Rising prices give a stimulus to business and lighten debt and tax burdens.

But prices still continue to fall in the United States and the havoc grows accordingly. England and Sweden have stabilized their price levels and are in better condition, I believe, for having done so. Until prices stop declining in the United States we can not say we are on the road to recovery. The price level depends upon the amount of buying power available to take goods off the market. Therefore, buying power must increase if prices are to rise.

If we decide, however, to deflate further, of which I see no need, we should call off the Reconstruction Finance Corporation and all other agencies which are trying to hold up the railroads, banks, etc., in order to get it over as soon as possible. Whether debt burdens are heavy depends upon the activity of business and this depends upon such a relationship between costs and prices that profits are possible. But when prices constantly decline costs cannot be reduced rapidly enough to catch up. Consequently, I would prefer concentrating attention upon forcing out more buying power in order to start prices up. Were thing too high 1929? Only, if the prive level stays down. It is a relative matter. Certainly, a recovery in prices will rescue many dangerous situations.

I have taught and preached against currency inflation for years; I know the history of inflation and the dangers. But, between further deflation, and an attempt at a controlled inflation program I prefer the latter, I would rather trust controlled inflation, than gold.

I have said nothing about war debts, tariffs, reciprocal trade agreements, etc. These would be helpful, but time is important and to rectify these takes much time. Inflation might drive us, temporarily, off gold, but I think there is a great deal of superstition about gold. This, again, runs contrary to what most of your witnesses say.

If after reading this you think I can be of any service, I think I could manage to come to Washington, at any time named by you. I am reluctant to do so because I am not confident that my views are absolutely sound. You have probably had too many contradictory statements already.

Very respectfully,

Charles S. Tippetts,
*Professor of Economics.*

EXPANSION OF LOANS BY BANKS DECLARED KEY TO PROSPERITY—IF PAST EXPERIENCE IS REPEATED, RECOVERY DUE IN 1933, SAYS UNIVERSITY OF BUFFALO PROFESSOR

(By CHARLES S. TIPPETTS, professor of economics, University of Buffalo)

Probably the worst depressions the United States has experienced in the past century were those of the forties and the seventies. Each of these lasted over five years. The depression of the nineties was somewhat less serious because it was not continuous. The year 1895 constituted a breathing spell between two periods of bad business.

If past experience is to be repeated, we should, by the end of 1933, be definitely on the road to recovery. We have, in our past history, never continued on the downward road for much more than four years. Will 1933 conform to the record of the past or will it establish a new precedent for the length of American depressions?

Whether or not 1933 will be a year of recovery depends very largely upon the ability of the banking system to expand its loans to industry and trade. The banks actually create the vast majority of the purchasing power of the country by furnishing funds through the medium of loans.

SITUATION IN DEADLOCK

These loans give rise to deposits which are transferred from hand to hand through the use of checking accounts. Thus, the banking system itself creates, by lending, the major portion of its demand deposits.

If we are to regain a high level of international prosperity, it will be necessary to reduce considerably the payments of foreign countries to us on the war debts. Attempts to make the reparation and war debt payments, in the face of terrific obstacles, was one of the major causes of this depression. They are inextricably related and can not be treated separately. The American people wish to retain our high tariff and collect the debts. But they can not do both; they must choose between one or the other.

At present, the situation is in a deadlock. Bankers claim that they can not increase their loans until business recovers. But, business can not recover substantially until the banks again feel free to furnish the funds which will make recovery possible.

What is needed is an increase in the ability of consumers to purchase commodities. When banks make loans for the purpose of replenishing depleted inventories or manufacturing, these loans furnish the additional purchasing power needed to start an upswing. As the process is repeated, the purchasing power of the consumers increases until business gradually returns to a much higher state of activity.

PRICE LEVELS WEAKENED

Because the panic among bank depositors last year forced banks to become as liquid as possible, it has been difficult to break the deadlock. The contraction of bank credit during the last two years by over $10,000,000,000 drove the price level still lower, wrecked the possibilities of profitmaking and increased the difficulties of the bank's. In other words, to meet the demands of frightened depositors, the banks collectively followed a deflationary policy which eventually weakened their position still further. There can be little real prosperity until the process is reversed, and banks resume their normal functions.

If the banking system can not expand its loans, further deflation may occur, forcing still more wreckage. To avoid this is the chief problem of 1933. The Reconstruction Finance Corporation has, on the whole, been of great value, but it should have been given the power to make loans to individuals and corporations to fill the gap caused by deflation of bank credit.

WAR DEBT REDUCTIONS URGED

The open-market operations of the Federal reserve banks, in purchasing $1,000,000,000 worth of Government securities, has, so far, proved disappointing because the expected use of the surplus reserves to expand loans has not so far resulted. The widespread purchase of Government securities by commercial banks has been beneficial from the standpoint of the credit of the Federal Government, but it has been done partly at the expense of bank loans.

## Balanced Budget Not Necessary to Recovery, University of Buffalo Economist Holds—Desirable Only if Effected Without too Great a Burden on Taxpayers—Sound Economics to Borrow With Condition of United States Credit, He Contends

(By Charles S. Tippetts, professor of economics, University of Buffalo)

The American people have been told many times during recent months that there can be little possibility of recovery from the depression until the Budget of the Federal Government has been successfully balanced. This statement has come not only from leading bankers and business men, but also from Congressmen, Senators, and others who occupy high places in the political life of this country.

If it is true, then all of our energies should be devoted to this task. If it is not true, we should discover this fact before we indulge in another period of wild histeria on the subject.

It is my belief that the importance attached to a balanced Federal Budget is much exaggerated. I realize that this runs contrary to popular opinion, but, nevertheless, I believe it to be true. Let us recall that we had experienced a year and a half of depression before signs of an unbalanced Budget began to appear. As a matter of fact, as a means of preventing the deepening of the depression, we lowered Federal income taxes in 1930. Not until late in 1931 did the problem of an unbalanced Budget become a serious one. An unbalanced Budget was, therefore, not a cause of the depression. It was the increase in the breadth and severity of the depression which lessened Government revenues and brought about the dislocation of the Budget.

### BALANCE IS DESIRABLE

Do not conclude that I do not believe a balanced Budget to be desirable. It is desirable, but only if it can be accomplished without adding to the present back-breaking burdens of the taxpayers. Wasteful expenditures should not, of course, be countenanced. But it is difficult to agree upon which expenditures are wasteful and which are not. The Budget may be balanced either by decreasing expenditures by increasing revenues through taxation, or by the use of both methods at the same time. If these means do not bring about a balance the deficit may be met by the sale of Government bonds, i. e. borrowing.

Is it necessary to balance the Budget of the Federal Government in the middle of a severe depression? The answer is that it is perfectly proper to secure the necessary funds through borrowing, as long as the credit of the Federal Government makes borrowing possible at a reasonable rate of interest. Governments should tax heavily during a period of prosperity, in order to have a surplus with which to retire outstanding bonds. We retired nearly ten billions in bonds from 1921 to 1929, but now we see that instead of lowering income-tax rates during this period we should have kept them high and retired several billion dollars more of Liberty bonds.

### BORROWING SOUND ECONOMICS

During a depression the Federal Government should not attempt to increase taxes by huge amounts, except on high incomes. It is sound economics to meet the deficit by borrowing. We must now ask ourselves whether the credit of the Federal Government has become so seriously impaired that it can no longer borrow?

In spite of the fact that over $4,000,000,000 have been added to the debt of the National Government during the depression it is still possible to borrow at extremely low rates. Short-time issues have been floated recently at a price which brings to the purchaser hardly any return at all upon his investment. Long-time issues can now be sold with an interest return of approximately 2½ per cent. In other words, although we are well along into the fourth year of the depression the credit of the Federal Government still stands practically unimpaired. The National Government is, therefore, still in a position to borrow large sums in order to meet its deficit.

### NO REASON FOR HYSTERICS

We find, consequently, no reason to become hysterical or indulge in an unwarranted panic even if the Government can not slash expenditures and increase its income so as to make both end meet. Leading figures in American life, aided in lamentable fashion by a portion of the press, did their best last spring to drive us into a frenzy of fear. They prophesied disaster unless a balanced Budget emerged from Congress. Such a campaign is very likely to deepen and prolong the depression.

If what we need is a return of public confidence, let us not repeat this episode. Let us not belabor Congress for being a bunch of dupes and idiots. If Congress is stupid the blame lies with those who elected its members. Congressmen would behave better and accomplish much more if the business organizations of this country would stop their perpetual lobbying and interference at Washington.

What I have said regarding national finances does not apply, of course, to a State, county, or city which as exhausted its borrowing power. That governmental unit has no choice; it must either reduce expenditures or increase taxes. If the community is already overburdened with taxes, and many are, a reduction in expenditures is the only way out. After a certain point, an increase in taxes brings in a smaller total return, for the reason that an increasing number of taxpayers can not meet the additional taxes and lose their property.

### OPPOSES SALES TAX

To return to the National Government. Additional sources of tax revenue can be tapped. Much larger income taxes on the higher brackets are possible, but too much revenue from this source should not be expected. Incomes dry up rapidly during bad times. It is a maxim of taxation that the income tax is a broken reed in a depression. One step is necessary and that is to remove the tax-exemption privilege from securities. The beer tax is another prospective source of revenue, but like most other taxes levied during a depression it will prove disappointing. It would, however, help. One tax that must not be levied is the general sales tax. That is not the way out of the depression, but an excellent way to reduce buying power further.

Some reduction in expenditures can be accomplished at Washington, but how much is uncertain. It may be possible to reduce interest payments on the public debt, by refunding outstanding bonds into securities bearing a lower interest rate. Any large decrease in expenditures must center around appropriations for the Veterans' Bureau and the Army and Navy. If much saving is to be accomplished, it must be effected there. The prospects are not too encouraging. But we must not become frightened, since the credit of the Federal Government is still far, far from being ruined. Just as it was the depression which unbalanced the Budget, a business recovery will balance it again. Balancing the Budget, therefore, is not the foundation stone for recovery.

(A letter and statement submitted by Prof. Willford I. King, New York City, are here printed in full as follows:)

FEBRUARY 16, 1933.

Mr. WILLFORD I. KING,
*Professor of Economics,*
*New York University, New York City.*

DEAR PROFESSOR KING: This will acknowledge receipt of your letter of February 11, inclosing a copy of an article giving your views concerning the immediate causes of the present depression.

I shall be glad to bring your communication to the attention of the Finance Committee.

Yours sincerely,

——— ———,

---

NEW YORK UNIVERSITY,
*New York, February 11, 1933.*

Hon. REED SMOOT,
*Chairman, Committee on Finance, United States Senate,*
*Washington, D. C.*

DEAR SIR: In reply to your letter of February 8 I inclose a reprint of an article appearing in the proceedings of the American Statistical Association in which I have set forth my views concerning the immediate causes of the present depression and possible legislative remedies. As I see it, two steps are now needed to remedy the situation in which we find ourselves:

1. The unemployed ought to be set to work under Government supervision producing the commodities which they themselves consume. The wages paid

should be in scrip and the scrip should be valued according to the amount of product turned out. A plan for accomplishing this end has been worked out by Prof. Frank D. Graham, of Princeton University, and is described in his book The Abolition of Unemployment.

2. A hasty statistical study should be made to ascertain, approximately, the weighted average date at which debts now outstanding were contracted. The commodity price level should be raised to the level existing at the date so determined. Such an increase of the price level would work the minimum degree of injustice to debtors and creditors alike. Two feasible methods of raising the price level and stabilizing it at the desired level, when that level has been attained, are given on pages 229 and 230 of the inclosed article on the Immediate Cause of the Business Cycle.

I also inclose a copy of a bill which I have drafted which, if adopted, would put the second plan into operation.

If, after the material which I inclose has been considered by your committee, you feel that I could be of assistance to you by coming to Washington, I shall be very glad to do so at a time convenient to you. My convenience would be best suited by appearing before the committee on Tuesday, Thursday, or Saturday but if it is not possible to arrange for a hearing on one of these days I could come on almost any day except Monday.

Very respectfully,

WILLFORD I. KING,
*Professor of Economics.*

The only satisfactory cure for unemployment is employment, and that in occupations similar to those for which people are trained, and not in some utterly unfamiliar lines of work. But how can such employment be secured?

To accomplish this end we need to surmount obstacles preventing normal employment. Two of these obstacles are:

1. There is a shortage of bank credit.
2. The normal exchange of money for goods and money for labor is blocked.

Can these obstacles be overcome?

In his book, The Abolition of Unemployment, Prof. Frank D. Graham of Princeton University has outlined various ways of setting the unemployed to work. The methods suggested are logical and constitute a great tribute to Professor Graham's genius. What is needed is to devise ways of putting these principles into operation promptly.

After careful consideration of this problem, it appears that it is possible to adapt the plan devised by Mr. D. C. Prince of the General Electric Co. of Philadelphia and modified by Prof. Frank D. Graham and Prof. J. Douglas Brown of Princeton University in such a way that it may be fitted to the relief machinery now existing in the various States. This adaptation is designed to secure the cooperation of many merchants and manufacturers in stimulating business, securing large profits for themselves, and setting the unemployed to work. Were these ends accomplished, it would no longer be necessary to raise huge funds for unemployment relief. The adapted plan is presented in the accompanying memorandum.

I hope that you can find time to study the plan and give me the benefit of suggestions and criticisms that occur to you.

Very sincerely yours,

WILLFORD I. KING,
*Professor of Economics.*

## A Plan for Multiplying Relief Funds and Stimulating Employment

(Modification by Willford I. King of Frank D. Graham's plan)

Requires no legislation but merely calls for the voluntary cooperation of a group of merchants and a group of manufacturers with the public relief organization.

### I. PRELIMINARY STEPS

A. All merchants of the State *having high credit ratings* shall be asked to join the Business Stimulation League. To become a member of this association the merchant must, however, agree to do three things:

1. To accept at face value, in payment for any goods in stock, notes issued by the emergency unemployment fund. Goods exchanged for these notes shall be sold at the same prices as goods exchanged for cash.

2. To order each month for the next eight months, *in addition to his normal volume of purchases*, goods equal in value to the amount of emergency unemployment notes which he took in during the preceding month.

3. Unless his receipts of emergency unemployment fund notes amount to more than one-fourth of his total sales for the preceding month, he shall agree to purchase from members of the Business Stimulation League goods totaling in value at least *twice* the amount of emergency unemployment fund notes which he took in during the month immediately preceding.

When he is billed for these goods he shall make payment through the emergency unemployment league, offering in payment those notes of the league which he has collected and covering the balance in cash or in his own note, payable to the emergency unemployment fund and due in six months from date, with interest at 6 per cent.

NOTE.—The italicized provisions in this and the two preceding sections are the very essence of the plan. Unless they are carried out, the plan will accomplish little.

The plan would work even if only Sears Roebuck or Montgomery Ward became a member. A member department store in each sizable city would make the plan workable. It would work if several chains selling different lines of goods entered the league. If only individual small dealers joined, a large number would be required.

B. All manufacturers of the State shall be asked to join the business stimulation league. Every manufacturer joining this league shall pledge himself to accept, at face value, in payment for any of his products, notes issued by the emergency unemployment fund. The plan could not be put into operation until manufacturers producing a wide variety of commodities used largely by the working classes had joined the league.

C. Hereafter, the emergency unemployment fund shall pay out no cash for unemployment relief, but shall make all such payments by issuing non-interest bearing notes in small denominations payable one year from date. The fund shall, at all times, keep on deposit in a bank cash sufficient to pay all notes outstanding. By thus substituting its notes for cash, unemployment relief will make no drain upon the reserves of the banks of the State. Those merchants public spirited enough to join the business stimulation league will get the trade of the unemployed.

The notes will be individually signed and will require indorsement by each person transferring them. In form, they will be as follows:

NEW YORK, N. Y., *March 16, 1933.*

For value received, the emergency unemployment fund promises to pay to the bearer of this note one year from date, without interest, $5. Each person transferring this note must indorse it. This note will be accepted at face value in payment of any debts owed to members of the business Stimulation League.

EMERGENCY UNEMPLOYMENT LEAGUE,
By W. M. JONES, *Treasurer.*

The reason for requiring indorsement by each holder is to prevent counterfeiting. The face value of the note will be punched in the paper thus preventing raising the amount of the note.

D. The notes paid out to recipients of relief will soon be used to buy goods from the merchants belonging to the Business Stimulation League. The amount of goods thus paid for will enable each merchant to estimate roughly how much and what kind of new business he can hope for through the working of this plan.

## II. HOW EMPLOYMENT WILL BE INCREASED

A. A merchant taking in during a month $2,000 of emergency unemployment fund notes, will, according to his agreement, order not only his normal amount of goods but will also order, in addition, another $2,000 worth, thus making up an aggregate order for at least $4,000 worth of goods to be purchased from wholesalers or manufacturers belonging to the Business Stimulation League.

B. When the goods are delivered to the merchant and he is billed for them he will, normally, send to the emergency unemployment fund $2,000 in emergency unemployment fund notes, and his own note for $2,000 due in 6 months with interest at 6 per cent. The unemployment fund will sell the merchant's note to its bank, receiving for it a cash deposit roughly equal to the face value of his note. It will now itself issue $4,000 of new notes and pay for the goods ordered by the merchant from wholesalers or manufacturers.

C. The manufacturer receiving the $4,000 in unemployment relief fund notes will use them either to pay wages directly to employees, (paying no more than 50 per cent of any given employee's wage in such notes) or to pay bills for materials purchased from other members of the Business Stimulation League. These members will, in turn, pay out the notes as wages to their employees.

D. The notes received as wages will promptly be used by buy goods of merchants who are members of the Business Stimulation League.

#### III. HOW THIS PLAN WILL INCREASE BUSINESS

A. Each month the volume of notes issued by the Emergency Unemployment Fund will increase.

B. Therefore, the merchants receiving these notes, will, if they carry out their agreements, increase their orders for goods. Increased orders for goods will mean more workers taken on at the factories. The more workers employed, the less will be the necessity of granting charity, and the less will be the necessity of asking the taxpayers or the charitably inclined for contributions. The money saved by these contributors will mostly be used to buy goods, and hence will stimulate business.

#### IV. WHY THIS PLAN WILL INCREASE BUSINESS

A. Business is hampered today by the fear that goods, if produced, can not be sold at a profit. Under this plan, the merchants, being furnished an advance guide to prospective business, order in advance and thus set the wheels of business in motion.

B. Business is suffering from a lack of circulating credit. This plan turns the six months notes of merchants of good financial standing into circulating credit. The use of plenty of such credit would tend to offset the influences which have been forcing prices down.

#### V. STRONG FEATURES OF THE PLAN

A. Since the notes issued by the emergency unemployment fund are always covered 100 per cent by bank deposits, the notes are as safe as the banks in which deposits are kept.

B. Participating manufacturers are assured of a market for their extra production and are given a chance to gain much additional profit with little risk of loss.

C. Participating merchants also run little risk, for the goods purchased from them by those who have been unemployed will be largely staples, and, if any overstock of such articles is accidently accumulated, no serious trouble is likely to result.

If only a minor proportion of all merchants should decide to join the Business Stimulation League, those participating in the organization would profit heavily, since but a small number would share in the gains arising from the greatly increased volume of trade.

D. As unemployment disappears, the emergency unemployment fund can proceed to redeem its notes in cash, thus helping to prevent the development of another unsound boom.

## The Immediate Cause of the Business Cycle

By Willford I. King

To give a generalized explanation of the business cycle has been the endeavor of scores of economists and statisticians Many have believed the end attained, only to discover later that the explanation fitting so well the phenomena of some one particular oscillation in business activity proved entirely inadequate when applied to a cyclical movement occurring at another time. The failure of so many to reach the desired goal has led some of the ablest students of the subject to conclude that there is no single force or set of forces dominating cyclical movements in economic life, but that each individual cycle is a separate phenomenon depending upon a unique combination of forces. If these writers are correct, any attempt to explain the business cycle is obviously futile. We are instead, faced with the problem of explaining an infinite variety of business cycles.

When years of exhaustive research by leading economists lead to such conclusions, it may be the height of folly to continue further the quest for a generalized explanation of the cycle. However, the existence of so many characteristics common to numerous cyclical movements at various times and places leads the present writer to believe that, in spite of the testimony to the contrary, and also in spite of the fact that some of the ultmate forces behind the business cycle are still admittedly obscure, it is not only possible but probable that there does exist a single set of forces which are, in the main, immediately responsible for practically all major cyclical movements. He has the temerity to hold further that it is now possible to catalogue some of these forces.

The particular theory of the business cycle which appears recently to have found most favor with the public is that of over-production. Its popularity is doubtless to be accounted for mainly by the publicity which has been given to the remarkable growth, after 1920, in average output per man-hour in many fields of industry To the layman it has seemed natural enough to suppose that, by 1929, the market had been oversupplied with goods, and that this oversupply caused the ensuing crash.

As a matter of fact, in June, 1929, there appeared to be plenty of money available to buy the entire volume of goods then being turned out. Inequality in the distribution of income showed no tendency to limit buying power and clog the wheels of industry. Neither overproduction nor underconsumption was in evidence. The stocks of finished goods in the possession of producers were not unduly large. New machinery had not thrown any considerable proportion of our would-be workers into idleness. Producers had apparently succeeded in guessing fairly well at what kinds and amounts of goods the buyers wanted. There was no considerable evidence of over-building, and over-capacity of plants did not seem to be a very serious problem. Rising costs had not cut profits down to any notable extent. Few seemed to be worrying about machinery being too efficient, working hours being too long, or demand for goods being saturated. Industry was, in fact, functioning with gratifying smoothness. Not till six months or more later, when the depression was already well advanced, did the hobgoblin, Overproduction, appear on the scene. To ascribe the depression to overproduction is, then, an excellent illustration of the common error of confusing cause and effect. The cart has been put before the horse.

That the whole idea of overproduction is based upon the fallacious view that the total demand for goods is a fixed quantity, must be apparent to any economist who considers the question carefully. Since human wants are instatiable and since the sale of one product makes available the funds necessary for the purchase of other products, it seems evident that a general saturation of the market for goods is impossible.

While this fact is usually recognized by economists, many hold that the real cause of the present depression has not been general overproduction but rather overproduction of a few basic things, like cotton, wheat, copper, coffee, rubber, silk and sugar. Advocates of this theory contend that, while there is plenty of demand for these articles at a very low price, the market will not absorb the supply at prices high enough to cover costs of production, and that this fact has dislocated our entire economic system. To defend this theory it is necessary to close one's eyes to the fact that our oversupplies of wheat and cotton have been present for a number of years and that they did not prevent the development of the boom of 1928–29. No oversupply of copper was apparent while business conditions continued active. Since we are buyers of coffee, sugar, silk, and rubber, the cheaper these are, the more we gain. However, Carl Snyder, the leading authority on production statistics has exposed so effectively the fallacies of the overproduction theory that, to go into the matter more fully at this time, seems superfluous.

A number of prominent academic and business economists tell us that this depression has been brought about by maladjustments in business and industry, and that we are now witnessing the necessary but painful process of eliminating superfluous plants and inefficient producers. This hypothesis is difficult to disprove statistically but it is equally difficult to demonstrate. It seems to overlook the fact that the weeding-out process goes on in time of prosperity as well as in time of depression. Furthermore, when depression comes, both the efficient and the inefficient suffer. In 1929, most of the leading industrial concerns were in excellent financial condition, heavy reserves having been accumulated during the long period of prosperity which they had been experiencing. Since that date, these reserves have been largely wiped out and not a few strong companies have either failed or been brought to the verge of bankruptcy.

Apparently, the depression, instead of serving as a device for eliminating the weak and preserving the strong has brought weakness all along the line. Furthermore, if the change from prosperity to depression were caused by maladjustments in industry, by growing inefficiency in production, or by the introduction of new machinery, we would expect the process to be a gradual one. The truth is that the decline is often both sudden and drastic. For example, in June, 1929, our factories were very active. By December, their rate of production had declined more than 20 per cent. To ascribe this change to any slow moving evolutionary process seems illogical. One must instead look for a force which is capable of acting with great intensity.

The experience of 1929 seems to show that the force producing the decline in that year was not connected with supply factors. Our factories, our railways, our mines were all in excellent condition to turn out the types of goods demanded by their customers.

What then led to the crash?

The answer is: "Demand suddenly failed." Between June and December, 1929, according to figures taken from pages 28 to 67 of the United States Survey of Current Business for August, 1930, new orders for various classes of goods shrank by the following percentages: Hosiery 19, knit underwear 23, finished cotton goods 17, fabricated structural steel 8, fabricated steel plate 49, steel boilers 39, steel shelving 23, steel castings 5, cast iron square boilers 3, radiaotrs 10, steam pumps 22, steel sheets 24, malleable castings 34, stokers 33, machine tools 43, electric hoists 19, electric cranes 38, wood working machinery 39, lavatories 34, sinks 41, miscellaneous enameled ware 40, electric motors 9, miscellaneous electric goods 15, electric furnaces 52, oil burners 44, General Motors automobiles 80, book paper 3, sales books 20, box board 21, building contracts 48, Douglas fir lumber 32. The only increases noted in this list were cotton textiles 32 per cent, steel business furniture 1 per cent, cast-iron round boilers 1 per cent, foundry equipment 17 per cent, and wire cloth 37 per cent. The fact may also be noted that the operating revenues of railways declined 12 per cent during the half year. Of course, some of the declines were seasonal but, normally, new orders in December to take care of spring business are probably about equal to new orders in June to accommodate the autumn trade. How then is this sudden and drastic shrinkage in demand to be explained?

The only plausible explanation seems to be that the forces responsible were psychological rather than physical. Ideas are contagious and, like some infectious disease, sweep over an entire nation with surprising rapidity and are then carried to foreign lands. In the United States in the early autumn of 1929, public opinion as to the outlook for the future suddenly changed. Faith in the "New Era" gave way, and when it did, the "New Era" tumbled to destruction.

It was primarily this change from confidence to doubt—from optimism to pessimism—which caused such a radical decline in the volume of orders for goods. There was, however, present another causal factor besides unreasoning fear. This other causal factor was increasing lack of ability to continue buying at the rate prevailing during the early part of 1929.

This latter force will perhaps be better understood if attention is first focussed upon the relation between the national income and the buying capacity of the nation.

The aggregate income of the people of the Nation is relatively stable. Thus, in the 20 years from 1909 to 1928, there were only 5 years in which this income, when measured in dollars having constant purchasing power, did not show an increase, the only decline of any consequence being that occurring between 1917 and 1921. This decline was apparently caused, first, by our participation in the World War; second, by the reconstruction of our industries made necessary by the return of peace; and third, by the serious disturbance to our industry resulting from currency inflation both here and abroad. Under reasonably normal conditions, the aggregate of realized income departs surprisingly little from a smooth trend.

That the national income fluctuates less than the total volume of production is probably explained primarily by variability in the lag between production and resulting income. To illustrate this variability, we may consider the case of the income derived from a wheat farm. Let us suppose that the wheat is harvested in July and that the entire crop is sold by the farmer at once. This does not mean that the effect of the wheat crop on the national income terminates immediately. The insurance company which owns the mortgage on the farm may receive in January as interest part of the receipts from the wheat crop. This interest money may be distributed as a dividend to stockholders in March. The chain evidently continues indefinitely. Clearly, then, the movements of the national income are by no means synchronous with the movements of production, even though the income total is obviously dependent upon the volume of production. The income figures, therefore, resemble a moving average of the production figures.

We may assume the present normal realized income of all the people of the Nation to be $90,000,000,000. Were we existing in a "stationary state," there would be no growth of population and no saving, hence the aggregate value of direct or consumption goods purchased annually would likewise be $90,000,000,000 yearly. Our actual economic life is, however, highly dynamic. We are unable to predict for the future the courses of prices, the demands for products in different industries, the demands for products of individual concern, or production costs. Because of this uncertainty concerning the future, and because of our desire to get ahead financially, most of us feel it necessary to save part of our respective incomes. All of us together save in the average year perhaps $10,000,000,000 out of the $90,000,000,000 aggregate of realized income and use the remaining $80,000,000,000 to purchase direct or consumption goods.

To say that we spend for consumption $80,000,000,000 per year on the average is very far from being the same thing as saying that we spend this amount in each year. The fact is that the actual amount spent varies greatly from year to year. An obvious reason for variation is that the national income is not constant. There is, however, another reason, which is perhaps even more marked in its effects, but which is frequently overlooked. This second reason is a change in national sentiment from optimism to pessimism, or vice versa. Optimism normally leads to free spending, pessimism to parsimony.

Whenever a wave of optimism sweeps the country, most individuals minimize the danger of future troubles and magnify future opportunities. The hope of securing easy profits leads business men to expand operations, and this means buying more materials for construction or more goods for stock. Individuals, feeling that their future incomes are reasonably secure, purchase new automobiles, radios, houses, clothing, and other durable goods of all descriptions. Before the period of optimism has long continued, a large proportion of business concerns and individuals find themselves spending more than their incomes. To do so, they must draw on accumulated savings. In many instances, these savings soon prove inadequate to cover their demands for goods, and, to make the desired purchases, it is necessary either to borrow money or to buy goods on credit. As the tendency to buy on credit spreads, the total volume of orders for goods soon comes to exceed the national income. In early 1929, for example, we may have been making purchases of goods and securities at a rate of $100,000,000,000 or even $110,000,000,000 per annum, although our total realized income was not much over $90,000,000,000 per year.

The contention may be advanced that, since for every dollar borrowed there must be a dollar lent, the whole line of reasoning here presented is fallacious. It must be admitted that if Brown, who has been planning to buy a $1,000 automobile, loans the $1,000 to Jones who spends it for furniture, the total demand for goods is not increased. This transaction is, however, not typical. The usual procedure is for Smith to order an automobile, paying a fraction of the value in cash and mortgaging his future income for the balance. The note which he gives to the automobile dealer is discounted and eventually is converted into a bank loan. Now one of the peculiar functions of a bank is to create circulating credit. When a bank loans money, it does not thereby curtail the total national demand for commodities, for the bank was not in the market for commodities. What really happens is that the bank creates a supply of circulating credit, known as deposits subject to check. These deposits virtually constitute an additional supply of money. Between 1924 and 1929 the volume of such demand deposits in banks belonging to the Federal reserve system increased by more than one and one-half billions of dollars. More significant, however, is the fact that, during the same period, the velocity of circulation of the whole twelve to fourteen billions of deposits increased nearly 70 per cent. The extent to which the banks of New York City, alone, enabled individuals and firms to buy beyond their incomes is also indicated by the $5,000,000,000 expansion, occurring during the period just mentioned, in the volume of their loans to brokers.

As the volume of loan-financed purchases grows, and as the velocity of circulation of demand bank deposits increases, prices rise, and this upward movement intensifies the spirit of optimism already prevailing. More and more orders for goods and securities are placed by both individuals and corporations.

Obviously, when credit extension results in increased sales by retailers and wholesalers, factories are immediately called upon to furnish more goods. When the unfilled orders on the books of factories increase in volume, the factories call for more workers. Before the boom has continued long, the supply of well-qualified workers, willing to work at prevailing wage rates, has been absorbed. If the wave of optimism rises still higher, the unusual demand for goods leads employers to raise wage scales. These higher wage rates entice into the field of "money-making" a considerable number of persons not normally classed among the gainfully occupied. For example, married women, aged and infirm men, and boys and girls usually in school enter industry to take advantage of the abnormally high wage rates prevailing. They come, however, reluctantly and must be paid heavily in comparison to their efficiency. Wage costs per unit of output therefore rise.

During boom periods, producers find, in fact, that costs of all types tend to advance, for, in order to secure the supplies needed to keep production at peak, some of these supplies must be purchased from producers ranking well below the maximum of efficiency. Similarly, interest rates tend to rise, partly because, in order to supply the capital necessary to finance a boom, saving must be encouraged among a class of persons whose desires to spend are relatively strong.

These rising expenses of production have often erroneously been supposed to be responsible for the crash. As a matter of fact, however, they apparently have little to do with bringing about the collapse, for profits normally remain satisfactory as long as orders from buyers continue to pour in. In so far as responsibility for the business cycle is concerned, rising costs must, then, be regarded primarily as resultants rather than causal phenomena.

However, as costs of production rise, producers tend to mark up the prices of their products. The result, which has often been noted, is that, in the later stages of the boom, although the total value of industrial output grows steadily, there is but little expansion in the physical volume of the product.

What terminates the upward movement of the cycle? To this question no convincing categorical answer can, at present, be given. It may be argued that increases in the prices of finished goods eventually frighten the buyers and produce a "buyers' strike." There is probably some truth in this hypothesis, though doubtless rising prices tend almost as often to stimulate buying through the fear that prices will go still higher as they do frighten buyers because the prices seem too high. Rising prices of finished products probably tend to bring about a collapse of the boom mainly because income, being sluggish in its movements, does not rise as fast as the prices of goods. Therefore, the volume of goods which can be purchased with the income available to consumers shrinks, and orders tend to fall off. If consumers insist on purchasing the same volume of goods as previously, they can do so only by going into debt.

The probabilities are that, at the inception of any boom period, nearly every adult has at his command credit sufficient to enable him either to borrow money or to buy goods on time. This command of credit may be only a few cents or it may run into many millions of dollars. As long as a person has additional credit available, he is in a position to spend more than his income. Business concerns are, in this respect, in the same position as individuals.

Nothing can be clearer, however, than that, if expenditures continue to exceed income, the time must eventually arrive when all available credit will be exausted. If we are correct in our assumption that booms are made possible solely by the fact that large numbers of people are spending more than their incomes, it follows that no boom can continue indefinitely for the simple reason that, one by one, the buyers will come to the end of their credit. If, during a boom, when the national income is $90,000,000,000, buyers are placing orders for $110,000,000,000 worth of goods annually, they are, as a group, going into debt $20,000,000,000 deeper each year. If half of them exhaust their credit, the remainder can not spend at a $110,000,000,000 but perhaps only at a $100,000,000,000 rate. This, however, means a shrinkage in orders of $10,000,000,000. Such a shrinkage is probably large enough to wreck any boom.

One is not justified in assuming from the discussion in the preceding paragraph that the collapse of the boom is always, or even usually, due to credit exhaustion. This is merely the force that is sure to act if no other force intervenes at an earlier date to cause a lessening of that spirit of optimism which is essential to the continuance of the boom. Whenever, for any reason, logical or absurd, a spirit of doubt becomes widespread, the knell of the boom is sounded, for this spirit of doubt will lead many to stop buying on credit and some will actually begin saving. This means a reduction in the total value of goods ordered.

When the total money volume of orders for goods diminisheds, it is evident that either prices must fall or factories must curtail production. Curtailment means laying off workers.

If either prices are cut or workers laid off, confidence in the future continuance of the boom will be severely shaken. Many persons will sell securities. Others will cancel orders for goods already given. More will stop buying articles not needed for immediate use.

This change in sentiment and buying policy acts like a snowball rolling down hill. As it gathers volume and accumulates momentum, panic results. Prices fall rapidly. Real estate and securities are sacrificed, not because the owners wish to sell, but because they are compelled to sell. The selling forces prices still lower and this new decline causes additional forced selling.

Not only do falling prices cause forced selling, they also lead to postponement of buying by those persons who believe that prices will go still lower and who are also in a position to wait. This postponement of buying likewise accentuates the price decline.

Declining prices make business unprofitable. They also lessen the value of collateral and make it difficult for business men to borrow. Though interest rates on loans accompanied by highly acceptable security fall very low, lenders are chary of lending on ordinary security, and credit is scarce for enterprises involving any considerable degree of risk. Finding it impossible to sell goods at prices sufficient to cover cost of production, entrepreneurs curtail operations and lay off workers. As workers cease to draw their customary wages, the national income is materially reduced. Soon dividends are passed, and this reduces the national income still further. Furthermore, the ratio of the value of commodity purchases to the national income declines, for now people in general are engaged in paying off debts or accumulating savings—in other words, they are, on the average, spending less than their respective incomes. As savings accumulate, few people wish to borrow and many wish to lend. The more general becomes the habit of saving rather than buying, the greater the number of the enterprises which must shut down and the more numerous the workers who must be discharged.

Why do we not then eventually arrive at the situation in which industry is at a standstill and everyone is starving? The answer seems to be that two safety valves prevent this dire outcome. First, no matter how pessimistic people become there always exists a list of goods to be bought which they consider so essential that they will buy them as long as they have the funds to pay for them. In the United States, therefore, even in times of extreme depression, sales of the more staple foods and articles of clothing decline realtively little. Second, in a fertile country like the United States it is possible for almost everyone to extract a living directly from the soil. When other sources of income fail, there is, therefore, a tendency to migrate to the farm and live on the products of the land. "Hard times" in this country are, then, never likely to become as hard as they may in countries which nature has less abundantly endowed.

According to the theory just expounded, changes in general optimism or pessimism cause people to order goods valued sometimes at much more and sometimes at much less than the national income, and it is these changes in the volume of goods demanded which are immediately responsible for the business cycle. If this theory is correct, it relegates to the discard many of the most widely held beliefs concerning the origin of the business cycle as, for example, the circuit flow of money theory, the maldistribution of income theory, the overproduction theory, the new machinery theory, the planless production theory, the maladjustment of production theory, the rising costs and shrinking profits theory, the excess of producers' goods theory, and a whole host of others less widely held.

The sweeping statement just made does not mean that numerous miscellaneous forces may not increase or diminish the intensity of the fluctuations. Thus it would be surprising indeed if, in some cases, a business depression was not made worse by crop failures, or by the aftermaths of war. The suggestion here made is that, while these auxiliary forces affect various cycle waves differently, the variable use of credit by purchasers of goods is a very important causal factor in the case of nearly every cycle wave.

The explanation here essayed is, however, avowedly incomplete. While it purports to cover all cycles, it leaves unsolved at least one of the most fundamental questions concerning every cycle. The fundamental problem still defying solution is why these ups and downs of sentiment and business activity occur at intervals which have a marked tendency toward uniformity, the typical wave length being some 39 or 40 months.[1] No explanation of the nature of the busi-

[1] For proof of this fact, see the article by the present writer in The Annalist of May 1, 1931. It is entitled "Has the Business Cycle a Definite Wave Length?"

ness cycle can pretend to be complete which fails to clear up this mystery. Jevons said we must look to sun spots for the clue. Similarly, Prof. Henry L. Moore tells us that rainfall cycles are responsible. Perhaps the explanation does lie in natural forces. Perhaps, on the other hand, the real cause is some peculiarity of the human mind which forces it to move from optimism to pessimism, or vice versa, in a rather definite time interval.

Even though we do not understand all the forces underlying the cycle, this is far from saying that we can do nothing to control its movements.

We do not yet know the nature of electricity, yet we are successful in making electricity serve our needs. Perhaps, then, an understanding of nothing but the mechanics of the business cycle will enable us to control it, even though we do not completely fathom its nature.

To those interested in the advancement of human welfare, the theory here set forth as to how the cycle operates is perhaps considerably less discouraging than many of the rival theories, for, apparently, it does not imply that, in order to mitigate the evil effects of depressions, we must rebuilt the foundations of our economic system. It does not, for example, assume that we have too much equipment, that our industries are too productive, that our system of business enterprise is fundamentally wrong in nature, that we must either control all our activities through cartels or government commissions or else have all enterprises taken over by the state. It does not tell us that thrift is pernicious and competition ruinous. It does not even hold that depressions are economic house cleanings, essential if our national domicile is not to become unduly cluttered with obsolete equipment and enterprises.

Granted, however, that depressions are due mainly to overoptimism and overuse of credit, what, if anything, can be done to lessen their severity? Opinions will doubtless differ on this point, but certain facts in past experience seem to warrant the view that it may be possible to exercise a very considerable degree of control.

Advocates of direct action would probably say that, if buying on credit is to blame, buying on credit should be limited or forbidden. To do this would, however, mean placing serious limitations upon freedom of contract, a policy which would doubtless come into immediate conflict with the Constitution, and would, furthermore, be at odds with all our traditions. It appears, therefore, that practical considerations make it imperative to attack the problem indirectly.

Let us begin our consideration of the problem of regulating the cycle by analyzing the situation in 1929. Production was progressing satisfactorily but not feverishly. The financial condition of business was excellent. Commodity prices were but slightly inflated. Stock prices, however, were absurdly high, many issues selling at 25 to 40 times earnings. The velocity of circulation of bank deposits was far above normal. Most of our excess indebtedness and most of our monetary fever centered in the stock market. A radical decline in stock values was then inevitable, even though painful. Presumably, also, a slight downward adjustment of commodity prices and wages was necessary in order to enable the normally expended fraction of the national income to cover production. The recession occurring up to the end of 1929 seems therefore to have been normal and did not call for remedial measures. By this date, most stocks, outside of a few of the blue chips and public utilities, were selling at reasonable ratios to earnings.

However, as later events showed, liquidation had then only begun. Nevertheless, what has happened since January 1, 1930 appears to have been due almost entirely to unreasonable fear and pessimism. The effects of the decline have been almost wholly pernicious. Could this secondary and most disastrous part of the fall in the cycle have been prevented?

The probabilities are that, had proper measures been adopted, optimism could have been reestablished early in 1930. Two forms of assurance were necessary; first, assurance to employees that they would not lose their jobs; second, assurance to business men and to consumers that there would be no further general decline in prices. Had the second form of assurance been definite, the need for the first would have been much less intense, but would, nevertheless, have been necessary. With these two assurances there would have been little reason for buyers to reduce their volume of purchases far below their respective incomes. With a stable volume of buying there would have been no reason to lay off employees, business earnings would have been maintained, dividends would have been secure, and the national income would not have been seriously reduced.

For stabilizing employment no direct method has yet been proposed which promises to be both simple and effective. The attempt to remedy unemployment after it has developed by means of public work may often result in little more than giving one unemployed man a job at the expense of another. Is it not, indeed, probable that, whenever the money raised either by taxation or popular subscription results in the contributors reducing their purchases of production goods, new unemployment is created as fast as the old unemployment is remedied? May it not well be true that, unless the contributed money comes from funds which would otherwise not have been used in the immediate future to further production, no net gain in the volume of employment results?

The best direct measures for stablizing employment are, then, apparently those which are preventive rather than curative. Something can doubtless be accomplished by putting pressure upon each employer to guarantee a stable volume of employment in his enterprise. Compelling each employer during boom periods either to lay aside a large reserve fund, or to pay taxes to cover the cost of furnishing public employment during the preceding depression would lessen the tendency toward undue expansion. The expenditure of accumulated reserve funds in periods of depression would increase the demand for goods at such times and would also provide considerable stocks of commodities which could not be marketed until business again became active. The marketing of these stored-up commodities would tend to prevent prices from rising unduly in times of prosperity.

There seems to be little doubt that, if every able-bodied would-be worker were assured by the Government, in advance, that employment, even at low wages, would be available at all times, the tendency on his part to stop buying when depression appears would be far less marked than at present. Since stabilization of industry is so essential to the public weal, it seems then that the guaranteeing of steady employment at a wage at least somewhat above the subsistence level, ought to be one of the prime functions of government.

Direct measures for stabilizing employment are, however, at best difficult to carry out effectively. Fortunately, there is another method of contributing to the stabilization of industry, which is, by comparison, simplicity itself. This method consists in manipulating the supply of money and deposit currency in such a way as to offset variations in the velocity of circulation, thus keeping the price level constant.

Were the public assured that the average of all prices would, under no circumstances, be allowed to deviate materially from a fixed level, there would certainly be much less probability either that exuberant optimism would develop wild booms or that unreasoning waves of pessimism would drag us down into disastrous business depressions.

Suppose, for example, that, in 1928, when the stock market was pursuing a runaway course and instalment buying was pushing orders for goods well above the national income, the Federal Government had rapidly withdrawn money from circulation. Would such action not have dampened the ardor of the public, prevented the mad orgy of speculation which followed, and reduced the tendency to expand plant capacity in some lines so far that the products of those industries could not be marketed when the people came to spend less than the national income? Suppose further that, in 1930, when prices began to plunge downward precipitously, the proper Federal authorities had begun vigorously to pump new money into circulation. Would not this process have started prices upward, restored confidence, or optimism, and brought business back to normal by the middle of 1931? The most probable answer to each of these questions seems to be "Yes."

Economists are familiar with several ways of manipulating the money supply, any one of which would keep the price level on an even keel. The two simplest devices which have yet been proposed for use by the Federal authorities are:

1. Whenever the price level is below normal, let the Treasury buy Government bonds with greenbacks and then retire the bonds. When the price rises above normal, exchange bonds for greenbacks, retiring the greenbacks.

2. Whenever the price level is below normal let the Federal reserve banks buy securities with Federal reserve credit or notes. Whenever the price level rises above normal reverse the process.

To be effective under all conditions, both of these plans would needs give aurhority to the regulating body to vary the price of gold, or, in other words, to change the weight of the gold dollar. Only in this manner could reserves be protected and a gold backing for the currency be pernamently guaranteed.

The difficulties in the way of gaining the benefits of price stability must be regarded as mainly political rather than economic. The opposition to such stability does not, however, lie in the fact that a fixed price level would injure any powerful section of the voters. Instability is allowed to continue mainly because of ignorance, conservatism, inertia, and prejudice. Until these are overcome, the chances of really making much headway in our endeavors to lessen the evil results of depression are, unfortunately, relatively slight.

(A telegram received from Hon. John W. Davis is here printed in full, as follows:)

NEW YORK, N. Y.,
*February 3, 1933.*

Hon. REED SMOOT,
*United States Senate:*

I have your telegram, and would be only too happy to give the committee any assistance in my power. Am constrained to say, however, that I have nothing to offer, either of fact or theory, that has not already been exhaustively discussed. As the depression is not due to any single cause, unless it be human folly, I am sure it can not be cured by any single remedy. I have long since ceased to believe in governmental miracles or legislative cure-alls. To my mind the most helpful thing Congress can do is to devote itself to the obvious things that lie close at hand trusting the future for further guidance. Among these things, I put (1) balancing the Budget by radical and drastic economy and general taxes, including a sales tax if no better plan is offered; (2) reducing the swollen and excessive appropriations to veterans; (3) revising the tariff with a deliberate purpose of promoting foreign trade; (4) readjusting the foreign debt settlements; (5) repealing the eighteenth amendment; (6) abolishing, consolidating, and reducing Government agencies and governmental activities. Such a program is capable of accomplishment. The country, in my judgment, is more in need of surgery than of opiates.

JOHN W. DAVIS.

(A letter and statement received from Mr. Lamont M. Cochran, Long Island, N. Y., is here printed in full as follows:)

HEWLETT, LONG ISLAND, N. Y., *March 2, 1933.*

Hon. REED SMOOT,
*Chairman Committe on Finance, United States Senate,*
*Washington, D. C.*

DEAR SIR: As requested in your letter of February 8, I inclose herewith a brief covering my views on the depression.

Very truly yours,

LAMONT M. COCHRAN.

The fate met by the governments of other nations and the results of our November elections, all prove that no government is strong enough to withstand the strain of severe, unrelieved, economical pressure, unless the people of the nation have confidence in their government and believe that it is properly constituted to meet the emergency. The people of the United States are impatiently awaiting proof that their newly chosen leaders have the statesmanship, patriotism, and courage to subbordinate their personal and factional ambitions to the national welfare, in order to quickly find a solution of the Nation's pressing problems.

The fear and uncertainty, in evidence everywhere, has one of its roots in the growing conviction that our Government is too unwieldy and rigid successfully to cope with the emergency at home, and that it is still less fitted to cope with it abroad. If we are to avoid catastrophe, immediate proof must be given to the people that they have leaders who have the courage and authority to cut through to the heart of the situation. Forces already in motion will be accelerated by further futile discussion, by quibbling over technicalities, and by questioning the constitutionality of much-needed reform. The masses, out of sheer desperation, will take the law into their hands. Those who are shirking the responsibility of applying basic corrective measures, dare not gamble on the temper of a mass movement or endeavor to predict what will be left intact when it has subsided.

The best way to protect constitutional government, in any crisis, is to vest in the President the widest possible emergency powers, permitting him to conscript the services of such men as may be needed and direct their combined efforts in the most effective manner. War-time organization should be resorted to when necessary. The people would make greater sacrifices without complaint if they felt that their sacrifices were not being made in vain. They now demand a leader who will lead.

The homes of the people and, in so far as possible, other private property should be protected by an extension of temporary relief measures. These measures can not be continued indefinitely and the prompt application of basic remedies is imperative.

It has been pointed out that although the volume of currency outstanding has been maintained at a high level, the amount of bank or credit money has been reduced by billions of dollars. One of the reasons for the determined effort of sound companies with salable assets, to pay off bank loans, and their refusal to borrow money repayable at short notice, is the fear of being called upon to repay loans at a time when it is inconvenient or impossible to do so. There is much work that could profitably be done now, which must wait until longer-term financing can be conveniently arranged. The Government must help the banks carry the burden of long-term financing until liquidity ceases to be their primary consideration. The Government should facilitate borrowing by banks against long-term obligations.

Our position on war debts should change with the circumstances surrounding them. We must not hastily revise these debts without a complete understanding as to how any change in the bargain may affect us in the future. The fact that we hold bonds supporting the debt owed to us should enable us to feel secure that the debt will not die a natural death unless revised before the June payment is due. The threat of selling their bonds in the open market should be sufficient to persuade our debtors to cooperate with us in the interest of world recovery, instead of creating further disorder for the purpose of forcing an unjust revision. We must not allow ourselves to be jockeyed into a position where we will surrender these bonds for a smaller amount of similar, although no better secured, promises to pay, to be sold to our citizens under the delusion that we are receiving a lump-sum payment from our debtors. Our debtors can not make a lump-sum payment in proportion to their capacity to pay over a period of time. Moreover, we must not allow a foreign bond issue to interfere with the ability of our Government to borrow large amounts in this market for emergency needs.

It is evident that the demonetization of silver and the willful depreciation of the pound sterling has depressed the world price of commodities, thereby placing England in a favorable position to demand drastic reduction of her debt. We should not pay England to return to the gold standard unless she is also willing to reverse her policy of depressing the price of silver by dumping the silver reserves of the Indian Government on the market. England must eventually return to the gold standard for her own interests. The mines of the British Empire produce most of the gold mined to-day. As commodity prices fall the value of their gold production increases, but if the British thought that we were ready to abandon the gold standard they would be the first to point out the necessity of universal support for it. It is worthy of note that British mines supply a relatively small part of the world's silver production, which provides another reason for England's opposition to the use of silver as a basic metal money. When England has obtained a large debt reduction and has further increased her gold holdings by drawing gold from India through exchange manipulation, she will stabilize the pound. In the meantime we must continue to suffer unless we defend ourselves. The threat of serious economic warfare may be the best way to force cooperation.

It is futile to restore the depreciated gold currencies to their former standards unless the monetary value of silver is first restored. The demonetization of silver is the first link in the chain of currency depreciation. Most of the world's troubles, economic and political, can be traced to the demonetization of silver. The war between Japan and China can be traced directly to the adverse effect of low silver upon the trade of Japan and the world. It created a desperate condition in Japan which made it possible for the military leaders to gain, for their mad imperialistic ambitions, the partial support of Japanese business interests as well as that of the people.

In considering our debtors' capacity to pay, we should carefully investigate all means of receiving payment other than through the transfer of gold. For example, we could allow England to return to us the silver we sold to her during the war. In our next war we may be obliged to purchase supplies from our debtors and it would be prudent to leave part of the debt outstanding as an open credit on which we could draw in payment for goods when required. England

and France request debt revision similar to that allowed Germany in the Lausanne agreement. They reduced Germany's debt to 10 cents on the dollar and expect us to accord them a similar reduction. If we revise the debt on those terms we will be permitting England and France to transfer German's war debt to us. Our industry will be burdened with taxes so heavy as to make our return to prosperity impossible. Even our expenditures for defense will have to be reduced below the level of safety as a means of balancing the budget. England and France will still retain the former German colonies, which have been valued at several times the amount due us, and they will have improved their competitive position by placing the United States and Germany under handicaps too large to overcome. Who can say what our debtors' capacity to pay will be in 10 or 20 years?

If it is necessary to cancel part of the war debt to obtain the cooperation of England and France in our efforts to prevent the Japanese from retaining any part of Manchuria, or fortifying their mandated islands, that would be money well spent. The statement by General Bliss, in a letter to President Wilson in 1919, to the effect that if we abandon a part of China to Japan we are sowing dragon teeth, is just as true to-day as it was then. Possession of Manchuria will double Japan's war power. If we are not successful in stopping Japan through our immediate recognition and cooperation with Russia and by also cooperating with England and France, we will be obliged to withdraw from the Oriental markets which have great potential value.

Furthermore, we will be forced to spend on defense hundreds of millions of dollars more than an economic boycott would cost. Cotton, our main export to Japan, would be consumed by other mills, which would fill the requirements now supplied by Japanese mills. We could also use cotton in place of the silk now imported from Japan. The economic structure of Japan is dependent upon the manufacture and export of cotton goods and the export of raw silk to the United States. The Japanese could not withstand the pressure of a general boycott because they are in no condition to wage war at this time. If, in her present condition, Japan is ready to defy the world how can war be avoided if she is given an opportunity to consolidate her gains in Manchuria? Now is the psychological moment to take concerted action against Japan if we would save ourselves future bloodshed, under conditions far more unfavorable to us than the present ones.

Balancing the Budget is important from the standpoint of confidence, but the confidence of the people can be restored if they are convinced that no unnecessary expenditures are made. A distinction should be made between ordinary expenditures and emergency expenditures part of which may be recovered. A drastic slash in necessary expenditures, or an unreasonable increase in taxes, may cause more disturbance than the financing of necessary expenditure by bond issues. An appeal could be made to the partiotism of the people for bond subscriptions as we did during the war. After prices have risen, higher taxes can be levied and the Budget balanced without disturbing business.

All agree that higher prices for commodities are necessary to halt the depression. Adjustments between the prices of various commodities and services can be scientifically aided after a higher level has been reached. Adjusting to the present price level would cause the destruction of our financial structure. Unless basic remedies are applied, without further delay, prices will not rise in time to enable us to avert that disaster.

The records show that after every large gold discovery, prices rose as the effect of rapidly increasing the stocks of metal used as a base for money. Gold from India and increased production of gold in Africa and Canada, will very slowly raise the price level but we can not wait for that slow process. We can, however, add to the world's supply of basic or metal money, in the same way that an important gold discovery would, by restoring silver to its former place as a basic metal money.

To have sound money does not mean that we must blindly continue, without any alteration, our present technic of operating the gold standard. In fact the preservation of the system of using gold as a base for money requires changes in our present methods. Maldistribution of gold has caused the breakdown of the international gold standard. If we value the gold standard we must redistribute part of the overconcentrated gold stocks. We can hardly be expected to set up an international gold fund, without receiving some concrete compensation. We could, however, exchange part of our gold for silver. The exchange of a small portion of our gold stocks for silver would cause a reversal of the flight from silver as a basic money. By causing the world's stock of 11,000,000,000,000 ounces of silver to be again used as money and as a gold equivalent, the pressure on the badly distributed stocks of gold would be relieved. The insane desire of nations and individuals for gold at any price would cease.

There are many plans or combinations of plans that could be satisfactorily adopted and they will all work in some degree, for the simple reasons that money is 90 per cent psychological and because it is a universal human characteristic to discard what others discard and accumulate what others accumulate. All that is required to start the movement now is for some important country to begin accumulating silver in the world market and others will imitate it. The action of accumulating silver and again using it as a money metal will cause an immediate fall in the value of gold in terms of commodities in the same way as a large gold strike would.

Any measures for raising the foreign exchanges in terms of dollars, should be made effective before we revise the war debts, as that would greatly increase our debtors' ability to pay. Compared with the British we are babes in the woods in matters of money and exchange. There are probably not a dozen men in the United States who have a thorough, theoretical understanding of the money question combined with practical experience in foreign exchange. Very few people understand how or why the depreciation of an important country's money in the international exchange market has such a great, adverse effect upon the welfare of other countries. There is no denying the presence of the adverse effects regardless of whether the depreciated currency is based on silver or on gold. The views of an expert, Mr. Rene Leon, have been heard before the Committee on Finance, but it is doubtful if they were fully understood or properly valued.

We are just beginning to learn what a timid thing credit is and we have seen how easily confidence can be destroyed by the publication of the results of an investigation or that of the list of banks borrowing from the Reconstruction Finance Corporation. It is imprudent to discuss in Congress, for broadcast to the world, the delicate subject of monetary regulation. A leader has been chosen; provide him with practical experts for advisers and vest in him the authority to do what must be done without further public discussion. Place an airtight moratorium on the publication of the results of investigations. The orators and investigators can be given an opportunity to show their ability after the struggle is over and the crisis is past.

LAMONT M. COCHRAN.

Hon. REED SMOOT,
*Chairman Committee on Finance,*
*United States Senate, Washington, D. C.*

DEAR SIR: Inclosed herewith, I beg to submit in response to your letter of February 8, a brief on the causes of the present depression and possible legislative remedies.

Sincerely yours,

MORRIS A. COPELAND,
*Economics Department.*

---

A BRIEF SUBMITTED TO THE UNITED STATES COMMITTEE ON FINANCE, CONCERNING THE CAUSES OF THE PRESENT DEPRESSION AND POSSIBLE LEGISLATIVE REMEDIES

## CAUSES OF THE DEPRESSION

To understand the depression we must recognize fi st of all certain general characteristics of our existing economic organization:

I. (*a*) When business activity is on the increase, that increase is for a time cumulative and self-supporting. Prosperity is contagious, and tends to spread and to increase.

(*b*) Such business expansion does not continue indefinitely. It may generate conditions that tend to bring it to a halt, or that make its continuance more precarious. Thus in 1929 the high interest rates during the stock market boom cut off the credit which supported our foreign markets and the market for new residential construction.

II. (*a*) Once inaugurated, a business contraction tends for a time to be cumulative and to continue of its own momentum. Business contraction is contagious, and tends to spread and to continue.

(*b*) Such contraction does not necessarily continue indefinitely. It may generate conditions and compel readjustments that either tend to bring about a revival or are favorable to the development of a revival.

These processes of cumulative expansion, turning point, cumulative recession, and turning point constitute the "business cycle." Most economists agree that a depression is not an isolated phenomenon but part of this characteristic of our existing system that we call the "business cycle." Economists disagree chiefly as to the relative importances of different factors, but most economists would agree that different factors are prominent in different cycles.

I will suggest four factors that seem to me to have been prominent in making the recession of business that began in 1929 peculiarly severe:

(1) Unlike the mild recessions of 1924 and 1927 the current recession has been world-wide. A local recession is likely to be stopped by an improved "balance of trade" with other countries, a world depression is not.

(2) The rapid development of new world sources of raw materials and new techniques of production has made necessary far-reaching economic readjustments, and has thrown many parts of our economic machine out of gear. Technological unemployment has resulted, and the plight of the farmer has been seriously aggravated. The sharp, wide-spread price declines fostered by the new production areas and new techniques (so widespread that the decline of prices has become seriously cumulative) have made debts contracted at the 1929 level severe and even impossible burdens in many quarters.

(3) 1929 contrasts with 1920 in the large stock of up-to-date buildings and equipment on hand at the start of the recession. Hence, private construction activity has not promoted an early revival as it did in 1922. Incidentally, the construction industry is hampered by the failure of construction costs to decline as much as many other prices.

(4) Since the war the United States has become increasingly a creditor nation, but our economic system is still adjusted to an annual "export balance of trade." During the post-war decade the market for our exports was largely supported by loans abroad. Foreign credit standing does not encourage further foreign loans, and without them our export market lacks support.

In addition to these four factors it is to be noted that this is the first prolonged depression the United States has experienced since it has become a highly industrialized nation without a frontier. For such a nation a prolonged depression is inevitably more difficult than for one such as we were in the seventies or nineties.

Measures for dealing with the situation fall into two general classes: (*a*) Those needed immediately to relieve suffering, to promote readjustments necessary to recovery, and to give a definite impetus to revival and (*b*) those designed to moderate the severity of future recessions, and to facilitate readjustments which will necessarily be slow.

## FALSE LEADS

A number of immediate measures have been proposed which are not likely to do much good, and which may easily do considerable harm. Among these are the following:

(1) Inflation by currency tinkering has been proposed in a variety of forms. Such tinkering at the worst will destroy confidence, augment instability, and perpetrate injustice. At best it will prove largely ineffective, and will delay and hamper constructive measures. Increasing the quantity of currency issued alone will not increase the circulation of currency, and currency must circulate to be effective. Increasing credit funds will not conjure up borrowers of good credit standing, so long as nothing is done to rehabilitate that standing. Making loans to shaky enterprises only puts off the day of reckoning, makes the reckoning more stringent when it comes and works injustice to creditors, as the experience of the Reconstruction Finance Corporation has already shown. Decreasing the weight of the dollar, so far as it can be effective, will have its chief effects through depreciating our exchanges, and so stimulating exports and curtailing imports. With other countries also depressed and striving to protect themselves, such a move is almost certain to provoke reprisals all around. It is therefore likely to increase international instability, and retard the process of world recovery without helping the United States. Our medium of exchange is certainly not functioning satisfactorily, and is badly in need of repair, but such measures as issuing more dollars, offering easy credit, and debasing the currency are more likely to do a

great deal of harm than to accomplish any good. (Some of these points I have elaborated in the hearings before the Senate Committee on Banking and Currency on H. R. 11499 and S. 4429, May, 1932.)

(2) Increasing tariffs to offset the effects of depreciated foreign currencies and to give us a more favorable balance of trade is a policy which under present conditions is likely to defeat its own ends. When we were a debtor nation and a much smaller item in the world economy than we are to-day, we could hope selfishly to give a stimulus to domestic business by restricting imports, especially if at the time the rest of the commercial world were not severely depressed. Because Europe could pay for the excess of our exports over our imports with the interest on what we owed her and have something left to lend us, we were formerly able to decrease our imports by raising the tariff without curtailing Europe's ability to purchase our exports; and because we were a small item in world trade the increase in our domestic business resulting from the more favorable balance of our trade helped us without seriously impairing European trade. But our growth and our becoming a creditor nation have changed matters. To-day decreasing our imports by whatever means (a tariff or a depreciation of our currency) will involve decreasing our exports, because the world owes us money and can no longer buy from us on credit. Even if this weren't the case, our vast size would make the attempt to revive our trade by the tariff rather like trying to make the tail wag the dog.

Because of the changed conditions a higher tariff policy would be ineffective for the United States. In any case such a policy is purely selfish and is an unenlightened form of selfishness, when it is almost certain to provoke reprisals. Trying to revive a depressed world by a general increase in tariffs is exactly as senseless as trying to revive it by a general increase in freight rates—the two policies, a general increase in tariffs and a general increase in freight rates, would have nearly the same effects. A general lowering of traiffs would be more favorable to world revival.

## SOUND MONEY

What is needed in the monetary field to promote revival is not abandonment of sound money by mere inflation in any of its guises, but the actual attainment of "sound money" in a sense of the word "money" that includes all of our customary medium of exchange. The largest part of that medium of exchange, and the part that does nearly 90 per cent of all money work ordinarily, is "deposit currency" or the individual demand deposits of our banking system. Sound deposit currency is essential to business recovery. The Congress has recognized bank notes as currency and undertaken to make them sound. Checking accounts are as truly a part of our currency system as bank notes, and they are a much larger part. It is patent to-day that a considerable fraction of the Nation's deposit currency is not in a sound condition. Whatever the causes of this condition—and the condition is far too widespread to be laid entirely to bad bank management—it is properly the concern of the Congress to see that our deposit currency is sound. The situation is too urgent to await the development of a considered, long-time policy. Half-way measures are more likely to aggravate the situation than to help it. As an emergency measure demand deposits at least, and probably time deposits, too, should be guaranteed by the Federal Government. Immediate action is imperative. The unsoundness of one bank's issue of deposit currency jeopardizes the soundness of the deposit currency of many others. If there is delay, the situation is likely to become more acute.

The condition of our banks has been weakened by actual and prospective defaults on the part of many whose debts are bank assets—defaults which are in large part the result of the depression. Unless an unbelievably rapid business recovery should take place, further defaults will continue still further to undermine the basis of our deposit currency for several months at the very least. That the precarious condition of bank deposits directly affects those parts of our currency system which are popularly regarded as money is evidenced by the decline in our monetary gold stock, which began in mid-January and last week amounted to $51,000,000. (Week ending February 21.) Such measures, as the fractional freezing of deposits, are likely to accentuate this decline. The gold standard is threatened, if immediate drastic action in the form of underwriting deposits is not undertaken.

(This proposal has been elaborated in a memorial to the Congress prepared by Professors Sharfman, Watkins, Griffin, Rodkey, and Paton, of the University of Michigan.)

159450—33—PT 7——18

REHABILITATION OF INDIVIDUAL CREDIT

One of the most important hindrances to business recovery is the poor credit standing of borrowers who need funds to carry on business. A vast total of indebtedness contracted under a régime of prosperity and higher prices has been made so burdensome by the rapid decline of prices and the present low volume of business and employment as to endanger the solvency of many honest and efficient businesses and persons. Even if business were prosperous to-day, on something like the present level of prices, many ownership equities would be practically wiped out by the fixed debts incurred in a period of higher prices. The extremity of the situation in various agricultural communities needs no comment, but it is by no means confined to agriculture, and its pervasiveness if reflected in the precarious condition of our banks.

The international debt situation, moreover, is one part of the same picture, in another part of which we see domestic foreclosure sales dominated or prevented by mob rule. Moratoria only delay the day of reckoning, and leave domestic debtors without the credit standing necessary to carry on business, and foreign countries without the credit standing needed to buy American exports. Debts readjustments are necessary, however painful the processes of readjustment may be to all concerned. For the readjustment and composition of debts within the United States existing agencies are far from adequate. They are slow, costly and too often wasteful. They were not intended to meet a wholesale readjustment problem such as the country is faced with to-day. If left to existing agencies the very size of the problem will mean that it will be many years before adjustments now needed are completed. But prompt readjustments will greatly aid business recovery, while postponement of readjustments means postponement of business recovery. The Federal Government is probably not in a position to compel readjustments, but it can greatly facilitate voluntary readjustments by providing a system of emergency adjustment agencies. And such a system, headed by a national board or commission could do a good deal to encourage such adjustments and guide them into wise forms, and it can develop a consistent national policy of debt readjustment. Such a system should be made the court of first resort for cases of actual and prospective defaults in payments, and it might be made to aid and expedite actual bankruptcy proceedings. A national emergency system of debt readjustment agencies is urgently needed to facilitate financial readjustments and so hasten business revival. (This point I have elaborated in a memorandum already submitted. A copy is herewith inclosed.)

A BUSINESSLIKE BUDGET POLICY

Much of the discussion of the Federal Budget has been vitiated by a fundamental confusion. Every good business accounting system distinguishes carefully between current expenses and capital expenditures: Government accounting does not yet make this distinction clearly. It is meaningless to urge on Congress the balancing of the Budget without accurately distinguishing current expenses and capital expenditures. The Budget of current expenses should be balanced with current revenues, and vigorous measures should be undertaken promptly to that end. All reasonable economies in the current costs of Government should be made. Legitimate obligations to veterans and other past public servants should be fully discharged, but it is believed that this end is not inconsistent with a considerable paring of the pension appropriation. If additional taxes are needed to meet current expenses, a sales tax on common necessities should be avoided, because it places the burden on those least able to bear it, and those especial ill-fitted to bear it at present. Capital expenditures are not properly chargeable against current revenues, and emergency outlays are properly spread over the current Budgets of a number of years. The advisability of emergency outlays and capital expenditures is not dependent on this year's revenues. It would help to restore public confidence and clarify our thinking, if a businesslike distinct-tion between current expenses and capital expenditures could be made in the Federal Budget.

EMERGENCY RELIEF

The increasing needs for relief expenditures to help those who, because of long continued unemployment or business difficulties, have exhausted their savings, and the decreased ability of local governments and charitable agencies to provide such relief, places an immediate responsibility upon the Federal Government to assist in providing such relief by an emergency appropriation along the lines of the Costigan-LaFollette bill. Such an outlay is not properly to be charged entirely against current Government revenues, but because of its emergency character should be amortized over a period of years. Quite apart from humanitarian considerations, it would be poor economy to allow a considerable part of our human productive resources to go without adequate maintenance, when they are, through no fault of their own, deprived of the opportunity to support themselves by societys failure to use their services.

### PUBLIC IMPROVEMENTS

If we were to embark upon an important war tomorrow, orders for the munitions and supplies of war could be financed by the Government and would stimulate a revival and expansion of industrial-activity. The mild but worldwide depression of 1914 was brought to an end in this way. Although there is no clear historical precedent in the short period of world history since business cycles became a marked characteristic of industrial civilization, one would be foolish to doubt that even a severe depression could be converted into a period of business expansion and full-time employment by war orders.

Fortunately the destructive direction of expenditure is not the essential feature of such stimulation of recovery. Three features, which are essential may be noted: (1) The volume of orders must be large. (2) The orders must draw upon a considerable range of industries for raw materials, supplies, and accessory services. (3) Business men must be given adequate reason to expect that the augmented volume of orders will continue for a period of months. The Federal Government is in a position to fulfill all three of these conditions by a constructive developmental program. No other agency is in such a position.

So long as the United States possessed a considerable amount of new resources awaiting development, relief from a prolonged depression might be brought about by the development of those resources. This situation is epitomized in the advice "Go West, young man." To-day we must look largely, not to an extensive development into new territory, but to a more intensive development in regions already occupied. Because of the present condition of private and local government credit brought about by the depression and the decline of prices, we can not rely on individual initiative or local public spirit to undertake a sufficient volume of such intensive developments in the form of "self-liquidating" projects. Federal initiative and Federal aid are needed.

The types of public projects which might be used have been often enumerated. They include: Safety improvements such as the elimination of grade crossings, public-school buildings, improved housing for the poor, regional development projects, and many other types of public improvement. To develop and put into operation such a grogram as would be needed to stimulate business revival, will take considerable time, but it will not be hastened by further delay, and it will not be made easier by a continuation of the depression

Apart from the purpose of stimulating business revival each project should be judged not in terms of balancing the Budget in a sense which confuses current expenses and capital expenditures, but on its merits as a project in the public interest and on the basis of economy—is the present an economical time to undertake such a project? There is good reason to believe that considering both costs of financing and costs of construction the present is an economical time to undertake such a project. Both types of costs are usually lower in a depression than in the ensuing period of business expansion.

If we could finance a major war now without inhibiting the necessary business activity by tightening the money market unduly (and if we could not, it is a serious indictment of our national defense) we can also finance a constructive developmental program. But in financing such a program we shall probably need to have recourse to measures similar to those of war-time finance—to a prosperity bond campaign.

### OTHER MEASURES

There are numerous other measures which might be undertaken in the present emergency. In my opinion those outlined above are the most urgent. The present, however, is the time in which to give attention to more permanent measures that will make for greater economic stability in the future. Among the measures of this type which merit serious cosnsideration are:

(1) Raising the standards for commercial and savings banks, and providing security of deposits, possibly through some well-considered form of deposit insurance.

(2) Development of a constructive policy of rural land utilization.

(3) Encouragement of State unemployment insurance on the American or "differential premium" plan.

(4) Development of adequate controls of investment credit.

A PROPOSAL FOR DEALING WITH THE DEBT EMERGENCY

NOTE.—Only the economic aspects will be emphasized in outlining this proposal. The writer's inadequacy in dealing with the legal aspects is fully recognized and parts of the proposal may be impracticable because of legal considerations.

The objects of the act here proposed are:

I. To aid in the development of a national policy adequate to meet the existing debt emergency.

II. To provide convenient channels for the readjustments, by voluntary agreements, of debts which have been made unduly burdensome by the rapid decline of prices, by the present depression, and by other factors beyond the control of the debtors.

III. To prevent, so far as possible, the hardships and wastes which are likely to result from the existence of such debts in the absence of such channels.

IV. To encourage such readjustments by voluntary agreement.

V. To provide agencies to advise both debtors and creditors as to how best safeguard their interests in the present emergency, by and in making such agreements.

VI. To promote uniformity in the methods of meeting the debt emergency among the several States, and to provide for cooperation between Federal and State agencies in meeting it.

The act should be temporary, say applicable for a period of two years with the possibility of continuation by presidential proclamation. An emergency debt adjustment commission consisting of five or seven members should be created. An adequate appropriation would be essential, probably an appropriation running into seven figures.

In general it seems desirable that the commission should have broad powers. The following powers and duties are suggested:

(1) To set up mediation boards and to appoint mediation agents. The commission would presumably district the country for the purpose of setting up general mediation boards or agents in each locality. It might decide to set up special functioning boards or agents either nationally or on a district basis for special classes of debtors for example: (*a*) Private business corporations; (*b*) commercial and savings banks, (*c*) local government units.)

(2) To delegate at its discretion powers and duties to these agencies or to existing agencies, such as State debt mediating agencies, the Interstate Commerce Commission, State insurance commissions.

(3) To develop and maintain a consistent and well-coordinated policy on debt mediation.

(4) To initiate and receive complaints and receive declarations of financial embarrassment. (Its jurisdiction might well include all debtors who are natural persons subject to or resident in the United States, and all debtors who are corporations of similar de jure persons created by the Federal or State Governments; or such de jure persons (created by foreign governments) who maintain an office or branch in the United States. It is intended to empower the commission to consider the case of any debtor who because of the general price decline or because of the business depression finds the meeting of his debts as they fall due a severe hardship, or finds his financial solvency in danger, and that the commission should attend to those cases first wherein the hardship is most severe or the danger of insolvency is greatest.)

(5) To endeavor to secure a voluntary agreement among the parties in interest for the revision and composition of the debts, and in case of private business corporations to secure a voluntary agreement for a plan of administrative and financial reorganization.

(6) To approve or disapprove voluntary agreements so made and in the case of disapproval to use its influence against the agreement.

(7) To secure the cooperation of State and local governments.

The legal status of the commission's action in connection with cases that come before it will only be indicated in general terms. The commission would need the power to compel attendance and testimony and the production of relevant documentary matter. So far as possible, actions in the courts to collect debts and petitions in bankruptcy should not be permitted until the case has been handled by the commission. In a case dismissed by the commission, if appeal is taken to court, the findings of the commission should, at least in certain classes of cases, become part of the court record.

In formulating a policy and in suggesting a basis for voluntary agreements between debtors and creditors in cases that come before it, the commission should have in mind inter alia the following considerations:

I. The changes in the prices of goods and services since the date when a long-term contract was entered into, which affect the financial condition of the debtor and the value of the debts if paid to the creditors, may have been largely beyond the control of either debtor or creditor, and may have been anticipated by neither party to the contract. A general price decline increases the cost of payment by the debtor as measured in physical quantities of commodities, and increases the value of the payment to the creditor as measured in physical quantities of commodities, although the increase in cost and increase in value may not be the same, since the two parties may be interested in different commodities. The changes in the commodity values or costs of two debts incurred at different times may be different.

II. The decreased abilities of some debtors to pay their debts may be largely due to and in proportion to price changes. The decreased abilities of other debtors to pay their debts may be largely due to decreases in the physical volumes of sales or of employment. Conditions beyond the control of the debtor affecting his ability to pay his debts may in one case be temporary, in another relatively permanent.

III. The debt emergency is greatly complicated by the existence of debtors who are also creditors—banks, insurance companies, etc. Readjustments of items due to them, and losses on such items necessarily affect their ability to meet their obligations to their creditors. This complication makes the development of a consistent policy by the commission a matter of prime importance.

IV. Although creditors holding pledges of specific properties may have legal priority over other private creditors in the settlement of their claims against a debtor, these obligations because of the length of time since they were incurred may have increased in the commodity cost and commodity value of their settlement as much as or even more than other obligations.

V. Where the financial difficulties of a debtor are largely due to conditions beyond his control, as indicated by the number of businessses of the same type as the debtor's in such difficulties, a voluntary downward adjustment of debt may yield the creditor a larger sum than he could get by attempting to collect through the courts.

VI. In view of man's inability to forecast the future course of prices long-term contracts for money payments made hereafter are more likely to protect the interests of both creditor and debtor, if each payment to be made is specified not as a sum of money in dollars, but as such a sum multiplied by a correction factor. This correction factor should represent the ratio of an appropriate specified price or price index at the date of payment to said price or price index at the date of entering into the contract. The Bureau of Labor Statistics index of wholesale commodity prices affords a reasonably satisfactory basis for computing such correction factors for many types of contract. For some types of contract, a single commodity price such as that of wheat may be preferable.

It would seem wise to make use of the commission and its agencies to serve the interests of both creditors and debtors by facilitating bankruptcy proceedings, and by improving the administration of bankrupt properties and expediting the process of liquidation. It is suggested tentatively:

(1) That the commission make nominations of liquidating personnel.

(2) That it might advise bankruptcy courts on matters of liquidation management.

(3) That it might have access to the accounts of properties in the process of liquidation during the liquidation period, and might audit such accounts.

(4) That it might call the attention of the Department of Justice or other appropriate agency to cases of dishonesty or gross negligence on the part of the liquidating personnel.

(5) That in certain cases some liquidation processes such as the proving of debts might be begun while the case is before the commission.

(A letter received from John Ise, Lawrence, Kans., is here printed in full as follows:)

LAWRENCE, KANS., *February 28, 1933.*

Hon. REED SMOOT,
*United States Senate, Washington, D. C.*

DEAR SENATOR SMOOT: I am sorry that I shall be unable to appear before your committee on the economic situation; but the financial situation here makes it impossible to make the trip. I shall however be able to indicate briefly what I believe to be a reasonable course to pursue in regard to the depression.

It would be my judgment that one of the most important causes of the depression is the high tariff, which has shut off foreign trade, and has therefore cut off the farmer's foreign market for his stuff. The first step to restore prosperity would seem to be to restore the foreign market for our surplus wheat and meat products; and of course this can be done only by accepting what the European countries have to trade us for our surplus agricultural products. The tariff should be reduced immediately and drastically, in fact the ideal toward which we should aim would be almost absolute free trade. Our international position as a creditor country suggests the same procedure, since we can receive payment of the debts due us only if we accept goods. If the United States refuses to accept goods—as we do at present—the debtor countries have no alternative but repudiation of the debts, and will, of course, be justified in repudiating their debts.

A second step should be to secure a better distribution of the wealth of the country, as our depression is no doubt caused in part by the fact that there is insufficient purchasing power in the great mass of the people. This could be done by a drastic increase in the income tax, especially in the higher brackets; and by a drastic inheritance tax. It is unfortunate that we are so late in putting this into effect, as it would of course have been much more effective put into effect when there were more high incomes and high inheritances; but it would have a good effect now.

Coupled with this there should be an extensive program of public works, financed partly as above indicated, and partly by an issue of bonds, or by a capital levy, or by both. My own preference would be for the capital levy, since it would not leave us with an increased debt burden, when debts are already one of the most important causes of the depression.

As one item in the public works program, the Government should take over and reforest a large area of marginal land. Some of this is already in the hands of the States, and more could be taken over at a very moderate cost. If we should undertake to reforest an area of perhaps 50,000,000 acres, we would in that way provide employment, get a better distribution of income, reduce the agricultural surplus, and provide for the long-time development of the country. In some cases it would be possible to have the farmers on the farms reforest part of it, or all of it; in some cases the States could be induced or encouraged to do the reforestation, and in some cases the Federal Government could do it.

On the question of inflation, I do not think we can see so clearly. There are undoubtedly strong arguments against inflation. I am highly doubtful whether we shall be able to get out of the depression on the present price level—at least within any future that I care to think about—and I think we may easily be forced to inflate. It is evident that if the present situation continues for a few years longer many of the ordinary processes of law will be abandoned, in the debt-ridden agricultural sections of the Middle West; and it is highly doubtful whether inflation offers more dangers than the present situation. At any rate, unless the price level can be raised considerably the country will continue indistress. Also, if there is to be inflation it should come soon, before too much of the farm land and other mortgaged wealth has changed hands. Whether it is too late even now, to do any good by inflation, is a serious question. At the very least the Government should decide immediately what policy it will pursue. whether it should proceed on the present price level, or whether it should assume a higher one. If the former, it should cut all Government salaries about 40 per cent, cut the income of bond holders to the same extent, and the principal of the bonds similarly. In other words, it should get all items of expense down to the new price level.

My own judgment is that a reduction of the tariff to 5 or 10 per cent, a $10,000,000,000 program of reforestation and public works, a high income and inheritance tax—up to the levels of England or Germany—a capital levy to finance the program of public works, and proper adjustment of the price level, would bring us out of the depression within a year or two. It is clear that the situation demands drastic remedies. Putting talcum powder on a cancer will not do any good. We have tried that sort of thing too long.

Very cordially yours,

JOHN ISE.

# APPENDIX

## Statement of Hon. George W. Armstrong, Fort Worth, Tex., and Natchez, Miss.

### PRELIMINARY

I am 66 years of age, reside in Fort Worth, Tex., where I have lived for the past 45 years, and I am a manufacturer and farmer, I am president and owner of the Texas Steel Co. which manufactures reinforcing concrete bars, steel castings, and oil-well supplies. I am also the owner of 30 plantations in the State of Mississippi, comprising about 30,000 acres. The Texas Steel Co. and also my plantations are mortgaged for more than their present value.

I pretend to have some knowledge of the money question and of political economy. In 1922 I wrote The Crime of '20 which revealed to the public for the first time the minutes of the meeting of the Federal Reserve Board and Advisory Council of May 15, 1920, that decreed the deflation which brought upon America and the world the catastrophe of 1920. I have since written Truth (two volumes); The Calamity of '30, Its Cause and the Remedy, and A State Currency System—To Hell With Wall Street. These books revealed to the public for the first time the enormous hoarding of our moneys by the Federal Reserve System, and the fact that we now have in actual circulation of all kinds of money, including Federal reserve notes, only about $1,250,000,000 or about $10 per capita instead of about $38 as stated in the official reports of the Comptroller and the Treasury Department.

### THE CAUSE OF THIS DEPRESSION

It is my understanding that the subject matter of your investigation is the cause of this depression and the remedies that will correct it. I have covered both of these subjects rather fully in my book The Calamity of '30, a copy of which I will be glad to furnish complimentary to any member of the committee or of Congress who is sufficiently interested to read it. I will here make only a very condensed statement with but little argument, of the conclusions of this book.

It must be obvious to you that the cause of this depression is the deflation of all values as measured by the dollar; or stated conversely, the inflation of the dollar. If that is the cause, then the remedy is equally obvious that this condition can only be corrected by reversing the process and by deflating the dollar and inflating all values as measured by the dollar—and your conclusions and recommendations should, therefore, be the best and quickest method of accomplishing this desired result.

The deflation of 1930 has been brought about through the operations of the Federal Reserve System in precisely the same manner that this System brought about the deflation of 1920, viz, by the contraction and hoarding of money and credit and by advancing the discount rate. The deflation of 1920 was brought about, as stated in the official minutes of the deflation meeting of the Federal reserve authorities on May 15, 1920, for the avowed purpose of "checking the vicious circle of increasing prices and wages." The deflation of 1930 was brought about by the same System for the purpose as stated in the press and in the Federal reserve bulletins of that time, of checking speculation on the exchanges. The methods used to bring about both deflations were precisely the same, viz, the contraction and hoarding of money and credit, and advancing the discount rate.

I have stated that the volume of money in circulation is only about $10 per capita. This statement is based upon the last annual report of the Comptroller of the Currency showing that the approximately 19,000 National and State banks have in their vaults less than $800,000,000—or as I recall the figures, actually $743,000,000. This represents all the money that is in circulation except the money in the tills and pockets of the people. The only estimate I have seen of this amount is one by Mr. McCoy of the Treasury Department some years ago estimating it at $440,000,000. This is surely a liberal estimate. I think your own observation will convince you that the people have less than half as much money in their pockets as the banks have in their vaults. Accepting this estimate, however, as being correct, there is actually about $1,250,000,000 in circulation—or $10 per capita.

In many of the States there is only $3 or $4 per capita in circulation. In Texas we have about $5 per capita in circulation. The volume of money in circulation is so limited that people are unable to conduct their ordinary small transactions in currency. There is no credit obtainable from any source except from the Reconstruction Finance Corporation and other governmental agencies, and except also for certain kinds of self-liquidating transactions.

The crying need is to correct this situation quickly and thoroughly. The best method for that purpose is to pay the adjusted compensation due the soldiers, in Treasury certificates and to make these certificates tenderable for debt and taxes. The effect will be to get new money in circulation in every nook and corner of the land, because the veterans are everywhere. This will restore buying power to the people, credit power to the banks, and values and prices and wages.

### GOLD STANDARD

My book "The Calamity of '30" contains a true story of the machinations of the international bankers following the Versailles Treaty in bringing about the restoration of the gold standard throughout the world. All of the countries of the world except the United States, have been forced to abandon it. The truth is we have not been on the gold standard since the establishment of the Federal Reserve System in 1913, but it has been used as a pretext to keep up the value of the dollar. If we had no other money except gold, and our gold was permitted to circulate, we would have approximately three times as much money in circulation as we now have, with the result that all values and prices would be approximately three times more than they now are, and the burden of debt and taxation three times less.

Practically the entire amount of our gold is hoarded by the New York Federal Reserve Bank in its vaults reported to be 80 feet below sea level. So far as its usefulness is concerned it had as well be at the bottom of an uncharted sea. The Congress has only recently compelled by law under heavy penalty, the bringing into the Federal Reserve System for hoarding, the small remnant of gold in circulation. There can be no possible purpose other than hoarding, since the Federal Reserve System and the Treasury will not pay out gold, and if they should pay out gold the recipient would be under the duty to return it at once and would be subject to a fine of $10,000 and 10 years' imprisonment if he failed to do so.

Of what service, pray tell me, is this gold if it can not be used? In the name of common sense, what reason can there be for a convertible gold note if the holder of the note is not permitted to have it redeemed in gold?

The gold standard has been throughout the ages but a pretext of the banking fraternity to limit the volume of money. They fear that without this artificial limitation the governments will respond to the call of the people for cheaper money and for higher prices for their services and products. It is the inborn, ingrained fear that is transmitted from banker to banker and from father to son. This fear is fundamentally a fear on the part of the rich and the conservative of the people and of popular government.

They hold up their hands in holy horror and point to the French assignat and the German mark as dreadful examples. But during the periods of inflation in France and Germany the people were prosperous and happy; it was only when the bankers succeeded in bringing about deflation that the people became poor and miserable. There is no occasion for America following in the footsteps of France and Germany, and nobody desires that that be done. The Congress can establish through the exercise of its constitutional duty, such value for money and for property and service as will be fair alike to creditor and debtor, and to the money lenders and the people. To say that Congress will not do so is to argue that our republican form of government is a failure.

Since the establishment of the Federal Reserve System, our standard, or yardstick of value, has been a manipulated one dependent upon the will and judgment of the Federal reserve management. The standard is now manipulated by the open-market committee of the Federal Reserve System, of which the Governor of the New York Federal Reserve Bank is chairman and manager. The result of this managed currency is that we now have three times as much gold in storage as we had prior to the World War, and about one third the money we then had in circulation.

It is absolutely impossible for America to maintain the gold standard, or higher value for its money than the other leading commercial countries of the world. Such condition will inevitably bankrupt the manufacturers and farmers of the country and pauperize the majority of the American people. The American exporter, whether of farm or manufactured products, must bear the burden of the difference in the exchange value between the dollar and the moneys of the importing countries, which means that the farmer and the laborer must pay the premium on the dollar. The farmers and manufacturers of countries having cheaper moneys have a cheaper cost of production, with the result that they can undersell the American producer in the American market. It is a necessary first step on the road to recovery to bring the value of the dollar down to a parity with the moneys of other leading nations of the world, which can only be done by increasing the number of dollars in circulation.

### SILVER

While metallic money is no longer of any consequence in itself, silver should be restored to the ancient and established ratio of approximately 16 to 1 for the dual reason that it will increase our volume of money and increase the demand for our exportable surpluses. Silver is the money of more than half the people of the world. To the extent that the value of their money is increased as compared with the dollar, their buying power and demand for our products are correspondingly increased. Besides, the restoration of silver will approximately double the volume of our money, which will increase prices and wages and reduce the burden of debt and taxation correspondingly.

We do not need to have any world conference to regulate our own financial policy. If we remonetize silver at the ratio of 16 to 1 the leading commercial countries of the world will be compelled to do so, otherwise the silver-using countries will buy our products in preference to those of other countries for the simple reason that their money will buy more of our goods.

The ratio of 16 to 1 is not only the ratio that we formerly maintained, but it is the established ratio throughout the ages for most of the commercial nations. It is less than the ratio of production of silver as compared with gold. This ratio is now and has been for several hundred years at about 13 to 1, with the result that the ratio of the stock of silver money and bullion in the world to the stock of gold money and bullion is about 13 to 1.

### FEDERAL RESERVE SYSTEM

As important as are the payment of adjusted compensation to the soldiers, the abandonment of the so-called gold standard, and the remonetization of silver—none of these measures nor all of them together will bring about permanent prosperity in this country so long as the Federal reserve management has the power to hoard, expand, and contract currency and credit, and to thereby manipulate the price and wage level.

No matter how much money is put in circulation nor of what kind it is, it will soon be gathered in and hoarded in the vaults of the Federal reserve banks. The cheapening of gold by reducing the gold content of the dollar will not increase the volume of money in circulation; it will only debase gold that is hoarded and in storage in the vaults of the Federal reserve system.

The Federal reserve system has developed into a vast hoarding machine and price and wage regulating bureau. It is responsible for two of the world's major calamities, viz, those of 1920 and 1930, and there can be no enduring prosperity until this system is abolished or radically reformed. The Congress should prohibit under heavy penalty (and not legalize, as proposed by the Glass bill) the open market operations of the system, should destroy its power to expand and contract currency and credit, and Congress should resume its constitutional power and duty to "coin money and regulate the value thereof."

I respectfully suggest that the Government should cause to be retired and canceled the stockholdings of the member banks, should abolish the Federal Reserve Board and Advisory Council, and make each district Federal reserve bank a separate and independent bank under local control. The surplus of the system, which, under the terms of the act, belongs to the Government as a franchise tax, is now considerably in excess of its capital stock and it is sufficient for the operation of a legitimate banking system. This system should be operated as a banking system purely, and for all banks, both State and national.

The Congress should immediately ascertain the true volume of money that is now in actual circulation and the volume of money required to restore and maintain the price and wage level of 1920; it should cause such volume of money to be put in circulation as quickly as possible and should take the necessary steps to insure that this volume is kept in circulation and is increased with the increase in population and the needs of the people.

The Treasury estimate of the volume of money in circulation makes no deduction for our money that circulates in other countries and for money lost or destroyed by fire during the last 150 years, except $1,000,000 destroyed by the Chicago fire. The estimated volume in circulation is grossly overstated, and it should be more definitely ascertained.

It cannot be disputed that the general price and wage level in any country depends wholly upon the volume of money in circulation, provided a tariff is levied sufficiently high to protect this level against the cheap products of countries having cheaper moneys. That, as stated by John Stuart Mill, is the "key" to the whole money question, and there can be no understanding of that question without a thorough understanding of the fundamental principle.

## INFLATION AND DEFLATION

The 1920 price and wage level is a just one to both creditor and debtor, because the greater part of our bonded and other indebtedness was incurred when the value of the dollar was substantially at that level. We then had what the "money changers" regard as violent inflation; we now admittedly have deflation. The difference between conditions then and now represents the difference between inflation and deflation. There were then no bread lines, no farm problems, no unbalanced budgets, no insolvent debtors, no bank failures, and no overproduction. Indeed, the Federal reserve authorities complained (as shown in their official minutes of the fatal meeting of May 15, 1920) that there was not sufficient production and that it was necessary to bring down values in order to increase production. History records the fact that the greatest advancement in the arts and in our civilization have been during inflationary periods.

Our national wealth in 1919–20 was estimated at about 500 billion dollars, our debts at about 150 billion, and our national income at about 95 billion. I have seen no recent estimate of our national wealth, but on the basis of the present value on the dollar it could not exceed 150 billion. Our national indebtedness is estimated at about 200 billion, our national income at about 35 billion, and our bill for taxes and interest at about the same figure. Our inherent wealth is the same; we have the same land, factories, and transportation facilities that we then had. The difference in the situation is due wholly to the appreciation of the dollar—the yardstick of value.

On the basis of the present value of the dollar we are obviously insolvent as a people and as a nation. It is obvious, too, that the only way we can restore our solvency is by cheapening the dollar—or, stated conversey, by increasing values and prices and wages—and this can only be accomplished by getting more dollars in circulation. There is no other way and no possible substitute.

It is generally conceded that the banks should maintain a minimum cash reserve of 10 percent of their deposits. The 19,000 National and State banks of the United States have an average cash reserve of only about 1 per cent. The last report of the Comptroller of the Currency shows that the deposit liabilities of all the banks of the United States are about 40 billion dollars and they they have in their vaults of cash and currency of all kinds, including Federal reserve notes, less than 800 million—which is less than 1 per cent. (NOTE.—I apologize to the committee for not stating these figures exact. This argument has been prepared at my plantation in Mississippi, and it has been necessary for me to get it up rather hurriendly in order to reach the clerk in time to be included in the published report of the hearings.)

If all of the depositors of all the banks had called for their money when the banks were recently reopened, every one of them would have had to close again within 3 days; all of them together could have paid only 1 percent. The President and his Secretary of the Treasury struck down the helpless and unfortunate victim and not the designing and guilty culprit—the Federal Reserve System.

The banks that rendered the greatest service to their customers as a rule had the greatest amount of uncollectible paper and the least amount of cash, and many of those banks have not been permitted to reopen—particularly if they are State banks. Many of these unfortunate bankers sacrificed themselves instead of their customers, with the result that many of them are suicides, or under indictment and in disgrace. Behind them and their bankrupt banks stand a horde of bankrupt customers who have been bankrupted because they, too, have sought to contribute to the production of goods and to the public welfare and have borrowed money for those purposes.

Please permit me to observe that it is not necessary to bring pressure to bear to force the State banks to join the Federal Reserve System if the System is made attractive to the average banker—if it is by law transformed from a tyrannical master to a faithful servant as it was originally intended to be.

### FREE THE STATES

The Congress should immediately repeal the 10 percent tax against State bank notes in order that the States may protect themselves against such a catastrophe as we now have. If the Congress provides a sufficient volume of money and continues to perform that duty faithfully and intelligently and with due regard to the interest of the great masses of the people, there will be no occasion for the people of the States to employ this power, but it should nevertheless exist as a protection to them.

We had four State banks with power to issue currency at the time the national constitution was written and this system prevailed up to 1866 when it was stricken down by the 10 percent tax. At that time there were more than 1,200 State banks with power to issue currency, and the national banking system had only recently been adopted. The change was made when the South was prostrate and not represented in the Congress. Nevertheless, the act passed the Lower House of Congress by a majority of only one vote—or rather, there was a tie vote—and the deciding vote was cast by the Speaker. It was sustained by the Supreme Court when there were only 8 members of the Court, and 3 of them dissented in an unanswerable argument.

The history of the State currency system is a creditable one. We had only 2 major depressions comparable to those of 1920 and 1930, and 1 of those resulted from Jackson's veto of the charter of the Second Bank of the United States. With the exception of the banks of three or four States, their currency systems were sound and there were no bank failures of any consequence. There were fewer bank failures during the almost 100 years that we had the State system, than there have been in the last 18 months under our present national system. The repeal of the 10 percent tax tax against State bank notes was one of the original cardinal principles of the Democratic Party even as late as the platform upon which Grover Cleveland was elected the second time.

### ALTERNATIVE REMEDIES

If the present situation is the legitimate fruit of capitalism, if capitalism means money princes and kings for the "money changers" and pauperism and slavery for the masses of the people, then it must be destroyed; and almost any substitute is better than present-day capitalism.

I suggest as alternative remedies: That we have a "Jubilee Year" such as the Jews had every 50 years; that the Congress cause to be canceled all mortgaged debts and bonds and thereby give the debtor a "new deal" and a new chance in life; that a graduated inheritance tax be imposed upon all gifts and inheritances that will limit the inheritance to $1,000,000. It is my information that the French rate is 99 percent on inheritances of more than $1,000,000. I respectfully suggest that the rate should be 99 percent on inheritances in excess of $500,000 and that the proceeds of the tax should be divided equitably between the National and State Governments. This is substantially the method that the ancient civilizations of Greece and Rome adopted and the adoption of which prolonged the life of both of these empires.

### CONCLUSION

If either of the remedies here proposed is adopted, the problems that now face the President, the Congress, and the people will melt away like thin mist. The Budgets of the National and State Governments will be quickly balanced, the bread lines will disappear, the crime wave will end, and the buying power and solvency of the people will be restored, and they will be prosperous and happy. There are no other remedies by which these desired ends can be accomplished. There are no other roads out of this terrible morass except revolution. One or the other of these remedies must be adopted or revolution is inevitable.

I say this as a firm believer in our Constitution and in the capitalistic system and as a lifelong Democrat. President Roosevelt is reported to have stated to the farm representatives that he proposed to cause to be put in circulation a sufficient volume of money to give every man a job who desired it. This can be done; and if it is done, he will go down in history as one of our greatest Presidents.

His record to date has been disappointing. Everything that he and the Congress have done has been deflationary. He apparently clings to the gold standard and opposes the remonetization of silver. He has delegated to the Federal Reserve management the power to relieve the very depression that it created. With all of the hullabaloo about increasing the currency, they put in circulation $9,471,000, or 7 cents per capita, in pursuance of the Emergency Act. But they withdrew from circulation during the period between March 15 and 22, $376,460,000, or about $3 per capita.

He has caused to be closed up a large number of banks, because they haven't enough of the small amount of money in circulation to pay their depositors, thereby further deflating credit. The Reconstruction Finance Corporation is aiding in the reorganization of these closed banks on condition that they nationalize. He has been appointed an autocrat to deflate the helpless Government employees and pensioners. He advocates a farm-relief measure that he admits is an experiment, when the farmer is in no condition for further experiments and there is no need for further experimentation.

This is not a "new deal"; it is the same old Hoover deal dressed up differently. It does not help the "forgotten man." This is more deflation and not less, and the more deflation we have the worse conditions will become. I repeat, there is and can be no relief without inflation—or "reflation", if you prefer that word.

---

## THIS DEPRESSION AND HOW TO END IT

(By S. A. Baldus)

### Part I. Depression Street—The Diagnosis

Let it be understood at the outset that I am not an economist—that is to say, I belong to no school; to no group; to no party. I have no pet theories to expound; no hereditary prejudices to defend; no personal interests to exploit; no propaganda to promote; no axes to grind. I am merely a student of economics; for 30 years it has been my hobby. I am what might be called an independent economic thinker; unorthodox perhaps, but, let us hope, not a heretic. I do my own thinking, my own reflecting, my own reasoning, relentlessly pursuing my ratiocinations wherever they may lead; but always adhering to the fundamental principles; and letting the chips fall where they may.

It is these things that have persuaded me into believing that perhaps the independent analysis I have made, and the conclusions I have arrived at with regard to the present economic and financial situation, may have enough merit in them to earn for them your thoughtful consideration; and I beg leave respectfully to submit them to you today.

I come to you, gentlemen, with a modest plan and some specifications, not for a new system but how to save the old one, which, despite its many excesses and abuses, has served us rather well in past years.

Please hear me to the end with patience and indulgence and without interruptions, and if you do, I'll promise you that you will hear at least a few things you may never have heard before; things that I hope will direct your minds into entirely new channels of thought. I'll be as brief as I can. I will confine myself to the matter immediately before us; and exclude everything not vital or germane to the subject.

### THE COUNTRY IS SICK

It is generally admitted that our country is economically and financially sick—gravely ill. On that one point there seems to be universal agreement. But as regards the precise nature of the illness from which the patient is suffering, what caused it, and what can or must be done about it, there seems to be a wide divergence of opinion.

Before we can hope to restore him to complete health, we must endeavor to determine what ails the patient, and what caused his malady, which seems to be not only physical but mental and moral as well.

What you have done in the past few weeks has been very fine, and is very encouraging; but do not deceive yourselves. The patient is still very sick, and will be confined to his bed for some time to come. He has responded splendidly to the change of doctors, and the new nurses, and the so different treatment you are giving him. You have changed his bed linens—sheets and pillows; you have given him a new bedpan. You are giving him daily alcohol rubs. You are allowing him to sit up for a little while each day, propped up with pillows. You've even rolled into the sick room a nice invalid's wheel chair; and you encourage him by pointing to it ever so often, and telling him that he'll soon be able to sit in it, and wheel himself out on the porch—and into the sunshine.

Oh, yes. All this and maybe more. But the chart at the foot of his bed tells a different story. The patient is by no means out of danger. He is far from being convalescent; and his ultimate recovery is by no means certain. He has made some progress within recent weeks—but the possibility of a relapse hangs menacingly over him. Let us diagnose his illness. Let us study the history of his case.

### WHAT'S WRONG

On August 21, 1932, Roger W. Babson, apostle of optimism, and considered by many as an economic major prophet, in an interview said that "American business is climbing out of the valley of depression and should be back to normal by 1934."

Now, this is too long to wait. We simply can't wait another year or two. Something must be done, and that without delay.

But what?

That's the question I'm going to try to answer, and I hope you will pardon me if I become a trifle pedagogic. The seriousness of the subject, and the gravity of the situation, demand it.

Without any further waste of words—what ails the country? What's happened? What's gone wrong? What has brought the car of commerce to a stop; and why do the transports of trade lie idle? What caused the closing of mills and mines, factories and shops? What brought about the collapse in the stock market—the tremendous drop in stock prices? The shrinkage in real estate values? In farm values? How can we explain the piling up of frozen assets? The thousands of bank failures? The billions of losses to the depositors? The interest defaults on bonds, notes, and mortgages? The tax delinquencies? The bankruptcies, foreclosures, receiverships? The ruination of millions of investors, and speculators alike? What swept away the savings of millions of men and women? What shattered the faith and smashed the confidence of the people?

### THE ANSWER

To all these questions there is but one answer. All our present economic troubles and financial difficulties are the cumulative result and necessary culmination of a prolonged orgy of wild and reckless inflation. There is one fundamental cause—primary, immediate, and ultimate—that explains why the nation is economically sick and financially in a critical and deplorable condition. It can be summarized in the one word—"inflation."

For 30 years I've been a student of economics, and all our national problems. For 30 years I've watched the economic and financial developments of our country; and I've written hundreds of editorials and articles, pamphlets, and even a book, exposing the fundamental unsoundness of our system; stressing its underlying fallacies; condemning its abuses and excesses; excoriating the falsity of our logic; pointing out the error of our ways; and warning the country that there is bound to be a day of reckoning—that a debacle is inevitable.

More than 20 years ago I predicted the utter collapse of our economic and financial system. My guess was that it would come around A.D. 1915. But the war intervened, and temporarily retarded the current of events that lead inevitably and calculably to disaster.

The war, furthermore, gave us a new lease on life; and incidentally taught us a few more inflation tricks, which enabled us, by sundry artifices, devices, and deceptions, to postpone the day of reckoning a while longer. And we succeeded in doing this until towards the end of 1928. Then the depression began to make itself felt. The culmination came in October 1929, when the stock market collapsed; and "O, what a fall was there, my countrymen!"

Inflation is the root of all our present troubles. Gentlemen, I've written an entire book on and around the subject of inflation. Naturally, I can't tell you all that's in that book in a few minutes and I'll not attempt it. I can't give you all my computations and reasoning on which my conclusions are based. But I'll try to tell you in as few words as possible just what inflation means, and what bearing it has on our present difficulties and problems.

CORPORATE INFLATION

Definitely speaking, this depression did not come suddenly upon us; nor out of a clear sky; it began just 32 years ago, or, to be accurate, it began April 1, 1901, when the United States Steel Corporation was organized, and its promotors dumped into the speculative market an issue of approximately $1,000,000,000 of water stock—$1,000,000,000 of so-called "securities"—behind which there were absolutely no assets; created by a stroke of the pen, out of nothing; $1,000,000,000 of fictitious "wealth" and on which nonexisting "wealth" the public has been compelled to pay interest ever since.

The story of the organization of this cormorant corporation is a matter of record, from which I need give only a few data.

Among the 10 or 12 competing companies consolidated into the U.S. Steel Corporation was the National Tube Co., operating 17 mills. Mr. J. Pierpont Morgan had employed Julian Kennedy, "a capable engineer of long experience in the construction and operation of steel works, both in America and Europe and Asia," to make an estimate of the value of the properties. Mr. Kennedy reported to Mr. Morgan that the actual value of the National Tube Co.'s plants did not exceed $19,000,000. In spite of this fair valuation, Mr. Morgan capitalized these plants at $80,000,000.

(Parenthetically I may say in passing, that Mr. Morgan, for his "valued services," received as compensation securities of this concern aggregating $20,000,000, or one million more than the total value of all the 17 tube plants.)

Another concern taken into the combine was the Federal Steel Co., whose actual property was estimated worth $33,000,000. Yet $200,000,000 of securities were issued against it.

Against the properties of the Carnegie Co., whose actual value its owner, Mr. Andrew Carnegie, had sworn did not exceed $75,610,104.06, the United States Steel Corporation issued $492,000,000 of its securities.

For every $100 of actual value of the American Steel and Wire Co. the report shows that $528.20 of securities were issued. And so on.

All other corporations, all consolidations, combines, mergers, etc., during the past 32 years were "put over" precisely in this same fashion. Plant values and actual investment were discarded as a basis for securities issues. The sky was the limit.

There are, of course, no collected statistics upon which we could base a fairly accurate estimate; but my own conclusion (and it isn't a wild guess, either) is that for every dollar of real value or actual investment represented in the corporate properties of all kinds—industrial plants, transportation systems, public utilities, etc.—$3 of inflation have been arbitrarily added.

### INFLATION OF FARM PROPERTIES

This ratio of $1 actual investment or natural, normal value, and $3 inflation, is apparent in all our statistics with regard to corporate properties. Multiply this by 25 or 30 billion and you'll get an idea of what has taken place. But what is still more obvious is the fact that inflation—tremendous, terrific, and violent—has taken place within a period of less than 30 years—and applies to all properties.

Let us take a glance at the statistics for farm properties in the United States (land, buildings, equipment, livestock, etc.).

| | Value of farm property |
|---|---|
| 1900 | $20,439,901,164 |
| 1910 | 40,991,449,094 |
| 1920 | 80,500,000,000 |

Today the value of farm properties is estimated at approximately 58 billion.

### REAL ESTATE INFLATION

A similar "rise in value" is, of course, predicable for what classifies as urban real estate—land and buildings. Without going into a lengthy discussion, the increase in inflated real-estate valuation has been enormous—fully equalling, if not exceeding in the aggregate, the inflation ratio predicable of corporations and farm properties.

### NATIONAL "WEALTH" STATISTICS

But the most illuminating and conclusive summary of the inflation story—showing how we arbitrarily "wrote up" values—we find in our national wealth statistics.

According to the United States census statistics, the national wealth in 1880 was $43,642,000,000; and in 1890 it was $65,037,000,000, an average increase of $2,140,000,000 a year.

By 1895 the national wealth had risen to $77,000,000,000, an average increase of $2,400,000,000 a year.

By 1900, five years later, it had mounted to $88,517,000,000, which was at the rate of about $2,750,000,000.

These increases in the Nation's wealth seem to me reasonable, natural, and normal. Then we entered upon our wild inflation career.

Now observe.

By 1904, four years later, our national wealth had mounted to $107,104,211,917, an increase at the rate of $4,600,000,000 a year.

By 1912 our wealth had risen to $187,739,071,090, which was at the tremendous rate of increase of about 10 billion dollars a year.

In 1913, according to the statistics of the National Industrial Conference Board, our national wealth was $190,713,000,000.

By 1920, according to the same authority, our wealth had risen to $488,692,000,000, an increase during the 7-year period from 1913 to 1920, at the rate of $42,000,000,000 a year.

It is only fair to say that the National Industrial Conference Board afterwards gave us a more conservative estimate. Its estimate of the national wealth in 1925 was $362,000,000,000, which still represents an annual increase of nearly $15,000,000,000. Wealth does not pile up that fast, gentlemen; most of it was inflation.

Today our national wealth estate is $360,000,000,000. My estimate is that of the $360,000,000,000 of our so-called national wealth, 160 billion is sheer inflation. And when I say this I think I'm exceedingly conservative. One hundred and sixty billion dollars of inflation without any assets behind it.

WHY INFLATION IS WRONG

Why do I condemn inflation?

Because it is on the inflated valuations and not on the actual value—or actual investment—that costs are figured and profits computed. Because it is on the inflated valuations of their properties that landlords are collecting rents, farmers estimate the prices of their products, railroads fix their freight and transportation rates, public utilities their rates, and manufacturers the prices of their commodities.

Figuring only 5 percent on the 160 billion inflation, the consumers of service or commodities have been paying approximately $8,000,000,000 a year over and above what they should have paid.

The one point I want to stress to you today is this, that inflation is directly responsible for a 300 percent increase in the prices of living commodities. All the other evils follow from this.

THE THREE CARDINAL POINTS

There are three things that I predicate and must prove to you:

1. Inflation is responsible for a 300 percent increase in the prices of living commodities in less than 30 years.

2. This 300 percent increase in the prices of living commodities has seriously disturbed the exchange value and purchasing power of money.

3. This 300 percent increase in the prices of living commodities has converted what was once a perfectly healthy 100-cent dollar into a 25-cent dollar.

Frankly, as I see it, unless we correct what's actually wrong, there is no hope for our economic salvation or financial redemption. Let's proceed with the proof.

INCREASES IN COMMODITY PRICES

The increase in commodity prices synchronizes exactly with the inauguration of the inflation system. My studies on this subject date back to 1896. In 1896 the dollar had its greatest purchasing power; prices were comparatively low. In 1897 the trust era began. Immediately, in order to earn dividends and reap profits on the inflated valuation of the industries that had been overcapitalized, it was necessary to increase prices. Prices, for many living commodities, were raised, in the beginning slowly and cautiously, a cent or two at a time. By 1913 the cost of living had increased a round 100 percent. The unit of goods that could be bought in 1896 for $1, now cost $2.

What was the effect on the dollar? This—the dollar that in 1896 had a 100-cent purchasing power, now had only half the purchasing power; it had become a 50-cent dollar.

Some of you may recall that around 1912 and 1913, things economically began to wobble; price increases had about reached the limit; it wasn't possible to raise them much higher. There was considerable discontent and unrest, not only among the wage earners, but people generally. Financially speaking, it was clear that we were headed for the rocks. According to my computations, the smash was due about 1915. But in 1914 the European war broke, and so for the next few years the war was blamed for the disturbed conditions. Commercially speaking, we remained in status quo, until we actually got into the war ourselves. Then things began to hum. Prices went sky high. By 1920, prices in general had risen a round 100 percent over the 1913 prices. But taking the 1896 prices as basic, prices in 1920 were 300 percent higher than in 1896, an increase of 300 percent in 25 years.

In other words, the unit of commodities that could be bought for $1 in 1896, cost $2 in 1913, and $4 in 1920. Needless to say, I am not speaking of any individual items; I am speaking of living commodities in the aggregate, which, of course, includes the item of rent.

According to Dun's Index number, the wholesale price of 300 articles in 1896 was $74.32, whereas in 1920 the price of these same 300 articles were $260.41. Bradstreet's Index number showed that the prices of 157 commodities, which could be bought for $591 in 1896, had risen to $2,087 in February 1920.

It is claimed by some that prices have again reached the 1913 level. This may be true for a few groups of commodities, particularly food products, but it isn't true for all commodities. I'd go no further than to say that, all things considered, maybe our dollar at the present moment is a 33-cent dollar as compared with 1896.

But these lower prices are admittedly a temporary condition. A few months ago there was an upturn in the prices of some commodities, and this upturn was immediately hailed as the beginning of a change for the better.

Hundreds of writers on the subject, including economists, have said that there'll be no recovery until prices are raised. The idea is pretty general that business recovery means higher prices, and that higher prices signify business recovery. It is clear that those who maintain this have their eyes glued on the 1920 price level. Not until prices rise again to the maximum level, will they be satisfied; and I shall keep this "price-raising" design before me as I talk to you today.

### THE FUTILITY OF PRICE INCREASES

I know that there are those who would like to get up on their toes to defend price increases, all price increases, of the past, present, and future. And if they did, I'm sure they wouldn't say a single thing I haven't heard before; they wouldn't advance a single argument with which I am not familiar. But wait. I'm not through. To reassure you, let me say that I'm not really condemning price increases so much as I'm trying to show you the hopeless futility of them.

I want to prove to you that price increases have not, and do not, and cannot benefit you, or me, or anyone, in the slightest degree. The average business man thinks that the more he gets for his particular commodity the better off he is. He's wrong. For a good many years now we've all been laboring under the impression that the higher the prices the more profit one can make, and the richer one will become. My friends, that's a delusion and a snare.

If you alone could raise your prices 100, 200, 300 percent—yes, then you would be immensely benefited by the higher prices. But when everybody raises prices the thing is reduced to its lowest common denominator; and to an absurdity.

### PRICE INCREASES—NO REAL ADVANTAGE

If only a few could raise their prices and maintain them, then undoubtedly the few would be benefited; but when all raise their prices, no advantage accrues to anybody. It becomes a self-cancelling system. Let me illustrate:

If A makes an article that he sells to B for a dollar at a profit of 25 cents; and B makes an article that he sells to A for a dollar, with a profit of 25 cents per unit, they are both doing a profitable business.

Suddenly, under one pretext or another, A raises his price to $2; then B must necessarily do likewise, but no advantage whatever accrues either to A or B; the profit remains practically the same.

The following year A and B look at their books; they find that they have done a 100 percent greater volume of business in terms of dollars. They can't understand why, in point of profit, they seem to be no better off than when they sold their goods to each other at the $1 price.

So both A and B raise their prices to $4 a unit; but still there is no commensurate increase in their profits. A three times greater money volume of business ought to assure them a three times greater money profit, but their books do not show any commensurate increase in profits.

Then they scratch their heads and decide to institute a series of economies, chief among which is always the cutting of wages; and so they maintain themselves on this new basis until labor trouble in their plants becomes acute. Also, on account of their radical price increases, and the lower wages they are paying, their sales necessarily drop off. And the landlord raises his rent; and, all in all, they've got a lot of worries they didn't have before.

I do not want to pursue this subject to its logical conclusion. I merely want to show that when business arbitrarily increases prices—and all price increases are more or less arbitrary—business is building on sand, and is accumulating a lot of grief for itself.

### PRICE INCREASES DISTURB THE VALUE OF MONEY

All this is preliminary to what I want to say most emphatically, namely, that there is only one thing on earth that destroys the integrity of the dollar; that lowers the exchange value of money, that reduces its purchasing power, and that is "price increases." I want that to sink in. There is only one thing on God's green earth that lowers the exchange value of money, only one thing under the sun that reduces its purchasing power, and that is "raising prices."

From 1896 to 1920 prices increased a round 300 percent, or at the the average rate of 100 percent every 8 or 9 years. And this is the explanation of all our trouble. We are doing business—and have been doing business ever since 1920—with a 25-cent dollar, a dollar that has only a 25-cent exchange value or purchasing power, as compared with the dollar 30 or 35 years ago.

### A 25-CENT DOLLAR AN ANOMALY

Now, a 25-cent dollar is an anomaly in economics. We insist on calling it a dollar, and it is, as far as appearances are concerned, truly a dollar. The Government has so designated it by printing cr stamping on its face the legend "one dollar", and it is legal tender for that amount. But in point of exchange value, or purchasing power, it is worth only 25 cents as compared with its exchange value or purchasing power 30 or 35 years ago.

One of the most flagrant fallacies that has creqt into our economic literature, and whose constant repetition has completely corrupted all our economic thinking, is that the value of the dollar determines prices. It is just the other way around. It is prices that determine the value of the dollar. When prices go up, the purchasing power of the dollar decreases; when prices go down, the purchasing power of the dollar increases. It hasn't the rise or fall of the quicksilver in the thermometer that causes the rise or drop in the temperature; it is the rise or drop in the temperature that causes the rise or fall of the quicksilver.

### OUR STANDARD DOLLAR

Nothing has happened to the dollar. The dollar is as sound today as it ever was. Let no one deceive you on that score. The gold dollar contains just as many grains (23.22) of gold today as it did 25 or 50 years ago. The intrinsic or legally inherent value of the dollar is the same; only the exchange value, the purchasing power, of the dollar has been reduced by the simple process of raising prices 300 per cent, and so compelling us to pay $4 (92.88 grains of gold) for the same unit of commodities which formerly could be bought for $1 (23.22 grains of gold).

Here is where the correction must be made. Not in the dollar, but in the prices of commodities. Until this is grasped by everybody there is no hope of amelioration. Until a rational price adjustment has been made, tampering with the dollar or inflating the currency, will only aggravate our troubles and multiply our difficulties.

Senator Borah recently declared that our dollar is a "dishonest dollar." I beg to disagree with the distinguished Senator. It isn't our dollar that is dishonest; it is our prices that are dishonest; it is our inflated prices that have made a bum out of our dollar; it is inflated prices (an increase of 300 per cent in 30 years—100 per cent every 10 years) that have made a derelict out of what was once a perfectly respectable measure of value, and a perfectly decent medium of exchange.

### OUR MONETARY SYSTEM IS ALL RIGHT

It isn't our monetary system that's wrong; leave it alone! It's our price system that's wrong! And unless we wake up to a realization of what has actually happened, our whole financial, economic, monetary system is doomed. Nothing can save it!

Of all the foolish statements made during the past 3 years, the glib one that "we'll recover because we've had depressions in former years and have always recovered", should be awarded the prize. Nearly everyone who has written or spoken about the depression, or suggested a cure or remedy, has referred to the country as being sick. And that's right, too. But evidently they have lost sight of the fact that sick people do not always recover. A man may recover from an apopletic stroke, even from a second and third stroke, but the fourth may be his last. He may have pneumonia oftener than once; but the third or fourth time it is likely to prove fatal. He may have heart disease and recover from every attack, but ultimately one of them will carry him off.

The real solution, and by all odds the simplest and quickest way out of a tight place, is, not to multiply the number of 25 cent dollars, currency or silver, but to raise the exchange value or purchasing power of the existing number of dollars of whatever kind of currency, to a 100-cent value. This can be done only in one way, namely, by lowering prices of all living commodities to a point that will reestablish the 100-cent value of the dollar.

### INFLATION PROPOSALS

There are today before the country sundry inflationary proposals, each of which, in the opinion of its advocates, will cure what ails us.

There are some who sincerely believe that inflation of the currency is the proper remedy.

Others just as sincerely believe that equally good, and even better, results can be achieved by the remonetization of silver.

Others, just as sincere, hold that going off the gold standard will work the miracle.

Again, others talk of revaluing gold, considering an ounce of gold now valued at $20 plus as worth $40 plus.

Again, others favor reducing the gold content of the dollar.

Again, others speak of a commodity dollar that will accommodate itself from day to day to price fluctuations.

And so forth.

Now, I'm not here to criticize or challenge any of these proposals, though it has occurred to me that if they are all equally meritorious, why not adopt them all and give those most concerned their choice as to which one they care to take advantage of.

But what I do want to remark is this: I have observed that every proposal made is based on the idea of raising prices. In my humble judgment the very worst action that we could possibly take, especially at this critical time, is to raise prices.

To argue that a general commodity price increase is our only salvation is about as logical as to say that the way to cure a man suffering from rheumatism is to increase the swelling in his legs and feet—to increase his agony; or, if he is afflicted with high blood pressure, to feed him foods and subject him to excitement that will inevitably increase his blood pressure; or if he has a high fever, the correct thing to do is to try to raise his temperature; or if he is in a state of coma, to administer opiates or hit him over the head with a hammer.

Muddled thinking is as much to blame for the fix we are in as is our selfishness. Our collective cupidity and gigantic greed got us into this mess: it is our aggregae asininity and stupendous stupidity that prevent us from getting out of it.

Commercially speaking, especially if we come to our senses, we will recover; but the rapidity of recovery depends entirely upon our speedy return to sanity. Beyond a doubt the country will survive; but to save itself, business must divorce itself from inflation. The two cannot thrive side by side. They are mutually destructive. Inflation is an economic crime. Inflation is responsible for a 300 percent increase in the prices of living commodities; inflation has given us a 25-cent value dollar. There you have it!

### WE CAN'T "GET AWAY" WITH IT

The country has been "getting away with it," after a fashion, for 30 years; but it will not be possible to repeat the performance during the next 30 years. Of that I am convinced; of that I am certain.

But has the country been getting away with it? I, for one, considering the precarious condition we find ourselves in today, seriously question it. For the last 30 years we have been shouting from the housetops and in the market places that we are the richest Nation in the world.

Are we? Well, let's see: In 1900 our national wealth was said be, in round numbers, 90 billion dollars ($88,517,000,000). In 1930 the statistics accredit the National with the possession of 360 billions of wealth.

Now, keep in mind that we have substituted a 25-cent dollar for a 100-cent dollar. Consequently, in point of quantity, we are exceedingly wealthy, but in point of exchange value or purchasing power, we are no better off today than we were 30 or 35 years ago. The 360 billion dollars with which we credit ourselves today have no greater exchange value or purchasing power than the 90 billion dollars had 30 years ago.

### OUR INFLATED TAX BILL

Moreover, for all these years we've made ourselves believe that we are three times richer than we really are. And all these years the tax collector has been keeping tab on us. In 1900 the tax bill of the people of the United States amounted to less than 3 billion dollars; in 1930 it had reached the enormous total of 12 billion dollars. And yet there is every reason in the world why we should be paying $4 of taxes for every $1 of taxes we paid 30 years ago for the same quantity and quality of goods and service.

In terms of dollars, business has been demanding $4 where only $1 was demanded 30 or 35 years ago. Then why shouldn't the tax collector do likewise? Indeed he has no alternative. We, not he, placed this fictitious valuation on our "wealth"—on our properties, on our productive plants, on our farms, on our real estate.

The truth is we are paying our taxes with 25-cent dollars, and we shall continue to do this until we change the 25-cent dollar once more to a 100-cent dollar. Minor economies may temporarily reduce the size of our tax bill. Through the partial substitution of a general sales tax—Federal and State—for a direct income tax, and sundry other desperate devices, we may delude ourselves into the belief that our taxes are not so bad; but in reality the burden of taxes will grow heavier with the passing of the years.

### WE HAVE DECEIVED OURSELVES

Economists are clever at inventing terms to take the sting out of unpleasant facts. Thus they distinguish between nominal wages (the amount) and real wages (what the wages will buy). Let us apply this same distinction to our collective wealth and our individual riches.

The man who estimates his wealth at, say, a million, in reality, that is to say, in terms of exchange value or purchasing power, is worth only one fourth of that amount, or $250,000. And so on down the line.

The man who considers himself worth $100,000, actually is worth only $25,000.

The man who nominally is worth $20,000, actually is worth only $5,000. And so on!

Whichever way we turn our scrutiny we encounter the same premises that force the same conclusions. Investments made, bonds purchased, volume of business transacted, rentals collected, income received, and profits made, all must be computed on the basis of a 25-cent value of the dollar in terms of exchange value or purchasing power.

In 1896, $250 had a purchasing power equal to $1,000 today; but a $1,000 insurance policy taken out in 1896, and paid in 1920, let us say, had no greater exchange value or purchasing power than $250 had in 1896. Why, we've gone backward, not forward!

The business man has been misled into believing that under the inflation system his books show a considerably greater money volume of business transacted; and this is true, in point of quantity; but unless he can show $4 of profit for every $1 of profit in former years, he has not improved his condition one iota.

Today manufacturers must borrow $4 for every $1 they borowed 25 or 30 years ago for the same unit of production; also they pay four times as much interest on their larger volume of borrowings.

If that is true, then surely the bankers are the one group of individuals who have benefited by the inflation system. They do a volume of business three times greater than they would have done under a more conservative system; and logically it follows that their profit is three times greater. Correct! if you consider quantity as the summum bonum. But their profits must be computed in 25-cent dollars. From which it can be seen that even the bankers derive no benefit from the inflation system. (And out of charity I'll not say a word about the billions of "frozen assets"—inflated assets, assets of a mythical value—now reposing in ever so many banks.)

The stock exchange and investment houses imagine that because they do maybe four times as much business as they did 25 years ago they are making four times as much money. But I want to tell them that they are fooling themselves, for the four times greater profit must be computed in terms of 25-cent dollars. Let them think that over!

AUTOHYPNOSIS

Oh, gentlemen, all these years we've only been deceiving ourselves; we have been throwing dust into our own eyes. We have deluded ourselves; we are suffering from self-hypnosis.

Isn't it silly to pretend that a given commodity was produced in a plant that cost $400,000, when in reality it was made in a plant that cost only $100,000?

Isn' it the height of folly to demand prices on the country's collective commodities, computed on the fiction that they were produced in plants costing, let us say, $100,000,000,000, when, as a matter of fact, only about $25,000,000,000 were actually invested in these plants?

Isn't it silly to reward capital that was never really put into productive properties; just as silly as if a manufacturer employing a thousand men were to pay wages to another 1,000 men who did no work in his factory?

Isn't it silly to continue to demand rents on an inflated valuation of properties on the theory that land values, materials, and labor costs have risen, when as a matter of fact 90 percent (and that's conservative) of all the buildings were put up at a time when land was cheap, and building material and labor low?

Isn't it silly that farm land, reasonably worth $100 to $150 an acre, should rise in price to $300, $400, and $450 an acre?

Isn't it silly that a building lot that could have been bought in 1896 for 1,500, cost $6,000 in 1920?

Isn't it silly that the building that could have been put up for $5,000 in 1896, cost $20,000 in 1920?

Isn't it silly—but why lengthen the list? I have said enough to show that the inflation system under which we have been operating for the past 30 or 35 years, is without justification. It cannot survive. It may continue for a while longer, in a groggy kind of way, but ultimately it will destroy itself and bring ruin to all of us. That must not be allowed to happen. And I'm here to say to you it can be avoided if we are willing to use our heads.

Good will, common sense, ordinary honesty, simple decency—that's all that's needed to bring us out of the wilderness of despair into the land of promise and hope.

## Part II. Prosperity Boulevard—the Cure

MY PROPOSAL

Well, what is the solution? What do I propose? This: We have ample proof that every cent of increase in prices lowers, by that much, the exchange value, or purchasing power, of money, whether that money be called capital, wages, investment, insurance, rent, interest, dividends, or profit. Which being the case, it follows of necessity that not higher prices but lower prices are the remedy for what ails us today. The only question is to what level to go in order to straighten out our badly tangled economic and financial affairs.

I have given much serious thought to this subject, and after due deliberation I have fixed on the 1913 price level as eminently fair and reasonable to all concerned.

First of all, the 1913 price level is just about midway between the low point of 1896 and the prices of 1926.

Moreover, a recent graph prepared by Bradstreet, showing the average purchasing power of gold from 1892 to 1932, fixes the purchasing power of gold in 1913 at 100.

Then, too, it makes liberal allowance for a legitimate increase in capital investment on account of normal growth since 1896.

(But it makes no allowance for abnormal development and against which an enormous debt of many billions is chargeable. The penalty for senseless overexpansion, wherever it can be predicated, must be paid. I do not see how it can be avoided. Honest mistakes can be rectified; but I know of no way to insure immunity from the logical consequences of deliberate folly.)

All these things combined suggest the 1913 level of prices as a fair and logical compromise. Of course, if anyone can show that the price level of some other year would be fairer, more reasonable, and more scientific, I have an open mind. But for the present, let us tentatively adopt the 1913 price level as a basis for our computations.

### THREE THINGS THAT MUST BE DONE

With this agreed upon, here is what we must do if we want to end the depression, and inaugurate a long season of prosperity and good times:

First: Let us universally adopt the 1913 prices as basic and standard.

Second: Let us pledge ourselves to the maintenance of this basic and standard price level. This will stabilize prices, which is the crux of the matter.

Third: With these two things determined upon—namely, a basic and standard price level and stabilized prices for practically all commodities—the exchange value of the dollar automatically becomes fixed, the purchasing power of money becomes permanized. With these assurances we are then justified to officially declare that our dollar is and shall be permanently a 100-cent dollar—and that all subsequent adjustments shall be made on that basis: A 100-cent dollar with a 100-cent exchange value and imbued with a 100-cent purchasing power.

With all the emphasis at my command I lay down this fundamental principle of which you must not lose sight even for a moment—stabilization of prices is the only thing that will stabilize the value of money. Changes in prices, whether sudden or violent, gradual or drastic, inevitably disturb the value of the dollar and the purchasing power of money.

In saying this I admit that price fluctuations for some commodities may be unavoidable, and in some cases desirable or even necessary, but speaking generally, I maintain that the fluctuations up or down for practically all manufactured commodities can be controlled so as not to exceed, let us say, from 5 to 10 or 15 percent, in either direction.

The establishment by universal agreement and the acceptance of the 1913 prices as basic by all concerned, will automatically reinstate the 100-cent dollar by regulating its exchange value and stabilizing its purchasing power.

There is no miracle here, gentlemen; nothing more than a common-sense readjustment, which will revitalize our present vitiated medium of exchange and nefarious measure of value. Once established, and universally adopted, nothing can appreciably disturb the equilibrium of the value of money except drastic price changes; and all that I'm saying is to stress the utter uselessness and folly of any such future attempt.

### BASIC AND STABLE PRICES

You may ask: How will going back to the 1913 prices restore the 100-cent value of the dollar?

I answer that the mere declaration that the 1913 prices are and shall be basic and remain stable, will accomplish that. I lay down this simple principle:

For every commodity, for every product, for every service, there is what might be called a fair, reasonable, natural, and normal price—and which people are willing to pay. Raise that price and one of two things will happen; either people will stop buying, or if it is an absolute necessity they will materially curtail their consumption. Self interest ought to persuade us to endeavor to determine what the fair, reasonable, natural, and normal price is for all commodities, and for every service, and make it basic. If today we are somewhat muddled as to the significance and importance of a basic price, we have our index number experts to thank for it. They have repeatedly and quite arbitrarily changed the index number basis, for what reasons, or by whose order, or by what authority, I have never been able to satisfy myself. I am dealing with the fact—easily proved from the records. Thirty years ago the 1896 prices were used by the index number experts as basic. Then suddenly they dropped the 1896 prices, and the 1913 prices were adopted as basic;

later they were dropped. At present most index number tables I have seen use the 1926 prices as basic.

If the index number compilers had continued to use the 1896 prices as basic for their computations, we would have the complete story of price changes, and the absolute proof that prices advanced around 300 percent in 25 or 30 years—or an average of 100 percent every 8, 9, or 10 years—a phenomenon that carries with it its own curse and condemnation. And the penalty must be paid by the generation concerned. We are paying the penalty now!

THE FIRST STEP

The three fundamental things agreed to by all, namely: 1. Adoption of the 1913 prices as basic and standard; 2. There stabilization; 3. Permanently imbueing the dollar with a 100-cent exchange value or purchasing power—steps must immediately be taken to eliminate every factor that has produced the drastic depreciation in the purchasing power and the exchange value of money; and to eradicate as intelligently and expeditiously as possible all the wrongs and abuses that were inaugurated 30 or so years ago, and which have been permitted to grow to alarming magnitude, and develop to their present ruinous proportions.

The rehabilitation of the dollar presupposes the removal of the causes which changed the 100-cent dollar to a 25-cent dollar. This implies the "writing down" of inflated valuations of all properties, to somewhere near their actual or natural normal value.

CORPORATE STOCK

I haven't the time to enter upon a lengthy discussion of all inflated valuations, including farms and real estate. I shall confine myself to a brief consideration of the inflated corporate properties.

Three years ago, when stocks were at the peak, I would have hesitated to make this suggestion, for a proposal to pull "values" down from their dizzy height to what might be called a more normal level, would have met with almost universal condemnation.

Today, however, I do not hesitate, for the fates have performed the trick; the thing is fait accompli—an accomplished fact. The collapse in stocks was not a collapse in values; it was merely a collapse in prices—a drop from an artificially inflated and absurdly high point, to a more natural and normal level. Water seeks its level.

On September 1, 1929, the value of the stocks listed on the New York Stock Exchange was approximately $90,000,000,000 ($89,668,276,854).

On July 1, 1932, the market price of these same stocks was less than $16,000,000,000 ($15,633,479,577)—a drop of $74,000,000,000.

Within recent months the price of these self-same stocks has been fluctuating somewhere around 20 and 22 billion dollars—which is considerably nearer their actual value.

My proposal is that we accept this lower price as a value basis not, however, for the purpose of starting the inflation ball rolling again, but to proceed from there on with the inauguration of our lower-price system.

Once more let me stress that a return to the 1913 prices would automatically reinstate the 100-cent dollar. Keep that in mind! Today we have a 25-cent dollar, a dollar whose exchange value or purchasing power is only 25 percent of what it was 30 years ago. All right! Let's see what effect this rehabilitation of the dollar would have on the stock situation.

When all the stocks listed on the New York Stock Exchange were at their height—$90,000,000,000—they had an exchange value or purchasing power of approximately $22,000,000,000.

Today the market price of these same stocks is approximately $22,000,000,000. Computed on the basis of a 25-cent dollar, these $22,000,000,000 have an exchange value or purchasing power equivalent to about $5,500,000,000.

But under my proposal—substituting a 100-cent dollar for the present 25-cent dollar—by the simple process of reducing prices to the 1913 level—the 22 billion dollars would acquire a 22 billion dollar exchange value or purchasing power.

In other words, if my proposal is adopted the owners of these stocks would actually recover all their losses, for, the exchange value and purchasing power of their present holdings, amounting to $22,000,000,000, would be just as great as they were when their holdings amount to $90,000,000,000.

Here we have a genuine miracle of finance of the first order, linked to which are two other major miracles, viz:

1. Corporations now staggering under a crushing load of over-capitalization could decently "write off" their inflated valuations without loss to themselves or injustice to their stockholders; and

2. Banks loaded up with congealed collateral, which, in the main, are depreciated stocks deposited against loans made on an exaggerated valuation—would be enabled to take the thaw out of practically all their so-called "frozen assets," which would become liquid again, and that, too, without any material loss either to banks or borrowers.

Mark you this, too! If stocks were to go up, slowly and conservatively (I hope it will be slowly and conservatively), every additional dollar rise in price will add a full 100-cent exchange value and purchasing power to your present holdings; whereas, under the present system, only 25 cents of exchange value or purchasing power would accrue to you for every dollar rise in price.

I know all this sounds strange to you. Nobody has ever told you anything like this before. And some of you may think I'm all wrong; but all I ask of you is that tonight or tomorrow, or the day after, you give an hour or two to this subject (I've given years to it) and figure it out for yourself.

There are quite a few other things I'd like to comment on while on the subject of stocks and the stock market—brokerage and investment houses, banks, etc.—but I must hurry on. Some other time, maybe!

### THE COUNTRY'S COLLECTIVE DEBTS

Now, gentlemen, prepare for a shock! Sit tight in your chairs! Hold your breaths! For my proposal is intended not only to salvage and give a decent value to what still remains of our assets; it also contemplates a readjustment of the country's debts as well.

The national wealth amounts to $360,000,000,000.

I maintain that of this amount 160 billion is fictitious—sheer inflation. That leaves $200,000,000,000 of actual assets.

Now, the collective debts of the country are said to be in excess of $200,000,000,000; some have put it as high as $250,000,000,000. I'm going to accept the more conservative figure; let's say 200 billion! What does that mean? It means that the $200,000,000,000 of assets are mortgaged to the limit. We are broke!

Wealth has been defined as the difference between assets and liabilities. Our national assets are $200,000,000,000, our national liabilities, $200,000,000,000. What is our wealth? And where is it? Who's got it? To whom does it belong? Answer that yourself!

Now, let's look at this subject from another angle.

What does the item of inflation, the fictitious valuation of productive properties, mean to the people of the United States? It mean this:

As I've already told you, they are charged at least 5 percent on the 160 billions of inflation—or $8,000,000,000 a year. Now add to this 5 percent on a $200,000,000,000 debt, or $10,000,000,000 a year, and you have a total of $18,000,000,000.

Now, just to be conservative, let us deduct 6 billion—let us say that the total charge on the two items, inflation and debt, costs the public 12 billion a year—and I think that's exceedingly conservative—and the mystery that hangs about the present depression begins to disappear.

But I'm not going to go into that now. Let me proceed with my proposal, and let's take things as we find them.

I propose that whatever the actual amount of all debts may be and of whatever kind, I propose cutting in half all debts, contracts, and obligations, public and private, involving money payment.

This, of course, like every other arrangement included in my proposal, presupposes universal agreement and general acceptance. There must be no exception, and it must be followed all the way through.

Once more! Keep in mind that the adjustment here proposed implies the substitution of a 100-cent dollar for the 25-cent dollar with which we have contracted (and presumably paid) debt and obligations within recent years.

### COMMERCIAL DEBTS

Quite a proposal, isn't it? But I think it's perfectly sound. Let us see what would be the effect of uch an adjustment on commercial debts—bills payable and bills receivable. Here is the case, briefly stated:

Now listen attentively! If the firm of Smith & Co. sold to Brown & Co. 100 units of goods at, say, $2,000, and Brown & Co. sold to Smith & Co. 2,000 units at, say, $2,000, the mutual payment of their bills would involve a total money transfer of $4,000. But considering that the present dollar has only a 25-cent purchasing power, the $4,000 actually have an aggregate value of only $1,000.

Now, if Brown & Co. cuts Smith & Co.'s bill 50 per cent, to $1,000, and Smith & Co. cuts Brown & Co.'s bill 50 percent, to $1,000, a total of $2,000 would change hands between them, but with this difference: Their $2,000, under my proposal, would actually have a $2,000 purchasing power.

Which is better for Smith & Co. and Brown & Co.—to receive each $2,000 with only, in fact, a 25-cent purchasing power ($500), or to "compromise" for $1,000—but with every dollar imbued with a 100-cent purchasing power?

Now, let us assume, in the aggregate, $4,000,000,000 of mutual commercial debts. If fully paid, with dollars that have only a 25-cent purchasing power, as is the case at present, the $4,000,000,000 will have an aggregate exchange value or purchasing power of only $1,000,000,000. Whereas under the plan proposed, namely, reducing the amount of the debt by one half, or to $2,000,000,000, but payable with dollars having a 100-cent purchasing power, not only will all debts be paid in full but there will have been created $1,000,000,000 of additional purchasing power as a fund and stimulus for a new volume of business. This point alone, if there were nothing else to commend it, ought to win for itself serious consideration.

### NOTES, BONDS, AND MORTGAGES

This same principle would be applied to all borrowings and lendings, all contracts and obligations involving money transfers. It would include notes, bonds, and mortgages—even insurance policies and premiums.

I'll try to illustrate just as briefly and as simply as possible how the adjustment would work out. Once more keep in mind the difference between a 100-cent dollar and our present 25-cent dollar.

### FARM MORTGAGES

1. The mortgages on farms aggregate 9½ to 10 billion dollars. Let us say 10 billion to make it easy figuring. Under the present arrangement—of a 25-cent dollar—the $10,000,000,000 have an exchange value or purchasing power of $2,500,000,000.

Under my arrangement the 10 billion dollars would be cut in half—reduced to 5 billions. But on the new basis of a 100-cent dollar, the 5 billion dollars would actually have an exchange value or purchasing power of 5 billion 100-cent dollars.

I think the farmers will welcome this suggestion—receive it, as it were, with open arms. The best that has been offered them thus far is a temporary extension, or moratorium. Ultimately they must pay in full. My proposal is an adjustment of their difficulties, a lifting of the crushing burden that is now weighing them down and ruining many of them.

### URBAN REAL-ESTATE MORTGAGES

2. The mortgages on urban real estate amount to 36 billion dollars. On the present 25-cent dollar basis they have an exchange value of 9 billion dollars.

Under my arrangement the 36 billion indebtedness would be reduced to 18 billion, but every dollar would have a full 100-cent exchange value.

If the investors who bought "gold bonds" (what a jest! gold bonds payable in gold!) will receive in the aggregate 25 cents on the dollar they will be exceedingly lucky. (And the dollars they salvage will be 25-cent dollars.) Under my proposal they would receive back 50 percent, but every dollar would have a 100-cent value. Here is an opportunity for them to recover their losses, not in quantity but in exchange value and purchasing power.

GOVERNMENT BONDS

3. There are 20 billion dollars of Government bonds in existence. Their value on a 25-cent dollar basis is 5 billion dollars. Under my proposal they would be cut in half—namely, to 10 billion—but every dollar would have a 100-cent exchange value and purchasing power.

I'll pause here long enough to remind the people of the United States that Government bonds are not an investment. They, the people, the bondholders themselves, are taxed in order that the Government may pay them the interest and the principal. Oh, can't they see that the quicker the public debt is reduced and liquidated the better off they'll be? I have stressed this over and over in my pamphlet on "War Debts and Their Redemption", and in my editorials.

MUNICIPAL BONDS

4. There are approximately 16 billion dollars of State, county, and municipal bonds. Their exchange value, on the 25-cent dollar basis of computation, is one fourth of that, or 4 billion dollars. I propose to reduce them by one half, or to 8 billion, but each dollar will have a 100-cent value.

What I said about Government bonds applies also to municipal bonds. The people, ultimately the bondholders themselves, pay both the interest and principal of all such bonds, through the medium of taxes. Their own intelligence ought to make them see that.

CORPORATION BONDS

5. According to a recent statement, there are nearly 40 billion dollars ($39,195,000,000) of domestic corporation bonds afloat. On the basis of the 25-cent dollar they have an exchange value of 10 billion dollars. I propose to reduce them to 20 billion, but imbuing every dollar with a 100-cent exchange value or purchasing power.

I need only add that the cutting in half of all valid bonds should be done on the basis of their face or original value and not on the basis of their present market price.

At any rate, under my proposal all bondholders would receive fairer treatment than has been accorded them under the sundry reorganization schemes put into effect during the past 2 years.

I would follow the same method with regard to notes, and insurance policies, and whatever debts, contracts, or obligations may be in existence.

ANCILLARY ADJUSTMENTS

And I wouldn't stop there. I'd go a step further. Now smile, for I have good news for you. I'd cut your tax bill in half. Last year the taxes of all kinds amounted to 12 billion dollars. Under my proposal your tax bill could and would be reduced by 50 percent. All Government appropriations could be reduced by one half, for $1 would do the work of $2. That's the way I'd balance the budget.

How do you like that?

And what else can we do? Let's see. Anything else? Oh, yes! All the goods on the shelves of merchants could be marked down 50 percent, and they could sell them at the marked-down price and be better off, make a bigger profit computed not in quantity, but in exchange value or purchasing power, than is possible under existing conditions and under our present high-price system.

All manufactured goods, all factory inventories could profitably be put into the market on this lower price basis.

What else? I would materially reduce rentals. Gentlemen, the chain stores have been blamed for putting thousands of merchants and small stores out of business. It is my belief that most of them were driven out of business, not by chain stores, but on account of excessively high rents. I would adjust all rents on this new basis.

And I would reduce all rates, freight and transportation rates, advertising rates, telephone rates, electric light and power rates, etc., in the same proportion.

And so forth. Wherever adjustment is possible and necessary, there the adjustment shall be made.

And let me whisper this: I am not an internationalist; and I'm certainly not a cancellationist. I do not favor transferring Europe's debts from the shoulders of the people of Europe to the backs of the people of the United States, for that is what cancellation really means; but merely in passing and in parentheses—and to show the possibilities of what I am trying to propose, I would be willing to readjust the obligations of our foreign debtors on the basis here suggested. Europe owes us 11 billion dollars. Without injustice to the American people we could cut that debt in half if we adopt the principles I'm propounding.

And most foreign bonds, now in default, could be reinstated and salvaged to the holders by this same procedure.

### THE WAGE QUESTION

On the question of wages, I shall say only a few words at this time. In the plan here discussed I include, of course, a readjustment of wage rates and scales. But in the readjustment under the new economics I am preaching, let us keep this dominant thought before us. The purchasing power of money is the important thing. But equally important is the purchasing ability of the people. Consequently, the aim should be not to curtail but to increase the purchasing ability of the wage earners, the people, by paying them, not a minimum but a maximum of wages. The greater the amount of wages paid, the greater will be the purchasing ability of the wage earners. That is self-evident. It is only by striving to bring this about that we shall succeed in laying the solid foundation for a progressive and permanent prosperity. Enlightened self-interest should be a sufficient motive.

We are confronted with several grave problems that cry out loudly for solution. The most important of these is the unemployment problem. Twelve million people are out of work. Even with complete recovery it is my opinion that, under existing conditions, some three or four million workers will remain permanently without work. The wages and salaries of those working have been cut from 25 to 75 percent—the average is probably in excess of 40 percent. We boast that we have developed mass production. There is only one thing that will put practically all men and women back to work, and that is our determination to develop mass consumption. This can be done in only one way, viz, by inaugurating a system of wages and salaries that will permanently increase the purchasing ability of the people.

The principle of the wage and salary adjustment should also be applied to fees, rates, stipends, honoraria, etc. But these, and many other things that must be handled, will be taken up each in its turn.

### THE PURCHASING POWER AND EXCHANGE VALUE OF MONEY

Thanks to the stupid inflation system, we have been computing our wealth, individual and collective, and our income and profits, by the number of dollars; from now on I propose that they shall be gaged, not by their bulk or size or quantity, but by their exchange value or purchasing power. Not the quantity of money, but what it will buy, is the important thing. Is that so hard to understand?

Under the present arrangement, $1,000, whether in the shape of a note, bond, mortgage, or insurance policy, when paid, will give the holder only $250 of exchange value or purchasing power as compared with the value of money 30 years ago.

Under my proposal that $1,000 will be reduced to $500, but its exchange value or purchasing power, on account of a lower level of prices, will be $500—an increase of 100 percent in exchange value or purchasing power.

And (don't sneeze at this) paying interest on $500 instead of $1,000 has its advantages. And receiving interest payments and dividends, to say nothing of fees, stipends, bonuses, salaries, and wages, in money that is worth 100 cents on the dollar, instead of 25 cents as at present, is three times better than we have now.

Gentlemen, I'm trying to tell the country how to get out of the hole we are in and how to get out of the danger zone with a whole skin.

One of the most amusing war cartoons by Bairnsfather showed two British Tommies who had taken refuge in a shell hole. Says one to the other: "This is a 'ell of a 'ole." His comrade replied: "If you know a better 'ole than this one, go to it."

Anyway you figure it, the arrangement I propose offers benefits to creditors and debtors alike that none of the "remedies" suggested or applied thus far can give.

HOW TO GO ABOUT IT

The plan that I am discussing here can be put into effect by voluntary and mutual agreements entered into under the supreme national generalship of a small group of, say, 10 or 12 or 15 or 20 men—but who must be of the highest type; men of vision, imagination, and farsightedness—able, honest; honorable, upright, and who shall have plenary and absolute powers.

I am unwilling to admit that such men cannot be found in the Nation; and, being found, I am confident that they can be trusted to perform their work wisely, prudently, unselfishly, and justly.

The only legislation that is needed is an enabling act that will confer power on those selected and legalize everything that is done under this proposal.

Two things, however, I recommend as necessary for the transition from the old to the new system:

1. That a 60- or 90-day moratorium be declared on all debts.
2. That the stock exchange shall be closed for the same length of time.

But these are bridges we'll cross when we get to them.

LET'S MAKE UP OUR MINDS

First, let's make up our minds. We will have to decide whether we are going to wreck the whole country in a desperate and impossible endeavor to maintain the stupid fiction that our dollar is a 100-cent dollar, when in reality it is only a 25-cent dollar; or whether we will face the facts and do whatever is necessary to save ourselves from the cumulative consequences of our collective cupidity and folly.

Every panic we have had in the past 50 years (and every future panic) and every period of depression that will visit us with increasing frequency in the years to come (unless we deliberately change it along the lines here suggested) is only paying another installment on the terrifically huge inflation and debt bill with which we've burdened ourselves; and these payments, if continued for a few years longer, will ultimately ruin us—all of us.

Gentlemen, the robot we have made has a gun in his hand and will blow off our heads, if we don't watch out!

A MERE OUTLINE

Needless to say, I realize that I have touched only a few of the high spots, in my attempt to show the possibilities of the proposed plan. That is all that anyone, discussing a complicated subject that has a thousand angles, ten thousand ramifications, and a hundred thousand intricacies, can hope to do.

Therefore let it be understood that in this brief summary of a rational readjustment plan, in this mere outline of a sane reorganization program, in this discussion of fundamental principles, I have said nothing of sundry necessary and fundamental reforms that must accompany any intelligent reconstruction effort.

It is opportune, though, to intimate that the principal reform must take place in the minds and hearts of all of us, but especially in the minds and hearts of our captains of finance and industry, our bankers, our brokers, our industrialists, our entrepreneurs, our business men, our leaders of thought, our statesmen, economists, and editors.

I repeat, good will, common sense, ordinary honesty, simple decency, these are the things that will get us out of the mess we are in; and restore faith in ourselves, and bring back the now badly shaken confidence of the people—in brief, end the depression period.

LEADERSHIP

To start the ball rolling, leadership is needed—leaders who are men of character and courage, of proved probity and tried ability. Given a national reorganization committee, a supreme board of directors of 10, 12, 15, or 20 men, we can accomplish what must be done. We have these men; let's call them into service. And having accepted, let them dedicate their God-given talents for the complete attainment of the sane purposes here set forth.

If you are at all impressed with my proposal, I should like to venture to suggest the chairman of this committee or board—a man I've never met, nor even seen; a man who probably doesn't know I'm on earth; a man whose name some of you may have heard: I mean the Honorable Alfred Emmanuel Smith—in whose integrity and ability the whole Nation has abiding faith and complete confidence.

Such a committee or board under the chairmanship of such a leader, with the whole-hearted support of the President of the United States and the complete cooperation of Congress, would be able, within a year's time (or at most two) to carry this country successfully through the most critical period and desperate crisis in its history.

The organization of such a committee or board, under the chairmanship of such a leader, would make possible the early discontinuance and orderly liquidation of the Reconstruction Finance Corporation—a consummation devoutly to be wished; it would remove the necessity for further Federal or State relief for the unemployed and those in distress; for, I'm not afraid to predict that within 90 days after the committee or board gets into action, smoke will ascend like incense from every factory and mill smokestack in the land; our streets will be filled with men and women—not looking for work or begging, but going to work, or returning to their homes, from work; our stores will be crowded, not with shoppers but with buyers; our farmers will take on new courage; our banks will settle down to a normal volume of business; our railroads will prosper as never before; hotels, restaurants, and theaters throughout the land will do a thriving business. The depression will be over; and a new era of real and lasting prosperity will have begun.

Nil desperandum! The ship of state, and all its passengers and cargo, can be saved—if we have the will and the guts to do it.

---

## Statement of Edward B. Benjamin, President Maginnis Cotton Mills, New Orleans, La.

### CAUSE AND CORRECTION OF THE DEPRESSION

The first essential in the correction of the present situation is a complete and sure understanding of the cause or causes thereof. In my opinion, our President hit the nail on the head when in one of his most important campaign speeches he attributed this depression to the collapse of extended speculation in securities. I first wish to amplify the President's statement in this regard.

More than 1,000,000,000 shares changed hands on the New York Stock Exchange in 1929. Nearly half a billion shares were traded in on the New York Curb Exchange the same year. Evaluating these stocks at probable averages, and taking into consideration sales on local exchanges, over-the-counter sales, and bond trading, the sum total of security trading in the United States for that one year probably exceeded $200,000,000,000. The Census Bureau estimated the total wealth of the United States in 1929 at about $384,000,000,000. Thus a fantastic situation confronted us: the volume of our security speculation approximated half our national wealth. In effect, every other home, every other farm, every other factory, every other everything in this broad land was sucked into this speculative maelstrom of 1929.

Bearing these facts in mind, let us reconstruct the economic scene as it stood just prior to the great climax of 1929. The bubble of wide-spread real-estate speculation had already been pricked a year or two before. For years we had been confronted with an agrarian problem, as had most of the other populous sections of the world. The much-discussed issues of European reparations and reconstruction had been with us ever since the war. To a considerable extent the spread of the chain store and the building up of great corporate structures had already displaced the small merchant and small producer. And by 1929 the high-tariff wall of traditional policy had been surrounding the United States for decades—a fact particularly important to bear in mind in view of the swollen number of amateur and professional economists who attribute the depression to the tariff.

Notwithstanding these many apparently adverse factors, all of them regarded by one authority or another as prime causes of our present depression, 1929 saw this country reach what was perhaps the highest peak of prosperity any nation ever attained. We can measure this by either of two yardsticks: By the mass product of our Nation's activity or by the real income from labor—the return in services and commodities.

It is doubtful whether many of us appreciate the enormous steady growth of our industrial output in the decades 1909–29.[1] The census figures on this are fairly staggering. Moreover, the last 10 years of the period also saw a decidedly downward trend in prices and in the so-called "price indices." This meant not only we were producing vastly greater quantities of goods than ever before, but that these were available at lower prices.[2] Although our city dwellers and factory workers as a rule enjoyed greater prosperity at this time than did the farmers, peak figures for national production and consumption showed a tremendous general prosperity. Years of advancing stock-market quotations had inspired the country as a whole with the greatest confidence. The wheels of industry were revolving at full speed. Material plenty for our people was at hand.

Just what happened to alter these prospects? We know business in the United States reached its peak prosperity in July, 1929. Then it began very slightly to taper off. But it was from October 1929 on the entire picture was to change with our stock-market collapse. Probably a sales movement on the part of our big trust companies gave the first real downward impetus to the stock market. Or, as others may have it, European investors, viewing the spectacle from without, felt the time was ripe for profit-taking on their American investments. It is also likely some of our very rich, returning to desks from protracted vacations in the fall of 1929, felt it no longer paid to "hold everything." Probably all three factors were operative. But with the market crash of October 1929 a general decline in securities began, and along with this declining market industrial and economic activity tapered off to the recent low level of prostration.

Many as have been the causes advanced for our present depression—tariffs, overproduction, whatnot—the simple theory that the collapse of a nation-wide speculative bubble alone can bring with it the collapse of a nation's prosperity has scarcely been more than suggested. Long prior to the debacle of recent years, the belief had come to be generally accepted that stock market action "predict" the course of a nation's prosperity. This point of view was shared by the leading economists of our great universities and the statisticians of our business forecasting services. Reading the economic history of the United States for decade back, the fact clearly show changes in business prosperity corresponding to the tone of the stock market. However, this admitted synchronism was not held to show cause and effect. That this cause-and-effect relation does exist can be determined in the opinion of the writer by a careful examination of the complex processes by which commodities and services are distributed in a highly organized society such as ours, and by a full appreciation of the part confidence plays in our Nation's prosperity.

In modern economic life, only a very small portion of commodities produced by a nation pass directly from producer to consumer. Even those commodities used in the raw state must be brokered, wholesaled, and retailed before going into consumption, whereas manufactured goods pass from the raw state through one or more manufacturing stages before being jobbed and/or retailed. All of this means that our necessities of life are bought and sold, and bought and sold over again, often several times, before coming to our door, our wardrobe, our table. In other words, the judgment of man intervenes time and time again between us and our commodities. As compared with the mass of our people, the intervening agents are few in number. In this respect our commerce and industry resemble a flask with a small mouth. Only that gets into the flask which passes the mouth, the latter representing those business heads who plan, purchase, manufacture, and distribute for the Nation.

In formulating the policy of our business men, in shaping their judgment of future values, nothing begins to compare in impotrance with our security markets. For decades and long before the advent of popular statistical services, shrewd business has regarded the stock market, consciously or uncon-

[1] Bureau of the Census, Manufactures, 1929, Industry Series.
[2] U.S. Department of Labor, Bureau of Labor Statistics, Bulletin No. 521.

sciously, as the barometer whereby a policy of action or watchful waiting has to be gaged. When stocks rise, even on minor flurries such as the Hoover campaign boom of last summer, business is accelerated. When stock prices crash—even if this be for no other reason than that a number of persons believe further advances are out of the question—a cycle of reduced industrial activity is immediately initiated. Orders to the producer-units for commodities and services promptly shrink in number and in size because, confidence in values having been shaken, the Nation's business heads begin to restrict their purchasing policies even in advance of purchase restrictions by the consuming public. The unfortunate cycle so started grows and extends over months and months. The decreased demand which constricts production in one plant affects many another plant supplying it. A wage cut to reduce expenses under curtailed plant operation constricts the purchasing power of labor. Transportation activities become curtailed in keeping with the decreased production of commodities. By the time such phenomena have extended through a nation's economic structure and have been repeated two or three times, things reach the pass where we find them today.

To cap the climax, the concatenation of our banking order with our industrial and financial functions must be borne in mind. With the deflation of security and commodity values reaching deep into the portfolios of our banks, constriction of credit takes place, and the picture of demoralization is complete

We need look no farther for explanation of the current depression than this bursting of a Nation-wide speculative bubble. A great many liberal-minded persons lay our trouble on the tariff. To such folk the thought of free international trade has the glamour of an ideal, like disarmament. But the facts are our international trade has never been a matter of sufficient moment to affect our national prosperity as a whole. In 1929 the sum total of our business in the United States, other than security trading, probably reached the monstrous figure of $250,000,000,000. At no time have our exports exceeded about 5½ billions a year. Obviously, therefore, with exports amounting only to about 2 percent of our total national business, such concern over the tariff in relation to prosperity as a whole is irrelevant.

Overproduction as a cause of depression likewise fails to stand the test of close scrutiny. The growth in productivity of this Nation in the decades (1909–29) previously referred to was a gradual and orderly development, with the product of the Nation's activity definitely passing into consumption. This situation might have continued indefinitely. The constant trend of modern productivity is to lower the cost of the output. Many commodities are available today at a fraction of their former price as a result of inventiveness and increased efficiency of production. In the case of a self-contained nation such as our own, consumption is only limited by our ability to produce and general overproduction can be regarded as an impossibility, provided our economic life is not radically disturbed.

Having defined the malady, the question of remedy arises. We need two kinds of remedies in this instance.

First. Amelioratives and restoratives for the present stages of the malady.

Second. The correction of a tendency toward the malady to prevent recurrence thereof.

My suggestions listed below under the heading of "Rehabilitation" cover the first type of remedy. The subsequent part of my program styled "Valorization", is intended to provide the ultimate safeguards against recurrence.

### REHABILITATION

1. The present situation in this country is tantamount to war, or certainly to the after effects of war. Millions of people are distressed. Various forms of attempted aid are not coordinated as well as they should be. The President should appoint a rehabilitation board to function in assisting him much as did the War Industries Board during the war.

2. The rehabilitation board should first seek to limit imports to commodities not produced in this country. Buying at home will put many thousands of people back to work. In times like the present the first thought must be for our own. While the cost to us of domestic products may be somewhat higher initially, the saving in the long run will be considerable through the reemployment of thousands, and the elimination of these thousands from community, State, or Federal support. Every great nation today is endeavoring to limit imports to produce employment for its own people.

For those who raise the hue and cry, "How can our exports be paid for", it should be pointed out that we are compelled to buy a large number of exotic products, tea, coffee, rubber, etc. Our exports can be paid for in credits on the countries sending these necessary imports to us.

3. Direct relief to the unemployed should be standardized and increased if financially possible. If this Nation can borrow three or four billions from abroad for this purpose, the effect would be salutory in more ways than one.

Incidentally, money spent for food, clothing, rents, will engage a great many more hands in production than a similar amount spent for producer's goods—steel, cement, etc. If three or four billions were available to distribute to the people of this country on the basis of sheer need, it is possible the distribution of the first two billions would so prime the pump of production and prosperity, that further direct relief could end there. Consumer's goods as a rule require more labor and are bulkier to handle than producer's goods. Not only does a million dollars' worth of shoes or hats require more direct labor to produce it than does a million dollars of steel or cement, but considerable more labor is involved in the transportation and distribution of the former. These facts should be borne in mind in planning relief.

4. Farm relief through the domestic allotment plan, or some equivalent, should be at once inducted.

5. A campaign of public education in economics should be undertaken. The cause of this depression should be definitely and emphatically branded as speculation. People should be made to understand that not the existing economic order is at fault, but our tendency to gamble in that order. The program for eliminating speculation mentioned below, the sure safeguard for the future, should be legislated at once. Such legislation would in itself have an enormous psychological benefit in definitely labelling the cause and principal corrective of present evils. Much of the present demoralization comes from uncertainty as to just what has happened. Explaining the past logically and clearly and setting up safeguards will do much to allay fears for the future.

## VALORIZATION

The cure for a recurrent illness lies naturally in the correction of a tendency toward that illness. Wide-spread gambling in a nation's tools of production is a comparatively new phenomenon, an outgrowth of the industrial revolution. It arises from the peculiarly fluid form capital has acquired under conditions of highly organized corporate manufacture and commerce, accompanied by the development of wide-spread means of instantaneous communication. Comparatively little social significance has hitherto been attached to the operation of our exchanges and to the wide-spread interest of the public in security trading. Much has been said of the "vice" of stock gambling from the high ground of morality; but the thought that uncontrolled gambling in the proprietorship shares of our tools of production should be ended as a simple guarantee of economic security is a new one.

There are laws in this country prohibiting the sale of narcotics. In the final analysis, is there any difference between the effects of a habit-forming drug and the effects of a notion that a security can be worth 20, 30, or even 40 times its earning power? Mob phychology periodically alters the judgment of our whole people as completely as indulgence in the most powerful of narcotics could do so. Therefore, we are impelled, while not "under the influence", to set up standards for ourselves which will safeguard us against financial auto-narcosis and auto-intoxication.

A program designed to meet this end has been designated by the writer as "valorization." The term is one of convenience rather than definition. The six distinct steps which this program comprises will be dealt with separately. They are—

1. Strict supervision of security trading and of the conduct of exchanges should be delegated to a Federal securities commission. This body should put into effect rigid accounting practices in corporations doing interstate business and should operate as a court of jurisdiction on such corporation practices as affect the marketing of securities.

2. The primary function of the Federal commission should be to define price standards based on past earnings, above which standards security-trading on exchanges would be prohibited. Thus it might be decided that industrial shares can safely be traded in up to 10 times their earnings. Whatever the

figure, the earning standards decided on should be fixed and rigid, to supply a brake on trading. This would not prevent advances in securities, but would prevent advances based on speculation, as under this arrangement enhancement in security values could result only from a factual increase in earnings.

3. In order to prevent bootlegging in securities at prices above the safe earning standards set by the commission, and likewise to prevent illicit trading in puts and calls, laws should be enacted making a vendor liable for damages to a purchaser when a security is sold at a price above the safe earning standards set by the Federal commission.

4. The proposed Federal commission should issue frequent bulletins dealing directly with specific security issues, pointing out the various factors in the situations concerned and endeavoring, through the creation of a full and complete understanding on the part of the investing public, to "valorize" securities at all times. In the long run, this policy, when coupled with those mentioned above, would replace purely speculative purchases with genuine investment.

5. Taxation can likewise be trained on security trading to wipe out its speculative aspect. A graduated scale of taxes on security sales can be set up whereby quick turnovers are so heavily taxed as to be made practically prohibitive. In this way the scalping of petty traders, a purely parasitic function can be done away with.

6. As a final step in "valorizing" security trading, short selling must be ended once and for all. A necessary supervisory force to this end would be cheap at any price, through the prevention of the easiest method of market demoralization. Every sale of a security should be a legitimate one, a simply normal transaction of some one selling out an interest in a business to some new investor. The stock arguments put forward in defense of short selling are all based on the existence of a highly speculative type of security trading. Once trading is "valorized" through the institution of safe earning standards and the other devices mentioned above, there will be absolutely no need for the so-called "cushions", "buffers", "technical correctives" and so on, which short selling is supposed to provide.

There is no doubt the volume of security trading would be materially diminished by the legislation and supervision herein set forth. The entire aspect of security trading would be changed, as speculation was replaced by legitimate investment. Unquestionably, a great many persons now employed in brokerage offices and security exchanges would be displaced from their present positions. But the gain to the country as a whole through the introduction of an era of rationalization in finance would be so monumental as to offset, many times over, the loss to these few individuals.

The time element must not be lost sight of, however, in the taking of steps to reform. Any legislation looking to the creation of a Federal commission with supervisory powers as outlined above should take effect not earlier than the year 1935. Such legislation should be put through now, however, so that the necessary adjustments in values, methods, and organization may take place slowly and properly over a period of 20 to 24 months. Incidentally a program of valorization when understood should serve to boost stock prices probably in advance of justifying business conditions. People would buy into our soundest and most promising corporations to avoid any disability to do this later through the induction of earning standards and other elements of the valorization program.

It is the writer's belief the elimination of security speculation would create an area of very real economic stability in this country. No other form of gambling would have the same virulence and pernicious potency. Land cannot be quoted on a ticker tape. It is costly to carry and hard to deliver. Its utility and prospects are pretty definitely limited; its probable value does not overlap all bounds of imagination. However, should real-estate speculation become anything of a national menace upon the elimination of security gambling, taxation as suggested on security sales could be brought to bear as a positive curb.

Based on all the foregoing facts, the sine qua non of any attempt to eliminate the industrial cycle and give the country a normally stabilized prosperity must be the elimination of the Nation's habit of irresponsible gambling in its tools of production. If these tools of production were used legitimately in the United

States of America, there would be not limit to the advance of our national standard of living. We are not subject to plague or famine. Not only can we be regarded economically as a self-contained and self-sufficient Nation, but with our resources and products so infinitely varied our business tone as a whole should always be healthy. A solution must be found for the agrarian problem, and certain industrial reforms are needed. As a Nation, however, we are inconceivably rich when gaged by our productive capacity. With the progress of the arts, and with a normal uninterrupted healthy tone to our business life, a truly golden era might indeed soon be realized in this land of plenty. But the one great perequisite is lacking—a serious concerted procedure to rationalize the business life of our Nation, and to prevent for all time the recurrence of gigantic speculative booms in security values followed by the crash of deflation with its attendant demoralization and suffering.

This prerequisite can be supplied by the program of valorization herein outlined.

---

STATEMENT BY HARRY GUNNISON BROWN, PROFESSOR OF ECONOMICS AND FINANCE, UNIVERSITY OF MISSOURI

We are suffering from bank credit restriction or deflation, and falling prices. No remedy is adequate that does not provide for rising prices, to be succeeded by a stabilized price level. But rising prices at the expense of curtailed output and further unemployment are purchased too dearly. The rising prices must come from increased demand and purchasing power, not from decreased supply. And if we do not provide the increased purchasing power, this will be because of unwillingness. It will not be because the job is impossible.

In the minds of the uncompromising deflation theorists, the cure for deflation is more deflation. They desire a more complete "liquidation" as a basis for recovery. Lower wages, lower prices, and a weeding out of all mortgaged farmers and other debtors who cannot pay their debts at a low price level, who are thus financially "unsound" is, in this view, a "healthy" process. But who is "unsound"? The answer is, Anyone whose debts are about as great as or slightly greater than the sale value of his property. And the farther we reduce prices and property values, the more titular owners there are whose debts exceed or equal such values. Conceivably we might deflate and reduce values so far that anyone who owed anything whatever, even the smallest debt, would be "unsound." Deflation to weed out the "unsound" is as ridiculous logically as it is merciless morally. Deflation makes "unsound" many thousands of debtors whose property, if there were no deflation, would be safely worth far more than their debts. What shall we say to those conservatively minded financiers who defend the policies which led to deflation, yet who think that inflation is necessarily artificial and unjustifiable interference with normal economic processes?

A major cause of the depression—in my opinion the outstanding cause so far as the United States is concerned—is an inept policy of those in charge of our Federal Reserve System. I believe it can be shown conclusively that the policy followed was definitely and unnecessarily deflationary and tended to produce depression. Those in charge of the System give no evidence of understanding the tremendous control they can exercise over our business prosperity. Apparently they are quite capable of doing, innocently and uncomprehendingly, the very things that conduce to the pitiful disasters of depression.

The new administration must beware. For these men, through following again such policies as they have followed in recent years, and which they have not admitted to be mistaken despite the resulting widespread ruin, may discredit Mr. Roosevelt just as effectively as the results of their policy have discredited Mr. Hoover, and may lead to Mr. Roosevelt's being repudiated at the polls quite as overwhelmingly. Will Mr. Roosevelt accept the advice of those who support such a policy?

To any self-styled "practical" men who support such a policy, we need only reply that such "practical" men have been permitted to run our economic system for the past several years and, by their "practicality", have ruined many of us and well-nigh ruined most of us.

Suppose we were back in the period of prosperity of 1924–29. Suppose, then, that some mysterious force spirited away a third of every person's money and bank-deposit account. Would not the demand for goods and for labor necessarily decline? Until prices, wages, and rentals fell greatly would there not inevitably be dull business, unemployed labor, and idle factories?

But without tracing these consequences further, let us turn to the possible influence of the Federal Reserve System on business prosperity.

The Federal Reserve System has the power to bring prosperity to an end and to plunge the country—and perhaps the world, since the financial position of the United States is so dominant—into severe depression. Suppose it sells securities on the open market. The buyers of these securities write checks to pay for them. These checks on various banks throughout the country go to the Federal Reserve banks for the securities the latter have sold. The checks must be subtracted from the credit balances of the various member banks with the Federal Reserve banks. In other words, the reserves of the member banks are reduced and they must therefore reduce loans to their customers. If they attempt to increase their credits with the Federal Reserve banks through rediscounting, this can be discouraged by high rates of rediscount charged by the Federal Reserve banks. In practical effect the Federal Reserve banks are then drawing money out of circulation and burying it in their own vaults.

A sufficiently persistent policy of this sort must inevitably decrease the demand for goods and for labor and must bring dullness of trade, falling prices and unemployment. It is ridiculous to deny that a wholesale withdrawal of money and bank credit from the channels of trade would have an effect on business and on prices. Our Federal Reserve System has power to do such things to us. Do those in charge of it acknowledge that they possess such power and that they are responsible for exercising it wisely?

There is considerable evidence that members of the Federal Reserve Board have no real comprehension of their relation to the price level and to business. Let me quote here from testimony by Mr. Adolph C. Miller, a member of the Board, before the Committee on Banking and Currency of the House of Representatives, in May of 1928:

"The CHAIRMAN. I notice this, Dr. Miller, that following the activities of the Board in the spring of 1923, the wholesale price level went down until, say, September of 1923, to about 97 or 98, which was followed by some irregularity later on in the year and in the early part of 1924, but in midsummer of 1924 the wholesale price level reached the low point of about 95. Was that lowering to that point of 95 the direct result of the activities that were taken by the Federal Reserve Board in the early part of 1923?

"Dr. MILLER. I would say emphatically no; emphatically no. I would say that prices were down at that time primarily because they went up so high in the previous period and that the whole movement of prices in this period was one toward the ascertainment of a new level. The prices themselves were, so to speak, finding their new level."

Is it necessary to remark that prices are not alive and that they can not find their level as a woodchuck finds its hole? Monetary policies of inflation and deflation, including policies of central banks, do influence prices and do influence general business conditions.

If a majority of the members of the Federal Reserve Board held such opinions as this, it is not surprising that they followed, in 1929, a depression-producing policy. It is not surprising that they did not heed—perhaps, they did not know of—the warning testimony of Dr. Gustav Cassel, internationally known Swedish economist, in May of 1928, before the same Banking and Currency Committee of the House of Representatives (just two days after Mr. Miller's testimony):

"The CHAIRMAN. In connection with the practical situation that confronts us here now, we are in the midst of what has been termed a 'speculative situation.' Yesterday the Federal Reserve Bank of New York raised its rates. Brokers' loans were reported to have increased $150,000,000 in the report that was issued yesterday. Much attention is being directed to the volume of brokers' loans and its effect on the whole monetary situation.

"We would be very glad to have your opinion on that present situation, if you care to express it.

"Dr. CASSEL. Well, Mr. Chairman, I am very glad that you ask me this question, because it gives me an opportunity to show how the aim of checking this speculation, from the point of view of stabilizing the money of this country, is an outside interest, involving the monetary policy in great difficulties. If you had not that speculative tendency in the New York Stock Exchange, the Federal Reserve banks here in this country, I understand, would be able to keep a 3½ or 4 percent rate of discount. Now, there is this stock speculation, and to meet that the Federal reserve bank in New York feels it is obliged to raise the rate of discount to 4½ percent. That is, I assume, not at all done for monetary purposes; that is a measure entirely outside of the normal province of the Federal Reserve System, which is to regulate the currency of the country; but there seems to be a popular demand that the Federal Reserve System should mend all difficulties arising in the country and particularly fulfill the function of keeping the speculators in New York within reasonable limits. I think that is unsound.

"It would be a great benefit to the country if some means could be devised by which it would be possible to limit speculation on the New York Stock Exchange without increasing the Federal Reserve bank's rates, because such increases may be very unwelcome. They may disturb the whole monetary policy, and it may have an effect on the general level of prices that will result in a depression in production in this country, followed by a decrease of employment, all only for the purpose of combating some speculators in New York."

Yet in 1929 the Federal Reserve banks not only sold securities on the open market but charged still higher rediscount rates than those of 1928 which Cassel had criticized, and higher rediscount rates than had been charged at any time since 1921. Were these high rates charged in a desperate attempt to break the stock market? The stock market, indeed, did break but so did business in general. And business has been depressed ever since.

A restriction of credit certainly must make for business depression if prices fall, unless and until production costs, such as wages and rentals, also fall. But credit restriction must bring business depression no less certainly if prices do not fall. For a decrease of means of purchase, imposed on dealers by bankers' restrictions, must certainly decrease the demand for goods. Who will venture to assert, then, that the sharp credit restriction by the Federal Reserve banks in 1929, had no repercussions on business? Will the members of the Federal Board make bold to tell us that sharp credit restriction had and could have no depressive effect on business? If so, why not restrict credit sharply all the time!

However, and regardless of the matter of justification for the high rediscount rates of 1929, a radical and sufficient reversal of policy at the first sign of dull business, before extended depression began to cause widespread failures, might well have brought us quickly back to prosperity. For a sufficient easing of credit and the purchasing of eligible securities in the open market would have increased purchasing power and would have tended to stimulate business.

But what reason could we have to hope for a sufficiently radical and courageous reversal of policy from a Federal Reserve Board which does not admit that its policy is at all a controlling influence on the level of prices or on business? Some too slow and inadequate reversal of policy was indeed attempted, but in the first half of 1931, despite widespread depression, we find a tendency for the Federal Reserve banks again to dispose of securities and so to draw money into their vaults.

It is true that in 1932, at long last, the Federal Reserve System did follow for several months, a policy of heavy buying of United States Government securities. And because this did not bring rise of prices and restoration of prosperity, there are some who insist that such a policy is futile. The fact is that by 1932 the accumulating forces of depression were too great to be overcome except by a stronger policy. Dull business and falling prices were causing numerous failures. Farmers, and men in many other businesses, could not pay their obligations to their banks. Banks were failing and, in failing, were thereby wiping out the purchasing power of their depositors. Money was being hoarded by banks as well as by individuals. Business men were afraid to borrow to buy goods. Sound banks which had loanable assets were afraid to lend except on the most unquestionable security. What wonder that all these forces were sufficient to offset, and more than offset, whatever effects the open-market purchases of 1932 might otherwise have produced! But perhaps without those open-market purchases even worse disasters would have come upon us.

President Hoover had everything to gain by preventing or quickly ending the depression. That he did not insist, through his Secretary of the Treasury and the appointed members of the Federal Reserve Board, on the adoption of the necessary measures, can be explained only on the hypothesis that the principles involved were beyond his understanding. And so he has stood, a helpless and puzzled figure, amid the spreading devastation, from time to time supporting some inconsequential remedy, and finally seeing himself and his party overwhelmingly repudiated at the polls.

But let not the new administration be overconfident. We have no evidence of a real change of opinion on the part of the Federal Reserve Board. It may continue to follow a deflationary policy or (not much better) a policy which offers no help and lets the accumulating forces of the depression work themselves out to the bitter end. Or it may, after we have enjoyed a few years of renewed activity, again precipitate us into depression. In either case the ascendency of the Democrats will be short lived. For an outraged electorate, however little it may understand the financial causes of depression, will be likely to have little patience with an administration or a political party which cannot find any way out. To increase the volume of money and bank credit circulation in a way which some conservatives are pleased to criticize as "inflation," may, indeed, bring a very small amount of temporary opposition to the administration's policy. But, as Frank R. Kent points out in his Political Behavior, "Prosperity absorbs all criticism." If a policy of definitely increasing circulating credit and currency leads to restoration of prosperity, the administration responsible for that policy will gain overwhelming popular support. Continued deflation, on the other hand, will cause more unemployment, more ruin of debtors, more bank failures, and increasing discontent.

There may, even yet, be a possibility that a really courageous Federal Reserve policy could bring us out of the depression. But in view of the accumulation of depressive influence, definite cooperation from the United States Treasury may now be essential. Fear has become so ubiquitous among the banks that many of them are unwilling not only to lend but even to purchase securities which they would once have regarded as first class. But almost any banker would feel safe in purchasing bonds and notes of the United States. If, therefore, the Government would borrow extensively, i.e., sell bonds and short-term notes to the banks and spend the money and checking accounts so realized, in various public works and otherwise, the volume of purchasing would be increased and recovery would be very greatly promoted.

For the Government to sell its bonds to citizens, if thus it merely secures, for spending, money which the citizens would otherwise themselves spend, would not meet the need, for this would not increase total spending, would not increase the demand for goods, and so would not promote recovery. But to sell Government bonds to the banks and thereby to get, for spending, checking accounts which otherwise would not be in existence, or Federal Reserve notes which would otherwise not be issued at all, or, even money which would otherwise be kept as excess idle bank reserves, would really increase the volume of spending and would definitely stimulate business.

If the above is a correct view, then the constant insistence that the Federal Government balance the Budget (interpreted to mean that it shall not borrow) is altogether mistaken. On the contrary, the Government definitely should borrow in order to facilitate the putting of new and additional purchasing power into circulation. When Government pays its civil servants or pays for any sort of public works by funds raised by taxation, the purchasing power of the taxed citizens is reduced by as much as the purchasing power of the Government is increased. In periods of prosperity this is as it should be. But at this time of acute depression it is desirable that Government spending be increased without compelling a corresponding decrease of expenditure by taxpayers.

To those conservatives who object to such borrowing and spending by Government, it should be pointed out that such borrowing was indulged in during 1917, 1918, and 1919 and that business activity was pronounced during nearly all of that period. If our financial conservatives insist that borrowing was then done under the pressure of war, let it be replied that we now need to wage war against depression. If Government borrowing and spending stimulated business in the war period, it will also stimulate business now. And, once we are rescued from the vicious circle of falling prices and business and bank failures, and from our depression psychology, the ordinary borrowing and spending of business, with proper stabilizing control from the Federal reserve system, should insure a continuance of prosperity.

But if, through such a policy, the new administration may expect to restore normal business and to rescue those who are now hopelessly in debt, this expectation can be realized only if the Government borrowing policy is not balked by an unsympathetic Federal Reserve Board. For the Federal Reserve System might, if it chose, withdraw circulating medium from the business community into its own vaults, by high rediscount rates and by selling securities on the open market, even faster than it was advancing funds to a borrowing Government. And, in view of the pronouncements and recent policy of the present Federal Reserve Board, there is no security against having any prosperity-restoring policy of the new administration rendered entirely nugatory by the Board, unless the President, through his power of removal, compels a right policy.

Those who have been responsible for Federal Reserve policy since 1929 are in no position to argue that the proposals here made are not "practical." These men obviously have not been able to devise any policy to prevent or to terminate the depression. They may, of course, argue that since they do not know how to prevent such calamities as we have suffered, therefore nobody knows. But, certainly, if control of our credit system has any significant relation to the problem—and there is overwhelming reason to believe it does—then it is high time we began to follow a different kind of policy from the kind that the present Federal Reserve Board seems to have considered "practical."

For the benefit of any who may think that the opinions of our usually conservative leading bankers are of especial weight in this matter or that a successful banker, is, ipso facto, an ideal choice for a position on the Federal Reserve Board, it may be worth while to contrast the requirements of central banking policy with the requirements of policy for the ordinary bank. In truth the requirements are so far different that experience in the successful management of the ordinary bank may be a definite disqualification for the management of a central bank or the control of Federal Reserve policy. In case of threatened crisis and depression, the ordinary bank must make its loans with unusual circumspection and must endeavor to get its resources into the most liquid possible form, in order that it may thereby be able to meet demands of its depositors and protect them against loss. But in the case of danger of crisis and depression, the business of a central bank or a central banking system should be to make loans at lower rates and more freely than before, to endeavor to put more money and checking accounts into circulation rather than to draw money into its own vaults, and so to prevent threatened depression from becoming actual and serious depression. A prosperous banker, or a student of banking of the old school, might therefore be the one type of person who would be a dismal failure in the management of central banking policy and might bring upon us just the kind of calamity that we are now suffering.

And now we come to the sacred cow of American monetary policy, viz, the gold standard. For the question is certain to be raised whether a deliberate policy of pumping more purchasing power into circulation and so raising the price level will not necessitate going off the gold standard. For, in the opinion of our more conservative financial advisors, it seems that however widely gold fluctuates in value, however great the ruin this fluctuation imposes on debtors who must pay back money of far more purchasing power than they borrowed, and however greatly insistence on a rapidly appreciating gold standard increases unemployment and distress among the masses, nevertheless nothing must be done either to abandon the gold standard or to make it more stable. A proposal to require the Federal Reserve system to use its powers so as to restore the predepression price level and thereafter to keep it stable was contemptuously referred to by Mr. Hoover as a proposal for a "rubber dollar." By implication, the present wildly gyrating dollar is of constant or stable value, not a rubber dollar at all.

But as a matter of fact we can, if we so desire, bring up the price level, restore prosperity and stabilize thereafter at this higher price level, while yet maintaining the parity of all our money with gold. It is true that a period of rising prices in the United States might tend to a considerable outflow of gold to foreign countries. Such an outflow of gold might help to promote recovery abroad as well as here. But any such outflow of gold can be stopped by an embargo on gold exports. And such an embargo, if it accompanies a definite increase of the domestic price level, will at once raise the domestic price of any farm crop having an international market and a world price, such as wheat or cotton.

For when our higher domestic prices cause Americans to look abroad for lower-priced goods of various sorts, they can not pay for these goods through an exportation of gold and must attempt to do so through the purchase of drafts on foreign banking centers. These drafts will inevitably rise in price and thus the price which exporters can secure on the drafts (drawn on foreign purchasers of wheat or corn or cotton) they sell, must rise. Thus, an increase of domestic prices, coupled with prohibition of gold exports, must raise the prices in American dollars of the farmers' products. Perhaps as a long-run policy it would be well to abandon the idea of a fixed weight of gold back of the dollar and adopt a policy of stabilizing the purchasing power of the dollar through open-market purchases and sales of securities and gold.

Credit and currency expansion is the right road to farm relief. Such expansion will remedy unemployment, draw back into the cities at least such surplus agricultural labor as the depression has driven to the farms, and raise the prices of agricultural products. Various marketing costs, such as transportation rates, which have not fallen as much as prices generally have fallen, also will not rise so much, and, therefore, a correspondingly larger part of the price rise will go to farmers.

We have gold enough now to support any reasonable amount of bank credit and to bring back the price level to something like that of the years 1924–29, while still maintaining domestically the gold standard. If we are unwilling to leave the gold standard, then a Presidential embargo on gold shipments ought certainly to be possible in any period of appreciation of the value of gold. Otherwise we are at the mercy of the rest of the world in case of any future "world scramble" for gold. For any such condition would, by causing tremendous gold exports, compel us, if we would remain on the gold standard, to restrict our credit sharply in order to maintain redemption, and such credit restriction would again precipitate crisis and severe depression.

But while we ought to have some adequate method of protecting ourselves from deflation and business depression in case of any future "world scramble" for gold, it appears that in the case of this particular "gold scramble" we have been not so much sinned against as sinning. For years, after the Great War, our financial position and strength was probably the greatest in the world. The policy of our Federal Reserve System was probably a dominant influence on the level of prices not only in the United States but in other gold-standard countries. The sharp credit restriction by our Federal Reserve banks in 1929 undoubtedly had its repercussions in foreign countries. There was, in 1929 and 1930, a considerable flow of gold to the United States. In a number of the foreign countries the choice seemed to be whether to lose the gold reserves of their central banks, to restrict credit sharply enough and bring prices down enough, with accompanying more acute business depression, so as to prevent loss of these gold reserves, or to go off of the gold standard. For a time, most of them suffered credit restriction and increasing business depression. But, finally, many of them gave up the struggle to maintain the gold standard under such difficulties and ceased to attempt redeeming their money and bank deposits in gold. But is it not a reasonable conclusion that the credit restriction, business depression, and falling prices suffered in Europe since 1929 have been due, at least in considerable measure, to the wide-spreading influence of our own inept central banking policy? If this conclusion is a right one, then the overturn of the labor cabinet in England, the rise of Hitlerism in Germany, and perhaps other events of more or less ominous import, may be the unforeseen consequences of, the results of a discontent really engendered by, a policy of our Federal Reserve Board entered upon with not the slightest premonition of its likely political consequences as well as with no apparent comprehension of its purely economic significance.

Whatever else we do, we must institute such control of our money and banking mechanism that it cannot be used to bring us again to such distresses as we are now suffering. We are literally at the mercy—as to our fortunes, our jobs, the care and education of our children—of a Federal Reserve Board which has the power to bring on business depression at almost any time, which has shown that it does not know how to prevent such depression, and which has evinced no support for legislation by Congress that would direct the Board to follow a policy of stabilizing instead of a policy of unstabilizing business and the general price level. Will the new administration, like the old, be guided by the advice of men who have approved of the Federal Reserve policy since 1929 and who, if they offer any criticism at all, content themselves with blaming the Federal Reserve authorities for not restricting credit sharply even sooner than they did—and this notwithstanding the fact that commodity prices were not rising? If a slump in the stock market for any reason whatever should tend to decrease bank credit, such effect should be immediately counteracted by low rediscount rates and a policy of open-market purchases on the part of the Federal Reserve banks. But if each seemingly unjustifiable rise in stock-exchange prices is to be the signal for a sharp and persistent country-wide restriction of credit by the Federal Reserve banks, then we may well begin to wonder whether the country can ever hope to enjoy any considerable period of sustained prosperity.

I should like to take this opportunity to express my dissent from the proposal that in order to raise agricultural prices the Government pay a rent for the holding of land out of use. This suggestion recalls recent attempts in some of our States to maintain the price of gasoline by compelling cessation of production from oil wells. Will we be likewise urged, before long, to attempt a rescue for businesses in cities by paying land speculators to hold city lots out of use?

Every really competent student of economics knows that the more land is withdrawn from production the poorer become the opportunities of the laboring man. The resources to which he may devote his labor are artificially decreased. The area on which labor can be employed is reduced. Greater unemployment must result unless and until labor consents to a reduction of wages. A decline of prices consequent on business depression seems to give rise to a variety of schemes to help out the owners of property by increasing the burdens and handicaps of those who own nothing at all.

In England there is a powerful movement, having the support of the majority of Laborites and Liberals, to increase the tax on bare-land values. The fact that such values are produced almost entirely by community development rather than by the individual is not the only argument urged for this policy.

It is contended also that by such a policy land speculation will be discouraged, the area of employment enlarged, and wages increased. "Idle land", they say, "makes idle men." But at the same time we in America are being urged to adopt direct Government encouragement for the withholding of land from production. Because of our interest in owners of farms, oil wells, and, perhaps, other property, are we going to overlook completely the needs of propertlyless wage workers and put upon these, who can least afford to bear it, the entire burden of the depression?

A policy of sufficient credit and currency expansion, coupled with success in securing general agreements to reduce barriers to international trade, and, along with these, stern repression of monopoly in the production of goods farmers must buy, ought to make obviously uncalled for any such uneconomic and unfair measure as this of taxing wage earners to raise money that will be used in reducing their opportunities for employment. Let us restore prosperity, and increase of jobs will again draw many workers to the city. Let us not try to accomplish this purpose by reducing present opportunities in the country for laborers and, perhaps, for tenant farmers, while paying rentals out of the consumer's dollar to landowners who will cooerate in a policy thus injurious to the laborers. Can it possibly be the case that in this period of distress Congress and the administration will consent to employ only inconsequential and harmful specifics and will persist in neglecting the one thing most important?

---

STATEMENT OF DAVID CUSHMAN COYLE, CONSULTING ENGINEER, NEW YORK

It seems unnecessary to suggest measures for the promotion of economic recovery, since the administration is evidently provided with a sound and adequate program. The most essential steps may, however, meet with opposition; and the economic principles which make such measures necessary need to be discussed and emphasized at every opportunity.

Three stages of Federal action may be distinguished. The first is that in which the Government consolidates its position; the second is the advance; the third will be the stabilization of prosperity.

Before a program of advance could be undertaken it was necessary to get control over the banks and potentially over the securities markets, so that neither public panic nor financial manipulation can force the closing of the banks. This object has already been accomplished. Financial pressure cannot be put directly on the Government either by exporting gold, by forcing liquidation of debts, or by frightening bank depositors into withdrawing their deposits. The Government can quickly establish any regulations necessary to protect its program.

Moreover, the Government has proved its ability to reduce waste and to resist the veterans' lobby. These measures, though directly injurious to business, have laid the foundation for a large increase of Federal expenditure, now that the country knows the money will be carefully and honestly spent. The program of advance must necessarily take the form of very large expenditures for public works and services, outside of the regular operating Budget.

Prosperity depends on a continuous supply of consumer buying power; money which accumulates in large incomes or capital funds must be continuously redistributed to the smaller incomes, or else the market for business necessarily dries up. Previous depressions have ended when this distribution recommenced through a revival of commercial investment which created employment and distributed wages to the building industry. This process is blocked this time by the following facts: (1) The new investments would be new business debts, and business still has left from the last boom an undeflated debt burden greater than it can carry. In previous depressions the mortality of capital was sufficient to make room for a large mass of new investment, but this time the required volume of bankruptcy was more than the country was emotionally able to endure. Measures were taken to prevent the collapse of capital structures. These measures may have prevented serious disorder, but they also blocked the possibility of enough new investment to restore prosperity. (2) The accelerating rate of technological advance renders it impossible to give enough employment on building new machinery to overcome the unemployment caused by the new machinery itself.

Capital funds must therefore be dissipated by direct spending in sufficient volume to provide business with a market without saddling business with large new debt burdens.

Just as business cannot stand the effects of a recovery depending on large capital investment, so also it cannot stand a recovery based on self-liquidating public work. Self-liquidating works have the same effect as business debt, because they drain off consumer buying power and reduce the buying market. There is no escape from the economic law that sound investment cannot be more than what business can carry, and that all other accumulated funds must be dissipated by spending or they will automatically dissipate themselves by bankruptcies.

This economic law is contrary to what has been believed to be "sound" finance. There will therefore be sincere opposition from those who consider it unsound to dissipate capital funds without setting up an equal volume of new debt.' This opposition must be overcome or it will emasculate the program by causing the growth of a new debt structure resting on the consumer, thereby leading inevitably to a new collapse of business.

The natural automatic adjustments of society to a high and increasing rate of mechanical productivity have become inadequate, and require to be deliberately fostered by Federal action. Shorter working time, the minimum wage, the restriction of child labor, and a generous old-age pension system are valuable and necessary palliatives. The fundamental adjustment, however, must necessarily lie in a rapid growth and in deliberate conservation of the service markets. The production of mterial goods can never employ more than a small percentage of our available labor. The surplus must necessrily be employed in cultural and quasi-cultural services, most of them generally classed as luxuries. The private luxury market, on which business now so largely depends, is excessively unstable, falling off severely in depression. Until the people are habituated to a high rate of personal spending, the market can be stabilized only if the Government serves as agent for collecting and spending a large percentage of the national income. Moreover, by proper tax exemptions, the Government can and should force a large volume of contributions into semi-public service institutions. For this reason public expenditure and institutional expenditure supported by tax-exempt contributions must greatly increase in the future if there is to be any hope of stabilizing business.

This, too, is contrary to what has been thought to be "sound" finance, and will be sincerely resisted by those who still think in terms of a system of low productivity. The resistance of these financial influences must be overcome, or business can never attain a stable prosperity in this country.

The process of financing an adequate program of public works in advance of the revenues necessary to pay for them involves certain dangers that are not generally recognized. If the bonds issued for this purpose are sold to the public for cash, the effect will be deflationary, and will largely counteract the stimulating effect of the public work itself. Moreover, if after the return of prosperity the bonds held by the public are paid off, the effect will be inflationary, tending to create a dangerous boom in the securities markets. On the other hand, if the bonds were to be sold entirely to the Federal Reserve, and paid for by an expansion of credit and currency, no deflationary effect would occur, and the stimulating effect of public works would be wholly operative. Again, when the bonds were paid off in good times, the effect would be deflationary, and would tend to prevent any tendency to a runaway inflation such as occurred in 1929. If it is necessary for psychological reasons to sell part of the bond issue to the public, the inflation of Federal Reserve credit or notes will no doubt be managed so as to avoid a collapse of the general bond market. The other half of the process, however, is more likely to be misunderstood. In order to prevent the inflation from running away as it did in the last boom, it will be necessary to collect taxes from capital funds while the bonds are being paid, so as to cause no net increase of free capital in the hands of the public due to such payment. Otherwise the inflationary effect of Federal bond payments will be added to the other dangerous currents against which the Federal Reserve is forced to struggle at such a time.

Here, too, the necessary policies are contrary to what has been thought to be "sound finance." Financial opinion will generally favor the minimum of inflation during depression and the minimum of deflation during prosperity. So far as financial influences prevail, there is danger that measures for promoting recovery may be rendered ineffective; and if recovery is obtained, such influences are liable to result in failure to control the inflation.

When prosperity has been restored through a bold program of Federal expenditure it can be preserved only if two permanent policies are adopted. The first is a large and increasing program of nonself-liquidating public services. In order to find an adequate outlet for the volume of expenditure required to keep business in sound condition it may be necessary not only to devise new and enlarged forms of public service, but to reduce or abolish many fees and charges now collected by the Government. Federal subsidy of local water supplies and bridges and reduction of postal rates are possible examples.

The second necessary policy is a shifting of tax burdens to the upper brackets of incomes and inheritances and reduction of taxes on business, on real estate, and on the consumer generally. If this policy is adopted on an adequate scale it will conserve the market for goods and services and will postpone the growth of the capital structure to the point where it can destroy business by the excessive increase of overhead. On the other hand, any attempt to relieve large incomes either by "spreading" the tax burden or by self-liquidation cannot have any other result than to repeat the events of 1929–33.

Here, again, the policies necessary to preserve prosperity are contrary to the accepted principles of "sound" finance and will be sincerely condemned in many quarters. Unless the resistance from financial sources can be successfully overcome, it will be impossible to prevent the history of the last decade from repeating itself in more violent form.

Finally the principles involved in the "balanced Budget" need to be fully understood. When the Federal expenditure is very much in excess of its receipts the result is stimulating to business, and tends to cause a large increase of Federal income and the reduction of the deficit. When the expenditures are reduced the tendency is to depress business, reduce receipts, and increase the deficit. It follows that when a Federal deficit appears expenditures should be increased on such a scale as to restore prosperity and wipe out the deficit. The situation resembles war in the fact that a spending program on a scale insufficient to destroy the depression is totally lost and serves only to use up Federal credit. It also follows that when a surplus appears taxes should be largely increased, so as to prevent inflation of the securities markets and the destruction of prosperity. The general principle is that in hard times the fiscal policy should aim at a very large deficit and in good times at a very large surplus, arriving at an approximate balance over a complete cycle.

This economic principle is also contrary to what has been believed to be "sound" finance. Financial opinion leans to the policy of reducing taxes in good times and reducing expenditures in hard times, a policy the results of which have been disastrous to business. Business cannot be placed on a sound basis of stability unless the influence of old-fashioned financial opinion in this respect is successfully resisted.

The foregoing statements of economic law, proved to be correct by the course of events since the war, are offered in the hope that they may be of assistance in buttressing the policies of the present administration which are required for curing the depression and stabilizing the subsequent period of prosperity. They illustrate the fundamental fact that the interests of finance and those of business are incompatible and that if this Government is to succeed it must succeed in protecting business against the influence of finance. In a highly productive economic system, in contrast to one in its pioneer stage, "sound" finance and sound business cannot exist together. If "sound" finance is attempted, the event has shown that business is wrecked and the system is wrecked. There is no way to make the system operate except to give business the right of way and force finance to conform to the needs of business.

---

STATEMENT OF HENRY S. DENNISON, PRESIDENT DENNISON MANUFACTURING CO., FRAMINGHAM, MASS.

THE CYCLE 1927–32

The study of business cycles is still young and we know as yet too little about their real character to give a full or dependable description of them. Presuming, however, upon the rights and prerogatives of an amateur, I shall attempt a rough and somewhat hypothetical description.

Each cycle has features in which it resembles others, and each has unique combinations of factors. In general it would seem that an increase in almost any part of our economic activity results in freer buying, larger employment, more borrowing, heavier investments. It is as if this activity were reaching for the maximum development which is possible in any given community; in a broad and somewhat charitable mood it might be called the pressure for the advancement of civilization. But the combination of competitive rivalry and a quite imperfect knowledge causes this reaching to turn into an overreaching, which even under perfectly healthy conditions results in a slowing up and holding back, as if in the search for a normal rate of progress. The time lag between cause and effect in economic activity slows up the adjustment of the normal rate and considerably exaggerates the swings and underswings, causing alternating periods of hypernormal and subnormal activity. Part of the time economic, political, and social health is relatively good, this overreaching is relatively mild and its reaction correspondingly so. It would seem from the history of the past as if, left entirely to themselves, these simpler cyclic factors result in a total swing which runs over a period of 40 months. But they are never left wholly to themselves. Some of the time these simpler forces are practically overwhelmed by others.

It is possible to draw a useful picture of the economic forces of the past hundred years if we use the conception of a series of waves overlapping and interacting. It is not, however, a useful picture if the analogy is carried too far; or if it is thought that these various wave series are regular or fixed and established in their character. Such a picture can only pretend to be a rough and inadequate approximation of the truth.

In the first place, there are the usual cyclical waves averaging something like 40 months in length; and by themselves running perhaps 7 or 8 percent in height above and below average. On the surface of these waves there are the short seasonal wavelets, but these for our purposes can be overlooked since the technique of statistical description of the cyclical pattern has been so far developed that it can be shown independently of the seasonal swings. Underrunning these cyclical waves there are a variety of others. There are the waves of agricultural production, which have been variously estimated as of 7-, 9-, and 11-year lengths. It is certain that there is no conformity, or complete causal dependence between these waves and the cyclical waves. Nevertheless, it is upon them, as upon some others to be noted later, that the cyclical waves perform. Secondly, there are the great swings of the wholesale price levels, which since the Napoleonic Wars have shown a total swing of about 50 years, running down for approximately 30 and up for 20. We are now upon the third down-swing since the Napoleonic wars; but with so few in the records, and records in any case being so inadequate, with these waves particularly it is unsafe to figure upon any regularity or any inevitability. They can, of course, be taken as the waves of the value of gold as well as the waves of the general wholesale price level. And while the relation between the quantity of gold and the price level is by no means definitely settled as yet, it is significant to notice that the gold stocks of the world increased 22 percent between 1905 and 1910, 20 percent between 1910 and 1915, 18 percent between 1915 and 1920, 10 percent between 1920 and 1925, and 10 percent between 1925 and 1930. To intensify the unfortunate results of this last small increase it must be borne in mind that something like 30 countries went onto the gold standard between 1922 and 1930.

Thirdly, there is a highly speculative but, nevertheless, quite possible great secular trend centuries in length toward and away from relative security. It is possible that one trough of this wave can be placed prior to the Renaissance, rising steadily upward toward pioneering and insecurity, and reaching its top somewhere toward the end of the last century. The wave character of this movement can very easily be questioned. It is, in fact, very doubtful indeed; but what is less doubtful is that the closing of the most available and most inviting open lands at the end of the nineteenth century (those of the United States) has certainly made a vital difference in the minds of men and to the relative risks and penalties involved in rapid rates of change, in pioneering, and in the logic of laissez-faire.

And, finally, there are the random perturbations in economic affairs such as the plagues and famines of nature, the wars of political units, and other social and political overturns. These might be likened to tidal waves, which certainly as yet seem to show no regularity but which vitally affect and condition the behavior of all the other sorts.

Again you should be warned that this is a mere analogy and that it oversimplifies the situation. It is certain that these economic results cannot be simple physical and arithmetical summations of various wave motions, even granting that the wave motions exist. Affairs in the economic world as in the psychological react upon each other in too complex a fashion for any such simple picture. It can be, however, fairly safely assumed for this picture that the fall of any given wave is seriously affected, if not totally conditioned by its rise; and that it is during the rise that we must expect to take the most effective steps for any cures and mitigations of the evils of the fall. You should be further warned that these movements are all aggregates of a great many separate factors, and that among the separate factors individual cases will run wholly counter to the statistical average of the total.

Granting all the imperfections of this picture, it will, nevertheless, be interesting to attempt to fit the cycle of 1927–32 into it. What were the ground swells upon which the simple cylical recession, beginning in the middle of 1929, imposed itself. In the first place there was the great tidal wave of war, receding, but still affecting the world economic situation. Secondly, there was the receding price curve, which from a trough in 1897 had found its peak in 1920. Thirdly, there was the receding curve of agricultural prosperity, relative to the prosperity of commerce and industry. Fourthly, there was an advancing wave of political stability, although from what may be called a very low trough in 1923, nevertheless advancing, I think it is safe to say. Fifthly, there was an increasing difficulty growing in international commodity exchange, through reparations and noncommercial debts and through the growth and intensifications of tariffs, which thickened the economic streams and lent it a viscosity of rather unusual strength, for modern times at least. Sixthly, there was a very rapid acceleration in the rates of increase in productive efficiency. And seventh, a decided increase in the proportion of the total income of the civilized world which was destined to be devoted to investment channels as against that proportion which was destined to be devoted to the purchase of consumers goods; and this in spite of the widely advertised absolute increase in per capita consumption spending; in other words, in the standards of living of the masses.

This last statement is so counter to the belief which gained strong currency up to 1929, and since, that certain figures should be given in support of it. In the first place there is an analysis of manufacturing costs on the basis of 1923 as 100 which shows that in 1929 the selling price was 90, cost of material 87, cost of labor 84, overhead and profits 102. Secondly, there are the rewards in the manufacturing world per unit of product taking 1899 as 100.

The figures show for 1923 that the producer of materials got 109, the laborer 120, and the salaried workers and owners 118; while in 1929 the three parallel figures are 99, 111, and 126. Thirdly, the net profits of corporations of 1½ billion dollars in 1923 increased to $2,650,000,000 in 1929. This showed an increase of 14 percent per unit of product. And, fourthly, between 1922 and 1929 the average rate of increase per year in the real earnings of all employed workers was 2.2 percent, but for the dividend disbursements as drawn from the internal revenue figures 12.3 percent, while the dividends of industrials alone showed annual average rates of increase of 21.3 percent. When in addition to these figures it is remembered that all this happened at a time of great increase in productivity, during which the true need was for rapid increase in consuming power rather than investing power, we can show, I think, one peculiarly powerful set of stresses and strains which were being set up to meet the simple cyclical fall of 1929 and intensify it.

In this review of seven underlying factors, there are many unfavorable conditions; yet before blaming their aggregation for present conditions we must remember that in 1924 and 1927 when commercial and industrial factors underwent, also, the true typical cylical recession, most of these underlying conditions were there and some were worse. There must be something more, then, to look for if we are to account for the immensely greater severity of the recession of 1929 over the two previous ones.

That this missing factor cannot be found in the nature of the commercial and industrial rise and fall itself seems to me to be clear from the fact that its rise was only 18 months long, whereas the average period of rise between 1871 and 1896 was 23 months, a period which experienced, also, a fall in the general price level. In extent the rise of commercial and industrial factors was less than average. In 102 out of 113 series which represent the operating end of business, they were less than average, and in only 10 were they more. Yet when the recession got fully under way 70 of these series showed more than the average decline; 18 up to the middle of 1931 had made all-time records; and only 40 showed less than average; many of these by this time must have shown more.

There seem to have been no important commodity price inflation. Wholesale prices, in fact, dropped from a basis of 100 in 1925 year by year to 97, 92, 94, and 93 in 1929. Retail prices from 100 in 1925 through 100, 98, 97, to 97 in 1929. That certain rather extraordinary projects in valorization of prices held up individual cases is admitted, but in view of the general fall during this period it is pretty hard to see how valorization can be credited or debited very heavily with the severity of the recession.

That there was no abnormal activity in industry, of the sort that is rather loosely called overproduction, seems to be indicated when the inventories of 253 corporations, upon which records can be gotten are compared. In 1927 these inventories taken at 100 against sales at 100 showed in the end of 1928 inventories of 104 against sales of 112; at the end of 1929 inventories of 117 against sales of 122. Inventories, of course, can be expected to move with sales, and if they move at a less rapid rate it is hard to see where the case of general overproduction can find its basis. In the great raw materials there are only a few cases of heavy increases until December of 1929, at which time the recession had already well set in.

The volume of production increased from 1922 to 1929 at the average rate of 3.8 percent per year as against 3.2 percent for the years 1901 to 1913. On a per-capita-of-population basis these figures are 2.3 percent for the later period against 1.3 percent for the earlier. If in any given community general purchasing power were to be reasonably maintained, it would be difficult to believe that the rate of 2.3 percent per year was too high to be assimilated by a rising standard of living; but even if it is somewhat too high, it is difficult indeed to believe that it is so excessively high as to have had any considerable share in causing the tremendous collapse and readjustment which has occurred since 1929.

On no way of figuring it can it seem reasonable that general overproduction occurred to any such extent as to be given any large share of the blame for the intensity of the recent depression. It may well be judged to have brought about its beginning in the usual way in which recessions in business have so many times in the past begun. But all figures seem to indicate that if this were the principal factor in the situation the recession would have been mild and not very long lived.

It is difficult indeed to get any facts upon which to examine the question as to whether our capacity to produce has been built up to an excessive degree. There is much to substantiate the belief that in a progressing and competitive system the theoretical capacity is always very largely in excess of production. In many lines the figures that are given of percentage utilization of capacity seldom exceed 70 percent, even at the best of times. As to the increase in production capacity during the past 6 or 7 years the figures are slight and not every reliable. The sales of the machinery trades in the years 1923, 1925, 1927, and 1929, run in index figures: 91, 100, 106, and 123; against production figures of 96, 100, 107, and 121, which are the figures for total production of the country. But the figures for industrial building do show a tremendous increase in 1929. For the 4 years mentioned, they run: 99, 100, 117, and 166.

The construction industry as a whole shows rather odd behavior with relation to the other industries. It was very high before the cycle began and ran high through the depression of 1924 and 1927, but it dropped early in 1928, showed a slight spurt at the most active time of 1929, and then a very heavy drop. It is residential building which is the chief factor in these figures; the others show rather more usual behavior, except, of course, for the great increase in industrial building in 1929. The heavy drop in the construction industry is, of course, an intensifier of depression as it is always, but the lack of any rise in the total construction in 1928 and 1929 is a somewhat modifying factor against inflationary activity. On the whole, the construction industry must be judged, I think, as an effect rather than a cause, although the minute the recession began it greatly intensified the difficulties.

It is when we turn from the strictly operating end of the business world to the stock market and the financial events associated with it that strikingly abnormal conditions appear. The facts are too familiar to need repetition, but one or two contrasts are worth noting.

I said above that 102 out of 113 operating factors rose less than the average to the peak of 1929, but, on the other hand, almost all factors connected with the stock market rose more than double the average, and the rise in the prices of stock beat all of the Dow Jones records, which run to 1897, and Macaulay's partial records which run back to 1857. The rather notable stock-market cycle of 1900 to 1903 showed a rise of 34 on the Dow Jones scale, while this recent cycle showed a rise of 99.

While the wholesale price index was running down from 1925 to 1929 from 100 to 93, common stock prices went up 100, 111, 132, 167, and 212, while the total value of stock sales ran 100, 113, 149, 251, and 316. And it must be remembered that these figures are averages for the year, not peaks at the high point of the years. And with regard to stock prices it must be remembered that while in the material commodity market increases in price finally induce reduction in sales, in the stock market there is a powerful and long continued influence for increase in prices to induce excessive sales.

Some economists who followed closely the course of prices and quantities in the commodity market were puzzled by their relatively moderate increase in the face of the increasing volumes of credit during this prerecession period. The quantity theorists faced growing skepticism. But when a price index is made up not only of commodities but of commodities and common stocks as well, it compares rather curiously with the index of bank credits. The figures of the two from 1925 to 1929 are as follows: For a combination of commodity and stock prices, 100, 101, 102, 110, and 118; and for bank credits, 100, 106, 110, 117, and 120. While this correlation may not be very close it is certainly strikingly closer than when commodity prices alone are considered since they receded during this period.

All sorts of evidence, in fact, shows that the increased credit volume was devoting itself very largely to the securities and real-estate market. As one example, the reports from member banks show between 1922 and 1927, out of a total increase in loans and investments of 7 billions, 3 in investments, 3 in collateral loans, and only 1 in commercial loans. By the end of 1926, 60 percent of the earnings assets of these member banks were engaged directly or indirectly in the capital markets. From 1922 to 1929 the average annual increase of commercial credit was 3.2 percent; of credits directly related to the security markets, 8.1 percent (and it must be remembered that this is a repeated annual increase); and to the urban real-estate markets, 12.5 percent.

The effects of this tremendous inflation in the financial world were widespread. On the purchase of commodities there was created an artificial demand based on nonrecurrent income, or at times on an imaginary or paper income, which was capable of a swift and sharp retraction. On the development of new productive capacity it offered an immense temptation to overcapitalize, and having capital to build, expand, or to merge high cost producers with their stronger competitors. On the commodity price level there was a slight influence through the tempting ease with which valorization schemes could be financed. On operating management there was a very serious influence by distracting attention from the hourly job of making a company good inside to the playing with its stock on the market outside. It is more than possible that the market inflation was partly if not largely responsible for the diminution in residential building in 1928, for certainly in many cases people withheld from intended building in the hopes of making a lot more money by investing what they had in the market for a rise. And its effects were not least on the international situation, for it has been estimated that of the 10½ billions we lent abroad since the war, 5 billions came back to the stock market directly or indirectly through the call-money market. It is in any case certain that the sharp reductions in lending abroad which occurred in 1928 were not unrelated to the enormously inviting opportunities for gains on money placed nearer home.

To sum up:

1. Almost all the strictly commercial and industrial factors, the so-called "factors of the operating business world", were moderate in their rise from 1927 to 1929, and the cycle started its recession in June 1929, among these factors, moderately and from no greatly inflated level.

2. But the stock and real-estate market inflation itself, and the banking that went with it (and some went a long ways) was of record proportions, at least for the 80 years during which we have records enough even to guess at.

3. Average and normal business recession in June 1929, was the signal for the bursting of the stock-market bubble, and this bursting thereafter has deeply intensified all recessional factors.

This collapse in the economic health of the world occurred at the time when most of the underlying constitution factors were seriously unfavorable. First and most important, it occurred upon a descending long-term trend of prices; second, upon conditions of agricultural stress, both as to prices and capital values; third, upon a structure of international finance which was improving, to be sure, but which was by no means solid; fourth, upon increasing resistances to the flow of commodities through rising tariffs; fifth, it occurred after sveral years during which, in spite of the rising standard of living of the masses, there was a largely increased proportion of the produced wealth going to the well to do and, hence, in considerable proportion into investment channels, and this just at a time when improved technique of all sorts was making our chief need consuming power rather than renewed investments; sixth, as is now clearly evident, it fell upon a banking management far below the high level of fine professional standards with which bankers have been credited and which we have a right to expect that they should assume.

Granting conditions to have been something as I have outlined, is there anything in the world that can be done about it? It must be admitted at once that we know very much too little for any complete answer, but we do know, I think, enough to point out some very definite directions of effort and directions in which further study might result in fairly prompt conclusions.

(*a*) In the first place there is the problem of the general long-range swings of the price level. There is a strong presumption of its relation to the gold supply or, rather, to the credit currency which so far has been built upon gold. This is clearly an international problem, a problem for which the Bank of International Settlement, or a group of international bankers through the B.I.S. seems the most practical means through which relief could come.

(*b*) There is the striking fact of sheer and pyramided gambling in stock markets. We may not yet know how to control this, but our recent experience seems to give us grounds to believe that few other measures will be any good at all unless we can invent some devices through which a limiting influence can be exerted upon these markets. They have their proper economic function, as is well known, but through the years previous to 1929 it is not an unfair estimate that their proper economic function exercised about 5 percent of the time and 95 percent was given up to what is no more nor less than a gambling game.

(*c*) There is obviously the need of international political stability. The close interlocking of nations in economic actuality has made it an absolute necessity from the economic point of view, as it always was a necessity from the moralistic point of view, to do everything that anybody can do to make war less likely in the future.

(*d*) We must recognize and make more clearly and widely known the modern need for consumption funds as against investment funds and, hence, the advantages of considerable and larger proportions of the national income turning into the channels through which they are mostly likely to flow smoothly and with maximum regularity into consumption spending. This is the old oversaving theory in a new aspect, and it gives to the high-wage doctrine its fundamental, cool, long-range economic validity, in addition to whatever it may have had of a sentimental, political, or moralistic nature.

(*e*) Our structure for deposit banking must be strengthened. When something like two billions of deposits is tied up by failures, affecting something like 5,000,000 people, it is about time to recognize that the deposit account has by habituation come to be considered currency just as truly as pieces of paper printed in green and bearing Government stamps and signatures. It seems to me inevitable that the day must come when deposit accounts are insured, and the only question is through what steps can this be brought about gradually and most effectively. And it must be recognized that when deposit banking is tackled as a problem, investment banking is related to it.

(*f*) It is time, also, for a reassessment of all our theories and prejudices relating to tariffs; and from an international angle, not because to be international minded is to be holy, but because economic society, which is now the overwhelming aspect of society in the so-called civilized world, flows over, by, and through all national boundaries, binding inextricably the economic good of each modern nation into the good of all nations.

(*g*) It is time, too, for a reappraisal of the good and evil elements of unrestricted competition. Such an elemental analysis will give us factual material upon which to invent ways by which the good in competition can be held and the evil[1] lessened. We have so far been satisfied with the mere slogan that competition is the life of trade; but this, like most slogans, says little or nothing. We know that food is the life of man; and we know, also, that food of the wrong sort, in excess, or in undue proportions, can be the death of man.

These examples of possible fields of action do not, of course, pretend to be complete. They are only suggestive; there are other possibilities in addition to them, in which anyone who is not so deeply discouraged that he will not act at all can find food for thought and opportunities for service.

## A 5-YEAR PLAN FOR PLANNING

There has been a great deal of careful thought recently given to the question of establishing some sort of a national economic council to undertake some degree of economic planning. And it has been given not only by theoretical men but by practical men as well. The report of the Senate hearings of Senator La Follette's committee last fall, a recent issue of the Annals, and a short pamphlet by von Haan, present a very large and varied amount of material on the subject.

Objections to beginning such a project seem to classify themselves under five heads—first, that cycles and crises are inevitable, and that it is not only useless to attempt to deal with them but harmful; second, that government should have less and less to do with business, and that economic planning even of the most limited sort would constitute, or would invite, intrusion of government into business affairs; third, that planning requires an intimate knowledge of every detail of economic activity, and a foreknowledge of the future, as well; and that since these are impossible, planning itself is useless or worse; fourth, the communists' objection that no planning is possible until the whole capitalist system is swept away; and fifth, the opposite objection that laissez-faire individualism contains within itself an automatic planning superior in the long run to any other.

The first objection, that cyclical catastrophes are inevitable, is inherent in the temperaments of certain men, and especially deeply imbedded if they happen to be in relatively comfortable economic circumstances or are of the

[1] As an example—and a most important one—the evils arising from the fact the most competition is now blindfold. The social losses from panicky estimates of what competitors can do and survive are very large. Open, full, universal, quarterly accounts would revolutionize while preserving competition.

sort who would gamble upon themselves to win out no matter what happens. It is practically valueless to attempt to argue against such temperaments or such circumstances; but to men of other temper such a fatalistic attitude is of too much of a piece with the earlier attitude toward the great plagues as acts of God. These men will admit that it may turn out to be impossible to do as much as we should like, but will maintain that if business leaders fail to make any attempt whatever they would be left defenseless when some day under great stress an enraged populace will call them to account.

Argument against the second type, that government must keep hands off business, is only a little less useless when addressed to men deeply ingrained with the idea that business and government are two separate or separable segments of the total social structure, notwithstanding the fact that a large majoriy of just these men are eager enough for government interference when they can see it react in their own favor. To men of broader perspective and richer historical knowledge it is more likely to appear that the fields of economics and politics in the last few hundred years have interpenetrated more and more intimately with every step in the development of the industrial system, the credit structure, and the facility of communication; that the fields, in fact, have never been separate or clearly separable, and that they are becoming less and less so with every year that passes. To such men any attempts to keep government out of business at any or all costs are likely to be as fruitless as Canute's edict against the rising tide. To them the crucial problem is the steady and progressive reorganization of governmental structure, so that its necessary influence upon economic life may contain less of harm and more of good.

The third objection, that men are not wise enough to plan, arises from a very common confusion of planning with a plan, and, moreover, with an interpretation even of the word plan, in terms of those plans which are most widely known to us, to wit, plans for a house or specifications for a machine. But as a matter of fact even finished plans are not necessarily thus rigid and specific. Only in those sectors of the engineering sciences where the objective can be clearly known and where all intermediate factors and materials are likewise known, can plans be so fixed. In most of the other fields of life they run in gradual steps away from this rigidity into the extremes of vagueness and flexibility. And planning is necessarily more flexible than the plans it may succeed in making. For planning must first explore its field of knowledge and determine the extent to which any given plan can be made specific before it attempts to draw up and plan at all.

The objection of the loyal Russian is partly an expression of his loyalty. But it, too, interprets the word planning so as to exclude any but complete and all-inclusive plans. When we plan for railroads so that they may operate more effectively, it is to the soviet devotee no plan at all, since it makes no plan for busses, trucks, or coastwise steamers. Obviously, however, his objections to planning as such is of little real import to him; his deeper conviction is that the ills of capitalism are of the essence of capitalism, not to be overcome by evolutionary methods, but only by the revolutionary overthrow of capitalism itself. In this conviction he rejoices when we wallow in all the ills of individualism and thus bring closer the "blessed day of revolution."

But granting him the benefit of every doubt in his reading of the evidence of history, there still remains upon his main contention a doubt too vital to allow any American lover of mankind to fold his hands for what in this country may be 2 generations, or 5, or 10.

The fifth objection, that of the Lazy Fairies, will detain us here a short time only. To give their automatic-planning system a test we must first have a system of laissez faire, and that, moreover, in a modern world where frontiers of pioneer settlement are no longer wide open. We must, for example, eliminate virtually all tariffs at home and abroad, abolish the I.C.C. and the Federal Reserve Board, reduce to insignificance the economic efforts of taxation and of the issuance and retirement of Government bonds, and make other minor alterations. Putter once with a delicate automatic system and it becomes more delicate, and no longer automatic.

Planning is no new or mysterious process in our lives. We are always planning, whether it is to go to work tomorrow morning or take some kind of vacation next year. Plans can be for a long time ahead or for the next few moments; they can be specific, or vague; they can be written on paper or contained in the planner's head; and they can represent a persistent purpose, or have as little compelling force upon action as day dreams. Planning, therefore, is nothing to be feared because it will force us into a strait-jacket; if it attempted to do so in a field where harm would result, it would simply be bad planning. The good plan will adapt its degree of flexibility, its length of time span, and its measures to impel action, all to the full circumstances which surround the situation it deals with.

The degree of flexibility of any plan, and the extent to which it goes into detail, will be determined largely by the correctness with which the essential factors in the given situation can be known and future reactions foreseen. Yearly budgets are good examples of plans which can be flexible or rigid, and, also, of some of the difficulties which may arise when they are too flexible or too rigid.

The proper length of time span will depend partly upon the possibilities of foresight, and very largely upon the natural or usual lengths of the cycles in the fields covered. For example, the yearly plan is appropriate for any matters connected with agriculture in the temperate zone, but for measures which are to influence industrial and commercial affairs, the year is inadequate; a period at least sufficient to cover the typical 40-month span of the industrial cycle must be chosen. Taxation is an example of an influence which has a very material effect upon business and industry; and taxation is subject merely to annual planning, whereas the business situation upon which it imposes itself varies with fair regularity over something like a 4-year period and is, therefore, sometimes too heavily, sometimes too lightly, burdened by taxation.

Not even with national planning are all plans necessarily to be thought of as written. There will probably be, for example, a great deal of educational work necessary which will be undertaken not as a part of any specific plan but which will turn out to be, nevertheless, just as much a part of some future plan as if it had been written at the outset. But the value of writing down a plan in black and white is considerable even where the plan itself cannot be complete or specific. For in even the attempt to write down a highly imperfect plan, the imperfections become more obvious and definite and hence show the needs for further information, or further education, or whatever they may be. Only by writing down vague and imperfect plans and attempting to make them clear can we learn to make better ones. An example can be chosen again from the field of budgeting where it is now fairly well understood that in order to get a really good budget some 3 or 4 years must be spent making concise, definite, but very bad budgets, and learning from each as experience shows where the bad spots are. The civil service is another example of the possibilities of definite and planned action in opening the way to better action; for however imperfect the examinations for civil service may be, they are at least down on paper; they can be seen and, if one cares to study hard enough, their imperfections may become known; whereas the method of choosing Government employees by the hit-or-miss method, hundreds of different people acting from hundreds of different motives each time, gives no opportunity whatever for perfecting the machinery.

The methods used to put plans into effect will vary, also, with the circumstances of each case. In national planning many of the proposals will require congressional action; but even with these it will be a practical question each time whether the project is merely to be left upon the doorsteps of Congress, or whether educative or other measures will be appropriate to the circumstances in order to advance action upon them. But likewise it will be a function of national planning to guide the actions of the business world; and here very real and practical questions will offer themselves as to the best method of getting such plans into effect. Certainly at the early stages any measures approaching compulsion will be impossible; but it is not usually realized that measures for persuasion should be as carefully considered as methods for compulsion. In the Senate's committee hearings it was brought out as an objection to national planning that even if dangerous situations were made known and advice given concernig them, the advice was not taken, as, for example, when in 1928 the overbuilding in Chicago was widely recognized and definitely stated by several responsible people, with no results at all upon the newer projects for building. Likewise with agriculture, when all sorts of powerful statements are made about the overproduction of certain crops there is no visible response in reduced acreage; and when warnings are given by the Department of Commerce of the increase of stocks or of overequipment in certain industries, seldom has any slowing up of the growth in production or productive equipment been noticeable. But this is bad planning, for it should be recognized that when the natural economic forces in an individualistic system are working strongly in one direction, words of advice and warning are as the wind blowing in the trees; and it should be further recognized that more harm than good is done by issuing warnings which can not in the nature of the case be followed.

For repeated warnings which can not in the nature of the case be followed will turn into the cry of "wolf" and make it impossible that future and better calculated warnings can be heeded. To get any of its plans followed out a national board will have to induce action, and of all the means imaginable to this end exhortation is the poorest. In its subtle and difficult problems it is more likely that a successful planning board will accomplish its ends by taking into consultation representatives of the people, or of the organizations involved, and giving them a large share in working out the facts of the situation and the resulting plans, so that they may gain that depth of understanding that comes from taking part in creation. With thoroughness and patience shown in its preliminary work, it is not too much to expect that a real planning board will be able to invent and discover methods of enforcement a thousand times better than exhortations and warnings.

To summarize what planning really means, I want to quote some parts of the article written by Hugo von Haan in the Annals:

"Planning aims at * * * the avoidance of rapid and excessive changes in economic life.

"Planning follows the law of extension from the narrower to the broader.

"Planning is to be based on planning units. These are: Geographical units, regions: economic units, industries; and political units, nations.

"Planning is not limited in time (like most of the plans), but represents a permanent way of concerted doing.

"Planning breaks away from crystallized habits and from the opinion that economics, industry, business (and), production * * * are ends in themselves, and sets its objective outside, over them, in the steady rise of the general standard of living.

"Planning, therefore, can not be entirely economic nor entirely social, but must be social-economic in character.

"Planning believes in evolution, not in revolution, and therefore adopts a policy of patience, which counts progress in terms not of years nor of decades but of generations, in conformity with a greater plan." Our national planning will by its nature aim at evolution, not revolution. It will have to do with an organic entity, with that group of human beings, human institutions, and human habit patterns which we call the United States of today; and its problem will, therefore, be of organic growth, partly of emergent evolution into the fields of the new, and, hence, a vital part of its technique must be recognized as experiment. Its final objective, therefore, will be somewhat vague and general, a statement of direction of effort rather than a goal. From the economic point of view it can, perhaps, be stated as a steadily, if slowly, rising general standard of living with the maximum possible freedom from large and abrupt fluctuations. From the broader social point of view we can at the moment, perhaps, state a general objective in no more precise terms than the attainment of fuller and deeper life for larger and larger numbers of people.

The problem of national planning is therefore not how to jump from complete laissez-faire to complete social control. We haven't, and never have had, the one, and haven't, and probably never will have the other. The problem will be how, in spite of existing obstacles, to take the most practical steps away from known evils and in the general direction of the broadest good. National planning would never attempt to decide whether laissez-faire individualism is in itself good or evil. It will attempt to discover, rather, in the present situation, whatever one may call it, the factors of good and the factors of evil, and propose such measures as will tend to eliminate or mitigate the evil factors one by one.

No one can pretend to be able to lay out in advance the various methods which a planning council would use to induce action, but some general comments upon the possibilities of such action can be made. In the first place, as I have already said, the members of the council must realize that truth does not of itself prevail. As a matter of fact, perhaps, it never has, or only when it has been driven home to the people by some near genius. Therefore the council will give advice only after considering the limitations of human comprehension, the limitations imposed by the habit patterns of thought, and the limitations imposed by self-interest. They must increase steadily the range of understanding of the business public and of the total public before they can hope to have influence. This understanding they must build before they can hope any proposals for compulsory action will be of real effect. It is the building up of understanding which is of principal importance.

For this reason, because much will depend upon their prestige, it is of the essence that the law which sets them up definitely frees them from any requirements to report on any specific subject, no matter who may ask for such report. It is clear to see, for example, that if in the first year any executive or Congress should ask for a report upon the tariff, the game would be up. Nothing could be said by them which would not injure their prestige with too large a section of the prejudiced public beyond hope of recovery.

But prestige even when gained must be held, and understanding even when won must be continually refreshed. Therefore it is probable that they will take the course of sending special reports to and taking into special consultation various types of organizations of business men; that they will maintain relationships with executive branches of the Government and with congressional committees. For this purpose, and to make this a continuous and organized activity, they should have a department for publicity. The word is unfortunate, because the publicity of such an organization as this would be far removed from the usual ballyhoo of publicity departments. Theirs would be, in fact, a difficult project in adult education. Nevertheless, in the true sense of the word it would be continuous publicity and could not be expected to succeed unless a permanent part of its organization were formed to see that it was carried on.

Their influence upon Congress is of essential importance, but I do not see that the technique of building up an influential relationship with Congress is far removed from that of building up such a relationship with various branches of the business world. If it is once understood that prestige and influence must be earned and rearned, the technique of developing it will not be too difficult. Again I repeat that if they are to build up such influence, they, themselves, must be the judges of what they undertake to study and upon what they decide to report, first, second, third, and all the time. They must not be required to issue reports upon any specific subject. If Congress or the executives need any such thing, and the council prefers not to undertake it, Congress and the executives have the same possibilities that they have today to set up special organizations for the purpose.

In the Senate hearings the statement recurs that such an organization as this must build from the bottom up rather than from the top down. It is certain that they must build from the bottom up, but it is equally certain, I think, that they must build from the top down. They must, that is to say, gain this growing understanding and attitude of cooperation in the business world, and in the legislative and executive branches of the Government; but they must, also, build their council into a piece of machinery for leadership. Understanding, cooperation, better organization—all the measures which build from the bottom up—will mightily increase their effectiveness, but out of such development there is not one chance in a thousand that leadership will grow. The council must appreciate that it is upon them that the responsibility for leadership in their field rests. The business community may be made more ready to respond to such leadership, but under competitive conditions we have no right to expect leadership to grow in and of the business community. For this leadership we must look to the national economic or planning council.

Planning on any considerable scale is itself a pretty large undertaking and, therefore, itself needs planning. For this reason I have given as the title of this talk "A Five-Year Plan for Planning." I want to attempt now to formulate such a plan, not because it will necessarily be the one which will be followed, but because it puts a proposition before us in concise and realistic fashion, so that its merits can be weighed and its deficiencies corrected. I am proposing activities for each of the first 5 years, and in each I am proposing certain subjects for action by the planning board or council. This point I think of major importance, for although there will be many subjects to which considerable study must be devoted before action can be taken, it would be most unfortunate to have such a council start for the first 1 or 2 years upon study projects alone. It is humanly difficult, always, to come out from a study in a mood for action. That mood, and the habit of that mood, must be developed from the very beginning. And for each year, also, I have suggested subjects for study, but it should be clearly understood that "study" does not mean that the planning board itself, through its own organization, will undertake all the studies. There are a number of organizations in the country, like the national bureau and the conference board and many others, with which it can cooperate or to which it can assign certain projects or parts of them. Moreover, projects for study should be understood in each case to be projects, also, for conference with appropriate associations or individuals in the business and political world, so that as many as possible of the factors vital for effective action will be brought into the discussion to take an active part in the working out of the proposal later to be developed.

### Program First Year

#### FOR ACTION

1. Public works and their financing over 5- or 10-year periods: A considerable amount of the study necessary to face this proposition has already been done. A recent book by Loucks is a compendium. There is no reason why, within a year from the time the planning board is organized, there should not be specific recommendations ready.
2. The development of the evolution of trade associations and other organizations: The effort should be made at once to evolve a new conception of and to develop a better and fuller working of trade associations on their present lines. For example, for the increase of budgeting among their members, of simplification and standardization, of uniform cost accounting, and of regularization of operation and employment.

#### FOR STUDY AND ACTION

1. Finance and credit: Many steps will be necessary here, and some, it is wholly reasonable to believe, it will be possible to suggest within the first year. Such steps as the strengthening of the Federal Reserve Board, and of the whole banking structure, are cases in point. In addition, there should be a study of the dynamics of the credit-currency system, not merely in its long run but primarily in its short run trends; and along with it a study of the relation of our national finance to international finance, and the relation of international finance to export and import trade.
2. The organization of some single industry: This will take some advance study, but before the year is out there ought to be definite plans for its organization; and the industry to be chosen would seem, without any question, to be the coal industry, or, more likely, the soft-coal industry. There should be developed by the planning board a definite scheme for a 10-year organization of this industry, which should allow its return to a more freely organized form at the end of that time—or if it should then turn out that the whole country is being better served, a continuation of the firmer type of organization.

#### FOR STUDY

1. Taxation: The primary purpose of such a study should not be so much on the revenue aspects of taxation as on the economic effects of the varieties of taxation commonly used, or other forms which might be used. Taxation for this purpose should be classified with relation to its different general economic effects over various separate sectors of the cycle, and each classification considered with regard to the possibility of planning such taxation not over merely annual periods but preferably over periods of from 5 to 10 years in length.
2. An intensive study of business cycles, with especial effort to segregate the cause and effects of the separate cycles: The industrial-commercial, the speculative, the agricultural, the long-time monetary cycles, and others.

3. Stock speculation: The deviations from long-run values in the case of separate stocks, and their various effects, as, for example, their effect in concealing the true valuation of savings, i. e., the true "price of capital."
4. A study of stock market cycles.
5. A study of the housing problem.

## Program Second Year

### FOR ACTION

1. Develop further the field and influence of trade and other associations.
2. Initiate the full organization of some second industry, such as and for example, the textile industry or the oil industry.

### FOR STUDY

1. Bring together in conferences men with statistical knowledge and men with practical knowledge in order to make more clear the practical application of statistical facts and the gaps in our statistical knowledge that must be filled before such applications can be made.
2. A study of the distribution of commodities: The technique of distribution, the extent and distribution of inventories, and the the cost of distribution.
3. The distribution of wealth and of income.
4. The quantity and trends of productive equipment, and incidental to this the beginning of a study of the effects of additional quanta of equipment upon the total valuation of such equipment in any given productive field.

## Program Third Year

### FOR ACTION

1. The organization of some third industry: It is too early now to make any specific suggestions. Certainly, experience in the fields of coal, and perhaps of textiles or oil, should point the way better than we can now know how to point it.
2. The beginnings of definite interpretations of statistical data.
3. Housing proposals based on first-year studies.

### FOR STUDY AND ACTION

1. The beginnings of a limitation of speculative excesses in the stock market.
2. Proposals for the betterment of antitrust laws.

### FOR STUDY

1. Agricultural problems—especially effects of capitalizing future in agricultural land values.
2. The relative flow of the income stream and the investment stream both in and out, that is, both from the point of view of sources and expenditures; and the influences effecting the relative flow of these streams.
3. Land speculation, its extent and its effects.
4. The problems of power production.

## Program for Fourth Year

### FOR ACTION

1. Establish under appropriate supervision the beginnings of the use of limited authority by trade and other business associations.
2. Establish open and uniform quarterly accounting by all public corporations.
3. Proposals for taxation based on the first year's study.

### FOR STUDY AND ACTION

1. A permanent organization for crisis relief; primarily, of course, economic crisis, but it is possible that natural crises, such as floods and the like, can be included.

FOR STUDY

1. An analysis of the elements of competition, with the specific purpose of disclosing exactly what elements are good and what are bad. And especially the effects of secrecy in turning competition into war.
2. The effects of labor and factory laws in this country.
3. A study of the elements and possibilities of business forecasting.
4. Tariffs and their effects.

### Program for Fifth Year

FOR ACTION

1. Business forecasting.
2. The oversight and guidance of production and of price limitation.

Here is the bogey which most critics of economic planning now fear, but after four years of action and study there should not be much left to be afraid of. In any case it is no proof that prices could not to some extent be regulated simply because in the past prices have been tinkered with, with evil effects. Moreover, any regulation of prices which was exercised without the specific idea of making the most money possible for those who exercised the regulation would be quite a different matter from most of the price controls we have known in the past. And it is a fair presumption that selling below cost or below reason is not so very much better than selling above a reasonable price. It is probable that price regulation with the view of holding up prices would only be indulged in during part of the recession phase of the business cycle, not even over the whole recession phase.

3. Proposals for government oversight of power production.
4. Measures proposed as a result of agricultural study.

FOR STUDY

It would obviously now be premature to attempt to set down projects for study in the fifth year. If any were needed from which to take a choice there would be no great difficulty in filling pages.

In a very broad generalization, this program puts into effect two main purposes: First, by getting the necessary knowledge and action to relate our economic society to our political society—openly and organically, not surreptitiously and guiltily; and second, to furnish to the individual factors in the business world more and better organized knowledge of present and past situations. This second objective purposes to improve for the business world its "memory", which Mr. Wiggin, in his testimony before the Senate committee, said the business world did not possess and never would.

In the light of this specific program and its generalization it will be pertinent to quote Mr. Lorwin's report of the purposes for which the German Economic Council was established:

1. To complete the structure of democracy by adequate representation of its economic factors.
2. To get for the Government broad and expert advice.
3. To work out an integration through national action which could take account of the many economic differences in different parts of the Nation.
4. To organize and legalize lobbying.

In accounting for the reputed lack of success of the German Council, Mr. Lorwin lays it first to the jealousy of Parliament; second, to the representative character of the council, and particularly to its size, which ran over 350; third, to the peculiarly difficult situation of Europe during the years of its establishment; and fourth, to the ebb of the spirit of democracy in Europe and the rise of the practice of dictatorship.

Yet, in spite of the general allegation of nonsuccess, Mr. Lorwin feels there have been very real successes to record to the credit of European councils—through their influence on legislation, which has been real if not very well known through their general educational influence; and finally through the fact that they have brought together, almost for the first time, great and conflicting economic factors, and developed the beginning of a better mutual understanding and tolerance among them.

Now in view of such a 5-year plan for planning, what would be the appropriate type of organization to carry it on? The essential specifications of the job are, first, the ability to decide what preliminary information is needed;

second, the ability to see that that information is gathered and digested; third, and most important, to determine upon definite constructive measures which should so influence the behavior of the country, that the objectives sought will be gained; and, fourth, to have influence and ability enough to get the measures put into effect. This job has then what we usually call the essentials of executive action, and so must be carried on by a relatively small group, probably five or seven men, certainly no more than nine. In itself, it can not hope to be representative; as a matter of fact there should be upon it no representation of interests. While it would be well to have among its members a range of knowledge, it would be important to avoid intense specialization of knowledge. Not one in a hundred of their proposals for action will fall within the field of any one specialty; most of them will cover, in one way or another, practically all fields. Hence, the ideal group would be, let us say, seven men, each of whom had had the bulk of his experience in a somewhat different field from the others, but each with a range of knowledge and imagination enough to put his specialty in its place.

Most of the proposals for an economic council agree upon this relatively small body, but many add to it a large representative council, or congress of business; but both European experience and common sense seem to indicate that this is hardly the way to get a proper background for the smaller planning board. They should be expected, rather, to invite and inspire regional organizations; organizations of whole trades which would include trade associations, representatives of the unorganized members, representatives of their customers, and labor; and organizations with whom could be discussed State and municipal problems as they came up. In addition to these there are already in existence hundreds of organizations with which they would be expected to keep in touch through consultation and reports. They should, in fact, from the very beginning be expected to use to the greatest practicable extent the existing services, associations, and instruments for research, for mutual education and understanding, and for effective action. It is very likely that from the beginning some special provision should be made for relationships between this body and the Federal Trade Commission.

Obviously, it is upon the character of the personnel of a group of 5, 7, or 9 men which the whole success of the undertaking will rest. They must clearly be full-time men; no part of this task is such that one can give the casual attention to it which part-time service invites. They must, therefore, be most carefully selected before being appointed. Who can do this? Suggestions have been made of considerable variety but most men have finally decided that the only possible means of selection is through the appointive power of the President of the United States. Yet this is no ordinary appointive job, and the President should be specifically expected to make the widest possible preliminary reference to the people of the country and to the business organizations of the country. They should be invited to partake as much as possible, by sending in names of men, not to represent them, but of men who can represent the country.

It might be well that the President should choose one only at first, and together with him choose the second, with them a third. They must obviously be men of broad knowledge of keen regard for public good, without strong prejudices in favor of any part of the public, men of professional attitude and standards, of thorough training in scientific methods, realistic, independent, and, hence, men who may be expected to exert effective public influence. Probably the richest field in which to look for such is among professional men who have had close connection with business, and in that new and growing field of business professionalism; economists like Stewart; engineer-business men like Flanders; analytical accountants like Ernst; highly trained trade association managers like Compton; a working political scientist like Merriam; and so on.

Such a group, given power to get essential information and equipped with a relatively small permanent staff but given financial power enough to establish special ad hoc staffs as needed, and to call upon and perhaps to assist financially some of the established research organizations, should be able to make a strong beginning. They would be men with sense enough to realize that there will be no way for them to gain public confidenc except by earning it. Previous standing can only give them a good start, and they will, therefore, have to plan their planning program so that those measures for whose success wide public confidence is almost solely essential, would be necessarily postponed until this confidence has been earned. They would be men of constructive temper rather than studious; the student they can hire or get help from in the earlier stages; they, themselves, must know how to use the fruits of study, by turning it into cogent and powerful proposal for action.

STATEMENT OF WALLACE B. DONHAM, DEAN OF THE HARVARD GRADUATE SCHOOL OF BUSINESS ADMINISTRTION

The problem which we face is the restoration of equilibrium in our Nation. This involves a study of the conditions surrounding great social groups like the farmer, the unemployed, etc., and efforts to restore the equilibrium of these groups and in so doing to restore the equilibrium of the Nation. The only practicable method of handling such a problem as the farm problem is the method of trial and error, because no one can with assurance say that any particular scheme will work. Any corporation facing such a problem would approach it by trial and error, with perfect willingness to revise any plan or to give up any part of the plan which turned out to be unsuccessful. The only way a nation can effectively try experiments is by large concentration of power either in the executive or in the executive with the backing of a small committee which has power. This applies to most of the problems of equilibrium. For this reason I advocate large power in a highly concentrated group—in the President either with his customary administrative assitsants or with the support of a small committee including in its membership representatives of Congress, of our university social scientists, and of men of affairs. Such a committee, if constituted, should represent very diversified points of view even within the groups which I have mentioned above.

Any plan for stabilizing a particular social group will secure its effectiveness largely because it is carried into effect simultaneously with other plans to stabilize other social groups. These plans must be related together. There are a few points which I would emphasize.

First. Most important of all we should keep control of our own problems in our own hands. If in this time of wild fluctuations we make international trade adjustments by treaties or agreements with other nations which fix many elements in the situation, we may easily lose this control to such extent that solution of our domestic problems becomes impossible. Reciprocal trade arrangements should always be made with this difficulty in mind. Treaties are hard to change. I am convinced that our great problems of stability can only be solved by trial and error and that to solve them we must keep control of our policies.

Second. We should seek by experiment a method of handling the farm problem so that prices of farm products now exported will be divided, the home prices being above the international price level. The international price level is beyond our control.

I am not at the present moment interested in limitation of output of export crops because industry is not able to absorb men. The sociological objections to limiting output when industry cannot absorb men are very great and limitation of output can wait until we have stabilized the industrial group. At the present time limitation of output of particular commodities seems to me the very way to cause distress in other commodities.

Third. Similarly we need specific treatment of particular farm products which are not exported so that their production and prices are properly related to the rest of the community.

In some way or other the farmers must be restored to their old relative price relationships or there is no prosperity in this country. We have some 40 million people directly and indirectly dependent on farming. Under present conditions they on the average need most of their income for either taxes or interest and in detail a large part of them are bankrupt. The increased debt and tax burden resulting from lower price levels has to be relieved if this group is to get back to a position of stability. The proposed debt relief will help. If a program doing these things can be put through it will restore the farmers as buyers.

Fourth. The Government should seek to bring about a labor shortage instead of an unemployment crisis as rapidly as possible. Curing the farm problem would do much but this will not put all our labor in industry back to work.

I believe that we should as a permanent policy regulate hours of labor so that the work goes around at all times. That is, we should regulate them to an elastic index of employment. It is a blot on our intelligence that today we have no proper labor statistics in this country. Any first step, therefore, would have to be arbitrary. Moreover, we have allowed the business situation to sag to such a point that actually making the present work go around would give each laborer too little employment. Some arbitrary point should be selected for experimental purposes but without any idea that such a point was fixed for good.

My belief is that we should adopt temporarily the American Federation of Labor program of regulating by Federal law hours of labor of the individual (not the factory) to 6 hours a day, 5 days in the week. The bill should provide in itself for a more elastic method, modifying those hours when conditions justify. It is all guesswork, but my own guess is that with the present state of technological development we are unlikely to find more work in industry than 6 hours a day, 5 days a week. The limiting factor under such a plan would be man power and not machinery. This is, I think, essential and the only basis I see for keeping employment in step with technological progress.

Fifth. Because we have allowed busines to sag so far, the introduction of new purchasing power will probably be necessary before the rest of the employment difficulties can be solved and before buiness can be prosperous. Some of this new purchasing power will come from the restoration of confidence. I fear that not enough will come in this way, and that it will not be widely enough distributed so that our men can be kept busy. I think in addition we need—

(*a*) Government works selected not with reference to their self-liquidating character but with reference to putting the maximum number of people at work both on the jobs and in providing new materials for the jobs.

(*b*) I am much interested in M. C. Rorty's plan for giving bonuses for private and public construction.

(*c*) Credit expansion probably futile now, would, I believe, help greatly if hours of labor were limited as suggested above.

(*d*) If a program such as I have suggested does not, in fact, complete the desired result and put men back at work to a sufficient extent, I think the Government should keep on the job of stimulating purchasing and employment until the machine is started again.

I am afraid of methods for introducing new purchasing power not accompanied by farm relief and limitation of hours of labor. This depression is too serious to rely on artificially created purchasing power alone.

Sixth. The missing link in the above program is that it contains no explicit way of accomplishing high wages without which a mass production civilization cannot maintain itself. The mass of people must be able to buy to support mass production. Wages have sagged during this depression, and there is a lot of entirely proper opposition by particular concerns to increasing wages. The only way to get wages up is by general social forces.

We have the recent experience that the war created a labor shortage and brought about rapid and, in general, I think, not excessive increase in wages. We should use that experience and run our affairs indefinitely on the basis of a labor shortage. That is, if we determine hours with reference to an elastic index, they should be so determined that employers are competing slightly for labor. This is necessary to bring employment to the group over 50 years of age and to men who are not quite as good as others. It would also enable manufacturers to raise wages. Steady social pressure for higher wages is, I think, the only correlative which can offset the steady advance in technology and management.

Seventh. This thesis involves a theory of the function of government. The last 3 years has been a period when individual initiative and energy and ability were powerless. In a society like ours when this condition arises there is no possible way out except through government action. Stability in the nature of a moving equilibrium is essential to progress. It is, I think, clear that the Government's primary job is to preserve the economic framework from fluctuations so violent that they exceed proper margins of safety and practically make it impossible for the individual to function. In other words, the Government alone can free the individual. The things I have outlined are designed as continuous attacks on the instability of social groups until such social groups reach not a static condition but a reasonable equilibrium which releases individual powers.

I do not believe this depression is one which can be handled on the theory of preserving what we have until time has a chance to cure it. I think it needs political leadership directed in such lines as I have mentioned. There may well be better specific measures than those outlined, but I am confident the general philosophy of the approach is sound.

Eighth. I am convinced that the solution of our problem must be found primarily at home and not by following any will-o'-the-wisp of internationalism which assumes the ability to get decisions out of the nations of the world or gives up the control essential to planning for stability at the one point where we have the power to exercise controls, namely, at and within this Nation's borders.

This whole thesis I have elaborated in an address I made at the Wharton Alumni Institute, Philadelphia, on March 23, 1933. It is now being published as a supplement to the April number of the Harvard Business Review. I attach this address as well as Mr. Rorty's plan as the exhibits to this statement.

---

STATEMENT OF ERNEST G. DRAPER, PRESIDENT AMERICAN ASSOCIATION FOR LABOR LEGISLATION, NEW YORK CITY

It would be presumptuous for me to speak with authority upon such a vast subject as the causes and cures for this depression. However, there is one phase of the depression which deeply interests me and upon which I have devoted a great deal of thought. It is the problem of unemployment. I hope that I may be given the privilege of discussing this problem briefly and suggesting possible ways whereby the volume of unemployment might be lessened by various legislative remedies.

I. A Nation-wide system of public employment offices, impartially and adequately serving both workers and employers, is one of the most needed steps in the direction of a permanent program of unemployment prevention. By assisting workers to find jobs and employers to find workers such a system will reduce to a minimum the time men and machinery stand needlessly idle. It will also make available information that will help employers to plan production more wisely and guide young workers in their choice of their trades. I am strongly convinced that the plan outlined in the bill introduced by Senator Wagner to provide for an integrated system of national, State, and local employment offices with financial encouragement and cooperative supervision by the Federal Government offers the most promising contribution yet proposed for developing a really adequate permanent public employment service.

II. The Government can also play a significant role in employment and business stabilization by intelligently planning its public works program so as to be prepared to throw the weight of public construction into the scales when most needed to maintain the Nation's economic balance. The Federal Government has made a beginning by the enactment of the Stabilization Act of 1931. If that act is administered with skill and foresight, the Government should be in a better position to act effectively when the next business depression arrives. There is, of course, need for legislation in the States to provide a basis for similar action by State and local governments. The Federal Government can encourage such State action by demonstrating in a practical way the advantages of advance planning.

III. Twelve years ago, at a legislative committee hearing in Wisconsin, it was my opportunity to speak as an employer in favor of compulsory unemployment compensation. The burden of my testimony before the committee was that the enactment of such legislation would focus the attention of employers upon methods to combat irregular employment and so diminish unemployment; and that diminished unemployment would mean stabilized industry, more even production, and freer opportunities to increase business profits.

I am today more than ever convinced of the soundness of that business judgment. Even if there were no examples to guide us, it is a matter of common sense that when placed under the sobering influence of having to pay part of the direct cost of unemployment, management will be much more careful to develop advance plans to stabilize employment; that managers generally will then do what only a few have done in the past. Think about and prepare for unemployment in good times as well as in bad. If there ever was a reasonable doubt of the need for this kind of permanent inducement, surely it has been dispelled by the collapse of our planless prosperity and the social degradation of our present plight.

But we need no longer resort to common sense alone in judging the merits of unemployment reserves as a business policy. The experience of American concerns which during the past decade have been far-sighted enough to put into operation voluntary plans for unemployment compensation or of dismissal wages, has amply proved the positive advantages of this device. The testimony of these pioneering employers uniformly shows that managers have thereby been stimulated to eliminate the wastes and inefficiencies which lead to and result from unemployment; that employees have gained a degree of security which is reflected in an improved morale and increased efficiency; and that consequently, the immediate cost of the plan is justified as a business investment. It is such evidence as this that has caused an increasing number of employers during this business crisis to recognize the merits of unemployment reserves. A few have even instituted new voluntary plans.

I suffer no illusion that the ideal of complete regularization of employment, or anything approaching it, can possibly be achieved by all employers under the varied sets of conditions which exist in industry. Nor will attempts at regularization by individual employers prevent entirely the recurrence of cyclical depressions. But I do wish to emphasize that to regularize employment, to the extent that it can be done, employers obviously need a new and sustained inducement. And when unemployment cannot be avoided, it is my conviction that employers should be prepared to assume the social responsibility of providing systematically for the workers they now from time to time carelessly cast aside until they need them again.

To my mind, a strong case can be made for unemployment reserves simply as a means of preventing destitution among those ready and willing to work, but for whom no work can be found. Surely it would be more efficient, more adequate, and more self-respecting than the haphazard devices we now employ. Moreover, it would remove from the taxpayer and the charitable a burden which should properly be charged to production costs just as effectively as industrial injuries under workmen's accident compensation now are. Faced as we are today with dwindling charity funds and exhaustion of tax resources, there is imperative need for the development of this third source of revenue in providing for unemployment relief.

I believe we must face the fact, however, that there is no hope of early and wide-spread adoption of unemployment reserve funds by American industry unless it is uniformly required of all business concerns by State legislation. The study of company plans made by Bryce M. Stewart of the Industrial Relations Counselors, Inc., has revealed that prior to the present emergency a mere baker's dozen of employers had set up such reserves. The recent announcement of a few additional voluntary plans should not be allowed to blind us to the validity of Mr. Stewart's conclusion that "a wide coverage of unemployment insurance * * * will come only through legislation." It is beyond my comprehension how anyone sincerely desirous of the prompt and general adoption of unemployment reserves by industry can oppose such legislation.

American plans for unemployment reserve funds legislation, such as the one proposed by the American Association for Labor Legislation, the similar plan enacted into law by Wisconsin in January 1932, and those now being proposed in bills in more than 20 State legislatures, seek merely to make State-wide what a few enlightened companies already have done of their own accord. They offer, moreover, the most promising direct stimulus to industrial stabilization that public authority is in a position to contribute. Such legislation will attack the problem of unemployment at its heart.

Congress can and should encourage the early adoption of State legislation providing for unemployment reserves. Senator Wagner, in his report as a member of the Senate Committee on Unemployment Insurance, has shown how this encouragement can be offered by means of income tax deductions to employers who set up unemployment reserves under State laws. Such an act of Congress, by its assistance to employees in those States which first enact this legislation, will effectively remove whatever basis there may be for the fear expressed by some cautious individuals that such laws may place employers at a disadvantage in interstate competition. States whose citizens are prepared to go forward now with this constructive method for dealing with our most urgent national problem are entitled to this reasonable aid from the Federal Government.

IV. It is a curious and rather shameful fact that whereas the Federal Government spends millions of dollars in furthering the activities of all kinds and conditions of commercial projects, there exists no single board or commission of any kind whose function it is to deal effectively with the great disease of industry—unemployment. Certain minor activities exist, such as the Federal Employment Service and various bureaus in the Department of Labor. But there is no central independent authority of any kind working on this problem.

Such a situation should be remedied, not only for the human misery involved, but for the economic waste involved also. If $700 per year represents the spending power of the average man in employment, and there are 10,000,000 now unemployed, then this country is losing at present approximately $7,000,000,000, which might otherwise go for the products of industry. Every million men put back to work means roughly $700,000,000 circulating through the channels of trade. It is easily conceivable that a central authority on unemployment, properly organized and effectively administered, could recommend legislation and encourage practices which might within a year cut our present number of unemployed into one half, or even more. It is probably too much to say that this could be done the first year. But it might be done. Certainly much more can be done by any such effective attack than can possibly be done under present circumstances where the problem is left to shift for itself or, at best, is hopelessly mired in the mud of political chicanery. To this end, it is recommended that a Federal board on unemployment be set up, according to some such plan as the following:

1. The Federal board on unemployment to have no mandatory powers, but like the Tariff Board, recommend to the President and to Congress such legislative measures and voluntary practices as will be feasible for the Federal Government or for the State governments to undertake in order to attack the problem of unemployment in more organized and more effective way than heretofore.

2. The Federal board on unemployment to consist of seven members, four of whom to be of the party in power and three of whom to be of the largest minority party. The Secretary of Labor to be an ex-officio member of the board. In addition, a technical advisor be provided for, whose duty it would be to prepare material asked for by the board and to suggest lines of activity for the board. This position of technical advisor to be a full-time position with compensation sufficient to attract the best economic brains in the country.

3. The Federal board on unemployment to work in cooperation with the Secretary of Labor (who is an ex-officio member of it), but to report only to Congress and to the President.

4. Present problems which such a board might study and report on now:

*a.* The Wagner bill for employment exchanges.

*b.* A proper Federal plan for public works at this stage of the depression.

*c.* Ways by which State employment exchanges might be improved.

*d.* Advisability of State compulsory unemployment reserves.

*e.* Advantages and disadvantages of the 5-day week, share-the-work plan, etc.

Let me emphasize the point that this board is not intended to be "just another commission." It is probably true that we have far too many incompetent, wasteful boards and commissions in Washington today. The point is, however, that this board, if properly administered, would be a productive institution. Insofar as it would promote the expansion of employment, in just such measure it would increase the productivity of all trade and the increased well-being of all wage earners. No one can seriously question the value to the people, over a period of many years, of the Interstate Commerce Commission. The field of the Federal board on unemployment would be even larger than that and might easily be even more effective in its influence on improving the condition of trade and the standards of life of working men in general.

March 10, 1933.

## Statement by Will Durant, Great Neck, N.Y.

### I. CAUSES

1. Technology and the nature of man: Our "Mississippi" of inventions has greatly increased the productive capacity of the average American; the economic system, through the natural inequality of men and the resultant concentration of wealth, has left the purchasing power of the people far behind their pro-

ductive power, despite the relatively high level of wages and salaries in America.

2. The war: A similar gap between popular production and consumption in other industrial nations led to surpluses of goods and capital, and drove these nations to compete for foreign markets and spheres of investment and control. War lies like an irrepressible seed in the very nature of our economic system. As England fought Germany in 1914, so America must, if our system cannot be changed, fight, first, Japan, and then the British Empire for the markets of the East. The War of 1914 helped to cause our depression by (*a*) destroying goods; (*b*) accumulating debts; (*c*) depreciating currencies; and (*d*) intensifying nationalism. Hence—

3. Expensive armaments, requiring a burdensome taxation; and

4. Tariff walls, obstructing trade and destroying the machinery for paying the—

5. International debts—an impossible burden because of the rise in the value of gold, the obstructions to trade, and the reduction of national incomes.

6. Domestic debts—an impossible burden because dollars worth approximately 100 cents when borrowed must, under present laws, be repaid in dollars worth 150 cents, by a debtor class, half of which is out of work. Hence the bankruptcy of the debtors, the consequent bankruptcy of one quarter of our banks, the practical bankruptcy of our mortgage companies, and the imminent bankruptcy of our insurance companies, unless the tide is changed.

7. Governmental extravagance, especially in the cities.

8. Revolutionary chaos, destroying political order and trade possibilities in China, Russia, India, and South America. Similar chaos is rising in Germany, and may appear in the United States.

## II. POSSIBLE REMEDIES

1. Inflation seems unavoidable, if we are to reduce that burden of internal debt which is stifling trade and ruining our banks and investments.

(*a*) The evils of inflation would probably be (1) a temporary reduction in the purchasing power of wage earners and the recipients of fixed incomes; and (2) the difficulty of controlling inflation. But the experience of France, Italy, and England indicates that this fear has been exaggerated in the interests of the creditor class, which likes the idea of being paid with the present exaggerated dollar.

(*b*) The advantages of inflation would probably be (1) To raise prices; therefore (2) To discourage hoarding, stimulate purchasing, and so aid employment; (3) To encourage manufacturing, and easier credits to manufacturers; (4) To reduce the burden of internal debt; (5) To protect what remains of our foreign trade from the competition of inflated currencies.

2. Reruralization: Since the advance of invention renders improbable the industrial reemployment of all the unemployed, some of the new currency should be used for—or bonds should be issued to finance—the establishment of as many unemployed families as are willing upon unused land; not with a view to competing with existing farms, but in an attempt to free these unemployed from the humiliation of charity by teaching them to grow food for their independent sustenance.

3. Reconstruction Finance Corporation loans to limited dividend, municipally regulated housing corporations for the replacement of city slums with modern but modest apartments.

4. The gradual redistribution of wealth by (*a*) High taxes on inheritances, incomes, and the export of capital; and (*b*) The removal of tax-exemptions from governmental securities.

5. The encouragement of employment by (*a*) Shortening the working day commensurately with technological advances; (*b*) Establishing legal minimum wages rising automatically with the price index; (*c*) Compulsory unemployment insurance; and (*d*) The establishment of employment agencies in all post offices.

6. The restoration of the credit system by (*a*) Removing the limits on postal savings, so offering a secure repository for the people's funds. In this way the Government could borrow directly from the people, and it might pay 3 percent on sums left for a year; (*b*) Regulating national banks, in their investments and procedures, to enable them collectively to guarantee their individual solvency; (*c*) Encouraging a similar application of the principle of in-

surance by the States to all State banks; (*d*) Governmental supervision and control of the credit system. Currencies are the roads of commerce, and should be kept open and safe like other public highways.

7. The promotion of international peace by (*a*) Tariff agreements with individual nations; (*b*) The reduction of intergovernmental debts—and, if possible, of international private debts—in proportion to the increased purchasing power of gold; (*c*) The conditional recognition of Russia; (*d*) Permanent international commissions to deal continuously with the recurrent causes of war: Foreign markets, investment spheres, food, fuel, raw materials, and trade routes; (*e*) A consequently practicable reduction of armaments.

8. The establishment of a national economic council to give unity, order and self-control to industry, to bring about, by agreement, higher levels of remuneration, thereby to raise the purchasing power of the public, and to rest the industry and prosperity of America not on the capture of foreign markets at the cost of war, but on our own market of 126,000,000 people.

9. The reconstruction of our economic system by (*a*) The maintenance of private ownership and operation of industry and agriculture, in order to utilize the productive incentives of personal ambition and family affection; but the control of the abuses of this highly productive system through (*b*) The legal recapture and retention of all the mineral, fuel, and power resources of the soil; (*c*) The unification and governmental control of all major means of transportation; and (*d*) Governmental credits to agricultural and industrial cooperatives, with a view to building peaceably a cooperative commonwealth free from that regimentation of men and minds which seems to go with complete governmental ownership of industry.

10. The reconstruction of democracy by (*a*) Requiring specific technical preparation for public office, through (1) A United States civil academy, corresponding to the United States Military Academy and the United States Naval Academy, training men and women, democratically selected from all the States, in the art and science of municipal and State administration; and through (2) Similar schools of government in all major universities. (*b*) Making this educational qualification for office thoroughly democratic by promoting equality of educational opportunity. Democracy should be redefined as meaning, not the equal right of all to hold office, but the equal right and opportunity of all to make themselves fit to hold office.

---

## Plan for Economic Rehabilitation through Practical Relief for the Unemployed

(By William J. Ezickson, A.B., M.D., Philadelphia, Pa.)

### The Basis of Present Economic Difficulty

All informed economic, academic, and legislative thought is unanimous in their opinion that the basis of our long-continued economic difficulty is our inability to put to work our monetary reserve, resulting in a financial drought that is perilous to vast masses of our people.

It is also accepted universally as true, that credit, the instrument through which alone those monetary reserves can be employed in our mechanism of production and exchange, cannot be put to work involuntarily and against its will, nor can it be brought into active use by any form of pressure exerted by government, nor by means of any brute force.

The use of credit in our operations of production and exchange must arise as a voluntary act in response to demand for such use, and the development of a demand for the use of credit is totally dependent, in turn, upon a contingent expansion of general business activity.

Now, since the expansion of business activity is dependent upon an increased consumption of the products of industry, which, in turn, is dependent upon the contingent increase of the buying power of the people, and since the increase of that buying power is normally contingent upon an increase of employment, we find ourselves confronted by a cycle of events, each contingent upon another, and that before any effective results can be obtained from any effort to rehabilitate business, that cycle must be broken.

It is the continued existence of this cycle of events unbroken, which creates the paradox of millions suffering want and hunger in the midst of plenty, of millions of unemployed in the face of needs for food, clothing, and shelter that can not be satisfied for lack of an acceptable "medium of exchange."

It is plainly evident from those facts that all action must be directed and concentrated upon the one objective, to wit, to secure a steady and general increase in the consumption of goods. That to secure this, buying power must be injected into the circulatory system of the Nation, so that everyone will have the necessary means to purchase the food, clothing, shelter, and other services required to maintain the American standard of living.

We cannot wait until the operations of the business cycle produce jobs for the unemployed—for millions of them face starvation and are crushed with despair—millions of them will then be beyond employability because of age or technological conditions, and other millions will have passed the habit-forming years during which skill at their tasks and discipline must be acquired.

We must face the fact that in this great emergency Government can do literally nothing toward lifting the Nation out of this terrible financial drought. Only the people themselves, through their own voluntary action, can do that and they will do that if our Government will but place the means they shall use therefor within reach of all of them.

### HERE IS THE MEANS THE GOVERNMENT CAN PROVIDE

*The plan.*—1. Let the Congress of these United States authorize to be issued by the Treasury a series of noninterest bearing, self-liquidating trade certificates for the period of 1 year per series.

2. Let the said certificates be issued in denominations of $1 and their eventual redemption be had upon receipt by the Treasury of the face value of each such certificate, payable to the Treasury as hereinafter provided.

3. Let the people of the United States who shall receive those certificates in any manner, voluntarily impose a sales tax upon themselves, of not to exceed 2 cents per week, per dollar of face value of such certificate.

4. Let the Congress authorize the Postal Department to sell a sales tax stamp, which the bearer of such certificate shall purchase and affix to the reverse side of such certificate in the spaces provided therefor.

5. Let the Congress provide that such certificate shall be legal tender in the payment of all manner of private debt arising from exchange of goods or services, when the requisite stamps are affixed thereto and shall not be bankable.

6. Let the Congress provide that the face value of such certificate shall be paid to the final bearer who shall present the same for redemption to the Treasury or its agents with fifty-two sales tax stamps affixed as provided.

7. Let the Congress provide that the initiation of the circulation of each series of the said certificates shall be had by the distribution thereof, through the States to the already existing agencies dispensing relief, to the unemployed, in such amounts as will best serve to meet their needs for food, clothing, and shelter, and that the total sum of each such series of certificates to be issued monthly shall be that required to cover those needs.

8. Let the Congress provide for the limited issue of eight monthly series of such certificates, the redemption of every such series to be effected by the termination of the twentieth month from and after the issue of the first series thereof.

9. Let the Congress provide suitable administrative officers for the undertaking and appropriate such portion of the proceeds received from the voluntary sales tax paid by the people to such administrative expense, any remaining surplus to accrue to the Treasury.

### DYNAMICS OF THE PLAN AS A MEDIUM OF EXCHANGE

It is self-evident from the foregoing that the certificates to be issued by the Treasury, as provided, are intended to serve as an auxiliary medium of exchange in the United States pending their liquidation and redemption during the time and in the manner provided.

The form of these certificates shall be of such design as the Congress shall determine, but the face of the certificate shall bear words and figures similar to the following:

"The United States Treasury will pay to the bearer on demand, after receipt of the value represented by 52 stamps affixed to the reverse side hereof, the sum of $1 in lawful money of the United States.

"This certificate shall be legal tender in payment of all private debt arising from the exchange of goods and services during the period covered by each of the respective sales tax stamps affixed hereto and pending its redemption at the time and in the manner as provided by law.

"This certificate will not be legal tender in the payment of debt, taxes, or customs duties due the United States and is not bankable, except as specifically authorized by law therefor."

The circulation of the proposed auxiliary medium of exchange is initiated and maintained throughout the United States through the payment of unemployment relief therewith, in the manner previously set forth.

### SELF-LIQUIDATING REDEMPTION FEATURE OF THE AUXILIARY MEDIUM OF EXCHANGE

The Congress shall provide that sales tax stamps for the uses and purposes of this auxiliary medium of exchange shall be made available for purchase at all post offices in the United States, the proceeds of such sales tax stamps to be impounded in a redemption fund set up in the Treasury which shall be disbursed only for the purpose of retiring by redemption the certificate that shall be presented for payment in accord with the terms and provisions of the proposed auxiliary medium of exchange. These funds shall also be available in such amounts as the Congress shall prescribe for the payment of such administrative expense as may be incurred thereby.

The Congress, through means of this auxiliary medium of exchange—having placed within the grasp of all the people the most potent force available—buying power—which they themselves can create through their voluntary action and cooperation, and by its general use break the terrible financial drought from which the Nation suffers, and having given the people the one and only opportunity they need to help themselves, and to restore employment through rehabilitating general business activity in a normal manner and in the shortest possible period of time, and by a method that is beneficial to all and burdensome to none, the next step is the actual operation of the plan, a step that can be taken within 30 days from its authorization by the Congress.

Each person to whom any of these auxiliary medium of exchange trade certificates shall be distributed. shall purchase and affix to such certificate as a condition precedent to its circulation as legal tender for its face value, a sales tax stamp, and the recipient of such certificate, during the succeeding weeks in which such certificate shall be outstanding, shall likewise purchase such sales tax stamps and affix the same to the reverse side of such certificate and in the spaces provided for each weekly validation, as a condition precedent to the further circulation of such certificate as legal tender pending their eventual redemption.

In the event such certificate shall be outstanding for the period of 1 year from their date of issue, there shall be affixed thereto by its respective successive bearers, 52 sales tax stamps, and in the event the face value of the certificate shall be $1, the cash value of the sales tax stamps sold by Government therefor shall total $1.04 per such $1 trade certificate. And such trade certificate shall have automatically—through the voluntary act of the people in taxing themselves therefor—established a self-liquidating redemption fund.

### ECONOMIC SEQUENCES OF PLAN

It is proposed to issue this Auxiliary medium of exchange in series (monthly), and it is estimated that the full needs of the unemployed which are to be met therewith, approximate 100 millions of dollars monthly.

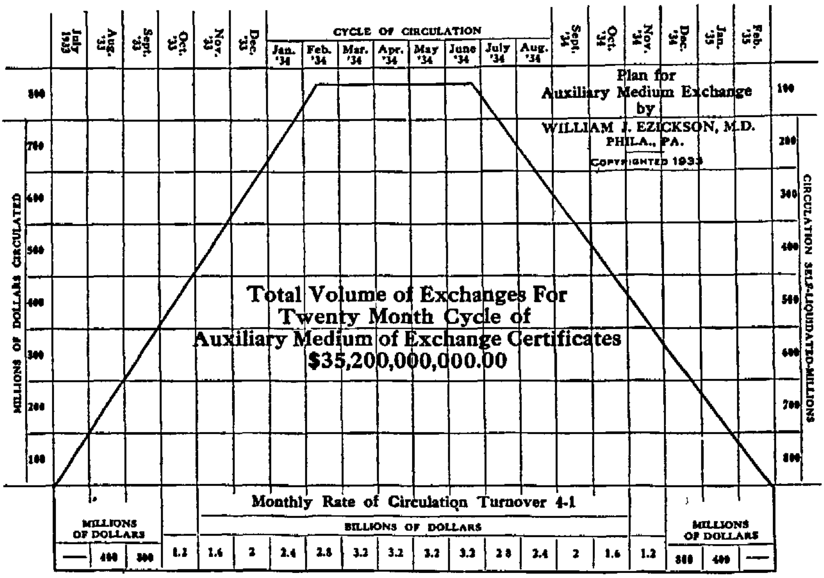
A total of eight successive monthly series are to be issued.

The total sum of trade certificates issued during the first 8 months will remain in circulation for an additional 4 months, when the first series issued will be retired by redemption through the operation of its self-liquidating feature. At the end of the twentieth month all the outstanding trade certificates will be similarly retired through the self-liquidation feature of the plan.

It is further estimated that each trade certificate so issued in this auxiliary medium of exchange plan will be used in exchange, a minimum of once per week, during the time it shall be outstanding. That, in turn, means goods and services purchased to the minimum amount of $400,000,000 during the first month the series shall be in circulation.

By the end of the eighth month, therefore, when the total sum of these trade certificates shall approximate $800,000,000 in circulation, the total volume of monthly exchanges for goods and services will approximate a minimum of $3,200,000,000—which shall continue in full volume until the end of the twelfth month—when the volume of exchanges will begin to decrease in an amount proportionate to the value of the series withdrawn from circulation by retirement and redemption.

But long before the eighth series of the proposed trade certificate shall have been put into circulation, the volume of buying power—previously injected into



the economic order—will have operated to cause such a tremendous increase in the general consumption of goods—with ensuing demand for new goods—as to compel industry to expand its activities to meet this new demand—thus bringing about those conditions that are so vitally essential in the present task—of putting our monetary reserves to work—through the expansion of our credit mechanism.

Thus, may the existing dangerous cycle of events be broken and the perilous financial drought be lifted—through the only medium possible in the absence of any abnormal event—the voluntary act of the people taken to help themselves.

The incidental advantages to government arising from a steady increase of revenue from a steadily expanding business activity in the Nation; the great advantages arising to industry through a measurable stabilization of the commodity price level and with it a corresponding stabilization of the purchasing power of the dollar; the tremendous advantages that will accrue to all agricultural interests through the vastly enhanced buying power of the Nation and its repercussion upon the price of all agricultural commodities; the great social advantages that will arise from the renewed spirit of hope, courage, and ambitions of our entire Nation; all those advantages are so self-evident that they require no presentation here.

If industry is to be left to recover its momentum through self-activating impulses, long delay in the return of any measurable degree of prosperity may be anticipated. In the meantime, millions of people cannot continue to suffer evils and wrongs thrust upon them by the operations of an economic system that cannot cure those evils; hence, if that system is to endure, delay in putting before the people the means with which to help themselves will prove doubly perilous.

There are those who would lead our people down the road to quick ruin, through inflation of our money, in the mistaken belief that more money will mean more buying power. Those who are informed know this is not true. But, in the absence of any other course, this road to ruin may be easily and ignorantly followed.

The Congress must give the people a chance to help themselvs. In the presence of the existing inability to put our great monetary reserves to work it has no other choice of means for this purpose but a plan of an auxiliary medium of exchange, which is respectfully submitted herewith.

---

## Statement by H. L. Ferguson, Newport News, Va.

The international situation is, in my judgment, the largest single influence in keeping down commodity prices.

The foreign debts should be written down to a point within the capacity of the debtors to pay, which would, I believe, result in a marked increase in commodity prices. A moderate downward revision of tariffs would seem proper in this connection.

In my judgment, one of the biggest single factors which has not been commented upon at any length in this country has been the payment of artificially high salaries and wages, particularly by the railroads. For many years their wages have been higher relatively than in other industries and at the present time are completely out of line. Restoration of railroad credit and consequent buying power appear of prime importance.

The theory of high wages furnishing purchasing power and prosperity is untenable when applied to restricted groups. The disparity between wages of farmers and public-utility employees and city industrial workers is entirely too great for any economical system. It appears to me that the country people must be assisted both by an increase in price of what they sell and a decrease in price of what they buy.

---

## Statement of David M. Figart, New York City

### SOME VIEWS ON THE PRESENT DEPRESSION

There seems to be fairly wide agreement that lack of purchasing power on the part of the people somehow has had a great deal to do with our present troubles. One theory is that too large a proportion of the earnings of industry, and of the savings of the people, went into capital equipment—such as factories, machinery, public works—and too little into the hands of potential consumers. The result was that the productive power of our industrial machine temporarily outstripped consuming power. Surpluses of goods began to pile up, factories began closing, thus curtailing an already inadequate market by reducing the purchasing power of the people upon whom the factories were dependent for their outlet. Every dollar shrinkage in wages meant a shrinkage of many dollars in the business of the country; every man laid off meant fear and anxiety among others.

There is also some measure of agreement on how to cure or prevent business recessions; but it is in broad general terms, such as the need for a redistribution of wealth, the need for greater purchasing power among consumers, the need for security of employment. When it comes to specific measures to be applied at this time, there is a wide divergence of opinion.

President Hoover tried to get industry to maintain wages; but when a manufacturer sees his sales falling off, the most natural thing in the world is for him to reduce output by laying off men. Some people feel that our industrial machine has become too efficient; but it does not seem right to blame a machine which gives us—or should give us—more goods with less effort, greater wealth with greater leisure; it would seem that the blame lies rather with the human errors made in distributing the wealth. Some, pointing to technological unemployment, urge the sharing of work; but the remedy for too little work is more work, not the same work redistributed. Nor is it changing the age, skill, or sex of the workers.

A great program of public works—if it could ever be put into force—might prove an excellent emergency measure; but, although it would increase employment and thus add to purchasing power, the route would be very circuitous, and hunger and want cannot wait. (The fact that such a program would add to future taxes would not seem to be a very strong argument against it; it is not improbable that the wisest policy a government could pursue in a depression would be to increase indebtedness, not try to decrease it; and it may be that the efforts to balance the national Budget at this time will prove unfortunate. Failing proper adjustment by industry itself between investment goods and consuming power, there remains only government which can impose artificial measures to restore the balance.)

Depressions work themselves out naturally, if one is content to wait for this. The decreased buying power of the community, due to cessation of wages and dividends, forces down the output of goods and price levels, and, supplemented by drawing upon savings, borrowing, and charity, ultimately exceeds the value of goods being manufactured. Inventories are then gradually exhausted and factories forced to reopen, bringing additional employment and increased buying power. The unfortunate thing is that the disease has not been eradicated; it is only the end of an epidemic. There has been a frightful business mortality, involving the loss of much of our wealth; the vast majority of us, on whom the prosperity of business depends, face the future in debt, with buying power curtailed for years to come. We must produce, but we may not consume. If, at the end of a depression, all indebtedness could be wiped out, we might look ahead with some confidence; but the significant thing about it is that the debts we owe are largely owed to institutions or individuals who are not potential consumers, and who, when we pay them, are obliged to invest in stocks or bonds, thus adding to capital equipment whether we need it or not. So that in the very process of liquidating the last depression, we lay the foundation for a future depression.

From every point of view, therefore, it becomes necessary to reconsider our attitude toward this question of purchasing power, which means—translated into everyday business terms—wages and dividends. This has never before hit us quite so forcibly because until recently there has always been unlimited scope in America for investment in capital goods. Temporarily, we are equipped with all the plant we need or can use. Our problem is not to build more factories—perhaps not even to modernize those we have—but to find a way to distribute the goods we are now equipped to turn out. Considering that the market is in our midst—those forty or fifty millions of our people who exist in poverty—the problem of distribution should not be very difficult.

Under a machine civilization great masses of the population gave up their liberty. They had a right to expect in exchange therefor a greater share of this world's goods, and, more important still, a greater degree of security, than they ever had before. The operation of this machine came into the power of those who from the very outset misinterpreted their trust; they forgot that they should be working for the good of all; they worked only for themselves. The result has been a great body of industrial slaves who, immediately they produce a sufficiency of the necessities of life, are prohibited from consuming their share.

The rights of the stockholder have been exaggrated out of all proportion to the rights of labor. A stockholder is one who invests capital for which he has no immediate use, in the expectation of earning a return through utilization of the knowledge and skill of others. If dividends cease, he still has his capital left. But let the wages of workers cease, and they have nothing to fall back upon; through no fault of their own—perhaps because of their very efficiency—they are suddenly deprived of the daily needs of life—food, clothing, shelter—for themselves and their dependents.

If we maintain that so-called " sound business methods " must take precedence over unspeakable human suffering, we are nevertheless forced to admit from an equally cold-blooded business standpoint that such a policy is suicidal. The stockholder who wants dividends, and who wants to preserve his capital, must first see that wages are maintained; for upon such purchasing power depends the market for the products made by his company. This is fundamental.

All wealth is the result of labor; and the right to consume wealth obviously arises simultaneously with its creation. When an excess of wanted goods accumulates, as in the period prior to this depression, it is because the right of the people to consume these goods has been for some reason withheld. Had a greater proportion of corporate earnings been distributed to consumers in prosperous years, and correspondingly less invested in plant extensions, demand might have been maintained at a level near the productive capacity of the country. Excess plant facilities thus represent purchasing power unwisely withheld from distribution, and now frozen into the form of corporate surpluses and reserves. This suggests two courses of action: First, to right the wrong unwittingly done to consumers; second, to prevent the recurrence of such a condition in future.

### A PROPOSED REMEDY FOR UNEMPLOYMENT

If we accept the principle of industry's responsibility to the community; if we admit the soundness of the principle of employing reserves accumulated in prosperity to carry us through periods of distress, as nature utilizes in winter the reserves accumulated in summer—then the utilization of corporate reserves in this time of national emergency would appear to be justified. Knowing that the output of labor increased far more rapidly than did labor's share in the product, then it would seem to be only fair to restore to labor that portion that was withheld, and to restore it now when lack of it means dire want.

It would appear that this could be done by thawing out for belated distribution the purchasing power frozen into corporate surpluses and reserves, through cooperation with the Reconstruction Finance Corporation, operating under slightly amended laws. What is proposed is, in effect, an industrial loan, with nominal interest and repayable out of future profits, made to the great basic industries of the country, secured by their physical assets, the proceeds to go directly to the reemployment of men who were formerly on their pay roll.

The capital of the country is largely represented by great manufacturing plants which are now idle. These have great potential but little present worth. The proposal involves an immediate and direct increase in purchasing power, and consequently in the consumption of products turned out by such plants. It is a challenge to industry to conserve its capital structure by restoring demand to predepression levels, rather than reconstructing industry to present depressed levels. It involves no increase in governmental tax burdens. It will restore price levels and at the same time bring relief to the debtor class. It will restore confidence in security of employment and tend to coax out hoarded purchasing power where it exists. It places upon industry itself, not upon charity, the responsibility for the welfare of its workers and their families, which is where it rightly belongs.

A decrease in wages of $2,300,000,000 from 1919 to 1921 was accompanied by a decrease in factory output of $18,600,000,000. A recovery in wages of $2,800,000,000 by 1923 was accompanied by a recovery in output of $16,800,000,000. A decrease in wages of $4,400,000,000 from 1929 to 1931 was accompanied by a decrease in output of $29,100,000,000. Yet those manufacturing plants which cut wages so drastically and destroyed their own market had, at the end of 1929, surplus and undivided profits amounting to nearly $20,000,000,000.

This proposition is not greatly unlike that of unemployment insurance, which, though it is a palliative and not a cure, will probably become standard practice until something better is found. If our major industries had adopted some such plan in past years, a portion of their surplus or reserves would have been carried now as "Unemployment insurance reserves", and would have been available for distribution. These same industries today have large reserves carried under some other name. The proposal, in effect, is to utilize a portion thereof just as if they had been accumulated for this specific emergency. The name is unimportant; the important thing is the actual existence of the reserves, and the part they can take in serving humanity by relieving distress.

Industry must definitely accept the responsibility of maintaining men in employment. There is no difference in principle between the duty of a bank to safeguard the deposits (past labor) of its clients, and the duty of industry to safeguard the employment (current labor) of its workers. The immediate need is to rehire the men who were fired, even if they have to engage in nonproductive labor for the time being. Where improved efficiency or improved machines within a plant displace labor it should be the responsibility of industry either to see that such labor is satisfactorily placed elsewhere, or that such increased efficiency is utilized in giving labor greater leisure, by retaining the same labor for less hours per day. We need not be concerned with how this would affect costs of production. The fetish of low costs has too often been the cause of disaster. Higher costs may mean higher returns to labor and consequently increased purchasing power. It makes no difference to a community, broadly speaking, whether a manufacturer sells an article for $1 or $2, so long as the amount of money the community spends on such articles is returned to the community by the manufacturer in the form of wages, dividends, and purchase of raw materials.

### TENTATIVE PLAN FOR PUTTING PROPOSAL INTO OPERATION

Any suggestion made without consulting competent legal, tax, and accounting experts must necessarily be tentative in form. But if the principles are right and just, a method of applying them surely can be found; if not in one way, then in another.

To recapitulate, the object of the plan is (*a*) to utilize corporate reserves, which represent purchasing power withheld from distribution and now frozen; (*b*) to increase consuming power directly and immediately; and (*c*) to make corporations responsible for the welfare of present and past employees, allocating the responsibility evenly over all industry.

It is suggested that a special tax equivalent to say 4 percent of 1932 gross income be levied on corporations, the proceeds of which to be utilized by the corporations themselves to reemploy labor formerly on pay roll.

Such reemployed labor to be used on nonproductive work, or to share the work available with part time and full pay, until demand is restored and normal working conditions in the factories are justified.

The effect of this would be a compulsory industrial unemployment insurance fund to meet a national emergency. Its administration would involve only such problems as must be met in any form of unemployment insurance.

Where corporations do not possess the necessary cash or liquid resources or do not wish to use their resources or weaken their financial position, the Reconstruction Finance Corporation could be empowered to give credit or advance funds at nominal interest up to the amount of the tax imposed, this indebtedness to be repaid out of future earnings.

To prevent corporations from collecting the amount of the tax imposed from the community by means of increased selling prices, provision could be made that no additions to corporate surplus or reserves would be sanctioned by the Treasury Department until the debt to the Reconstruction Finance Corporation was liquidated.

Corporations might be permitted to pay out earnings in wages and dividends up to some maximum. In other words, the Reconstruction Finance Corporation would not necessarily require corporations to repay the indebtedness immediately, provided the corporations were not withholding earnings and storing them up in reserves. The theory is that so long as earnings are being distributed, and not withheld, business must improve.

While the proceeds of such a tax should not be distributed in a lump sum, it might prove advisable to make a part thereof available to meet back bills for groceries, rent, etc., adjusted to the length of time a man has been unemployed.

The purpose of the tax is primarily to reemploy the unemployed; the proceeds should not be diverted in any way to wages for those now employed; and some check should be provided to prevent employers reducing wages payable out of earnings, at the expense of wages payable out of this special tax. One suggestion would be to forbid for a limited time and as an emergency measure, the dismissal of labor or reduction in wages.

The charge for funds advanced to corporations by the Reconstruction Finance Corporation should be as small as possible so that no heavy interest obligations would accumulate.

The plan should be carried out with as little interference with private business as possible. For example, if corporations wished to expand plant facilities from new stock issues, before repaying the Reconstruction Finance Corporation loans, they might be permitted to do so, even though such a proposal seemed generally unwise. Possibly they could be penalized by being charged a high rate of interest for their unpaid indebtedness.

In the case of a corporation which is now financially weak, and which could plead danger of being forced into receivership, provision might be made whereby the Reconstruction Finance Corporation eventually assumes this burden itself, relieving the corporation of the necessity for repaying the funds. Ths would be done only where it was a clear case of the operation of the law being responsible. The theory is that we will have done our best to bring a recovery in business, and prosperity for all industry. Failing some such recovery, the country must face taxation for unemployment relief, and it would be wiser to place this burden directly upon those industries in which unemployment exists; and if industry cannot bear it all, it can be met later out of the country's finances, when it will be less burdensome.

It would probably prove true that some corporation would obstruct the operation of the law as much as possible, and refuse to abide by its spirit. In such cases it might be feasible to amend the income tax law in such a way that corporations which could not provide satisfactory evidence of having restored a given wage level, would automatically come under certain higher and penalizing supertaxes on earnings when and as made.

It may be objected that an indebtedness of this kind would depress Wall Street stock values. This might or might not be so; for the creation of the indebtedness, repayable only at the corporation's convenience, would tend to restore normal business conditions and corporation earning power.

The working of the plan would tend to preserve a corporation's capital structure and restore the value of its assets. It is designed to build up demand to productive capacity rather than tear down previous values by reconstruction, thus creating unfair competition with those industries which have been soundly managed.

It is in effect the buying of factories on the installment plan. You have the plant capacity now, but pay for it in the future; your small competitor may not be burdened with extra plant capacity now, but he will have to set aside earnings to pay for extra capacity, if he wants it later on. There is one important difference, however, between this proposed installment plan for manufacturers and the installment plan for consumers. Private installment debts can only be settled in capital goods, a situation which contains elements of danger, as pointed out before. Corporate debts incurred under the plan suggested, by involving a direct contribution to purchasing power would reduce private indebtedness; and the repayment of the corporate debts would be in the nature of paying off mortgages, and would not add to capital equipment.

To supplement the duties of the income-tax officials, "business examiners" with responsibilities similar to those of "bank examiners" might be appointed with power to examine the financial position of a corporation at any time. The theory is that a company, like a bank, is in more serious need of investigation when it begins to make losses than when it makes so-called "excessive" profits. Also that it is far more important, as society is to-day organized, to safeguard employment (the day-to-day living expense of our people) than to safeguard bank deposits (the past savings of our people deposited in banks because they were not needed for immediate use).

It is suggested that the Reconstruction Finance Corporation might be empowered to issue notes, similar to Federal reserve notes, against the security of the industrial property involved. While this might be termed "inflation," it is basing currency on the country's finest assets and regulating the quantity to the business requirements of the country, a theory which would seem to be fundamentally sound; for as these notes were issued, they would immediately go into circulation in exchange for consumers' goods.

The plan is simply a means of converting the accumulated savings of the community, now arbitrarily held by industry in the form of "reserves," into consumable goods, and restoring to those who helped to produce the goods the unquestionable right to consume them.

While the looks of a balance sheet should have short shrift if it stood in the way of alleviating wide-spread misery, the effect of such a plan would not, in fact, alter corporate balance sheets to any startling degree. The gross income of corporations engaged in manufacturing only, as reported by the Treasury Department for 1929, was $72,000,000,000, and the "Surplus and undivided profits" amounted to $19,500,000,000, over 27 per cent. While gross income declined nearly $30,000,000,000 by 1931 there must have remained a very substantial amount under "Surplus and undivided profits." The longer business remains depressed the faster this item will shrink. It would be far better to risk a portion of it in constructive and logical measures to restore business.

The work of the Reconstruction Finance Corporation, laudable as it has been, is so far largely defensive. The plan proposed is constructive; it would mean launching an offensive against the depression.

### A SUGGESTION FOR REGULATING BUSINESS IN FUTURE

The other problem that is suggested by the foregoing analysis is how to prevent recurring periods of business stagnation. The most successful plan would seem to be the one that interfered least with our present methods of doing business. A central planning board, acting in a purely advisory capacity, might render invaluable service; but it is difficult to conceive an effective centralized control over industry, either from the standpoint of the ability of the men exercising such control or the willingness of American business men to be so dominated. Perhaps nothing so drastic is necessary.

The objects we want to achieve are to insure adequate purchasing power to enable our people to consume what they produce; to prevent excessive competition with all its waste; to discourage speculation; to protect our savings.

The main source of all these evils seems to be in certain business practices. Our corporations withhold from distribution an average of 40 per cent of earnings annually. The bulk of these find their way into plant expansion, oftentimes unnecessary. Such hidden assets are the foundation upon which Wall Street speculation is laid. With industry operating on the "profit system" and the mass-production theory, the diversion of this potential purchasing power from workers and stockholders into excess plant is necessarily followed by destructive competition, unemployment, suffering in the midst of plenty.

Much of this could be prevented, it is felt, if a few comparatively simple but basic changes were made in our corporation laws or in our Federal income-tax law, such as (*a*) the requirement of standard accounting practices; (*b*) the prohibiting of surplus and reserve funds beyond certain percentage of capital; (*c*) the prohibiting of plant expansion except from capital raised by new issues of stock; and (*d*) the establishing of unemployment insurance.

(*a*) The adoption of standard accounting practices, already widely urged, is a logical outgrowth of our present corporation laws.

(*b*) If corporations were not permitted to plow back earnings into plant expansion, this would, first of all, do away with those hidden assets on which speculation is based. Earnings would be paid out in the form of dividends and increased wages or wage bonuses. If an unduly large proportion went to stockholders, an income tax law would penalize the higher brackets; moreover, such a practice would make the corporation a target for competition. The tendency would be to increase the return to labor, which is what we need—for it is there that the vast potential market for goods remains unexploited. Furthermore, it would give back to the people the right to determine how much and in what manner they will save or spend—a function which industry has hitherto attempted to exercise, with unfortunate results.

(*c*) Were directors forced to approach the public for capital every time they desired to expand plant, they would make pretty certain of a sustained demand for their product before doing so, because such a practice would soon establish a tradition among investors of requiring corporations to show a history of earnings and dividend distributions. Attention of investors would be diverted from market appreciation to regularity in dividends. The tendency would be for stockholders to become more concerned in the management of their company, and reduction of earnings would soon be regarded as a danger signal. Obviously, earnings would be more secure, dividends more regular, the purchasing power of the community more stable, and—completing the circle—business more profitable.

(*d*) Experience already gained with unemployment insurance indicates that management is much more cautious in hiring and firing of men, and in drastic varying of production schedules. Competition would be less, business on a more even keel; and the very inauguration of the plan would tend to prevent development of conditions under which the plan would come into operation. This would bring back to business executives a sense of their responsibility, and of the responsibility of their corporations, to workers, and to the community. Should unforeseen conditions arise necessitating the laying off of men, their needs would be taken care of; starvation and distress would be eliminated, their morale unimpaired.

Our people are entitled to security, and a share in our national wealth proportionate to the individual contribution in creating it. For in the aggregate the people own and operate all the means of production.

With every family in economic security, with every child having proper educational facilities and a proper environment, the probability is that many of our most serious social problems would gradually disappear. One wonders if even the farm problem might not be solved. From an industrial standpoint, perhaps the most important byproduct would be a home-building movement such as this country has never seen. We had the cart before the horse when we urged home building at a time when unemployment was spreading rapidly. Job security must precede any such movement.

Life seems to be pretty much of a paradox. The more wealth you take from a rose bush, the more it gives. The most selfish attitude a man can adopt is to be unselfish. The most profitable course business can pursue is to pay out the profits which breed more profits. "There is that scattereth, and yet increaseth; and there is that withholdeth more than is meet, but it tendeth to poverty."

---

### Statement of Edward A. Filene, Boston, Mass.

It seems to me that there could be no such disagreement as there is to-day, concerning the meaning of this depression and the way out, if it were not for some confusion of terms. We all want to know the facts of the existing situation; but if those facts are reported in misleading terms, or in terms which are capable of misconstruction, the facts become obscured. May I be pardoned, then, for noting in the beginning that one of the commonest assumptions concerning this depression, upon which most of the proposed remedial measures are based, while literally true, is not actually true. I mean the assumption that prices are lower now than they were in 1929.

In terms of money they are. In terms of human life they are not. I take it that this committee, in seeking a way out of this depression, is not so much interested in what becomes of money but in what happens to human beings; but the word "price" is used so loosely that focusing our attention upon the price level, instead of upon the human level, is likely to lead to all sorts of difficulties and disasters.

It is commonly said that prices are high in periods of prosperity and low in periods of depression. So they are, usually, if we refer to money prices. But how about actual prices—real prices? And how can we find out whether prices are really low or high?

We have all learned to make a distinction between real wages and money wages. Whether real wages are high or not depends not upon how many dollars a worker receives daily but upon how much those dollars will buy. Whether prices are low, likewise—at least as far as the masses of people are concerned—depends not upon the figures upon our price tags but upon how much those prices enable the masses to buy. No matter how low the money prices may be, real prices are surely not low if they are beyond the reach of the masses of American people.

Prices of many of the necessities of life, however, are now concededly beyond the reach of twenty-five or thirty million Americans, who have to depend on help of one sort or another. It is not to be supposed that those who are advocating measures to maintain or restore the price level really want to put prices beyond the reach of more Americans. I think we all want the same thing—lower real prices. We all want some arrangement by which more people will be enabled to buy more things.

Only if we understand this double meaning of price, however, and understand every time we used the word just which meaning we intend to convey, can we approach the problem with much hope of finding our way through.

While prices even of the necessities of life are now beyond the reach of a large part of the American people, money prices have fallen in many instances below the actual cost of production and distribution. I think we must all recognize that such a situation is unendurable. For goods are sold at money prices, and unless they can be sold for more than the cost of production and distribution, production and distribution must become demoralized.

Theoretically, there are two ways of correcting such a situation. One is to raise money prices above the cost of production and distribution. The other is to lower the cost of production and distribution below the level of existing prices.

For several years now, we have been trying the first way. My only objection to it is that it can't be done, and that all attempts to do it produce exactly what has been produced—putting real prices beyond the reach of more and more people.

There is no clash of class interests involved in this inquiry. And it is not a question of good or bad motives. I am certain, at least, that those who have proposed measures for the raising of money prices have the interests of the whole country at heart quite as much as anyone.

There was a time in American history when high prices for certain industrial products were temporarily advantageous to business. But that was when there was a ready market for the things which the industries in question were producing and offering for sale. But industrial processes were constantly improved; and when industry became so productive that it needed a mass market, it was necessary to lower the price of its products to get that mass market.

If any industry were sure of selling its whole output, then, raising prices would seem to be good business; although it would doubtless be good public policy, on the part of the Government, to see that such an industry could not charge prices which would obviously exploit the public. But there is no such problem before us today. Business is in depression today because the masses cannot buy enough, or fear to buy enough, to keep business going. If any step toward dispelling the depression is to be successful, it must be either in the direction of increasing the buying power of the masses, or of dispelling this prevailing fear.

Any effective action toward one of these goals, in fact, would necessarily bring us toward the other. Increase of buying power would automatically restore confidence. Increase of confidence would automatically restore buying, thus reviving industry and increasing mass buying power through increasing employment. Before making any definite recommendation, however, I wish to present one more question.

If production doubles, triples, or quadruples by the introduction of better methods, will it naturally tend to make things scarce? This may seem like a foolish question. In fact, it is a foolish question. But we are in a period of business depression today for the definite reason that business has been foolish.

Everybody will admit, I believe, that the discovery of better ways to do things will naturally make things more plentiful. This is natural law, and no natural law can be violated without incurring a natural penalty. Business depressions are not necessarily natural, but they naturally follow any violation of this natural law.

We business men discovered ways of increasing production, but we did not find ways of increasing distribution and buying at the same ratio. There were reasons why we did not do this, but natural law does not pay much attention to our excuses and explanations. Criminal courts may suspend punishment because of extenuating circumstances; but there is no court in nature which will suspend the consequences of any of our acts, or take note of how sorely we were tempted.

What happened was that we marvelously improved our system of production, and nature wouldn't wait for us to mark our money prices down accordingly. It wasn't that we weren't interested. We wanted to sell more goods than ever. We wanted to sell enough to keep the whole mechanism working at top speed. But every time we introduced a new method, we abandoned an old method, and if prices were brought down to the point indicated by the new method, we couldn't see how we could make any further profits out of the old method.

No one can blame us, surely, for failing to find a way of making profits out of a method which we had abandoned. But we had paid money to install the old method, as well as to install the new method, and we wanted returns now on all the money that had been invested. We thought we could fool nature, but something went wrong with our plans.

It simply isn't natural law to make goods with machinery which we have quit using or to make profits with capital which we have quit using. We can use the new machinery to produce new capital, and we can use the new capital to produce the new machinery, but when we write off the machinery, we must write off the capital, or natural law will step in and do it for us. This is the determining principle underlying the railroad problem with which you are dealing—but not only the railroad problem.

In other words, in every period of prosperity business habitually gets busy doing two things: First, increasing production by the use of better methods, and, secondly, building up a structure of capital and debt to take the place of the one which has recently fallen down. For every period of depression wipes out old capital and old debts, and until the liquidation is sufficiently complete, prosperity cannot set in again. When the liquidation has been completed, however, business is freed from the necessity of earning dividends on capital which is no longer in use, and, the system of production being more efficient than ever, business rises to new heights of prosperity.

During these periods of increasing prosperity business men almost uniformly demand that the political government shall keep its hands off, but it is continually employing new processes and abandoning old ones, while trying to make the new processes not only pay for themselves but pay for all the dead horses that are strewn along this path of progress. The inevitable result is that the time comes when property gets such a strangle-hold on functional industry that business cannot continue successfully until a large part of these burdensome debts is liquidated. When this necessity arises, however, business men almost uniformly reverse their attitude toward government and appeal to government to help maintain the structure of capital and debt and thus prevent the liquidations which are decreed by natural law.

In such an emergency, the usual appeal to government is to assist somehow in raising the level of commodity prices; and since business thinks at such times in terms of immediate expenses and financial obligations, not in terms of how the existing mechanism may best serve the interests of the masses of people, this appeal to help raise the price level is invariably accompanied by wage reductions, thus putting real prices beyond the reach of more and more consumers.

I am not one of those who believe that the political government can successfully regulate this business process. I believe it can and should cooperate with business in a way which will automatically work toward business prosperity; but if it attempts to assist business in the way in which many panic-stricken business leaders think that business can be assisted, the inevitable result must be to prolong depression, to create more unemployment, to keep the masses paying for dead horses instead of buying new motor cars, to put real prices of the necessities of life beyond the reach of more and more millions of people, and generally to injure the businesses which it seeks to help.

To avoid business depression—to escape from these violent, periodic breakdowns, resulting from failure to coordinate production, distribution, and finance—business should look upon liquidation as a necessary, normal process, and should be ready at all times to take losses when, because of changing conditions, the investments involved can render no further human service. I realize that it is asking a good deal of our business men to ask them to take this attitude. But the only alternative is to put up with these violent dpressions. Business health demands this constant liquidation. The economic body, no less than the physical body, must eliminate its dead cells if it is to keep in good condition.

Loans which cannot in their very nature result in the production of new wealth must be canceled or scaled down as soon as their futility is discovered, or business, in its attempt to pay interest on such loans, must withhold some of the service which it is physically equipped to give. It doesn't matter, when we consider the question according to the natural laws from which we cannot escape, whether these are foreign loans used to destroy wealth in war, or whether they are loans to our farmers, made on the supposition that farming was entering on a period of super-prosperity. It doesn't even matter from the standpoint of natural law what widows and orphans may be in possession of the bonds concerned. Natural law will see to it that interest cannot be paid on useless, foolish, or destructive loans except by taxing the mechanism of the production and distribution of wealth in such a way that it cannot give full, normal service to the consuming masses.

Our financial leaders seem to be quite generally convinced by this time that we should and must scale down our foreign debts. Unfortunately, this does not necessarily mean that the principle involved is understood. If it were understood by financial leaders generally, finance would not be in such a predicament as it is. The principle is that loans, to be successful, must be employed for useful purposes, and that they must be profitable alike to borrower and lender. Whatever our statutes may say about it, the only security for loans which is recognized by natural law is that the loan itself shall be constructive, and that borrower and lender shall cooperate in making it as easy as possible to collect the loan.

The only American financial institutions which, to my knowledge, have been expanding lately are the credit unions; and they have been expanding most rapidly, even in these depressed times, because their policies directly conform to these natural laws. Credit unions with assets now of over $50,000,000 and under the supervision of the same banking laws as other banks, have stood up when banks by the thousands went down; for in the credit unions, the borrower and the lender have had a common aim, and every possible effort has been made to reduce instead of increasing the interest rates. Although the loans of the credit unions generally have been accompanied by no security which the banks would recognize as security, their percentage of losses on such loans has been, in good times as well as bad, really negligible and therefore far less than the losses suffered by the banks in supposedly well-secured loans to us business men. I suggest a careful inquiry into the principles and practices of the credit unions, before any conclusive step is taken looking toward the reconstruction of American finance.

There is as yet an abundance of idle money in America, and an abundance of needed work-producing credit. But the money is not being used as capital, and is not available for use as work-giving capital, mainly for the reason that our whole society is charged with expenses from which society can not possibly receive any benefit. While the masses are so short of buying power that they can not consume the products of our improved machines, a large section of the population is still hoarding money individually or putting it in banks where it is not being constructively employed. It can not be constructively employed, in fact, unless the masses have adequate buying power; and because it can not be so employed, we have not only unemployment, but the fear of unemployment, both of which still further reduce buying and aggravate the whole situation.

Unemployment, at a conservative estimate, has for some time been costing America above a hundred million dollars a day. The unemployed produce nothing, whereas, if employed with modern machinery and under scientific management, they might be producing and in the main consuming much more than the volume of wealth represented by the figure stated. Instead of using our money and credit, however, to put the unemployed producing the things which the unemployed need, we have been using it in efforts to sustain a top-heavy structure of debt under which industry has found it impossible to operate profitably. By means of the Reconstruction Finance Corporation and other credit resources, we have hoped to keep the mechanism of industry going, and in the end to provide employment. The most that has been accomplished, however, and the most that could possibly be accomplished by approaching the problem from that angle, has been to defer necessary liquidation and maintain the stranglehold of property upon our industrial functions.

I say this as a believer in the institution of property. But such an approach to our problem constitutes an actual menace to the institution of property, and plays into the hands of Socialists, Communists, technocrats and others who can see nothing in the present situation excepting that we have built up a machine capable of supplying everybody with such an abundance of everything that we have all decided to sit down and starve to death.

To preserve social order is the first essential of government, but no social order which ignores social evolution can be preserved. Government therefore must deal not only with those efforts aimed to destoy the social order, but with those which aim, in the name of preserving the social order, to preserve all its unendurable burdens.

I believe that the reduction of wages and salaries is an even more important factor in prolonging and intensifying the present crisis than is even unemployment itself. I believe this so intensely that when the company of which I am president recently reduced wages and salaries, over my protest, I felt compelled to make a public statement that I believed the act to be a most unwise and unbusinesslike step. When I say "unbusinesslike," of course, I do not mean that it was unlike the policy of American business in general; nevertheless, any move which tends to reduce the buying power of the masses must be bad for business, and must tend to rob business of the mass market which is now vitally necessary for business success.

Unemployment and wage reductions must necessarily reduce buying, not only because the unemployed and those whose wages have been reduced, can not continue to buy as usual, but because other masses of people fear to buy as usual, and hoard their money instead. I know of no more effective single step toward dispelling this fear than unemployment insurance. I do not mean a dole. I mean unemployment insurance which will not only insure workers against destitution in the event of unemployment, but will tend to insure them against unemployment itself. The cost of this insurance should not be levied on the employers, in the present emergency, to the extent that it should when it is well underway and its business advantages are generally understood I say this because the times are excessively abnormal now, partly because of business failure to organize such unemployment insurance in days when it could have been done with relatively little difficulty. This system should be set up immediately, not merely to relieve the unemployed, but to give assurance to those who are hoarding that they need not hoard in order to be assured of at least the necessities of life.

In every State, however, in which an unemployment insurance system is set up, the greatest care should be taken to avoid one of the traps which may at any time turn unemployment insurance into a dole. Every unemployment insurance law should contain a clause giving employers the option of setting up their own unemployment insurance system, providing only that the benefits and safety of the funds are equal in every respect to those of the State system. The more alert and wideawake employers, then, would be certain to set up their own system, so as to escape paying for unemployment caused by less alert and less progressive employers. The more backward employers would rely upon the State system; and when unemployment developed, we could expect little from them in the way of providing new employment. The good business executives, on the other hand, to save the costs of paying unemployment insurance to their own unemployed, would seek better ways and new ways of employing all those who otherwise might be laid off. With such a set-up, I am confident, the bulk of Amelcan business would soon be in the hands of progressive, wideawake employers who were keenly conscious of the business necessity of maintaining employment. Inasmuch as unemployment is national in its effect, more State laws can not adequately cope with it; and Congress should go as far as it constitutionally can to bring about Nation-wide unemployment insurance of the right kind.

I do not presume to know what Congress might do in an effort toward making such legislation general. But I do know that such insurance would further prevent hoarding, restore confidence among the masses of potential buyers, and renew mass buying, without which business can no longer be successful. I am not suggesting additional governmental expenditures. I am suggesting simply that appropriations be employed constructvely to remedy or, better yet, prevent such situations as the present, which necessitates still greater expenditures for more relief. I know, of course, that relief is necessary, but it would be an excellent use of public money to disburse all aid to the unemployed through this unemployment insurance set up in each State; for the present system of unemployment relief is, at best, a dole, with the extreme disadvantage of carrying with it no suggestion of security, and nothing, therefore, to allay the fear which causes even those who have money to hoard it.

The attempt to treat unemployment as if it were a local matter has aggravated the situation incalculably. It is not a State matter. It is not even wholly a national matter; for the same fear which paralyzes buying on the one hand, and credit on the other, has disrupted world trade and is making international relations increasingly difficult.

The most common expression of this fear is the fear of war—a fear by which all the nations of the world seem driven to all sorts of violations of economic law, even when they know that they must suffer the penalty.

The whole world is suffering under the burden of armament, and there is scarcely a nation in the world that would not welcome world disarmament.

Nevertheless, all the nations are inhibited from any definite action toward the commonly desired goal, and our disarmament conferences seem to get almost nowhere. If we could but realize the extent to which the war problem, the unemployment problem, and this whole problem of business depression are the same problem, our Congress could, I am sure, take definite action at this time toward dispelling this world-wide fear which not only places upon each nation this great burden of armament, but causes each nation to conduct its business affairs in an absurdly expensive way.

Our own Nation is no exception. If our world trade had increased at the rate in which our technical ability to serve the world has increased, we would not find ourselves in the present plight. But our world trade was suddenly cut in two, and thereupon reduced again and again; not, however, because the other nations did not need our goods, not even because they had found ways of supplying all their own wants, but because they were trying to conduct their business as if they did not need any imports from other nations.

No nation, not even our own, was economically independent of the rest of the world; but the fear of war has caused every nation to try to become self-sustaining.

Now, at any previous stage of industrial development, such an attitude might be economically sound. But it is economically unsound now. To do our work most economically today, we must do it with a mass of machinery so large that, to operate it successfully there must be a great mass market. To employ mass production methods to serve a small market would be prohibitively expensive. On the other hand, if mass production methods are not employed, more expensive methods must be employed, which means that, even if wealth were equitably distributed, there would still be a relatively low standard of living generally. Where old-fashioned industrial methods are employed, however, there will be no equitable distribution of wealth. It remained for mass production to discover the necessity, not only of lowering prices so that a greater and greater number of people would buy more things, but of raising wages as better methods of production were discovered, so that masses of wage earners would have more buying power.

This attempt of all the nations to become economically self-sustaining does not permit the successful employment of genuine mass-production methods. Each nation is anxious, of course, to sell goods to other nations, but this is rendered impossible by simultaneous attempts to keep the goods of other nations out. Mass markets are destroyed, and uneconomical methods of production and distribution, which necessarily lower the standard of living everywhere, are employed. This is brought about, often, by governments which know that the economic principles involved are unsound. Tariffs and trade barriers are erected and "buy at home" propaganda is let loose because of the fear of war, in which event any nation which is not self-sustaining may be subjected to starvation or conquest by the enemy nation.

I trust, then, that this committee will not think that I am moralizing about world peace, or that I am drifting in the slightest degree from the business problem which is before it, when I speak of the business necessity of the present time for American cooperation with the other powers in a definite movement to reduce this world-wide fear of war. I refer particularly to the situation in Manchuria.

I believe that what I shall say on this problem will be as much in the interest of the Japanese people and of Japanese business, as it is in the interest of the American people and American business. But all of us must face the facts. For 15 years, the world has been trying to find a way to peace. Most of the nations have officially outlawed war, and are committed to policies of arbitration and conciliation; and the League of Nations, often with friendly, if unofficial cooperation by America, has struggled along year by year to set up some mechanism of peace. It has accomplished many things; but in the atmosphere of insecurity and suspicion in which it has necessarily labored, it has not yet convinced the people of any nation that it is safe to look to any sort of world understanding for its national safety. Each nation has therefore worked desperately for its own defenses, and, in spite of what all international movements could do to prevent it, the staggering burden of armament is greater than it was before the war.

Today the world is faced with a crisis which will determine whether there is or is not any possible world security to be expected from international agreements. I do not mean to indict Japan. Her course is quite understandable in the light of traditional diplomacy. Many of the great powers have, in the past, acted in much the same way. But this is not the past. This is a new time. This is a time when the prosperity of every nation, including our own, is obviously dependent upon removing the fear of war; and if Japan is permitted to continue in the course she is taking, no matter how it may be justified by ancient precedents, the people of every nation must become convinced that our international peace machinery is not to be relied upon, and they will turn more madly than ever toward the policy of national preparedness.

Such a policy, however, even if it did not eventuate in another world war, is necessarily deadly to business everywhere. The mere cost of the armaments is probably negligible compared with the cost involved in doing business in the way it must be done if the various nations continue their attempt to become self-sustaining instead of employing the economical mass production methods which cannot be employed successfully unless the barriers to international trade are removed.

America must not be misled by the fact that our country seems more nearly self-sustaining than any other, and that, even in normal times, our world trade is but a small percentage of our total production. That is, of course, fortunate, and enables America to do many things that other nations cannot do. But our world trade, nevertheless, constitutes a very important part of our business upon which a large part of our other business depends. One cannot afford to lose his right eye on the theory that it constitutes such a small percentage of his body. Not as a moralist, then, but as a business man anxious to help dispel the business depression under which all the nations are suffering, I urge upon this committee the necessity of our supporting the policy of the League of Nations as expressed in the Lytton Report, the report of the Committee of Nineteen, and by Secretary of State Stimson. I am stressing this for business reasons. If there were any conflict, of course, between business advantage and the common good, Congress should consider only the common good. But industrial advance has reached a stage where this cannot be true. Because our productive capacity has increased to a point which necessitates mass buying, and a constant raising, therefore, of the standard of living of the masses everywhere, the interests of business and the interests of the whole world have inescapably become one.

Without the cooperation of America, the League of Nations could probably do little toward removing this present menace to world security. I refuse to call it the Japanese menace. It is, as I see it, just a test case which, if it had not arisen in Japan's dealings with China, was bound, sooner or later, to arise somewhere. America is faced with the issue of whether or not we shall go on to a world of international understanding, or go back to a world in which military force is the only known law, and, in doing that, continue a situation in which this business depression will be indefinitely prolonged, in which supertariffs and supernationalism will go on destroying commerce—conditions under which we know by sad experience business cannot operate successfully and the masses cannot be served.

It is imperative, then, that America join with the other powers in whatever economic sanctions may be necessary to prevent the course which Japanese militarism has set out upon. Our failure to do this, especially if we were to permit the shipment of any military supplies from this country to Japan, could result only in continuing and intensifying this depression.

For the same reasons, although I shall not go into any details now, it is imperative, I believe, that we should immediately recognize the Government of Russia.

Few of our problems are merely ours any longer. Certainly we can not collect international debts when conditions in every nation are such that they can not find means of paying their debts. Nor is it enough merely to scale down these debts according to the capacity of the various nations to pay. What is necessary in such world cooperation that all nations may utilize their capacity to produce, a process which need be limited only by the capacity of the whole world to consume.

To-day almost all nations, including our own, are frantically trying to balance the National Budget, mainly because they have used their resources in ways that do not result in the production of wealth. Of course, the balancing of our National Budget is fundamental. Our failure to do so means destruction of our credit system and possibly of the gold basis of our money. The cry everywhere is to economize; but no adequate economy is possible unless the wealth-producing machinery is set in motion. This machinery can be set in motion, however, only by such measures as will establish security and promote mass buying. Such measures, if undertaken, will in themselves provide adequate security for the money or credit necessary for the undertaking.

Many proposals have been made to broaden the base of the income tax, not merely for purposes of revenue, but so that the masses generally will feel more responsibility toward Government. Many of these proposals, while decrying the principle of "soak the rich", definitely propose to "soak the poor." Any practical lowering at present of the standards of incomes to be taxed would not make the base broad enough to serve the ends desired. The effective way to bring everybody into the income-tax-paying class, is to take steps which will result in the masses generally having ample work, which means ample earning power—ample income.

The most dangerous, the worst of the proposals for additional taxation is the sales tax. No other tax so directly diminishes the buying power of the masses of our people, on which buying power depends our ability to use the best methods of production for our home markets and for export. It is claimed that it is proposed to levy only a very light sales tax. But can anyone doubt that once this tax is established nationally there will be a constant enormous pressure to substitute higher and higher sales taxes in place of high income taxes. Nor can it be doubted that if the National Government adopts the sales tax, State and municipal governments will also impose sales taxes. They have already begun.

There are no physical barriers to our increasing incomes to a point where they may properly be taxable. Every survey of our industrial capacity indicates that, if we were working at full capacity, we might be distributing wealth enough to everybody in America to qualify everybody as an income-tax payer on the basis of the existing laws. We are not so producing and distributing wealth, but are suffering widespread privation, in spite of our increased ability to produce, because it has not occurred to us as yet how to use our money and credit to achieve what all of us want to have achieved. I urge economy in Government expenditures as strongly as anyone. But there is little economy in simply paring down expenses; and budgets can not be balanced simply by increasing taxation. Real economy demands that we use our resources more effectively for the production and distribution of wealth. If we do that, we will have plenty of money and credit. We can balance our budgets while reducing taxation, if we can only make certain that the masses everywhere have ample incomes to be taxed.

Let me repeat. There is only one way by which the buying power of the masses can be safely and constantly increased; and that is by enlisting the masses in the most effective production of wealth—in other words, in making and distributing, by the best possible methods, the things which the masses most desire. Any public-works program which does not take this into consideration must measurably fail. Simply to find work for the masses is not enough; for, unless the workers receive high enough wages to enable them to buy extensively, business generally can not be profitable, and taxable income and taxable wealth can not be measurely increased. If they are given high wages, however, for work which is not intrinsically of great value, or their labor is not organized to do the work as efficiently as it can be done, the result will be an economic loan which must be made up by increased taxation.

Workmen want leisure as well as work; and they must have leisure if we are to use our machines to capacity. They must not only have the price to buy things, but the time to consume them. Not merely as an emergency measure, then, but as a perfectly reasonable business program, I have been urging upon American industry the 6 hour day and the 5-day week, with no reduction of wages unless the unit cost of production should rise. If this program were adopted, I am convinced that unit costs would fall, because of the irresistible pressure it would bring to bear toward reducing the great wastes which still exist in most of our production, and the almost incredible waste in distribution, and because of the enormously greater market which such a move would create. But if at the end of a trial period of, say, 6 to 9 months, the unit cost of production should be higher than before, wages must be correspondingly reduced until such time as the unit cost may be brought down. These unit costs surely can be reduced by conquering the great wastes that still exist in most of our production, and the incredibly greater wastes that exist in distribution.

To prevent a similar new debt burden being created, with the inevitable consequence of another violent depression, we must primarily employ our manpower, our machinery, our capital and credit, and our legislation for the production and distribution of buying power to the masses. Unless this is done, any attempt to remedy our distress can not meet with lasting success.

---

## Statement of Irving Fisher, Professor of Economics, Yale University

I will be brief and refer, for a full expression of my views to Booms and Depressions (Adelphi Co.).

### OVERINDEBTEDNESS

According to my studies, this and other major depressions have been due in the first place to overindebtedness, however caused. In the present depression the overindebtedness came about chiefly because of the World War, both directly and indirectly. Directly our national debt rose because of the war from 1 billion to 25 billion. In 1929 it was 17 billion. The total Federal, State, and local debts increased from 6 billions to 30 billions in 1929. The public debts of other countries increased even faster, including the German reparation debt and the interallied debts, all contributing to the world overindebtedness. Indirectly, due to the war, were the farm mortgages of the win-the-war-with-wheat days and the investing abroad after the war for reconstruction. Another cause of debt was for investment in new inventions which were, in some degree also stimulated by the war.

It was largely these inventions which led to the speculative boom on the stock exchange, though there were other reasons also (see my Stock Market Crash and After, MacMillan). The total debts owing in the United States in 1929, I have estimated at 234 billions, including brokers' loans (10 billions), commercial bank loans (39), corporation debts (76) farm mortgages (10), nonfarm mortgages (37), private foreign loans (14) and several other categories. The total wealth of the United States in 1929 was estimated at 362 billions as compared with the 234 billions of debt. The ratio of debt to wealth was probably about 25 per cent greater than 10 years before.

### SWELLING THE DOLLAR

But that is only the beginning. The next and much more important step is the fall of prices, or as I much prefer to call it, the rise in the dollar. It was the overindebtedness which swelled the dollar. As soon as some overextended debtors begin liquidation, and throw their stocks and other securities and property on the market, prices are depressed, others overextended are forced to distress selling and soon there is a mad scramble to sell constituting a crash. Even worse is the deflationary effect of liquidating bank loans; for this means wiping out the deposits which rest on those loans, constituting a contraction of the circulating medium and tending powerfully to shrink prices.

### AND SWELLING DEBTS AGAIN

When prices crash or, in other words, when the value of the dollar swells, every dollar of debt still unpaid is that much harder to pay. That is, while the liquidation reduces the number of dollars owed it increases the size of each dollar still owed. Not only that, but when we try to liquidate so vast a debt as in 1929, the dollar swells faster than the number of dollars owed shrinks. That may seem amazing; but it is exactly what has happened and what must happen if the debt burden is big enough and if nothing is intentionally done to prevent the dollar from so swelling. In short, in such a situation, honeycombed with debt, the very effort to decrease debts increases them in terms of real things. The farmer who has paid off half his mortgage but whose prices for wheat have been reduced to one fourth of what they were, while he really owes only half his original debt in terms of dollars really owes his original debt in terms of wheat. Such liquidation is a mockery. It does not really liquidate but aggravates the debts. Overindebtedness is made worse.

THE OVERINDEBTEDNESS OF 1929 AND TODAY

Up to the time my Booms and Depressions was written a year ago, the 234 billions of debt of 1929 had been, in terms of current dollars, reduced to 197 billions, a reduction of 16 percent; but each dollar was 53 percent bigger in value or purchasing power than in 1929, so that in terms of the 1929 dollar the debt was not 197 billions, but 302 billions. This is 29 percent more than the original 234.

If these figures could be brought down to date we should find that the situation was worse. The dollar has now swelled 80 percent over the 1929 dollar and the debts (in current dollars) have fallen but little. It seems likely, though I have only rough statistics, that the present debt burden, measured in commodities, is greater than in 1929 by at least 40 percent. That may seem incredible; but I think it is more likely to be an understatement than an overstatement. Moreover, our national wealth and income are less than half of what they were in 1929.

THE MONEY ILLUSION HIDES THE FACTS

People who thinks things cannot be worse because they are so bad and that we must be scraping bottom are grossly misled. They count the dollars owed but do not measure them. They have the "money illusion" that a dollar is always the same. The Germans had the "money illusion" that the mark was always the same. It took the most terrible inflation in history to wake them up and it is taking the most terrible deflation in history to wake us up.

PREVENTABLE AND CURABLE

If his diagnosis is correct, we could have been spared this depression, for the most part, if the deflation had been prevented, and we can only spare ourselves further depression by stopping and reversing deflation.

This can be done and by many methods, as I have shown in Booms and Depressions and in Stamp Scrip. Among these methods is devaluing the gold dollar, buying bonds with United States notes or with Federal reserve credit, guaranteeing bank deposits for a time, accelerating money velocity by the Riefler plan or by stamp money or both, and subsidizing the reemployment of labor. As I write, I feel sure there is no time to lose.

THE ALTERNATIVE

The alternative is liquidation. This, as I have shown, has not yet begun. It would take years to do it and would require bankrupting banks, savings banks, like insurance companies, and railroads, with far more unemployment than now, with bloodshed and perhaps political revolution.

I do not expect this alternative to happen, for even if the Government should refuse voluntarily to reflate, it would, I believe, soon be forced to do so against its will, because it could not balance its budget. Deflation which has already "got" so many banks will soon "get" municipalities, and if Uncle Sam continues to try to save everyone else from bankruptcy it cannot be long before he will be faced with bankruptcy himself. Then the only way out will be reflation.

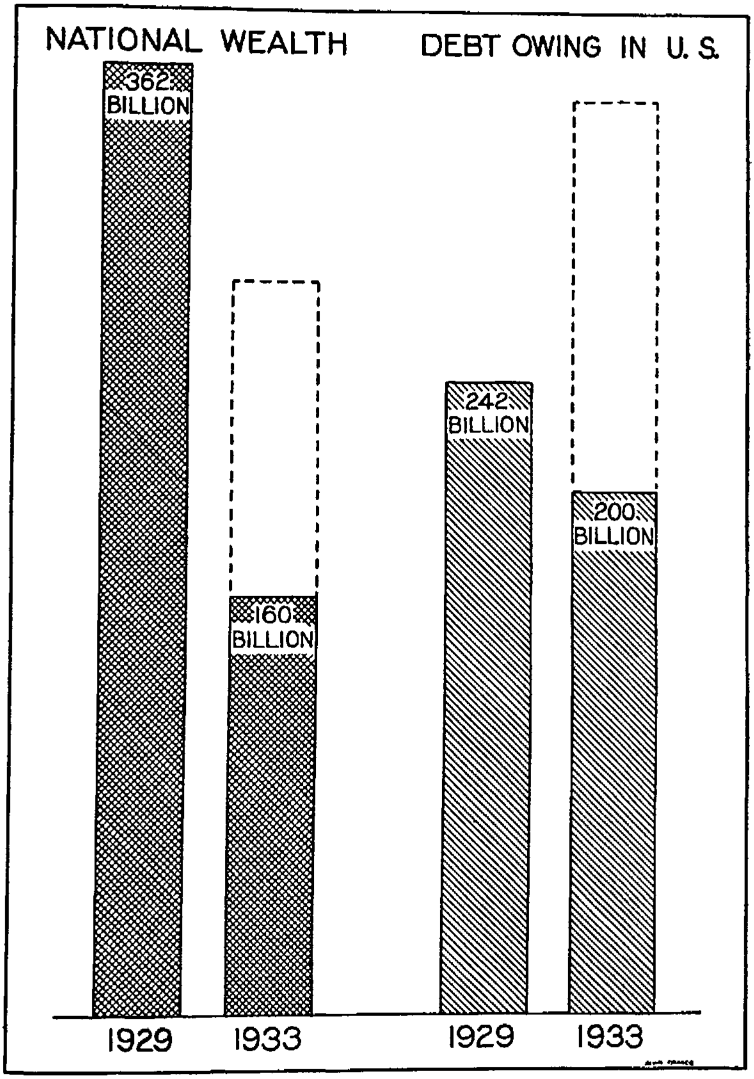
Between 1929 and 1933 wealth decreased greatly and debt decreased little; this is shown by the shaded columns. Real wealth decreased and real debt increased; this is shown by including the unshaded parts. The attempt to liquidate debts really increased them by increasing the dollar. The dollar could have been stabilized. It should now be stabilized after being restored.

---

STATEMENT OF FRANKLIN FLICK

NEW YORK CITY, *March 6, 1933.*

At a time when the best minds of our country are endeavoring to be helpful in solving our present difficulties and providing ways and means to avoid such serious disturbances in the future, I welcome the opportunity to lay before you suggestions intended to assure "man"—in his relation to what I have elected to combine under the heading "The job" and "The savings" to the end that his fear of loss of these fundamentals may be permanently removed, and that he may never again experience such a calamity of unemployment and concern about his savings as has been his lot through this depression, which has threatened the very foundations of ordered and civilized representative government. Unless, from this calamity, we devise means to abate or eliminate



unemployment in the future and safeguard savings the laborious building of this great Nation and its established order and institutions which have thus far been civilization's greatest heritage are doomed, because fear possessing "man," in desperation he resorts to violence leading finally to chaos and ruin.

In presenting my views, I will be brief as possible, confining myself to fundamentals, just so that I may feel sure that my ideas are clearly understood. I will start with the premise that if a man is assured a job to the extent of an equal division of the available work among the workers and is guaranteed protection against the loss of his savings you have eliminated the two most potent elements of fear from human existence. Such distress as we are going through could not exist, and if at all, in a very modified form. The job and the bank account are the rocks of fear upon which our ship of prosperity is stranded.

How shall we proceed to handle the problem?

First, the job. Through Federal enactment we have coordinated National, State, and local workers' bureaus for Nation-wide cooperation throughout the Nation and established trade commissions and other agencies dealing with employment and trade. Expand these agencies into a national board of control composed of members, one third to be selected by the business interests of the country, one third by the working interests, and the remaining one third by the President. This agency would maintain up-to-the-minute information from every section of the entire country, covering the problems of demand and the workers available. It is then determined that every worker employed, each having his share of the work, the demand will be met by a work day of 6 hours. Let that be the decree of the board of control. If it should be 3 hours, or 8 or 9 or 10, let that be the decree. This likewise solves the question of overproduction because production is measured by demand. In times of heavy demand let the workers lay up against the day of a light demand. The arbitrary or legal fixing of so many hours of work per day or week is absolutely unscientific and can lead but to overproduction, underproduction, and upsets in our economic structure.

All sorts of machinery and labor-saving devices are certain to contribute to such upsets. It is ridiculous that the use of labor-saving machinery should be opposed as a remedy to prevent such upsets. Automatic labor-saving machinery should be encouraged to take from man's back the burden of labor and give him greater leisure and enable him to enjoy the social and spiritual values of life. The machine is for man—not man for the machine. If with the machine he can produce in 1 hour what it formerly took him 10 hours to produce by hand, let his pay be measured by the hand time and not machine time and our economic structure would remain stable, while giving to man the greater leisure to enjoy life and its values, which were created for him.

Then let there be a protection fund created and administered by this same control board to be contributed by both employer and employee to provide such necessary benefits for the workers in emergencies as would be agreed upon. The worker not to lose this benefit through change of employment or otherwise. Such funds should not remain with or under the supervision of the employer, whereby the same would be subject to the business hazard.

Some will urge this is socialistic, unconstitutional, and revolutionary. We should not be concerned with names or forms but with human values and proceed to properly provide therefor or we may have to reckon with a revolution of blood rather than reason. The "rights of man" is the issue, not outworn and obsolete systems.

Recognizing the right of man to an equal division of the available work, he must submit himself to scientific and humantarian mass regulation. If in times like the present our citizens insist that it is the duty of their Government to provide for them in their individual misfortunes then they must submit to mass regulation to the end that such conditions do not occur, since it is not a proper government function of self-governing people, but rather their obligation to so govern themselves as to obviate the necessity of government or private charity. There would be no occasion for either at the present time, as a burning public issue, if such regulation were in effect.

Second, the savings. Now that we have seen how the workers may be guaranteed against fear of unemployment, let us proceed to guarantee him against the fear of losing his savings. It has been urged that the Government could not undertake such a task. After all, our form of Government is "of the people, by the people, and for the people." We submit to taxation for every form of undertaking we deem of service to the people, including a deficit running into many millions of dollars annually for the Post Office Department. Why shouldn't we assume the responsibility to guarantee against fear of losing savings, even though it might result in some increase in taxation? This is so much more vital than that we should pay a little less for a postage stamp. But I contend that banking could be so supervised that there need be no concern of the taxpayers over removing the fear of loss to the depositor.

In the first place, money is a medium of exchange created and controlled by the Government. In the next place, the Government provides machinery in the form of banks to deal in its money and sets up rules and regulations for control and invites the people to make use of same. Then it would seem reasonable that the Government assume full resopnsibility for the proper management and safety of the banks or withdraw from what is so often a mere sham and create drastic laws whereby individual responsibility is held strictly accountable, but this would not eradicate fear from the minds of the depositors, so that is out.

Granting, then, that the function is one of Government responsibility, let us proceed to the method. In the first place all banks, State and National, should be required to be members of the Federal Reserve System. In the next place, this system should be charged with rigid examination of all such member banks and be responsible to the public for solvency. A bank liquidating corporation should be created. This corporation should assist any member bank if for any reason its assets should become temporarily frozen and aid in liquidating such assets so that the funds may be returned. Or if it would appear that the responsibility of the Government through its supervision had allowed a bank to become insolvent with no hope that its trouble may be overcome, let the bank be closed and taken over by the liquidating corporation and the depositors be immediately paid in full and the liquidating corporation take all the time necessary to liquidate the assets so as to avoid the losses involved in present-day hasty liquidation. This, together with stockholder liability, should practically assure the liquidating corporation against loss. To this might be added a capital or deposit tax to be paid to the liquidating corporation by each member bank. The system in itself, properly supervised, should practically protect the liquidating corporation against loss and should make a tax unnecessary, having in mind that the Government might as readily assume deficits in this department of government as well as others, especially in so vital a matter.

Something more could be said about a condition that has existed with many banks throughout this depression, i. e., refusal to make loans and the maintaining in some instances of nearly 100 percent liquidity. Authorities could be set up in each Federal Reserve bank district to control this condition, but if the foregoing provisions, relating first to the job and second to the savings, are in effect and fear is thus eradicated from the minds of the people, a condition may never arise causing the banks to also fear and refuse to loan.

Also, that we may never again experience an inflation in any line of business such as brought about the crash of the stock market in October 1929, empower the Federal Reserve bank in each district, subject to review by the Federal Reserve Board, to fix a proper proration and diversification of loans with respect to the entire capital, surplus, profits, and deposits, and when any one line of business has absorbed its permitted percentage, loans for that particular division of business to be curtailed or reduced in individual amounts and spread to a greater number of borrowers in the same division. This would permit the interest rate to remain normal. The arbitrary raising of the interest rate to discourage speculation in the stock market was unsound; it did not discourage speculation but it did penalize other legitimate and uninflated lines of business. It is often true in highly competitive business that the fraction of a percent on the interest rate is the difference between profit or loss to the concern. The interests of the people as a whole are once again the dominating issues of government.

Expanding this thought of Federal Reserve bank authority I propose that the Federal Reserve bank of each district become the hub of all the banks of the district, the relationship of the member banks being very much akin to that of branch banks. This provision would give banking all the benefits of branch organization devoid of private monopoly. Banking should be operated to serve the people rather than for private profit. I am not an advocate of present-day branch banking. I believe we should not only conserve but encourage individual initiative and effort as the most priceless heritage of our country. I would maintain the unit bank, but if necessary, go so far as to nominate one person in each bank directly responsible to the Federal Reserve bank. The Federal Reserve Board to be the supreme authority and final appeal.

These two issues, "the job" and "the savings", must be treated as one problem. The proposals are not impractical theories but sound and scientific principles that can be expanded from present basic standards. We conserve all we have thus far attained and build upon it as a sure foundation for our further progress in our struggle in behalf of the rights of man.

The subjects covered are so broad in their general application that the foregoing cannot be considered more than an introductory outline. I make the assertion that my position on these issues cannot be successfully refuted and would welcome the opportunity to appear before your committee for an exhaustive examination of my views.

I feel impelled to submit this for your consideration at this time, desiring to be helpful in the solution of some of our difficult problems. In November last I wrote a letter to the President embodying the views I have outlined herein.

---

STATEMENT OF WILLIAM TRUFANT FOSTER, OF NEWTON, MASS.

All proposals for the solution of our economic problems should be related to our chief economic aim.

Our chief aim is the restoration of our volume of production and employment. Nothing that we can do on paper with statistics of debts, taxes, budgets, gold reserves, hours of labor, and the rest, is of much avail, unless the result is an increased annual output of real wealth to the value of at least 30 billion dollars—real wealth which we are now losing solely because we are not using our available productive resources, human and material.

The restoration of production and employment requires nothing but an adequate flow of purchasing power to the 90 per cent of our consumers who are eager to buy more, but who lack the buying power. Consumption regulates production. Consumption therefore regulates employment. All that business needs is a buyer. Even in the depths of this depression, abundant credit is available for the production of anything for which there is a market. The beer business, at the moment, is the best-known example. All producers are eager to increase pay rolls and production. They will do so the moment expansion is justified by consumer demand.

The necessary flow of consumer purchasing power does not come about as a result of natural law. It does not come about at all, in a period of depression, as long as we rely on each rugged individual. For 3 years we have waited, in vain, for private enterprise to put the necessary currency and credit into circulation. When private enterprise fails, public enterprise is our only resources. We can restore consumer purchasing power by collective action, and in no other way. Collective action means, necessarily, action by the Federal Government, for the Federal Government is the only agency which represents all of us, the only agency which is entrusted by the Constitution with the power to regulate the currency, the only agency which has had sufficent power, every day of this depression, to end the depression by placing adequate buying power in consumer's hands.

Some ways of distributing this buying power are better than other ways. Any way is better than no way.

The way which will yield the greatest value, dollar for dollar, is for the Federal Government to make available to the States, sufficient funds to restore education. The present scuttling of the schools—now Nation-wide and daily becoming worse in our hysterical demand for tax cutting at any cost—will leave the deepest scar, when this depression is over. We are making our children pay the heaviest penalties for the mistakes of their elders. We are balancing our budgets with unbalanced schools. The damage can never be repaired: no 10-year-old child will ever be 10 years old again. Moreover, for the purpose of sustaining the morale of the Nation, education is more needed than ever before. Closing our schools because there is a depression is like closing our hospitals because there is an epidemic.

Another way of getting the needed buying power into pay envelopes is through the construction of needed public works. This method was all but universally favored 5 years ago. It was advocated by Mr. Hoover, Mr. Coolidge, and Mr. Mellon. It was made a plank in the platform of the Democratic Party. It was indorsed by the annual conference of governors and by the American Federation of Labor. It has been approved by most economists for a generation. It is just as sound a policy today as it was before men became hysterical.

Still another way of achieving the purpose is through loans for self-liquidating projects. Most valuable to the people of all such projects are the rebuilding of city slums. In pursuing this policy, the Government should be aggressive, not hesitant; and it should make funds available at cost, not insist on 5½ percent interest. Its aims should be, not to make money, but to get buying power into circulation quickly in connection with the creation of wealth.

Insofar as dwellings, bridges, harbors, roads, power plants—and, for that matter, all public works—are created by the use of labor and materials which otherwise would be wasted, they cost the country nothing, no matter what financial figuring has to be done on pieces of paper.

A more immediate emergency means of putting men and money to work is through reforestation. This plan has great advantages; it can take idle men promptly out of our congested centers of population; it can provide jobs for which any able-bodied man is equipped; it can take marginal lands out of cultivation; it can prevent floods; and it can become, with the growth of the forests, partly self-liquidating.

As another spur to economic recovery we should adopt a policy which gives reasonable expectation of a settlement of foreign debts. The United States has persistently refused either to cancel the foreign debts, or to establish conditions under which the debts can be paid. If the decision is made to try to collect the debts, the United States must buy more abroad or sell less. It must either lower its own tariffs or restrict its own exports. I favor lowering of tariffs. The best course for both creditors and debtors is to make it possible for debtors to meet their obligations. But many persons in this country are loudly crying, "Buy American!" and just as loudly crying, "Collect every dollar of the foreign debt." We can take one of these courses or the other. We cannot take both.

The way the foreign-debt question is settled, however, is relatively unimportant. The paramount need is that it should be settled and settled quickly.

The national debt should be increased as far as is necessary to restore employment and production. An addition of many billions of dollars of national debt, incurred in achieving that aim, need not be harmful. When we have increased our annual output of real wealth to the value of $30,000,000, we have created the means of paying our debts. All debts and all taxes are paid in real wealth, insofar as they ever are paid. They never will be paid in this country unless the Government boldly puts into circulation enough purchasing power to bring about a sustained rise in the commodity price level and in the volume of production.

In the future we must prevent the oversaving and the underspending which are the chief causes of this depression. We can most easily prevent oversaving by higher taxes on large incomes, on profits, and on inheritances, and by the elimination of tax-exempt securities. These measures will tend to sustain consumer buying. They are demanded by arithmetic, no less than by social justice. It is impossible, as this country has demonstrated again and again, for the rich to save as much as they have been trying to save, and save anything that is worth saving. They can save idle factories and useless railroad cars; they can save empty office buildings and closed banks; they can save paper evidences of foreign loans; but as a class they can not save anything that is worth saving, above and beyond the amount that is made profitable by the increase of consumer buying. It is for the interests of the well to do—to protect them from the results of their own folly—that we should take from them a sufficient amount of their surplus to enable consumers to consume and business to operate at a profit. This is not "soaking the rich"; it is saving the rich. Incidentally, it is the only way to assure them the serenity and security which they do not enjoy at the present moment.

Still further to sustain consumer buying, and therefore prosperity, we should adopt some form of employment insurance and some form of health insurance. Both must be compulsory, or else fail to reach most of those who are in greatest need of such protection.

We should also sustain consumer buying by protecting the savings of consumers. Toward that end, we should bring all banks—including what are now State banks and private banks—under one Federal system, with uniform regulation, inspection, accounting, and reporting; and we should then set up a sufficient fund to guarantee all deposits. To this protection of consumer savings, we should add protection by means of Federal regulation of all security issues and Federal regulation of stock exchanges. We should deny each State the inalienable right of having as many fraudulent issues and as many bank failures as it pleases.

Once we have recovered our lost volume of employment and production, and largely restored the values of the assets of banks and insurance companies, in connection with a sustained, steady rise in the commodity price level, we should then make a stable commodity price level the conscious and avowed aim of Government fiscal policy. In pursuit of this aim, and the further aim of maintaining a market at par for all Federal Government securities, the Federal Reserve System and the Treasury Department should cooperate, as they have not cooperated in the past.

These aims cannot be achieved, however, without long-range planning of public works, Federal, State. and local. The main purpose of such planning should be to increase public payments to consumers, as soon as indexes of prices and employment show the beginnings of a slump, and to decrease such payments, as soon as prices begin to rise too rapidly. In spite of almost universal approval of this plan, and the definite and repeated commitment of the Hoover administration to it, the plan has never been tried. We have not yet had long range planning of public works. We have had instead long-range planning to plan to plan public works.

---

## Sounder Money and Better Business

(By Benjamin Graham)

Herewith is presented a measure designed as a sound and effective means of raising and stabilizing the general price level. Such a development is generally recognized as the most important single requisite for the restoration of prosperity and employment. This plan avoids the chief defects of others, now before the country, in that:

1. It does not involve abandoning the gold standard, devaluing the dollar, coining silver at a high price, or issuing unsecured or bond-secured paper money.
2. It requires no governmental expenditures, borrowing, or guaranties.
3. It imposes no taxes.
4. It involves no changes of any kind in our political or economic system.

The propsed measure, on the other hand, will produce numerous and vital benefits. In ascending order of importance they are as follows:

1. It will improve the soundness of our existing currencies.
2. It attacks directly the central paradox of the present depression, namely, poverty from superabundance, by transforming our surplus of commodities from a cause of national disaster into a source of national strength.
3. It will establish a stable average price level for basic commodities and thus contribute signally to the maintenance of stable and prosperous business.
4. It supplies an effective mechanism by which the country's productive capacity can be utilized for its proper purpose, namely, to raise the standard of living of the American people.

There is still a fifth important advantage of special character:

5. The plan provides an acceptable method of solving the vexing problem of war debts.

The measure is not intended as a panacea, however. It does not guarantee employment for all, a profit for every business, or a satisfactory price for every product.

### DESCRIPTION OF THE MEASURE

Under present law, Federal Reserve notes are issuable against deposit of 40 percent in gold and 60 percent in eligible commercial paper, which may be obligations secured by warehouse receipts representing important commodities (termed "readily marketable staples"). It is proposed that this arrangement be supplemented by introducing the following three modifications:

A. In lieu of a single stored commodity, the 60 percent backing shall consist of commodity units of a fixed character, comprising proper relative amounts of all the basic storable commodities dealt in on public exchanges. The makeup of these composite units will be discussed in detail below. Such commodity units shall have a fixed value as a backing for the 60 cents of each dollar not covered by gold. This value will establish the average price level for all basic commodities taken together. The level shall be set at some figure between the present low point and the 1923–29 average. It is suggested that a figure be taken about midway between these limits, say at 75 per cent of the predepression average, as recently recommended by Sir Arthur Salter.

B. "Federal notes" shall be issued against the direct deposit of 40 per cent in gold and 60 per cent in the fixed commodity units.

C. Federal notes shall be redeemable at the holder's option in gold as at present, or in the combined gold and commodity units deposited against them.

The nature and operation of this plan will need to be discussed under various headings, as follows:

A. ITS BROADER AND MORE FUNDAMENTAL ASPECTS

I. The character of the additional currency.
II. How the higher price level will be established.
III. How the measure will relieve the depression.
IV. How the price level will be maintained on a stabilized basis.
V. How the measure will raise the national standard of living over the long-term future.

B. TECHNICAL CONSIDERATION

VI. The relation between a higher price level in this country and the international situation.
VII. How the plan may facilitate settlement of the foreign-debt problem.
VIII. How the commodities unit is established: Principles governing the selection of the commodities and determination of the amount of each in the unit.
IX. Physical aspects of the plan. Storage expense and deterioration.
X. Size of the Federal note issue and its effect upon the banking and currency picture.
XI. Relation between the stabilized price group and other price groups.
XII. The question of overproduction under the plan.

I. The currency provided as above will have the following characteristics: It will be redeemable in gold, as is all our present currency. It will have a direct gold backing as large as, or larger than, all of our present currency except god certificates. The present forms of currency and their backing are as follows:

| Name of currency | Backing | Amount outstanding Jan. 1, 1933 |
|---|---|---|
| Gold and gold certificates | 100 percent in gold | $1,069,000,000 |
| Silver, silver certificates, and U.S. Treasury notes. | 100 percent in silver at $1.30 per ounce (present value 25 cents per ounce). | 401,000,000 |
| Subsidiary silver and minor coin | Metallic content worth considerably less than face value. | 371,000,000 |
| National-bank notes and Federal Reserve bank notes. | 100 percent in U.S. Government bonds at par | 823,000,000 |
| Federal Reserve notes | 40 percent in gold; 60 percent in Government bonds or commercial paper (including paper backed by warehouse receipts for basic commodities). | 2,716,000,000 |
| U. S. notes | 40 percent in gold; no other deposited security | 295,000,000 |
| Proposed Federal notes | 40 percent in gold and 60 percent in commodity units having an average value in 1923–29 one third more than the face amount of the notes against them. | |
| Total | | 5,675,000,000 |

In view of the large gold backing, there should be no more difficulty in maintaining gold redemption for the Federal notes than for any of the other classes of currency, nos. 2 to 5 above. The part of the Federal notes not covered by gold will have a direct tangible backing consisting of those commodities which are vital to our daily needs and our economic life, in quantities proportionate to their relative importance. Since, in addition to being exchangeable for gold alone, these notes may be converted on presentation into the deposited gold and commodity units, the holders of this currency will have a fixed claim also upon basic goods more useful and hence more valuable than gold.

For this reason it is asserted that the plan will improve the soundness of our existing currency.

The Federal notes will be created on the basis of "free and unlimited coinage" of gold and commodity units at a fixed rate. This corresponds exactly to the present free and unlimited coinage of standard gold alone at the rate of 25.8 grains to the dollar. It differs radically, however, from the proposed coinage of silver at the rate of $1.30 per ounce, in that our plan does not establish a fixed money value for a single commodity at a level far above its current worth relative to all other commodities.

No currency will be issued under our plan against deposit of any single commodity, but only against deposit of complete units containing all the eligible commodities. Hence the price of single commodities is in nowise fixed, and each is free to fluctuate in accordance with variations in supply and demand. The price level is stabilized by fixing the value, not of individual commodities but of all basic commodities taken as a whole.

II. *How the higher price level will be established.*—As soon as this measure is made effective the price of commodities in general will advance to the new standard level. This will be brought about in the most direct manner possible. Specialists will purchase commodities on all the exchanges in appropriate amounts, and tender the resultant units, together with gold, in exchange for new notes. This buying will continue as long as the units can be bought for less than their "coinage value."

It will probably be desirable to establish the "standard level" by gradual stages over a period of say a year. This might be done by making the initial coinage value of units only slightly above the present price and advancing the value at the rate of say 4 per cent per month, until the "standard level" is reached. The advantage of such a course is twofold. First, it may prevent too violent an uprush of prices. Secondly, it may permit the Treasury to acquire a large quantity of commodity units at the early "coinage values", which will be considerably below the ultimate standard. At the beginning only 40 cents of Federal notes may be issued against a commodity unit later to be worth 60 cents. This will result in a substantial initial "profit" on the operation, in that the Treasury would be free to issue the additional 20 cents in currency without further deposit of commodity units. This "profit" will afford one of the three methods, to be discussed later, of meeting the administrative costs of the plan.

It is likely, however, that the public will anticipate the ultimate establishment of the standard level and its buying of commodities for a later assured profit will force up their price, more rapidly than contemplated in the above-described program. Since such an opportunity for profit will be open to all, its disadvantages, if any, are not serious.

The new standard price level will thus be promptly established by the operation of three major forces: (1) Direct buying of all commodities, (2) reduction in the surplus stocks of commodities by depositing them as backing for money, (3) increase in currency outstanding.

These developments will be of enormous benefit in the present economic crisis. The surplus stocks of all commodities, which are now a leading cause of unemployment and want, will be taken off the market and mobilized for later consumption as and when our full consuming power is restored. These commodities will no longer constitute a menace to our welfare, but will take their rightful position as national assets and national wealth, in the same way that the gold behind our currency is national wealth in the same way that our natural resources underground have always constituted national wealth.

III. *How the operation of the plan will speed the return of prosperity.*—The ability to turn basic goods into money at a respectable price will increase the rate of production of basic commodities above the present subnormal level, and increase employment in these fields. This will improve purchasing power among farmers, miners, and other raw material producers and their employees. The beneficial effect of this increased purchasing will communicate itself rapidly to the fields of manufacture, distribution, transportation and finance. A tremendous impetus will be given toward the complete restoration of prosperity in this country, for which we now have—and have had throughout this depression—every basic and tangible requisite.

For the reasons just detailed we repeat the assertion that the plan attacks directly the central paradox of the depression, namely, poverty caused by superabundance, by transforming our surplus of commodities from a cause of national disaster into a source of national strength.

IV. *Maintenance of the standard price level.*—After the standard level has been reached, it will be maintained automatically by the operation of the three forces which established it, or by their opposites. Should a businses recession send the price level down, an opportunity will be immediately presented to buy units and to turn them in at a profit. Hence such buying will appear on all the commodity exchanges; floating stocks of commodities will thereby be reduced, and the outstanding currency increased. The result will be the almost immediate return of general prices back to the standard level.

Conversely, if speculative activity should send prices up above the standard level, there will be a corresponding opportunity to redeem money for commodities at a profit. Specialists or "arbitrageurs" will sell commodities on all the exchanges and turn in Federal notes for commodity units to make delivery. The three corrective forces will now be (a) selling by specialists, (b) increase in the floating supply of commodities, and (c) decrease in the outstanding amount of Federal notes. The result of those forces must again be a rapid return of average prices to the standard level. (The mechanism just described corresponds exactly with that which under normal conditions maintains foreign exchange quotations between the gold shipment points.)

These compensating influences acting against either advances or declines from the standard levels will be so immediate and powerful that variations in either direction will be exceedingly small. A fixed average price level for basic commodities does not in itself assure continued prosperity, nor can it guard against depressions in weakly situated industries or against individual losses from mistakes of judgment. It may not be questioned, however, that a stable general price level will contribute powerfully toward the maintenance of stable and prosperous business. This outstanding advantage should follow from the adoption of this plan.

V. *How the plan will help raise the national standard of living over the long-term future.*—This aspect is not closely related to the immediate crisis, but it may well prove to be the most significant of all. General overproduction has been termed a theoretical impossibility, but it has proved also a practical and disastrous actuality. This has been due to the failure of effective purchasing power to keep pace with increasing production. Under the proposed measure, such a condition will result in the accumulation of commodity units and in a corresponding increase in currency. If this accumulation and increase continue persistently, it will mean that not enough of the national income is being expended or actually invested. This in turn will be a definite sign that the purchasing power of the consuming masses is smaller than is justified by our productive capacity and our actual production. Such unmistakable evidence will call for broad public policies designed to increase the relative purchasing power, and hence the standard of living, of our poorer citizens. This may be done through the extension of minimum wage laws, unemployment insurance, old-age pensions, and other welfare work already accepted in principle.

As the stored commodity units grow and then diminish in quantity, the system will operate as a huge overflow reservoir, or compensating mechanism, to maintain a reasonable equilibrium between the secular increase in our productive capacity and the secular increase in our consuming power. Under present conditions, when production in general outstrips consumption, the whole economic mechanism is thrown out of gear. Deflation and depression are the only remedies. The adjustment is always painful, sometimes protracted, and in this instance almost fatal. Under the proposed measure, excess production will accumulate without disturbance in the Federal Reserve warehouses, and it will remain there, safely mobilized, until our statesmanship succeeds in placing the equivalent buying power in the hands of those who need it and will spend it. We shall recur to this the most fundamental merit of the plan in our final brief discussion of the "danger" of general overproduction.

## TECHNICAL CONSIDERATIONS

VI, VII. *International aspects of the plan—Its relation to the problem of war debts.*—This heading is placed under technical rather than fundamental considerations because at bottom the United States has the resources and the financial power to save itself even though the rest of the world should commit economic suicide. International trade and international cooperation are immeasurably desirable; but our overshadowing problem is to increase production and consumption within our borders. If the plan proposed is sound we can protect ourselves to any extent necessary against external influences hostile to its success.

Such protection, however, should not be necessary. The whole world is anxious to restore the commodity price level. England has begged us to cooperate with her to that end. The plan can be made the basis for international cooperative action, looking to similar results in all countries "suffering" from an excess of commodities. Those having a shortage of commodities cannot, by their unaided acts, depress the international price level.

Assuming that such cooperation is not forthcoming, we may readily defend ourselves. The apparent dangers of the plan from an international standpoint are merely those which inhere in any effort to maintain higher prices in one country than in another. Goods threaten to flow into the higher price country and gold to flow out. But because we are a creditor nation we can take in a large amount of goods without losing gold; and under the system proposed the receipt of such commodities from abroad need have no demoralizing effect since they can form part of the stored commodity units. Moreover, to any extent necessary, we can impose compensating tariffs to protect our higher price level, in accordance with our consistent, though much-criticized policy.

By receiving commodity units in payment of debts due us from abroad, and by mobilizing them as backing for domestic currency, we should finally obtain some concrete enjoyment, instead of only headaches, out of our foreign investments. For eventually we can and shall find some way to consume these goods. This applies with particular force to the war debts, for it answers the plea of the foreign nations that they can find no means to pay us because we refuse to accept their goods. Our Government might well accept the annual debt installments in commodity units, against which it could issue currency, thus turning them into cash. It should not be necessary to require the 40 percent in gold, which we can supply out of our abundant holdings. Furthermore, if tariffs are imposed because of disparate prices, we should waive the tariff on commodity units sent us direct by foreign governments on war debt account. Assuming the war debts still exist, this should provide as practicable a way as any to discharge them.

VIII. *How the commodity unit is determined.*—Every commodity will be eligible for inclusion in the base, provided it meets prescribed requirements as to:

(*a*) Storability.

(*b*) Dealings on a public exchange, under approved regulations governing tenderable grades, price differentials, etc.

(*c*) Importance, i.e., a minimum value of production or consumption in the United States.

The object of these regulations will be to avoid discrimination between commodities and to establish as wide a base as is practicable under the physical limitations of the plan. The method of selecting relative quantities will in general correspond to the procedure in formulating weighted index numbers of commodity prices. It is proposed specifically that the relative amounts of the several commodities in the unit be made proportionate to the quantity produced or consumed in the United States, whichever is larger. Commodities not included at the inception of the plan can be made eligible later and added to the unit by means of a simple adjustment. Adjustments of quantities can also be made at infrequent intervals to reflect changes in relative production or consumption.

Assuming that a price level of 75 percent of the 1923–29 average is desired, and assuming also that 25 commodities, given in the appended list, are found to be eligible for inclusion in the unit, then the amount of each to be comprised in the unit will be ascertained as follows:

1. The aggregate production or consumption of each commodity in the United States for the years 1923 to 1929 is calculated and a 1-year average taken, This will establish the relative quantities of each commodity in the unit. For example, since there was nine times as much sugar as coffee consumed in this period, there will be nine times as much sugar as coffee in the unit.

2. The aggregate value at wholesale of all these commodities over the 7-year period is determined, and a 1-year average taken. This average will be found to be about 13½ billion dollars for the 25 commodities.

3. At a price level equal to only 75 cents of that obtaining in the base period, the aggregate value of all the products would be just about 10 billion dollars. Hence to find a commodity unit equal to $1, each of the

average production or consumption figures must merely be divided by 10 billion.

Examples: Average production of wheat was 825,000,000,000 bushels. Amount of wheat in a $1 commodity unit is therefore 825/10000=1/12 of a bushel.

Average imports of tin were 168,000,000 pounds. Amount of tin in the commodity unit is 168/10000 or 1/60 of a pound.

IX. Physical aspects of the plan: The plan will involve storage expense and small losses through deterioration. There is no interest charge on the value of the stored commodities. The costs may be met in three possible ways:

1. There may be a large original money "profit" from acquiring commodities at less than their ultimate value. If the conversion level is advanced gradually from 45 to 75, the average deposit price may be about 90 percent of the standard value. This would permit the issuance of up to 10 percent in additional currency to meet expenses, without creating an overissue. On the basis of one billion of currency issued prior to attaining the stabilization level, the "profit" available to meet expense would be no less than $110,000,000.

2. A "brassage" differential can be established between the issuing and redemption rate, which may produce a substantial income (or, as an alternative general procedure, the Treasury may be given the sole right to "coin" commodity units, being directed to do so whenever average prices fall below say 97 percent of the standard level).

3. If necessary, costs can be defrayed through an assessment upon the commodities benefited in proportion to their share of the expenses of the plan.

The losses through deterioration can be reduced through periodic substitutions of new crops for old, the latter going into consumption before they deteriorate. It should also be practicable to accept some commodities processed into more durable semifinished staples, e.g., wheat into flour, cotton into gray goods, etc. Proper differentials can be established between wheat and flour, etc., in the same way as between different tenderable grades of the same commodity.

In general the principle should be recognized that, since inclusion in the unit is of great benefit to the producers of a commodity, that industry should be called on to meet the physical problems, if any, of such inclusion. The commodity exchanges can be of prime assistance in this respect. Wherever such problems are insuperable the commodity must be excluded from the unit.

The only important difficulties herein may be encountered in the case of corn because of its rather complicated relation to meat products—especially pork and lard—and because of certain storage problems. These problems, however, are not very different from those which have to be met at the present time in connection with marketing and storage of corn and meats.

X. Size of the Federal note issue and its effect upon the banking and currency picture: The theoretical limit of the Federal note issue is determined by the gold available for the 40 percent reserve. The amount of gold in the country is about 4½ billions; that in the hands of the Federal Reserve banks is about 3⅓ billions. The latter amount will support a total note issue of over 8 billions. This means that up to $5,000,000,000 of commodity units can be taken off the market and used as a backing for currency. This calculation presupposes that the present reserve notes may be replaced by the new currency, to any extent necessary, in the normal course of banking procedure; and that the Federal notes will be held also as reserve against deposits by member banks under the "lawful money" provision of the present law.

We shall come nowhere near needing this theoretical upper limit of 8 billions of Federal notes. The 5 billions of commodities units involved in this sum would represent a half-year's production at prosperity rates. The stocks of most of the component items are now far less than this figure. A good part of these stocks must be held at various points in the productive process, and hence are not available for segregation as part of commodity units. A survey shows that in most cases the current stocks are only about one tenth to one fifth of a normal year's requirements. There are some exceptions, of course, notably wheat, cotton, copper, and rubber. But since only complete units can be deposited against currency issues, the floating supply of the scarcest items will, theoretically, determine the maximum number of units available. Certain special problems resulting from this point can be satisfactorily dealt with by accepting responsible future contracts to deliver as part of commodity units tendered, the currency equal to the money value of such contracts to be withheld until physical delivery is made.

In my opinion, the maximum currency emission likely to take place may be set at about $2\frac{1}{2}$ billion dollars, of which $1,000,000,000 must be represented by gold and $1\frac{1}{2}$ billions by commodity units. These units will represent some 60 days' production of all the component items. The effect of taking that volume of commodities off the market will be so stimulating in all directions that in a short time prices will probably rise above the standard level and commodities will begin to flow back into "circulation" against redemption of Federal notes. The automatic stabilization features of the plan would then be in actual operation.

It has been very properly asserted that we do not need more currency, as such. We need more purchasing power, whether it consists of cash or bank deposits. If the issue of Federal notes should be redundant, in the technical sense that it exceeds actual currency needs, the notes will pile up in the banks as cash held against deposits. Since cash is a nonearning asset, a large increase therein should impel making of loans or purchases of securities by the banks. This influence is similar to that from the receipt of large amounts of gold or from the recent increase in member bank reserves caused by the reserve bank's purchase of Government securities. The failure of credit actually to expand during the past year is due to the fact that the impetus to expansion was outweighed by more powerful deflationary forces. An increase in general business, produced under the plan by the rise in commodity prices and the actual purchase of goods and their removal from the markets, will check these deflationary influences and permit the normal consequence of large bank reserves—namely, a more liberal credit policy.

This would indeed be the result of any strong reflationary measure, not accompanied by impairment of confidence. The ultimate danger of such a policy—namely excessive expansion of business, speculation in commodities, and an undue rise in prices—are all avoided by the present proposal, because speculative advances will be promptly checked by the redemption of Federal notes and the sale of commodity units on all the exchanges.

XI. Relation between the stabilized price group and other prices: The plan stabilizes the wholesale price of basic commodities, taken together. How would other price levels be affected—e.g., wages, rents, prices of manufactured goods, and retail prices? Would any harmful disparities tend to develop? The answer is "No." The effect on wages would be beneficial, to the extent that better and more stable business improves wages. Otherwise, the relationship between the price level and the wage level should work out in the same manner as it has in the past. A similar observation applies to the price of manufactured goods, to rents, and to retail prices. These groups will not be as thoroughly stabilized as will be the average of basic commondities at wholesale, but they should be much more stable than in the past, and no new causes of price disparity should be created.

The plan will help correct a great disparity now existing between the present prices of the commodities in the unit and all other prices. Basic commodities have declined far more than have other prices. (Our table shows a present average of 44 percent of 1923–29 against Bureau of Standards index of 65 percent for 784 items including 70 percent for finished goods.) The improvement in their situation through the present plan should restore the price of basic goods to a more reasonable relationship with other prices—which is the prime object of the domestic allotment plan.

XII. The plan and overproduction: At first blush it may appear that the plan will result in disastrous overproduction. This has always been the vital defect of valorization schemes to fix the price of an individual commodity at higher than the preexisting level. The instant proposal, however, is not subject to this danger; in fact, its most essential merit is that it banishes the anomalous specter of general overproduction. It must always be borne in mind that the plan in no sense whatever seeks to fix the price of any single commodity. Hence, if more copper should be produced, for example, than business conditions justify, the price of copper will fall—as fall it should to prevent an uneconomic persistence in producing the wrong thing. The price of all the other commodities in the group will advance slightly to restore the standard level; thus setting in motion corrective forces somewhat helpful to the price of copper. The same would, of course, be true of any other commodity. If special measures are justified to correct the social consequences from an overproduction of wheat, cotton, etc. (as is contemplated by the allotment plan), such measures may be put into effect entirely independent of this proposal, and without affecting its operation but they should not be necessary, except possibly as to wheat, because of the corrective effect of this plan.

Hence our plan will in nowise contribute to perpetuating an unbalanced production of any single commodity. But, as far as overproduction in general is concerned, our thesis is that there should be no such thing. It exists in actuality through a defect in our economic mechanism. This defect our plan proposes to remedy, by mobilizing a temporary excess of commodities in such form that they cannot disorganize business and eventually will be turned into use and enjoyment.

In Joseph's time the overproduction of the 7 fat years was mobilized in this fashion to avert the famine threatened by the 7 lean years which followed. Our proposal involves going back to the same simple and concrete realities. Let us welcome and not fear years of plenty. If we can store goods in these times, they may prove our salvation if later "the famine shall consume the land", or—as is more probable—if shortage should develop through war. But if neither war nor famine supervenes, then this stored plenty can serve a more magnificent purpose: to endow all the people of this land with comfort and security.

TABLE I.—*Quantities, average price, and value of commodities included in proposd unit*

| | 1923-29 average production and/or imports | 1923-29 average price in cents | Average value | |
|---|---|---|---|---|
| | | | Amount | Per cent of total |
| Wheat ........ bushels.. | 825,000,000 | 138.00 | $1,138,000,000 | 8.3 |
| Corn ........ do.... | 2,747,000,000 | 93.00 | 2,555,000,000 | 18.8 |
| Refined sugar ........ pounds.. | 12,156,000,000 | 6.10 | 742,000,000 | 5.4 |
| Oats ........ bushels.. | 1,342,000,000 | 46.00 | 617,000,000 | 4.7 |
| Coffee ........ pounds.. | 1,407,000,000 | 18.70 | 263,000,000 | 1.9 |
| Barley ........ bushels.. | 245,000,000 | 70.00 | 172,000,000 | 1.3 |
| Cottonseed oil ........ pounds.. | 1,378,000,000 | 11.00 | 152,000,000 | 1.1 |
| Rye ........ bushels.. | 51,000,000 | 100.00 | 51,000,000 | .4 |
| Cocoa ........ pounds.. | 410,000,000 | 10.20 | 42,000,000 | .3 |
| Total ........ | | | 5,732,000,000 | 42.2 |
| Petroleum ........ barrels.. | 827,000,000 | 142.00 | 1,174,000,000 | 8.6 |
| Soft coal ........ tons.. | 728,000,000 | 1.51 | 1,105,000,000 | 8.1 |
| Hard coal ........ do.... | 80,000,000 | 5.37 | 424,000,000 | 3.1 |
| Total ........ | | | 2,703,000,000 | 19.8 |
| Cotton ........ pounds.. | 7,094,000,000 | 20.60 | 1,462,000,000 | 10.7 |
| Silk ........ do.... | 65,500,000 | 588.00 | 385,000,000 | 2.8 |
| Wool ........ do.... | 597,000,000 | 40.00 | 240,000,000 | 1.8 |
| Burlap and jute ........ do.... | 700,000,000 | 11.90 | 83,000,000 | .6 |
| Total ........ | | | 2,170,000,000 | 15.9 |
| Pig iron ........ tons.. | 36,500,000 | 1,926.00 | 732,000,000 | 5.4 |
| Copper ........ pounds.. | 2,306,000,000 | 14.50 | 335,000,000 | 2.4 |
| Lead ........ do.... | 1,494,000,000 | 7.30 | 109,000,000 | .8 |
| Tin ........ do.... | 168,000,000 | 51.80 | 87,000,000 | .6 |
| Zinc ........ do.... | 1,154,000,000 | 6.50 | 75,000,000 | .6 |
| Silver ........ ounces.. | 64,500,000 | 62.00 | 40,000,000 | .3 |
| Total ........ | | | 1,378,000,000 | 10.1 |
| Lumber ........ board feet.. | 36,200,000,000 | 2.78 | 1,007,000,000 | 7.4 |
| Hides ........ pounds.. | 2,000,000,000 | 16.00 | 320,000,000 | 2.4 |
| Rubber ........ do.... | 921,000,000 | 33.00 | 303,000,000 | 2.2 |
| Total ........ | | | 1,630,000 | 12.0 |
| Grand total ........ | | | 13,613,000,000 | 100.0 |

TABLE II.—*Proposed commodity unit equivalent to $1,000*

| | Quantity | Current price in cents | Present value | |
|---|---|---|---|---|
| | | | Amount | Per cent of total |
| Corn ... bushels | 274.70 | 27.0 | $74.16 | 12.4 |
| Wheat ... do | 82.50 | 48.0 | 39.60 | 6.6 |
| Refined sugar ... pounds | 1,215.60 | 3.9 | 47.41 | 7.9 |
| Oats ... bushels | 134.20 | 17.0 | 22.81 | 3.8 |
| Coffee ... pounds | 140.70 | 7.5 | 10.55 | 1.8 |
| Barley ... bushels | 24.50 | 35.0 | 8.57 | 1.4 |
| Cottonseed oil ... pounds | 137.80 | 3.6 | 4.96 | .8 |
| Rye ... bushels | 5.10 | 34.0 | 1.73 | .3 |
| Cocoa ... pounds | 41.00 | 3.4 | 1.39 | .2 |
| Total | | | 211.18 | 35.2 |
| Petroleum ... barrels | 82.70 | 63.0 | 52.10 | 8.8 |
| Soft coal ... tons | 72.80 | 122.0 | 88.81 | 14.8 |
| Hard coal ... do | 8.00 | 475.0 | 36.00 | 6.0 |
| Total | | | 176.91 | 29.6 |
| Cotton ... pounds | 709.40 | 6.1 | 43.27 | 7.2 |
| Silk ... do | 6.55 | 114.0 | 7.47 | 1.2 |
| Wool (grease) ... do | 59.70 | 18.0 | 10.75 | 1.8 |
| Burlap and jute ... do | 70.00 | 4.0 | 2.80 | .4 |
| Total | | | 64.29 | 10.6 |
| Pig iron ... tons | 3.65 | 1,334.0 | 48.69 | 8.2 |
| Copper ... pounds | 233.60 | 5.0 | 11.53 | 1.9 |
| Lead ... do | 149.40 | 3.0 | 4.48 | .7 |
| Tin ... do | 16.80 | 23.0 | 3.86 | .6 |
| Zinc ... do | 115.40 | 3.0 | 3.46 | .5 |
| Silver ... ounces | 6.45 | 26.0 | 1.68 | .3 |
| Total | | | 73.70 | 12.2 |
| Lumber ... M board feet | 3.62 | 1,600.0 | 57.92 | 9.8 |
| Hides ... pounds | 200.00 | 6.0 | 12.00 | 2.1 |
| Rubber ... do | 92.10 | 3.0 | 2.76 | .5 |
| Total | | | 72.68 | 12.4 |
| Grand total | | | 598.76 | 100.0 |

TABLE III.—*Summary of 1923–29 and present values represented by commodities in the proposed unit*

| | Average value 1923–29 | Per cent of total |
|---|---|---|
| Domestic farm products | $7,084,000,000 | 52 |
| Fuels, metals, and lumber | 4,887,000,000 | 36 |
| Imports | 1,642,000,000 | 12 |
| Total | 13,613,000,000 | 100 |

| | Value of 1923–29 volume at present prices | Per cent of total | Per cent of 1923–29 value |
|---|---|---|---|
| Domestic farm products | $2,430,600,000 | 41.6 | 34.3 |
| Fuels, metals, and lumber | 3,046,700,000 | 51.0 | 62.3 |
| Imports | 509,700,000 | 7.4 | 32.2 |
| Total | 5,987,000,000 | 100.0 | 44.0 |

*Note regarding the tentative commodity unit.*—Of the 25 commodities in the suggested unit all but 6 are now dealt in on organized exchanges. Three of the others—pig iron, petroleum, and burlap—formerly enjoyed a futures market, and the other 3—hard coal, soft coal, and lumber—are considered by authorities as well adapted to exchange trading.

Among the additional commodities which may be made eligible for inclusion in the basic unit are the following:

Tobacco, wood pulp, flaxseed or linseed oil, rice, cement, brick, rayon, yarn, potatoes, apples, evaporated milk, butter, cheese. The aggregate value of these 12 products in 1923–29 averaged about 2½ billion dollars, or some 20 percent of the values represented by the 25 commodities in the tentative unit.

---

STATEMENT OF REV. WILLIAM MATHEW HOLDERBY, WASHINGTON, D.C.

At the invitation of the chairman of the Senate Committee on Finance, as requested by Senator Morris Sheppard, in my behalf, as President-Director of the National Christian-Family Defense League, I submit a suggestion, based upon the effort heretofore developed by this organization in its purpose of serving the interests that would be conducive to the material prosperity of the Nation, in the trust, that it may be of meaning in helping to find a solution for the economic situation confronting the Nation. No solution of the economic problem will terminate with benefit upon the corporate life of the families of America, until a spiritual and moral basis of life is accepted for the Nation. This essential requirement therefore should be of primary consideration, if results are to be secured, for the time and effort given by the Senate Committee on Finance. to this economic investigation. No nation indifferent to God can prosper more than the individual who forgets God.

There are three spheres that develop categories of law that must be studied to discover the nature of their separate contribution to human existance; but equally so, their sense of interdependability in the whole scheme of life among men. The benefits that will promote the interests of the life of the people of our country are developed out of the economic, political, and religious spheres of effort. No progress toward a betterment of the peoples' welfare, of this or any other nation, ever can be made, if only a partial program of consideration or treatment is given the whole problem.

The laws found in the spheres of these three economies are thus the total support of the Nation's life. It therefore is as if the Nation rested upon a tripod of support that these three legs afforded it. Obviously all three legs of this tripod are necessary to this upholding of the prosperity of the people. No one of these legs can be withdrawn without the collapse of the other two sustaining factors of the foundation. The spectacle at this hour of the jeopardy confronting both State and church, as likewise the homes of our land, because of the lack of economic contribution of maintenance, is a revelation of the seriousness of the crisis. This danger to the peace and prosperity of the people has developed because of the isolation of these forces from each other; that themselves only are strong when developed in the combination of cooperation. False concepts of the functions of both church and State and a totally oblivious attitude to the revelation of God's laws lie at the root of the causes precipitating our economic disorder as it terminates upon the homes of our land. It is certain that our present national predicament in the spheres of both economic and political operations is due to the lack of the third leg of the foundation on which rests national security and prosperity, namely, the spiritual.

Until a problem is stated it is impossible to offer a solution. In the printed form of Senate Resolution 28, of the Seventy-second Congress, introduced by Senator Morris Sheppard, of Texas, and which is appended, is found a statement of the present problems of nation life. A cogent résumé of the resolution is that the present problems of national disorder are due to the loss of the balance between the material and the spiritual elements in national life. This is the cause producing in the social, industrial, political, and religious fields the demoralizing and ravaging effects terminating upon national security and prosperity.

In an editorial in the Chicago Daily News of February 18, 1933, by S. J. Duncan Clark, which likewise is appended, there is stated that observers of national trends are disturbed by weaknesses in the ethical foundations of government and business:

"In the voluminous report on present social trends, prepared by a group of economists, social scientists, and other men of learning, at the request of President Hoover, the assertion is made that, while the economic and governmental factors in American life have developed immense influence and power, two major factors—the church and the home—have declined in influence over men's behavior, although retaining their essential values for society.

"Later in the report there is a solemn warning that the vast technological superstructure of the Nation is advancing over crumbling roads and shaking bridges.'" Combining those two assertions—and they are clearly related—it is apparent that the wise observers and commentators on social trends are disturbed by weaknesses in the ethical foundations of government and business. The church and the home are peculiarly the conservers of those foundations. If they are losing their efficacy to shape American attitudes, standards, and ideals—and many agree with the finding of the report in that respect—then the danger is unquestionably serious.

"The unbiased warning of the report constitutes a challenge to those who believe in the values for which the church and the home have stood. Renewal of fidelity to those values is a first duty. Church and home are essential to each other. Neither can do its full part in serving the life of the Nation if the other fails, and all of small avail if the roads and bridges of spiritual and ethical ideals crumble and quake beneath the governmental and economic superstructure."

In this editorial is set out, in the clear definition of practical terminology, the tricotomy of the spiritual, economic, and political forces playing upon human existence. It therefore is patent that the political and economic problems are at the root of a spiritual nature. Deep-seated in the body politic are diseases that have come, both by contagion with infectious causes, as well as the deliberate inoculation by enemy forces, that would destroy the life of the Nation, founded on the ideas and ideals that came out of the Plymouth colony, established by the Pilgrim ancestors whose offspring has become indigenous to the soil that gave them birth. No progress ever will be made in undergirding these ethical weaknesses, that have disintegrated the political and economic structure, by statesmen closing their eyes to the presence of these forces of alien and enemy factors in our national hegemony. We must diagnose accurately if we are to prescribe effectively.

No disturbance in our economic life today but is a manipulated or promoted effect. There are four factors at hand to produce prosperity: That of unlimited raw material, of farm, forest, and mine; adequate labor to produce or convert these into finished commodities of commerce; an unimpaired medium of exchange; and the complete systems of transportation to deliver the products to the ultimate consumer. What is it that hinders the material prosperity of the United States of America? The gross exaggeration, as well as the totally false statements concerning prevailing conditions, inspired as they have been to force a condition of fear upon the people, have been published by the forces using this method to distress the people. It is a psychic method to undermine the physical and moral fiber of the masses. It already has operated in other nations to produce the desired results of the perpetrators. Twenty nations in the past three years have overturned their governments. The economic chaos of America has been created that her political destruction might be accomplished. It is a process of exhaustion that is meant to produce the weakening of every defense resisting these enemies.

The one hope of defeating the forces that seek, through collectivism, operating in the social, political, and economic attacks, to destroy the home, church, and state is to reemphasize the idea of the family, as contrasted with the present effort to emphasize the individual as the organizing unit of society. The one dependable factor, if we are to reestablish material prosperity, is the developing of national consciousness in terms of the family. Home life is built on the unit of father, mother, and child. Give the home life of the Nation the defense the Nation owes the family and this defended family life at once becomes the buttressing strength of the Nation. The bolshevists and others who menace the Nation are men who evade family ties; wanderers, irresponsible, they have nothing to lose. When every man or woman is made responsible, as son or daughter, husband or wife, father or mother, to the family to whom they owe allegiance then Communism, I.W.W.ism, and anarchy will die of malnutrition. The family life of the Nation is the avenue or channel way through which the strength of these spiritual ideas and ideals are to be made to contribute an effect of helpfulness upon both the economic and political supports.

John W. Weeks, as Secretary of War, said:

"The first line of defense of our Republic from the enemies without and the enemy within is not the Army, nor the Navy, but the home."

There is not one human problem but can be solved by the proper treatment of family relations and obligations. In the processes used to spiritually integrate a family every problem of their physical maintenance is solved. It is the family only that establishes the institutions of home, church, and state; and these in turn bless or blight the family accordingly as is the character of the family that originated them.

To catch an understanding of the view of statesmanship concerning the spiritual nature of the family, I quote Theodore Roosevelt, in a plea for maintenance of the relationship of the family to the Nation:

"Questions like the tariff and currency are literally of no consequence compared with the vital question of having the unit of our social life, the home, preserved. If we have solved every other problem in the wisest possible way, it shall profit us nothing if we have lost our national soul; and we will have lost it if we don't have the question of the relations of the family put upon the proper basis."

Herbert Hoover said in his interpretation of the factors contributing to the perpetuity of the Nation:

"This is a land of homes, churches, schoolhouses dedicated to the sober and enduring satisfactions of family life and the rearing of children in an atmosphere of ideals and religious faith. Only with these high standards can we hold society together, and only from them can Government survive or business prosper. They are the sole insurance to the safety of our children and the continuity of the Nation."

To be practical, in the contribution I would make to this serious study of our present national situation, I wish to include in the record the very relevant and germane proposals of Mr. Henry Ford, on the subjects: Farm and factory, Self help, Unemployment, offered in a Nation-wide publishing of them, in full-page inserts, in the newspapers used in this campaign. Each of these clear and cogent studies goes directly to the heart of the essential requirement, to make a family economically independent, which is the only hope of economic security. These illuminating and understanding presentations of ideas show the conscientious citizens of the United States what can be done to ameliorate the conditions of such citizens as are willing to work their way out. These observations of the fundamental requirements to national prosperity likewise will serve for statesmen to propose policies of government for the people in guiding them out of their dilemma, rather than by the prevalent method of political chicanery and demagogism, to constitute classes of our citizens as menaces to our Government, because they have been misled to a position of false hope as to relief from their critical state. These observations are presented for printing in the record of these hearings of the Senate Committee on Finance.

Only as this line of approach is taken, of a consideration of a national spiritual need in meeting the issues now confronting the Congress of our Government, can there be any meeting of the material exigencies. In achieving this stabilization of natural life the great ends will be achieved of crime being checked, social conditions corrected, economic security maintained, industrial concord established, the future of the state assured, the conservation of our youth for future citizenship provided and our Nation preserved for that destiny intended for it by the Almighty God.

The consideration that I would plead for an emphasis as to the place of the spiritual in the maintenance of national security, which is the foundation to material prosperity, grows out of the words of George Washington, who, as the first President of the United States of America, said in his farewell address:

"Of all the dispositions and habits which lead to political prosperity, religion and morality are indispensable supports. In vain would that man claim the tribute of patriotism who should labor to subvert these great pillars of human happiness—these firmest props of the duties of men and citizens. The mere politician, equally with the pious man, ought to respect and cherish them.

A volume could not trace all their connections with private and public felicity. Let it simply be asked, Where is the security for prosperity, for reputation, for life, if the sense of religious obligations desert the oaths which are the instruments of investigation in the courts of justice? And let us with caution indulge the supposition that morality can be maintained without religion. Whatever may be conceded to the influence of refined education of minds of peculiar structure, reason and experience forbid us to expect that national morality can prevail in exclusion of religious principle."

That this plea of the first President of our Nation, for the place of the spiritual element, for the assurance of national prosperity, is no less emphasized in our day, I quote from an editorial in the Wall Street Journal of a somewhat recent issue:

"What America needs more than railway extension, and Western irrigation, and a low tariff, and a bigger wheat crop, and a merchant marine, and a new Navy, is a revival of piety, the kind mother and father used to have—piety that counted it good business to stop for family prayers before breadfast right in the middle of the harvest; that quit work a half hour earlier on Thursday night so as to get chores done and go to prayer meeting. That is what we need now to clean this country of graft, of greed, petty and big, of worship of fine houses and big lands and high office and grand social functions."

In this same attitude, of an evaluation of the essential worth of the definitely spiritual resources to which all the prosperity of the Nation is due. The custom says:

"Much of the prosperity of this Nation is due to the family prayers which were once daily held in the homes of our fathers. To a very large extent, the custom has gone by. Whatever the argument pro and con may be, the fact nevertheless remains that such family prayers nurtured and developed these spiritual resources to which all the prosperity of the Nation is due. The custom of family prayers should be revived."

The forces that today are manipulating America financially are the forces that have corrupted her morally. The attacks upon the womanhood and childhood, to seduce them from the ways of virtue; the attack upon the family, in ways of youth taught free love; promoted easy divorce and the prevalent childless marriage, through even church justified, advertised birth control; the persuading of the masses to enjoy the luxuries that bring life to the experiences of lasciviousness rather than being willing to live in the realm of the simplicities are the sure signs that America is in the grasp of some enemy power. This covert enemy is of a spirit that hates our history of glorious achievement, through the godliness of leaders, who are our heroes of faith and patriotism. This enemy covets the priceless heritages that the God of the mountain, valley, and plain has given to the children of a pious ancestry, that loved Him and served Him, as they pioneered their way through hardships, to build this land gloriously for Him.

The lifting of the lid of the chest of secret causes of our national economic and political distresses reveals the word of One who knew His own. He said, "Beware of the leaven of the Pharisees." This spirit made a breach among 12 brothers that destroyed a kingdom. The same spirit crept into 1 of 12 disciples and crucified a Messiah. It is this same spirit abroad today among the nations of the world, bringing distress to them, that they may be destroyed. There is a hidden organized system at work today in the whole world wreaking the vengeance of hate against the nations it would destroy. It is a warfare, not in terms of bullets and blood, but no less merciless in its destruction of life, by its subtle employment of the means to rob men and their families of the means to secure food, raiment, and shelter; or else become mastered and enslaved by these masters of capital, and the preemptors of the God-given mercies for man's needs; that they garner and exploit but themselves do not produce.

Alexis de Tocqueville, in his volume, Democracy in America, writes:

"I sought for the greatness and genius of America in her commodious harbors and her ample rivers and it was not there. I sought for the greatness and genius of America in her fertile fields and boundless forests and it was not there. I sought for the greatness and genius of America in her rich mines and her vast world commerce and it was not there. I sought for the greatness of America in her public-school system and her institutions of learning and it was not there. I sought for the greatness and genius of America in her Democratic Congress and her matchless Constitution and it was not there. Not until

I went into the churches of America and heard her pulpits flame with righteousness did I understand the secret of her genius and power. America is great because America is good; if America ever ceases to be good, America will cease to be great."

Has our prosperity fled us for the same reason that our greatness, too, must go, because at last our Nation no longer is good? Has the liberalism of a new day defied the holiness God would give America that His righteousness might exalt the Nation? Will we have our land healed of its sore distresses? There is a remedy of God's prescription. Hear Him:

"If my people, the people called by my name, shall humble themselves and pray, and seek my face, and turn from their wicked ways; then will I hear from heaven, and will forgive their sins, and will heal their land."—2 Chronicles 7:14.

A future glorious life among nations is foretold by the prophet Micah as he envisions a reign of righteousness upon the earth:

"And he shall judge among many people, and rebuke strong nations afar off; and they shall beat their swords into plowshares, and their spears into pruninghooks: nation shall not lift up a sword against nation, neither shall they learn war any more.

"But they shall sit every man under his vine and under his fig tree; and none shall make them afraid: for the mouth of the Lord of hosts hath spoken it.

"For all people will walk every one in the name of his God, and we will walk in name of the Lord our God forever and ever."—Micah, 4:3–5.

Only as nations shall acknowledge the Jehovah of Israel shall there be prosperity to their peoples. Their spiritual exultation shall be their material exaltation. It is into such an era that we fast are moving. There shall be painful travail of nations ere that day shall come. There are things now in the systems that must surely go. God is trying to burn them out, but some men are trying to put out the fire. They can not do it. God's will, in God's time, in God's way, through God's Son is to prevail. A new day is at hand for which humanity long has yearned. It is such a picture, in the words of Micah; that is the picture of future national prosperity in terms of economic security, based upon a spiritual realization by the nations that have learned the political relationship that comes from submission to Him who came to bring peace on earth and good will toward men. Man can not and will not determine this new order. It is God, the Jehovah of Israel, who will do it.

The judge of all the earth shall in a day judge the nations. Some He will set upon his right hand and some upon his left. Those upon His left shall depart from Him, but those upon his right shall go in to serve Him in His Kingdom. In this new day the foundation of God at last shall be underneath His people, who acknowledge Him in all their ways that He might direct their paths. This burning message of the truth of the Kingdom of Heaven on earth must be sent broadcast over the Nation. So surely as it fails of being sent, that it might be heard, so our Nation will perish under the judgments of God because we forgot God. "What shall it profit a man if he gain the whole world but lose his own soul?" So what profiteth this Nation to look to a golden calf for the help it can not give, rather than to look unto the mount of the Glory of God from whence only can come the help the Nation needs.

I quote the words of Howard B. Rand, L.L. B.:

"Multitudes are failing, because of spiritual blindness and the lack of prophetic discernment, to recognize in the overthrow of thrones and the fall of governments, with the attending disturbances and turmoil, the fulfillment of ancient predictions. Treating the present conditions as but a passing phase of readjustment, which they believe will ultimately result in stabilization, they are little disturbed and less concerned so long as their normal life activities continue. Because human nature quickly adjusts itself to abnormal conditions, making them but commonplace, the present stresses and strains, which are but a prelude to the great crash, will increase in intensity, unrecognized by the majorities.

"The eventide of the age has passed and having entered the blackness of a dark night we need light. From whence will that illumination come?"

This is the answer of this question to the Senate Committee on Finance conducting this investigation. If the statesmen of the Congress of the United States of America will acknowledge the God of our Nation, by an appeal to the people to honor Him, as He is acknowledged, the God of the Nation; if the families of the Nation will remember Him in their gratitude for his tender mercies and loving kindnesses to this people; if the prophets of the Nation and the pastors of the people shall be true to their missions, then and only then will the way of the Nation be made smooth. As the voice of one who cried in the wilderness, "Prepare ye the way of the Lord, make His paths straight," so America must realize that her destiny as to a place in the Kingdom of Jesus Christ on earth is to be determined, not alone by material prosperity, but by the direction of her spiritual goings.

"Except the Lord build the house, they labor in vain that build it."—Psalm 127.

National defiance of God is bringing judgment to the Nation; national repentance will bring His mercy and loving kindness to our people.

---

STATEMENT OF EDWIN WALTER KEMMERER, RESEARCH PROFESSOR OF INTERNATIONAL FINANCE, PRINCETON UNIVERSITY, PRINCETON, N. J.

THE PRESENT ECONOMIC SITUATION WITH PARTICULAR REFERENCE TO THE CURRENCY

We live in an exceedingly complicated economic society, and the economic disorders we are now experiencing are the result of a large number of causes, direct and indirect, which act and react upon each other in an almost infinite variety of ways. Any attempt to explain our present economic breakdown chiefly by reference to any one cause would be futile. The principal causes, direct and indirect, of our present economic depression, in my judgment, are the following:

(1) The destruction wrought by the greatest war in history—a destruction of scores of billions of dollars of property and over 13,000,000 lives, representing the best blood of the world, men who, if they had lived, would to-day be in the prime of life. Our present generation has been greatly weakened by the loss of life and of vitality due to the fatalities of the war.

(2) The gross maladjustments in the production of various basic commodities, growing out of the efforts of different countries during the war, to produce goods for themselves which war conditions prevented them from importing as formerly, or to produce certain classes of goods in great volume for war needs. These maladjustments have contributed to the existing excess stocks of various commodities, have reduced to a lower level than would otherwise exist the efficiency of world economic production and distribution, and have been important factors in the tremedous decline we have been witnessing of late in the world's international trade.

(3) The large amount of farm mortgages floated during the war and early post-war period for the purchase of land at war-inflated prices, and the great increase in the burden of the debts represented by these mortgages, which resulted from the great decline in commodity prices, including the prices of farm products, and which was inevitable after the discontinuance of war-time inflation.

(4) The large and increasing amount of restrictions on international trade in the form of tariffs, quotas, exchange restrictions, currency depreciation, anti-dumping regulations, arbitrary customs valuations, so-called "trade-clearing agreements" and the like. Many of these restrictions upon foreign trade have been the results of efforts to maintain uneconomic industries, expanded production in specified lines, or high-wage scales, created by the abnormal conditions existing during the war. They represent wasteful efforts to resist the natural economic liquidation of the war. The Department of Commerce reports that, in addition to various forms of exchange control, the year 1932 "saw trade barriers increased by various means in over half of the 65 commercially important countries, with a general downward tendency in tariffs observed in only a very few cases."

(5) The large backwash of basic commodities which the world has accumulated, by reason of its attempts to defy the law of demand and supply through valorization schemes intended to hold up prices without controlling the supply of the product. Examples are: Rubber, coffee, copper, wheat, and sugar.

(6) The burden of interallied debt obligations, and particularly the uncertainty and tension growing out of attempts to solve the problem of war debts.

(7) The unstable political situation abroad, particularly in Germany, the Near East, South America, and the Orient.

(8) The widespread loss of confidence, "virtual shellshock", resulting from the inevitable collapse of the great speculative boom of the years 1928 and 1929—a lack of confidence which has been perpetuated and aggravated by a

number of factors, viz: (*a*) The breakdown of the gold standard throughout most of the world; (*b*) the apparent failure of the disarmament conference; (*c*) the revelation of crooked practices in a number of high places in the financial world; (*d*) the weakness of our American banking system, which has been evidenced by 10,738 bank suspensions during the years of 1921–1932,[1] including 5,096 suspensions for the years 1929 to 1932, and by the enormous additional drop of bank suspensions so far this year; (*e*) agitation for inflation, in Congress and out; (*f*) the failure of the National Government to balance its Budget, with the resulting heavy increase in our national debt, and accumulation of undigested Government securities in our Federal Reserve banks and other banks; (*g*) increasing burdens of indebtedness of farmers, home buyers, and others, as prices and wages fall; (*h*) increasing burden of taxes as incomes fall; (*i*) large and increasing unemployment.

All of these factors are causes and all likewise are effects. They act and react. They overlap and they merge. There are no sharp demarcations.

I shall limit the rest of my statement to matters relating to currency and banking, because these are the subjects to which I have given most study.

Aside from the widespread breakdown of the gold standard, at home and abroad, probably the two most important facts relative to the currency in the United States are: (1) The great rise in the value of the dollar during the last 4 years; and (2) the unequal way in which this rise has affected different groups of commodities and services. Each of these will be discussed briefly.

(1) The value or purchasing power of the dollar, though comparatively stable for about 8½ years ending with the autumn of 1929, has since then increased greatly and is now high as compared with what it has been at any previous time during the past 20 years. The value of the American dollar, or its purchasing power, as measured (*a*) by the wholesale price level, and (*b*) by the general price level, including prices at wholesale and retail, rents, and wages since 1913 has varied as follows:

*Purchasing power of American dollar*

| Year | Purchasing power as measured by wholesale price level [1] 1926=100 | Purchasing power as measured by general price level [2] 1926=100 |
|---|---|---|
| 1913 | 143.4 | 170.9 |
| 1914 | 146.9 | 170.9 |
| 1915 | 144.1 | 166.1 |
| 1916 | 117.6 | 146.2 |
| 1917 | 85.5 | 123.0 |
| 1918 | 76.4 | 108.9 |
| 1919 | 72.3 | 98.8 |
| 1920 | 65.4 | 88.6 |
| 1921 | 102.9 | 104.9 |
| 1922 | 103.5 | 108.2 |
| 1923 | 99.4 | 103.6 |
| 1924 | 102.2 | 103.0 |
| 1925 | 96.7 | 106.0 |
| 1926 | 100.0 | 100.0 |
| 1927 | 104.9 | 100.0 |
| 1928 | 102.4 | 97.2 |
| 1929 | 103.6 | 95.5 |
| 1930 | 116.1 | 101.8 |
| 1931 | 137.6 | 114.0 |
| 1932 | 154.1 | 129.5 |
| 1933 | 164.0 | 134.6 |

[1] Index of purchasing power, Standard Statistics Base Book, 1932, p. 220, and supplement of Mar. 15, 1933, p. 15. The figure for 1933 is based upon the January figure only.

[2] Index of general price level, Federal Reserve Bank of New York, Standard Statistics Base Book, 1932, p. 233, and supplement of Mar. 15, 1933, p. 15. This index is prepared on the 1913 base. I have converted it to the 1926 base. Weights used in original index: Commodity prices at wholesale, 2; composite wage payments, 3½; elements of cost of living, 3½; rents, 1. The figure for 1933 is based upon the January figure only.

[1] Of these 10,738 suspended banks 1,372 were subsequently reopened, leaving net suspensions for the 12 years of 9,366.

(2) The great increase in the value of the dollar that has taken place since the crisis of 1929 has been very unequal, as it has found expression in the prices of different classes of commodities and services and in the wages of different kinds of labor. The farmer and other producers of basic commodities have suffered particularly. The result is a great lack of equilibrium and, in consequence, a great instability in our present price structure. For certain groups of products and certain classes of prices, for example, the index numbers for 1926, 1929, 1932, and early 1933 are as follows:

*Wholesale commodity price indexes*

[Relatives, 1926=100]

| | 1926 | 1929 | 1932 | 1933 |
|---|---|---|---|---|
| Wholesale commodity prices | 100.0 | 96.5 | 64.9 | 61.0 |
| Raw materials | 100.0 | 97.5 | 55.1 | 50.2 |
| Farm products: Group index | 100.0 | 104.9 | 48.2 | 42.6 |
| Foods: Group index | 100.0 | 99.7 | 61.0 | 55.8 |
| Hide and leather products: Group index | 100.0 | 109.2 | 73.1 | 68.9 |
| Textile products: Group index | 100.0 | 93.7 | 55.9 | 51.9 |
| Fuel and lighting: Group index | 100.0 | 81.6 | 70.3 | 66.0 |
| Metal and metal products: Group index | 100.0 | 104.4 | 80.2 | 78.2 |
| Building materials: Group index | 100.0 | 97.1 | 71.5 | 70.1 |
| Chemicals and drugs: Group index | 100.0 | 94.4 | 73.7 | 71.6 |
| Finished products | 100.0 | 96.2 | 70.4 | 66 7 |
| Retail food prices | 100.0 | 98.1 | 63.8 | 59.3 |

NOTE.—U. S. Bureau of Labor Statistics figures, Standard Statistics Base Book, 1932, pp. 219–231, and supplement of March, 1933, pp. 15–16. The figures for 1933 are based on January figures only.

These two facts are the chief explanation of our debt problem and of our farm and unemployment problems aside from their debt features. Let us consider each of these problems briefly.

*Debt problem.*—The National Industrial Conference Board estimates the net interest-bearing debt of the United States at the present time at about $155,000,000,000. The great bulk of this debt has been created since 1913. Since the general price level is lower today than it has been at any time since the spring of 1917, most of this debt is today payable in dollars of greater purchasing power than were borrowed. In other words, it takes more bushels of wheat or of corn, more pounds of beef or of hogs, and more bales of cotton to pay a hundred dollars' worth of debt today than would have been required to do so at the time most of these debts were contracted. This is a real burden and is causing great hardship.

In weighing this burden, however, two important facts should not be overlooked: First, that inasmuch as a comparatively small part of the principal of these debts is being called for payment at the present time, if this drop in the price level should prove to be but temporary and if prices should in the not distant future return to something like their predepression level, the present hardship would not continue; and, second, that for most of the time since 1896 the price level has been advancing or remaining comparatively stable and that in only 4 years of these 36 have we had excessively low or strongly declining prices. For these 36 years, the general price level rose in 24, declined in 5, and remained unchanged in 7.

Most of the payments of principal and interest on long-time debts contracted since 1896 have been made in dollars of less value than the dollars that were borrowed. In other words, during nearly all of this 36-year period (unlike the 23 years preceding it), the world has been having rising prices, and the debtor has, therefore, been benefiting at the expense of the creditor.

The lack of equilibrium in the rates at which different classes of prices and the prices of different classes of commodities have declined has caused much hardship, and particularly to our agricultural population. In general, the prices of the goods our farmers have had to sell have declined during the last 4 years much more rapidly than have the prices of the goods which they have had to buy. The following citation from the recent Report on the Agricultural Situation, prepared by a special committee of the Association of

Land-Grant Colleges and Universities, summarizes this phase of the situation by comparing recent figures for extremely favorable and extremely unfavorable dates, namely, for the boom period immediately preceding the depression and the "black summer and fall" of 1932. The report says:

"The aggregate of farm production in the United States in 1932 is approximately equal to that of 1929. Consequently the shrinkage in returns is broadly indicative of the total influences of the recent changes in domestic and foreign demand conditions, together with such additional influences as have arisen from the drop in the general price level. Prices received by farmers in the fall months of 1932 were approximately 40 per cent of those received in the fall months of 1929 * * *. In 1928, the ratio between the prices received by farmers and the prices paid by them for the goods they buy was about 90 per cent of the pre-war ratio. In the depression of 1921, the ratio was 75 per cent, and in 1925, the most favorable postwar year, the ratio was 92 per cent. By June, 1932, farmers' purchasing power declined to 48 per cent of their prewar purchasing power—a decline since 1928 of nearly half * * *."

Such a lack of equilibrium in price and wage adjustments has, of course, been one of principal factors in the unemployment situation. When the prices of a manufacturer's product decline rapidly, while the wages he must pay, the freight charges he must meet, and the prices of some of his raw materials decline much more slowly, if they decline at all, the manufacturer soon finds his business unprofitable and must shut down. When the public begins to feel that prices are destined to fall farther, they naturally hold back their purchases. Why buy today if things will be cheaper tomorrow? Furthermore, if there is a widespread feeling, as there doubtless is, that wages of certain classes of labor and the prices of certain classes of goods and services have not been liquidated to a level reasonably in equilibrium with other wages and prices, the public will reduce to a minimum its purchases of these "highly priced" products and its employment of this "overpaid" labor. The sooner that the prices of different groups of commodities and the wages of different kinds of labor are brought into a reasonable equilibrium, the sooner we will have a normal revival and a consequent decrease in unemployment. An upward movement is much more likely to take place after a more or less stable equilibrium in price and wage adjustments has been attained than before. The quicker, therefore, that we can iron out these maladjustments, the sooner may we reasonably expect an enduring upward movement.

For the present, the important question is: How can this situation most effectively be met?

A widely advocated solution is deliberate inflation, or reflation, as it is often called when the purpose is a return merely to the price level of predepression years. One type of inflation of which we hear much of late is the so-called "devaluation" or reduction in the gold content of the dollar. The theory of those who advocate devaluation is simple and usually runs something as follows:

"The price level today is about two thirds as high as it was before the crisis. This low price level is not a temporary one incident to a passing crisis, but is of an enduring character. It is due chiefly to a world scarcity of gold. Reduce the gold content of the dollar to two thirds of its present amount, or from 23.22 grains of pure gold to, say, 16.5 grains, which would be equivalent to calling 67 cents of our present gold dollar the new dollar, or to calling $1 of our present gold money $1.50 of the new gold money. Prices would then automatically rise", the proponents of this plan say, "by 50 percent, or, in other words, would be brought back approximately to the 1929 level. By giving us a dollar of about the same purchasing power as the average dollar of the period 1921–29, the debt problem would be largely solved." Such, in brief, is the argument of those who advocate a devaluation plan.

Before considering how this plan would work, let us discuss briefly the fundamental assumption upon which it is based—namely, that we are suffering from an enduring shortage of money resulting from an enduring shortage of monetary gold.

The principal grounds for claiming that such a shortage of gold exists are four:

(1) The great increase in the value of gold since 1929, as evidenced by the decline in the price level in gold-standard countries which we have just mentioned.

(2) The fact that the world's gold production declined substantially during the years 1917–22.

(3) The fact that, although there has been a considerable recovery since 1922, the world has only within the last couple of years gotten back to the high production level of the period 1908–16.

(4) The fact that the demand for gold increased greatly during the 11 years following the armistice, as a result of the growth of the world's production and trade and of the return of a large part of the world to the gold standard.

Let us consider these reasons briefly.

If the world were suffering from an enduring scarcity of monetary gold, this scarcity would be likely to be felt in a slow and continuing decline in prices, as it was in the period 1873–96, rather than in a catastrophic drop like the one we have recently had following a long period of comparatively stable prices.

The value of gold is a question of the world's total supply of gold in relation to the world's total demand for gold; and the world's total supply of gold is a very large sum, representing the accumulation of the ages; while the world's annual production of gold is a very small percentage of this total supply. The total supply of monetary gold in the world today is about 12.5 billion dollars, while the world's total annual production of gold is about 4 percent of this figure, and only a little over half of the annual product normally goes into the monetary uses. Slight changes in annual increments, which themselves represent only a little over 2 percent of a total volume, affect that volume very slowly. In this connection, it should be noted that the comparatively stable wholesale commodity price level in the United States from 1921 to 1929 was a high level—averaging about 41 per cent above that of 1913.

Although the world's gold production fell off considerably during the war and early post-war years, the world's supply of monetary gold has increased substantially and almost continually since 1913. The world's average annual production of gold for the 8 years ending 1913 was 21,514,000 ounces; for the 8 years ending 1921 it was 19,354,000 ounces; and for the 8 years ending 1929 it was 18,660,000 ounces. The average for the last two 8-year periods was only 11 per cent less than for the pre-war period—which was the greatest in the world's history—and the average for the three years 1930, 1931, and 1932—21,300,000 ounces—was almost equal to the average for this period of pre-war maximum. The gold production for the year 1932 of nearly 24,000,000 ounces was 5 percent higher than that of 1915, which was the previous maximum in the world's history.

We are here, however, more concerned with the amount of gold that has actually been coming into the monetary uses. Turning, therefore, from the world's gold production to the growth of the world's supply of monetary gold, absolutely and relatively to the world's production of basic commodities, we find no evidence of an enduring scarcity of monetary gold. The Federal Reserve Board estimates the world's stock of monetary gold in the hands of central banks and governments at the end of 1921 at $8,023,000,000 and at the end of 1929 at $10,297,000,000. This represents an average annual increase (geometrical) of about 3.2 percent. For the 19 years 1913–32 this world stock of monetary gold increased 144 percent, representing an average annual increase (geometrical) of about 4.8 percent. The studies of Dr. Carl Snyder, of the New York Federal Reserve Bank, covering the principal commercial countries of the world for the period 1865 to 1914 show a rate of increase in the physical volume of production of basic commodities—tons, bushels, yards, etc.—of approximately 3.15 percent a year. For the 16-year period from 1913–14 to 1929–30, the annual rate of increase was only 1.86 percent, and for the 9 years 1920–29 it was 3.2 percent.

Under normal conditions, there would be no need of the world's supply of monetary gold increasing as rapidly as the world's production of basic commodities or as the physical volume of business, because, with continually improving currency and banking organization, with increasing cooperation on the part of central banks, with increasing use of checks in business transactions in substitution for coin and notes, and with increasing velocities of monetary and deposit circulation, the efficiency of monetary gold should be continually increasing. In other words, each dollar of gold should perform a progressively larger amount of money work.

It may be reasonably concluded, therefore, that for the approximately 9-year period from April 1921 to the end of 1929, during which wholesale commodity prices in the United States were fairly stable at a level averaging about 41 percent above the pre-war level, and during which the world's stock of monetary gold in central banks and government treasuries increased on an average of 3.2 percent and the world's production of basic commodities likewise increased about 3.2 percent, there is no evidence that the world was suffering from what could be called an enduring scarcity of monetary gold.

The world's stock of monetary gold in central banks and government treasuries at the end of 1932 was approximatly 19 percent greater than it was 4 years before, and the recent increase in the value of gold is greatly stimulating gold exploration and production.

While it is true that, during the decade 1921–30, many countries went over to the gold standard, nearly all of these countries or the areas they cover had been on the gold standard before the war, and their return to it did not represent an increased demand for gold, as compared with the pre-war demand. Furthermore, a large number of these countries substituted the gold-exchange standard or the gold-bullion standard for the pre-war gold-coin standard, with a resulting almost complete discontinuance of the hand-to-hand circulation of gold coin throughout the world, thereby effecting very substantial economies in the use of gold.

The Agenda recently published for the forthcoming World Monetary and Economic Conference says: "Before the war more than 40 percent of the total monetary gold stocks consisted of gold in circulation or with private banks, while, at the present time, only 9 percent represents gold not in the hands of central banks." Moreover, contrary to all expectations, gold has recently been pouring into the world market from the hoards of India in large quantities, approximately 291 million dollars having come from that source during the 15 months ending December 1932. Contrast an average annual net absorption of gold by India for the 5 years ending with 1928 of about 136 million dollars with a net exportation of 196 million dollars for the year 1932. Since the outbreak of the World War, Russia has poured over 600 million dollars of monetary gold into the rest of the world. Moreover, during the last few years, there has been a very decided decrease in the amount of new gold absorbed in industry and the arts.

At the present time the prospects are stronger that we are facing another period of gold inflation and of rising prices in gold-standard countries than a period of gold scarcity and declining prices, which some economists have been prophesying. While the commodity price levels as measured in gold have fallen greatly since 1928 in countries like England and Denmark, which have suffered substantial losses in their gold reserves, they have also fallen greatly in the United States, whose gold reserves at the end of 1932 were approximately what they were 4 years before, and in France, whose gold reserves increased from 1,253 million dollars at the end of 1928, shortly after she returned to the gold standard, to 3,254 million dollars at the end of 1932. During this same 4-year period of enormously increasing gold reserves, the commodity price level in France dropped 30 percent. The market for gold is a world market and the value of gold is obviously determined by world forces.

The situation in the United States as regards the monetary circulation, the supply of monetary gold, bank deposits, and the physical volume of business on or about June 30 of each year since 1926 and for the latest date in 1933 for which figures are available, is summarized in the following table. The index numbers have been computed, using the figures for 1926 as 100.

*Circulating media and physical volume of production, 1926–1933*

| | 1926 | | 1927 | | 1928 | | 1929 | |

| Physical volume of trade [4] | 100.2 | 95 | 85.7 | 81 | 65.7 | 62 | 57.1 | 54 |
| Industrial production [5] | 106.4 | 88 | 88.1 | 73 | 57.7 | 48 | 59.3 | 49 |

[1] All of the figures for 1933, except those for physical volume of trade and industrial production, are averages of the months of January and February. The figures for the two exceptions are for January only.
[2] Year 1926=100.
[3] These figures represent the average of the 4 or 5 weekly reports for the month of June.
[4] This is the Clearing Index of Business, prepared by the Federal Reserve Bank of New York.
[5] This is the Composite Index of Industrial Production, prepared by the Standard Statistics Corporation.

Briefly summarized, these figures show that we have in the United States today 3 percent more monetary gold than we had in the boom year 1929; that our monetary circulation for the year 1932 was 20 percent larger than for the year 1929. It averaged for January–February 1933, 30 percent larger than for the corresponding months of 1929. On the other hand, the physical volume of trade in the United States was 41 percent lower in 1932 than in 1929, and was 48 percent lower in January 1933 than in the corresponding month four years ago. Broadly speaking, comparing early 1933 with early 1929, we have only about 50 percent as much business being done, and this business is being done at a general price level only about 70 percent as high, while we have 30 percent more money with which to do it and our demand bank deposits, through which by means of checks we normally perform more than 90 percent of our business, have declined in reporting member banks only 13 percent. In view of the much larger percentage of "non-reporting banks" that have suspended than of "reporting member banks", the percentage decline in demand deposits for all banks will probably appear appreciably larger than that for "reporting member banks" just given, when figures become available. From October 4, 1929, to September 30, 1932, total deposits (exclusive of interbank deposits) of all banks in the United States declined 24.3 percent. For nonmember banks the percentage decline was 23.9 as compared with 24.5 for member banks.

The great trouble is that our money and our bank deposits have not been moving. The efficiency of money as a medium of exchange and the efficiency of bank deposits for the same purpose depend upon the velocity with which they circulate. A decrease in the average rate at which money circulates, say, from 40 times a year to 20 times a year, is equivalent to the cutting in half of the volume of money in circulation. Money that is hoarded has a zero rate of circulation during the period in which it is hoarded. The same principle applies to bank deposits. An average volume of demand bank deposits balances, say, of $20,000,000,000, would do $800,000,000,000 of money work in a year, if the total amount of checks drawn against these deposits in the course of the year were $800,000,000,000. representing an average velocity of circulation of 40. This same volume of deposits, however, would do only $400,000,000,000 of money work if the volume of checks charged against it during the year were only $400,000,000,000, representing an average velocity of circulation of 20. In both cases, the percentage of monetary and of gold reserve against the deposits would presumably be the same. In the second case, each dollar of gold reserve held to support the deposits would be only half as efficient as in the first case. Deposits that are not moving are analogous to money that is being hoarded. In this sense of the term, an ernormous volume of our bank deposits today is being hoarded, and those that are moving are in general moving very sluggishly.

Unfortunately, we have no satisfactory figures for the rates at which our hand-to-hand money circulates, but we have reasonably satisfactory figures covering 141 important cities in the United States for the rate at which our bank deposits circulate, and, since over 90 percent of our business is done by means of these bank deposits circulating through checks, these figures for the velocities of bank deposit circulation are very significant. Briefly summarized, they are as follows, for the period 1926 to the present time:

*Velocity of circulation of bank deposits in the United States* [1]

| Year | New York City | | 140 other cities | | 141 cities, including New York | |
|---|---|---|---|---|---|---|
| | Actual data | Index [2] | Actual data | Index [2] | Actual data | Index [2] |
| 1926 | 67.1 | 100.0 | 33.9 | 100.0 | 53.4 | 100.0 |
| 1927 | 74.9 | 111.6 | 35.0 | 103.2 | 57.4 | 100.7 |
| 1928 | 93.5 | 139.3 | 37.9 | 111.8 | 67.7 | 126.8 |
| 1929 | 111.9 | 165.8 | 41.6 | 122.7 | 78.0 | 146.1 |
| 1930 | 69.5 | 103.6 | 34.9 | 102.9 | 55.2 | 100.4 |
| 1931 | 46.2 | 68.9 | 28.8 | 85.0 | 41.1 | 77.0 |
| 1932 | 33.1 | 49.3 | 25.4 | 74.9 | 32.8 | 61.4 |
| 1933 [3] | 25.7 | 38.3 | 24.0 | 70.7 | 28.9 | 54.1 |

[1] Figures of Federal Reserve Bank of New York.
[2] Base year 1926=100.
[3] Figures for January only.

The velocity of circulation of deposits in 141 cities declined 58 percent from 1929 to 1932, while the decline for New York City was 70 percent. For these 141 cities an average dollar of bank deposit credit did more than two and one third times as much money work in 1929 as in 1932, and likewise an average dollar of gold held as reserve against bank deposits. These figures demonstrate that our trouble is not in the volume of gold, or of money, or of bank deposits, but in the fact that our money and our bank deposits are not moving. The money is here and the bank deposits are here, but the people who have them are afraid to use them. For several years now the majority of the people in the United States who have had sufficient optimism to buy securities or land, to expand production on farms or in mines (except gold mines), to enlarge production in their factories, or to extend their commercial business, have lost by so doing. Concerns which have expanded their inventories, in the great majority of cases, have done so only to see the prices of their stock of goods decline after purchases were made. Consumers have had similar experiences in making improvements on their homes or in buying household supplies. An optimist who repeatedly gets his fingers burned is likely to become a pessimist. A widepread philosophy is "why buy goods today if they are to be cheaper tomorrow?" To the public mind practically everything has been depreciating in value except money, and money has been rising in value. The natural conclusion is "hang on to the money you have and get as much more money as you can." This is the philosophy of hoarding, a harmful, antisocial philosophy which we rightly deprecate but which we can understand and must face.

These velocities at which our currency and bank deposits circulate are extremely low, because of the low state of business confidence. And this low state of confidence is due chiefly to the factors we have already mentioned—namely, "shellshock" from the speculative collapse of 1929, the failure of the National Government to balance its budget, resulting in a continually increasing deficit and enormous public borrowing, unreasonably high tariffs at home and abroad and other excessive restrictions on international trade, a grossly defective banking system, frequent revelations of abuses in high finance, the tension in the political situation abroad, and widespread fear arising from agitation in Congress and out for radical legislation in the fields of currency, banking, and finance.

When the fears growing out of these difficulties are allayed and confidence is once restored our money and our bank deposits will again move and our supply of monetary gold will again function normally. Then we shall find that the world has an abundance of gold.

If this is a correct statement of the facts and if this reasoning is sound, then the present low level of commodity prices is but a temporary one, and the commodity price level of the years 1922–28 is much more nearly normal for these times. The predepression commodity price level may, therefore, be expected to return as soon as confidence is restored. In that case a reduction at this time in the gold content of the dollar would ultimately give us a dangerous inflation and probably ultimately put our price level far above that of 1922–28. This would be grossly unfair to the creditor classes—the classes which suffered from a depreciating dollar from 1896 to 1920.

If the proposal to devaluate the dollar by reducing its gold content should be adopted, and should prove effective in helping many worthy debtors, it would at the same time do great injustice to many equally worthy creditors. Our principal creditor in the United States on long-time account is the bondholder; and, inasmuch as a large proportion of our debts consists of corporation debts, the largest single class of debtors consists of stockholders, namely, the people who own the corporations that owe the debts expressed in the bonds. Corporation debts (long- and short-term bonds and notes) in 1932 were estimated by Irving Fisher to equal about seven times the volume of farm mortgages and other agricultural loans combined.

A great part of our bonds is owned by insurance companies, savings banks, and other banks, universities and colleges, scientific, charitable. benevolent, and other welfare institutions in their endowment funds, by pension funds, and by widows and orphans and other beneficiaries of funds held in trust. These creditors are our most conservative investing classes—classes whose welfare is a matter of such great social importance that we protect them by special laws which restrict the investment of trust funds to a limited and and supposedly safe field of investment. In these restrictions, bonds and mortgages are favored, and investments in equities like common stocks are usually disfavored.

A reduction in the gold content of the dollar, or any other policy which led to a large inflation, would take funds from the creditor and give them to the debtor. The stockholder would gain to a large extent what the bondholder lost. Our corporations would pay off their debts in cheaper dollars and our stockholders would gain scores of billions of dollars at the expense of the bondholders. This would greatly favor the speculative classes at the expense of the conservative creditor classes.

In helping certain classes like farmers, home buyers with mortgages on their property and others who are really suffering under the burden of long-time debts during this temporary period of abnormally low commodity prices, any plan involving an extensive devaluation of our gold unit would cause much injustice to other equally worthy classes and, in my judgment, would result in such a breakdown of confidence and credit as would be nothing less than a national calamity.

The serious agitation in Congress of a proposal for a devaluation of the American gold dollar would itself tend to break down our currency standard. Foreigners holding American bonds would wish to unload them at almost any price, in order to avoid the possibility of having them paid off in 67-cent dollars.

American bondholders would feel the same way. Mild beginnings in the efforts to sell the bonds before the devaluation scheme should become effective would be in danger of eventuating into a stampede. The same principle would apply to other kinds of long-time obligations and to preferred stocks. The scramble for gold would be intensified. If bank deposits were expected to be payable shortly in 67-cent gold dollars, the public would want to withdraw their deposits at once and to convert them into 100-cent gold dollars and would be willing to bid up for such dollars, if necessary to get them, to a premium of nearly 50 percent. If we were on the gold standard when agitation for such a devaluation began to be taken seriously by the public, the fear that the plan would be adopted would quickly break down that standard; and if we were on a paper-money standard, with our dollar worth substantially more than 67 cents gold, the value of that dollar would be quickly depressed. The public would lose confidence in their money and instead of hoarding it would be disposed to unload it quickly before its value should decline. The velocities of monetary and of bank deposits circulation, which are now abnormally low, would become abnormally high, and we would find ourselves thrust into the mire of inflation. Unfortunately, it would not be controlled inflation, but a wild and uncontrolled one. The present time, when the country is suffering from an intense case of "nerves" and when confidence is at a low ebb, is no time for agitating for a devaluation of our gold dollar.

Suppose that the plan were adopted and that, after the storm had done its damage and had cleared away, the expectations of the proponents of the plan should prove to have been realized and prices should have been raised to a level approximately 50 percent higher than the level of today, even then the farmer's problem would not have been solved. He would have been helped in the payments of his long-time debts. His possibilities, however, of again borrowing needed funds, at least for a considerable time, would have been greatly impaired. Such a plan would be a great shock to credit, and for a time would tend to dry up the sources of credit. Furthermore, if all prices were increased 50 percent, that increase would apply to the things the farmer bought, as well as to to the produce he sold, and the farmer would still be suffering, as he is today, from the same abnormally low purchasing power of farm products over other products.

A reduction in the gold content of the dollar for the purpose of meeting an emergency like the present one, which is probably temporary, would create a very dangerous precedent. We have had many severe economic crises in our history and many changes in our monetary and banking system. We have been reluctantly forced off our metallic money standard twice in time of war and once in time of peace. There have been times when an appreciating currency has temporarily placed increasing burdens on the debtor class, and there have been times when a depreciating currency has resulted in economic injustice to the creditor class. Never in our history as a Nation, however, have we deliberately changed our actual metallic unit of value in order to meet such situations. The claim sometimes made, that we debased our metallic unit of value by our coinage laws of 1834 and 1837, is not correct. From the beginning of the National Government down to 1873, we were legally a bimetallic country. During all that time both gold and silver were freely coined at our mints at a fixed ratio of equivalence determined by law.

The ratio of 15 to 1 established in 1791 overvalued silver and undervalued gold, with the result that very little gold was coined prior to 1834, and the little that was coined quickly disappeared from circulation. Gold was at a premium and our currency, though legally bimetallic, was, in practice, a silver standard. The de facto monetary unit in 1834 was a silver unit, and the coin that best represented our unit of value was the half dollar, of which there was free coinage at that time and of which there was a substantial circulation. Gold was more valuable as bullion in the United States, or as money in France, than as money in the United States, and so gold coins did not circulate to any appreciable extent in the United States. Debts, prices, and wages were actually paid in terms of the silver unit. Two changes in our monetary law, one in 1834 and a slight corrective change in 1837, raised our bimetallic ratio from 15 to 1 to 16 to 1, with the object of bringing gold back into circulation. The reduction in the gold content of the dollar was a little over 6 percent and it resulted in an increasing circulation of gold and a decline in the coinage of silver. It did not impair existing contracts, for existing contracts were practically silver contracts. It was merely an attempt to bring our mint ratio into closer harmony with the market ratio and thereby to make it possible to bring gold coin back into circulation and to maintain an effective bimetallic standard.

Another significant fact in connection with this problem is, that for a generation now, say, 36 years, the general price level has been rising most of the time. From 1873 until about 1896, the general tendency of the price level was downward, but since 1896, when the influence of the great production of gold in the newly discovered gold fields of South Africa began to become effective, the general price level has moved upward. For example, for the 36 years, 1896 to 1932 inclusive, the general price index number prepared by the New York Federal Reserve Bank rose in 24 years, remained unchanged in 7 years, and declined in only 5 years; and 3 of these 5 years were the years 1930, 1931, and 1932. During this same period the index number for farm products in general rose for 22 years, remained unchanged in one year, and declined in 13 years. Either long- or short-time debts contracted during this period, whether paid in full at maturity or regularly amortized, have, for the most part, been paid in cheaper dollars than were borrowed. During this generation the debtor in general has gained much more from the instability of our monetary standards than has the creditor. If the policy of changing the gold content of the dollar from time to time, in order to equalize the burden of debts, had been adopted in 1896, most of the changes would have been in the direction of increasing the gold content, rather than of decreasing it.

The debtor's case for a revaluation of the gold content of the dollar, on the basis of a decline in the price level during this brief period of 3½ years, is weakened by the fact that he has gained at the expense of the creditor by reason of the instability in the value of the dollar during by far the greater part of the time during an entire generation. For the reasons already given, there is a good prospect that the present low price level is but temporary and that the price level of the future will be a much higher one than that of today. There is, moreover, a fair prospect that, after the depression is over and the commodity price level has again returned to normal, the general upward movement of prices which began in 1896 will again assert itself, and that we may be facing in the not distant future the problem of gold inflation and the rising cost of living with which we have been so much concerned most of the time for over a third of a century.

If once the precedent were established of changing the gold content of the dollar by legislative action in order to reduce the injustice which a fluctuating dollar imposes upon debtors or creditors, we would enter upon a course of action likely to do much more harm than good. How far should the dollar appreciate or depreciate before its gold content should be changed? Many substantial changes in the price level are but temporary. Temporary rises succeed temporary declines, and vice versa. How long should a change endure before the dollar should be revalued? How much should it be changed on each occasion? Who is to answer these questions? Shall each country of the world answer them for itself? Is it possible in a matter of this kind which vitally affects the welfare of the entire population—a population in which the debtor classes greatly preponderate and have by far the largest proportion of the votes—to keep the decision on a scientific level and free from politics?

In a country like our own, what would happen if the general price level were rising substantially, so as to call for an increase in the gold content of the dollar at a time when farm products in general or, say, wheat and cotton in particular were rapidly falling? At such a time, when the plight of the farmer was bad and getting worse, could we raise the gold content of the dollar in the general public interest, if in doing so we should aggravate the farmer's hardships?

These problems would arise in every country in the world that adopted such a plan. Unless we could have an international plan of monetary stabilization, we would have chaotic conditions in international finance and international trade. Furthermore, unless we could keep our revaluations on a thoroughly scientific basis and free from politics, the situation as regards domestic loans would become very grave and the heavy risks involved would be likely to increase greatly interest and other service charges on loans. The time may come when we can put into operation a thoroughly scientific plan for varying the gold content of the dollar so as to maintain a stable price level, when we can base the value of the dollar upon a satisfactory international price index number, when we can keep the whole problem out of politics and maintain the administration on a thoroughly scientific plane, and when all this can be done through a plan of international cooperation so as to maintain a stable unit of value throughout the leading countries of the world. In my judgment, however, the day when this Utopian dream can be realized is far distant.

In the present state of international affairs, of popular economic knowledge, and of politics, both in this country and abroad, a man must be a great optimist, to put it mildly, to believe that any such plan is at all feasible.

Inflation in any form is exceedingly difficult to manipulate and control. History shows that practically all attempts at deliberate inflation, and all experiments with inconvertible paper money, despite their optimistic promises and their frequently very favorable beginnings, have broken down and have ended in excessive depreciation and widespread injustice. Such were the experiences of all the paper-money experiments during the World War. Such were our experiences with Colonial paper money, Continental paper money, and the American greenback; and such was the experience of England during the Napoleonic period. Already Australia, New Zealand, and Denmark, which undertook a short time ago to maintain their managed currencies at a parity with sterling, have broken away and their currencies have depreciated to a substantially lower level. The illustration given by Mr. Henry J. Haskell before this committee a few weeks ago is a particularly appropriate one. He said:

"Primarily, inflation is like a balky and unruly horse. It simply refuses to be guided by the rider. At first it balks; the rider applies whip and spur and still it will not budge. Then, of a sudden, it bolts and there is no controlling it. When it finally stops it throws its rider and he is left flat on the ground."

So far I have assumed that the horse, if goaded sufficiently, would get started, and I suppose he would. So far, however, our attempts to goad him into action have not been very successful. Over a year ago our Federal Reserve authorities inaugurated a vigorous relation plan and for many weeks they bought Government securities in the open market at the rate of $100,000,000 a week, thereby expanding Federal Reserve credit, inducing the banks to pay off their loans to the Federal Reserve banks and to accumulate heavy excess reserves. In pursuance of this strenuous reflation policy, our 12 Federal Reserve banks increased their average daily holdings of United States Government securities from $740,000,000 to $1,851,000,000 between February 27, 1932, and August 13. This was one of the most extreme attempts at deliberate inflation—or reflation, if you prefer—that the world ever saw. The public, however, were afraid to borrow the funds that were thus made available, and the banks were afraid to invest them. Consequently, the funds piled up in the banks and in private hoards. Actually, the general commodity price level as well as the level of security prices was lower in August when the making of these heavy purchases was discontinued than in February when it was begun.

This very reflation process itself scared a great many people to such an extent that the velocities at which the bank deposits circulated were decreased by more than enough to compensate for the increase in the volume of the deposits. In early March of this year, at a time when the monetary circulation of the country was the largest that it had ever been in our history—about 52 percent larger than the maximum of the boom year 1929—when the expanded bank credit resulting from the aforementioned reflation policy of the Federal reserve banks was still outstanding, when the physical volume of the Nation's business was only about 50 percent of the predepression figure, the general price level about 70 percent and demand deposits in reporting member banks

90 percent, in a situation like this our currency broke down completely, gold payments are suspended, and all the banks of the country were closed for over a week. What better proof could one ask, that our problem is primarily one of confidence?

Of course, reflation to a price level approximating that existing before the depression is desirable, but the best and safest method of obtaining this reflation is through such a restoration of confidence as will cause our existing supply of money and of bank deposits to circulate again at their normal rates. A return to normal of the velocities of our money and bank deposits circulations would give us not only all of the reflation we need to restore our prices to the level preceding the depression, but much more. It would, in fact, create a situation in which our most urgent problem would probably be to curb inflation rather than to stop deflation.

To accomplish this purpose the only suggestions I have to make are the very commonplace ones previously implied:

(1) Balance the budget, and by balancing the budget I mean a bona fide balancing of revenues and expenditures, and not a mere juggling of terms and accounts.

(2) Take a firm stand against all inflationary panaceas, including schemes to reduce the gold content of the dollar, and the various proposals to remonetize silver.

(3) Maintain such checks upon the recent concessions to possible currency and credit expansion as to contract the new circulating media promptly and effectively as confidence is restored. Most of these measures are temporary emergency measures. In their present form they should not be permitted to become permanent. Let us not forget that, in September 1923 nearly two thirds of Germany's 45 quadrillion marks of Reichsbank notes outstanding were backed by treasury bills of the German Government.

(4) Pass effective banking reform laws, bringing all commercial banks under national law and into the Federal Reserve System, substantially extending branch banking under effective governmental supervision, completely divorcing investment affiliates from commercial banks, and providing for adequate Government supervision of investment banking.

(5) Discontinue the publicity provision in regard to Reconstruction Finance Corporation loans to banks.

(6) Make a definite and final settlement of the problem of interallied debts.

(7) Arrange for a substantial leveling down of the tariff, in cooperation with other countries on a basis of mutual concessions, providing for the necessary changes in the "most favored nation" agreement.

---

## Statement of Francis J. Kunnecke, Dean of Philosophy-Sociology-Political Economy, University of Dayton, Dayton, Ohio

The suggestions contained in the following pages are all excerpts from the book, The Way Out and The Way Beyond or Out of the Depression in Sixty Days, by Francis J. Kunnecke. Therefore, for their full understanding, reference must be made to the book mentioned.

My whole plan, in all its departments, is built up about the two essential points, unification of our financial institutions under Federal control, and the reestablishment of the purchasing power of the masses, by justice to the laboring man. Therefore, the measures I suggest are directly construtive and not merely palliative.

A reference to my booklet, published last year under the title "The Way Out and The Way Beyond", will demonstrate that a number of my suggestions have already been carried out by the Government, I will even make bold to say that, before the end of the depression, it will be found necessary to adopt still more of my suggestions with regard to financial institutions. These institutions once put in order, it will be found that the only way out of the depression is Federal command to start the wheels of industry turning, according to the plan proposed in my new book, a revised and enlarge edition of last year's publication.

I start with the manufacturing industry, because, according to the Federal Trade Commission's report, this industry produces more than one third of the national income.

I beg to call attention to the fact that, by reestablishment of national income, the national Budget will automatically, positively balance. This is preferable to the mere negative method at present used, by reduction of taxation, and, therefore, almost necessary curtailment of governmental service to the people, at a time when they most need such service.

With just a mention of the fact that employment assurance would make unemployment insurance unnecessary, and that the latter would in nowise heal the evils of the depression nor find a way out of it, whereas the former will render both these services to the Nation and prevent reoccurrence of our disaster, I pass over to my views and suggestions for correction of our present situation. It will be noticed that I deal primarily with national questions, maintaining that each nation must first solve its own internal problems before there can be any thought of solution of international economic questions. It is reasonable to expect our minimum 88 percent domestic trade to be able to pull after it our maximum 12 percent foreign trade, but not vice versa.

### THE WAY OUT OF THE DEPRESSION

1. The first step necessary to prompt ending of the depression is conferring, by our legislature, emergency powers upon the President of our country with a view to carrying out the plan herein proposed. Emergency needs prompt action and not long-drawn-out political debate.

2. The President would exercise these emergency powers through two boards that already exist in our governmental administration, the Federal Reserve Board and the Federal Trade Commission, or the Interstate Commerce Commission.

3. These boards would be composed, not of politicians, but of ethical economists, in the sense in which I have defined such, as presiding officers, under the President. In addition to these economists, upon the Federal Reserve Board, the membership of that Board, as at present constituted, would function. The Federal Trade Board would have, besides the presiding ethical economists, representatives of corporation and private industrial capital, representatives of labor interests, and representatives of the agricultural industry.

4. The action of the boards, under prompt decision of the President, should be backed by energetic and immediate action of the Department of Justice, all legal action against the boards to be suspended during the emergency. Otherwise the cumbersome, interminable process of courts would nullify the emergency action. We fully recognize the law, as it is at present administered, could create difficulties for this point in our program. However, without any interference with the Constitution or any necessity of an amendment to the Constitution, temporary legislation that would render emergency action more effective could readily be passed by Congress, if it sincerely wishes to end the sufferings of our Nation.

5. This plan is proposed because our captains of industry have stood by helpless and counselless for more than 3 years and have not found a way out. The Nation has suffered enough because of their inefficiency in this matter. Nor let us be reminded, in excuse, of the wonderful prosperity, which these same captains of industry are supposed to have procured for us during the few years preceding the depression. For a prosperity that leads to such a depression was evidently false. An engineer, who spans a river with a bridge that lasts but 4 or 5 years, and then crumbles, would never dream of referring with pride or with excuse to the few years of service the bridge rendered. Such excuse sounds like the definition of pleasure given by some ridiculous psychologists, namely, that pleasure is the absence of pain. For such industrial captains prosperity would be but the absence of depression.

6. The unification of all financial institutions into one system through membership in the Federal Reserve, whereby the financial situation of America will remain privately owned and privately operated but nationally regulated, is explained in the Way Beyond, page 67. Likewise, the principle of dividend to labor, above wages, out of the profits of industry, and the method of application of this principle are treated in detail in the Way Beyond, page 64.

With these six points, as explanatory and defense introduction, we propose the following suggestions, for prompt action to pull the Nation out of the depression, within 60 days.

### MONEY

1. Stop all issue by the banks, loan associations, and financial institutions in general, of our present currency.
2. Let the Government issue short-time currency, 3 months or 6 months, to all financial institutions, in return for enforced deposit, with the Government, of say, 50 to 75 percent of their present individual holdings of currency.
3. Said new currency will be invalid after 3 or 6 months, unless deposited with the financial institution from which it was obtained by the individual user thereof. Any other institution receiving such money, accepts it as deposited with the issue institution, and returns it as soon as possible to that institution.
4. This process will continue until normalcy returns.
5. Close the stock exchange and permit no expansion of business investments for a period of say 6 months. Extension of this period of closure will be decided by the Federal Reserve Board.
6. The banks are to issue this short-time currency only for exchange and for operation of actual industrial plants, with the proviso made above for advantageous investments.
7. Limit interest and discount in any form to 3 percent, for the time being, to cover expense of banking.
8. Enforce loans by financial institutions, through taxation of retained money, according to a sliding scale, exempting a reasonable amount as reserve to be decided by the Federal Reserve Board.
9. Embargo on all capital intended for foreign use. This action will naturally apply to America's gold reserve.
10. Impose direct taxation upon all foreign investment of capital.
11. Foreclosure and liquidation are to be prohibited.
12. Limit withdrawal on deposits to a fixed percent per week and thus protect the banks against runs; refuse all gold payment or redemption of currency in gold, to protect the Nation's gold reserve.

### INDUSTRY

1. Enforce agreement, among all producers of similar products of consumption, to some restriction as to types, models, sales fields, etc.
2. Lower the speed of machinery to 60, where 100 stands for the speed of 1928 and 1929; no decrease in hours of labor, however, will be permitted, except in favor of employment of a greater number of the unemployed at full wages.
3. There must be fixation of salaries and of number of officers in each concern, according to Goverment recognition of service to the Nation. No man is worth more salary than the President of the United States of America.
4. Sacrifice, for the time being, the 10 per cent depreciation in the figuration of the cost of production.
5. Prohibit all further investment.
6. There should be replacement of equipment only when absolutely necessary.
7. Enforce declaration of dividend to labor's buying power above wages, out of profits, according to the plan of The Way Beyond.
8. Small dividend or no dividend at all, if necessary, will be allowed capital until we rise to normalcy.
9. Order the wheels of industry to move, and force banks, as per above, to issue loans for the operations of business and industry.

### AGRICULTURE

1. We heartily indorse the forestration program of our newly elected President, Franklin D. Roosevelt.
2. We recommend immediate prohibition of foreclosure proceedings against the farmer.
3. Strengthen the farm banks, which have never recovered from the weakness created by the withdrawal of loans under President Harding's administration.
4. Necessarily, there must be a suspension of taxation for the time being.
5. Some form of cooperative planning of crops must be adopted to prevent excess supply. Cooperation in other ways among neighboring farmers could decrease the amount of each farmer's capital investment.

6. Some form of control of our produce exchanges must be adopted by the Federal Government.

7. Besides what we have thus far mentioned, we must not forget that as soon as the purchasing power of labor in our cities is reestablished the market for the farmers' products will automatically build up.

GOVERNMENT

1. It is of prime importance that we correct extravagance in all form of governmental expenditure.

2. It is an utter impossibility for the Government to balance its Budget in the present economic situation.

3. We therefore suggest that the Government do at present, and that productively, what the Government did in war time, and that, at least, in a material sense, destructively, go into debt. We pay off debts in time of prosperity and not in time of depression. Debtors are wiped out by their creditors, but the things which the debts created become concentrated in the hands of the creditors, and, in the last analysis, in the hands of Wall Street.

4. The same necessity faces our State and municipal governments for the maintenance of their services to the people, in the form of police and fire departments, educational sytem, and the like.

5. Taxes, therefore, instead of being increased in time of depression to balance the Budget should rather be decreased in order to increase the buying power and reestablish, by so much, the failing income.

6. We also highly recommend that the Government, by very prompt action, reestablish the ratio fixed by the Federal Reserve Act of 1913 of $1 in gold to $2.50 in currency.

According to governmental statistics the gold was 54.94 percent of the total stock of money on June 30, 1930. If this be true, and the ratio of the Federal Reserve Act correct, as we have all reason to believe it was and is, then our currency should be $11,337,164,290 as backed up by $4,534,865,716 in gold coin and bullion, as reported June 30, 1930. Now, the total stock of money in the United States, according to the report of the same date, was $8,306,564,074, which automatically shows that our currency was $7,565,465,932 short of what it should have been, June 30, 1930. The Government, therefore, according to the ratio fixed by the Federal Reserve Act of 1913, could issue $7,565,465,932 in currency without there being the least plausibility of inflation accusation. We are not forgetting that gold certificates have full gold backing; but, on the other hand we would have it borne in mind that silver notes require no gold backing at all.

The possibilities of this issue of currency to supply the dearth of money in circulation in the United States must be evident to all. The Government could, without the least suspicion of currency inflation, with the Federal Reserve Act of 1913 justifying its action, pay off by far the larger portion of our national war bonds. If, moreover, the Government would apply the principle of multiple tender, or pay its debts in honest dollars, it could actually cancel the war debt of the American Nation and have money to spare. Let it further be remembered that it would be but applying the powers already given it by the Federal Reserve Act of 1913.

It cannot be too strongly insisted upon that this is not inflation and especially that it is not the exaggerated real inflation perpetrated by Wall Street, during the years preceding 1929, when credit money was raised to the enormous figure of $117 to $4 in gold, when universally accepted economic practice fixed the ratio of $12 in credit money to $1 in gold. The reason why Wall Street resists, by false propaganda and misstatement of the issue concerning the relative ratios of the elements of our monetary system, is, that it will deprive their currency of the dishonest, exhorbitant buying power, which restriction of that currency necessarily implies.

Wall Street desires to buy back the articles created, with half the currency that was used in the process of creation. This is but another trick, whereby Wall Street wishes to concentrate in itself the wealth of America. It has the affrontery to ask the American Government and the American people to pay the New York bankers twice the amount of buying power given the American Government in 1917 and 1918. To put the question so that every layman can understand, this is equivalent to demanding that the Government, and, therefore, the American people, present Wall Street with two houses for the one they gave, with two farms for the one they sold, with two factories for the one they financed. The injustice of this usurious demand will be evident to any tyro of the study of economics.

Need we further mention that we would thus be provided with an excellent means to partly balance the national budget by deducting $400,000,000, or thereabouts, which the American Government, and consequently the American people, must pay as interest on these war bonds, and that, therefore, the American people would be saved this enormous sum of taxation every year, as also the taxation that will be necessary to redeem the principal.

The investment of the Nation in its Government bonds is an evidence of the confidence the people place in the Government's security and in its ability to meet its obligations. Furthermore, it demonstrates the people's faith that the Government will be able to pay the principal on the date designated by the bonds, as also the interest due yearly, as determined by the bond issue.

Fiduciary money likewise witnesses to the confidence of the people in the ability of the Government to redeem, in gold if gold be the accepted standard or in gold or silver if the monetary system be bimetallic, the notes issued by the Government as elements of the monetary system.

From the point of view of confidence, the case of bonds versus notes seems to be equal; for whilst the bonds are redeemable only at a future date, whereas the notes are redeemable upon presentation, the bonds imply the Government's ability to meet a greater obligation in the long run because of the accumulating annual interest payable on the bonds, whereas the notes imply a possible demand, though saving the enormous amount of interest the bonds require.

The possibility of this sudden unexpected demand could be obviated by restricting the amount of allowable redemption per year to a certain fixed sum. The Government then could invest the interest that ordinarily it would have to pay yearly on the bonds, in purchase of gold or silver, or both, as the case may be, thus gradually increasing its gold reserves out of taxation instead of increasing bankers' wealth, as is the case, when the bankers hold the bonds. Moreover, an issue of notes instead of bonds, or in replacement of bonds, or in redemption of bonds, would render the banks more liquid, and therefore more willing to contribute to the circulation of currency and to the expansion of a possibly unnecessarily restricted credit element of our monetary system.

From the point of view of redemption, bonds are just as much fiat money as an issue of notes replacing them, with the sole difference that the bond is a lien of the Government in the future, with the advantage all on the side of the holder of the bond, whereas the note, unless restricted as above suggested, is a lien of the Government in the present, with the advantage preferably on the side of the Government.

There are still further reasons why we advocate the issue of notes, currency, by the Government, to redeem, immediately, all its war bonds, with the added proviso of the application of the multiple tender or honest-dollar principle.

If we assume in round figures the amount of gold at present in the United States Treasury and deduct the amount that would be necessary as strict guarantee for currency in circulation, the Federal Reserve Board could, according to the Federal Reserve Act of 1913, issue $4,410,439,690 in Federal Reserve notes, without the slightest suspicion of inflation. Now, nobody spoke of inflation when C of section 11 of the Federal Reserve Act was passed as law.

Furthermore, by law, if new law were necessary, the gold backing of the gold certificates could be reduced to the same figure as the percent of gold backing declared legal for Federal Reserve notes. This would allow the Government to issue an extra $2,045,694,763 of additional Federal Reserve notes. The sum total of the extra possible issue, within the percent prescribed by the Federal Reserve Act, would thus become $6,456,134,453. So that the Government could issue such an extra amount of currency and be fully within the gold reserve percentage fixed by the Federal Reserve Act of 1913. The Government would thus be able to purchase this amount of its war bonds.

At present the Federal Reserve bank notes require a 5 percent reserve in gold and 100 percent backing in Government bonds. What should prevent the Government, on this same basis, from issuing Federal Reserve bank notes up to the amount of these bonds thus purchased? This would furnish the Government with an extra issue of $6,456,134,453 Federal Reserve bank notes which would have the same security as our national bank notes have at present. Nobody questions the national bank notes. Why should anyone question this suggested issue of Federal Reserve bank notes from the point of view of security backing.

With these two issues of currency, amounting to $12,912,268,906, the Government could cancel its war-time debt and thus save in the neighborhood of $400,000,000 interest per year, which it at present must give as payment upon a dead investment, the destruction of war-time materials. This money can be expended by the Government yearly to increase its gold supply, and with each addition to its gold supply the Government would be able, by application of C of section 11 of the Federal Reserve Act, through issue of currency legally backed, to wipe out its further bonded debt in living investments. The bonds which the Government thus purchases back from the people can be used as stabilizers of our currency situation.

The cry raised against such a procedure on the part of the Government would be Wall Street's "inflation refrain." If this be inflation, then the Federal Reserve Act passed by Congress in 1913 was inflaticnary, and yet it has never been thus described. No; such redemption of its bonds by the Government would not be inflation, but would be transference of investment in dead issues and dead business, such as war-time issues and investments were, to living investment in business operation.

The money that would thus be given the banks for the Government war bonds they hold, would be loaned out to the people for business operation and business investment, in order by these, to make up to themselves, the banks, the interest they would no longer obtain from the Government or the people's taxation. This would start circulation of currency and consequent increase of business. Moreover, if we take into consideration the ratios between currency and credit money, the amount of credit possible upon this governmental issue of currency would rise to, in the neighborhood of $54,000,000,000. Everybody, who is conversant with our financial situation, knows that the credit element of our monetary system was, through panicky fear of the banks, as well as of the people, so curtailed as to manacle the hands of industry.

We cannot conclude the suggestions contained in these proposals without pointing to the fact that the $400,000,000 interest a year paid the banks out of taxation, was $400,000,000 of purchasing power taken from the people and by so much decreased the possibility of business return. Moreover, as these war-time bonds become due, an enormous amount of further taxation will deprive the masses of the people of purchasing power and thus still further retard the return of business to normalcy and prosperity.

In ultimate analysis, each one of the plans suggested is but replacing one form of faith for another, Government bond for Government currency, one form of credit for another, future credit of Government bonds for present credit of Government currency. Will anyone hesitate in asserting that present credit is more valuable to us in this time of depression than future credit which we have years, as yet, to build up?

As final argument for the adoption of the above suggestion, let us consider the situation in the light of a simultaneous run on all the large banks of New York City, a thing which is not beyond the realm of possibility. It would be impossible for any one of these banks to pay off their depositors in our actual currency. They would be forced to seek both State and Federal aid. The State of New York might permit them a perpetual holiday, to the extreme disadvantage of business with untold suffering for the people. The Federal Government could aid them to the real advantage of business operations and to the relief of the suffering of the people, by transforming the Government bonds, which are, in reality, large denominational currency reserved for circulation among the banks and wealthy citizens into currency of smaller denominations, $5, $10, $20, $50, and $100 noninterest-bearing notes. In the final analysis, the Government will be obliged to take such action to save the banks of the entire Nation. Why wait till unnecessary suffering drives the Government to save its people?

Before concluding the dicussion of this section we wish to remind the reader again that the issue of Federal Reserve notes and Federal Reserve bank notes, to purchase United States bonds, is, in final analysis, replacement of large denominational currency, restricted by its size to circulation among the banks and rich holders of the same, by noninterest-bearing currency of smaller denominations, capable, therefore, of circulation for ordinary business operation. This will have to be done either by taxation or by Government act. which latter will lift a tremendous burden from the shoulders of the mass of the people.

"SEC. 11. The Federal Reserve Board shall be authorized and empowered: (c) To suspend for a period not exceeding thirty days, and from time to time to renew such suspension for periods not exceeding fifteen days and reserve requirement specified in this act: *Provided*, That it shall establish a graduated tax upon the amounts by which the reserve requirements of this act may be permitted to fall below the level hereinafter specified: *And provided further*, That when the gold reserve held against Federal Reserve notes falls below 40 percentum the Federal Reserve Board shall establish a graduated tax of not more than 1 percentum per annum upon such deficiency until the reserves fall to 32½ percentum, and when said reserve falls below 32½ percentum, a tax at the rate increasingly of not less than 1½ percentum per annum upon each 2½ percentum or fraction thereof that such reserve falls below 32½ percentum. The tax shall be paid by the Reserve bank, but the Reserve bank shall add an amount equal to said tax to the rates of interest and discount fixed by the Federal Reserve Board.

"(d) To supervise and regulate through the bureau under the charge of the Comptroller of the Currency the issue and retirement of Federal Reserve notes, and to prescribe rules and regulations under which such notes may be delivered by the Comptroller to the Federal Reserve agents applying therefor." (Federal Reserve Act.)

7. The Government must adopt some form of regulation of the stock exchange, as well as of the produce exchanges.

8. Passage by our legislative bodies of a higher inheritance tax, especially when there is question of legacies in the higher brackets, would be collecting Government revenue where greater service is rendered and where the burden can be more readily borne.

9. To prevent overbalance in investment it would seem advisable to reestablish the higher income-tax schedule, dropped too soon after the war.

10. Taxation should, on general principle, restrict itself to income, respecting as much as possible the reasonable demands of capital investment, whether this be in home, farm business, industry, or finance.

11. It might seem possible through greater cooperation between Federal and State executives to secure the welfare of the Nation as a whole much more promptly than has been the case in the past. Unpatriotic, political bias has frequenly disrupted some of the best moves intending both State and national welfare.

12. To protect American industry against foreign competition, favor such nations, as accept and carry out the newly adopted American system of dividend to labor out of profits, with free-trade policy, maintaining a tariff, competitively protective, with all other nations.

## THE WAY BEYOND—INDUSTRY

1. The Federal Reserve Board and the Federal Trade Board, as constituted for the emergency, shall continue to operate according to laws passed in accordance with the following principles.

2. The right of private ownership, being a derivative of the natural law, must be respected and maintained; and the right of individuals to accumulation are limited proportionately by the rights of others to the necessities of life.

3. Security of capital and labor in a nation will strengthen the security of government. An economic system that effects, builds up, and maintains capital producing power and performs the same service for labor's ultimate consuming buying power, by that very fact establishes the security of the government upon a sounder basis.

Furthermore, the security thus obtained is the real source of confidence for both producer and buyer. The consumer will buy for present consumption and will invest in purchases for future and long-time consumption, as for instance in a home and its comforts, when he has the assurance of an income, in form of labor and its remuneration, with which to meet his obligations, present and future. The producer will not hesitate in business when he knows there is an assured purchasing power prepared to confidently take the produced article off his hands. The banker or financier will find ready security for his loans to business enterprise in the stability of business activity, and worthy security for loans to consuming labor in assurance of steady employment and consequent income of the wage-earning or salaried consumer.

An economic system, therefore, that attains these ends, or even only tends to their realization, is worthy of trial. Make it a 4-year or an 8-year plan. Such experimentation could not possibly produce a worse situation economically and socially, than our past 100 years or 40 years, whichever view you choose, of experimentation have brought upon us with such cyclic frequency, and, moreover, has all reasonable evidence of procuring for us a betterment in social and economic conditions, and a greater opportunity for attainment of life's purposes.

4. The end and purpose of production is consumption, and the unbalance between these two produces the ups and downs in the business cycle with accompanying exaggerated expansion and consequent waste for capital, and with periodic need and suffering on the part of labor.

5. As progress and increase in production in general can come only from the profits of industry, so from this source also must come the necessary consumption in form of buying power; the advantage of buying power for consumption in the end implies increased demand and, therefore, advantage for producing capital.

6. According to statistics of the Bureau of the Census, whereas capital in manufacturing industries increased from 1879 to 1929 from $2,700,000,000 to a minimum of $86,900,000,000 or 3,035 percent, bulk wages increased in the same period from $900,000,000 to $11,200,000,000 or 1,109 percent, and individual wages from $251.11 to $1,318.07 or 375 percent, demonstrating that the tension between buying consuming power and producing power constantly increases, and that this unbalance is the cause of our cyclical drops with the waste, confusion, suffering, attendant upon readjustment.

7. (*a*) The dividend to capital and labor shall be declared after some such method as follows:

Total profit in the manufacturing industry at the close of a year is divided in two, in a ratio determined by the Trade Commission of disinterested economists and business men and labor representation. The one portion going to labor is divided by the number of wage earners and their dependents, the quotient being declared the labor dividend over and above wages. Each wage earner in all business, receives as many times the quotient as he has dependents, including himself. What remains in each concern goes to the profits of that concern. This method will slowly readjust capital investment without our present general disturbances.

(*b*) Wages in the various industries will be maintained as in the past, with the perhaps necessary fixation of a minimum in the different occupations, varying according to the success of business, but always sufficient in all occupations to provide the necessities of life.

(*c*) A maximum salary schedule, graded according to positions of officials in a business, will be determined, based upon remuneration to individuals, according to responsibility, in the National Government. No man in the Nation fills a more important position than the President of our Nation.

Sections (*b*) and (*c*) of paragraph 7 are intended to prevent padding and multiplications of salaries and cutting of wages, from absorbing profits before dividend is declared to capital and labor.

Dividend is declared to labor according to the number of dependents, for the wage earner with children is taking care of the man power of the industry of the future, an essential factor in the determination of America's place among the nations of the future, among whome economics will assume a more important role even than it has occupied in the past. There are those who speak of possible economic war, which seems to be in the offing, and in such war man power will decide as it has decided in other warfare. The capitalist receives wages for the future maintenance of capital. The laboring man should receive means of support for the future laborers he is rearing, for the consumers of future production which he is fathering.

The employment ratio of men with dependents as to men without dependents could be decided by the Trade Commission along flexible lines.

8. Speed of production should be adjusted so as to make the laborer a wage earner and a buyer from the age of 20 to 60.

Machinery should primarily be intended to relieve expenditure of unnecessary human effort, and may not rationally be used to the disadvantage of human well-being, through exhaustion of quality or of fundamental stamina of human labor. Moreover, viewed in the light of 3 or 4 decades, a lower speed of machinery will insure a longer duration of labor ability and consequently increase the number of buying laboring men, with accompanying advantages to maintenance and increase of demand for the producer's article. The machine rationally should be suited to the man and not vice versa.

| | Each 10 years A | Each 10 years B | Each 10 years C | Each 10 years D |
|---|---|---|---|---|
| Speed of machinery | 100 | 90 | 80 | 70. |
| Buying laborers | 10 million | 20 million | 30 million | 40 million. |
| Profit per 10,000,000 | 100 percent | 90 percent | 80 percent | 70 percent. |
| Total profits | do | 180 percent | 240 percent | 280 percent. |

In the above schedule with speed of 100, our present sweat shop or track system, the Nation's labor and buying power are consumed and must constantly be replaced every 10 years with decrease, by 10,000,000, in buying laborers and increase of social burdens. According to speed 70 there is multiplication of buying laborers with decreased supply of articles and consequent better profit, better opportunity for labor, and lessening of social burdens. In The Way Out we have explained how 70 speed could mean 6 hours per day with 2 or 3 men running the machine.

### FINANCIAL INSTITUTIONS

Our banking system should be unified into a national institution and credit expansion should be put under control of the Federal Reserve Board, acting in the interest of balance between consumption and producing power, with advice from the Trade Commission.

However, by unification of control we do not imply unification of ownership. We wish to have it distinctly understood that we are in favor of as wide a field as possible for individual incentive and individual private investment and ownership.

The banking system of a country is not an end in itself, but finds its real purpose for existence in serving the requirements of cooperative endeavor on the part of capital and labor to turn a nation's natural resources into national wealth, individually owned and used.

A disturbance in the go-between institution, our banking system, necessarily entails failure and hardship for both capital and labor.

Advance in civilization, together with its advantages to the individual, always implies, in organization, sacrifice of something that, when rationally viewed, is less than the benefit obtained. Regulation or supervision and unification of our banking system, privately owned, insures the whole system, and, consequently, its individual members against the ignorant, mistaken management of members unworthy of the people's trust or incapable of administering to the financial needs of the Nation.

1. Regulation of credit given by financial institutions must be adopted upon a basis of capitalization, deposits, and resources, and only up to a fixed amount right to expansion of credit must be purchased from the Federal Reserve directly by a graded scale of taxation which is arranged for by the Federal Reserve Board according to requirements for real business expansion, with advice from the Trade Commission, which would be in possession of facts concerning the real needs of further actual investment. This requirement would serve to act as restraint upon too hasty expansion and too rapid inflation. Contrariwise, to prevent unnecessary or manipulated deflation, a graduated scale of taxation would be imposed upon unemployed money beyond a determined amount above the reserve required for safety.

2. Banks could not foreclose on banks without previous examination by and consent of the Federal Reserve, which would be in best position to judge upon advisability and opportuneness of such foreclosure.

3. Loans given should be supervised at regular intervals by the bank making the loan, to insure safe management of the depositor's money, and action should be taken by the bank when necessary for this purpose. A reasonable margin should be allowed between the amount of the loan and the appraisal of the mortgaged property or the par value of collateral to prevent losses to the bank, by variations in valuations.

4. In cases of disputed loans those members of the Board favoring the loan should become signatories to the loan and be held personally financially responsible.

5. Classification of financial institutions of all kinds should be adopted with laws differentiating the kinds of operations legal for each.

6. Guaranty of the honesty of officials of financial institutions can be secured through regular supervision and through the penal code. This is better than guaranty of bank deposits of the people out of the people's taxes, which method would, perhaps, lead to loose banking and real sport for speculators. The bankers would take the chances in the gambling dens of the markets, and the Government would shoulder the responsibility and pay the price out of the people's taxes.

7. The stock exchanges, for their operations would be obliged to submit to certain specified legal forms, exclusive of "shorts" and "gambling" on margin, upon penalty of invalidation of the transaction and imposition of fine, equal to the amount of the transaction, or imprisonment. Business stability is more valuable to a nation than satisfaction of a gambling and get-rich-quick inclination of some few individuals. Laws here should be positive and not negative.

8. Adoption of the multiple tender principle will correct the deficiency of all modern money as a standard of deferred payment. Lists of wholesale prices are regularly furnished by Dun's index number or Bradstreet's index number, or could be supplied every three or six months by the Government to determine the ratio that should multiply debt and interest thereon to be paid, to insure just buying power exchange, and obviate the evident injustice of our present method of payment of time loans and debts, and interest thereon. This would be just as feasible as our constantly changing rate of exchange.

9. This principle of multiple tender should be applied to the international debt.

10. All suggestions included in the plan of the Way Out and not here mentioned should be maintained as permanent features of Government control of our financial institutions.

### AGRICULTURE

We recommend adoption of the measures suggested in the Way Out for permanent establishment of the farmer's security.

### GOVERNMENT

1. Strict economy and adherence to budget as closely as possible is naturally the first recommendation.

2. Efficiency and fitness, and not the spoils system, should be guides in appointment to Government positions.

3. It is but an expression of the real purpose of Government to state that national and not party or group interests should be the primal purpose of all legislation and administration.

4. Taxation should be collected from profits and not from consumption directly. Profits as divided above, taxed will furnish deserved support for government from both capital's and labor's dividend.

5. We recommend, lastly, carrying over from The Way Out, all governmental measures that were efficacious in bringing the Nation out of the depression.

In time of war, the Government is expected to adopt measures that will win for its people as quickly as possible, to hasten return to peaceful normalcy. At present the Nation is suffering from a calamity that has caused and still is causing more suffering and want than the World War brought the Nation. It was and is the duty of the Government to adopt measures that will return us speedily to normalcy, if it wishes to keep the confidence of the people in the sincerity of its intentions towards them. In the name of common humanity, if patriotism is not sufficient in its appeal, stop the suffering and want of our people. If the task is beyond the representatives of government, it is a mark of noble, self-forgetting wisdom to call in broadly trained specialists who have an answer. The Chief Justice of the United States Supreme Court calls in a medical specialist in case of sickness. The Mayo Brothers consult lawyers in case of legal action. America is suffering from a complete collapse of its economic system, a system that has produced a series of depressions and finally the curse of the present utter collapse. Does not reason dictate the necessity of the service of economists and sociologists, who are not slaves of the tyranny of economic theory that has demonstrated its own fallacy by costly experimentation of decades, and whose error can be proved by philosophic analysis? United States Government will you fail your people?

---

## Charting a Course Out of the Financial Hurricane

(By Warren M. Persons, of New York)

Since the spring of 1931 industry and finance in the United States have been battered and tossed about by a financial hurricane of a violence never before experienced in the history of this country. Our industrial and financial machinery has been disabled or put out of commission. The ship and its machinery have been seriously damaged; grievous injuries and fear have demoralized the crew and officers; and the safety of the ship has been imperiled because each has sought his own financial safety. Even the pilots have been confused. They have been counselled to steer this way or that and even to disregard their compasses and sextants and blindly steer in a direction dictated by the feelings of the numerous volunteer advisors. Meanwhile, the injured have had to be cared for and the immediate emergency met.

The problem has been to care for the disabled, to repair the ship and machinery in order that it might function normally and to decide upon a course that will carry us permanently out of the paths of such hurricanes.

During the past 2 years we in the United States have been primarily absorbed in meeting an emergency resulting from an unprecedented financial hurricane. We have adopted measures like unemployment relief, the Reconstruction Finance Corporation, public works and bank holidays to relieve suffering, stop the panic and avoid a mutiny. But, meanwhile, other measures have been proposed or adopted to get our monetary and financial machinery in working order so that industrial activity would proceed in normal fashion with men working at their former jobs. Still other measures have been proposed that we, forthwith, not only abandon our existing economic organization of pilots, officers, and crew, but also alter our method of navigation and steer in the direction of a new economic polar star.

The various measures which have been adopted or proposed, however, have not been measures purely to meet the emergency, or to crank the industrial and credit machine, or to abandon our previous economic system and steer toward a new economic goal. The measures and proposals have had a mixture of these elements. It is time to stop and ascertain the import of the measures we have adopted or proposals we are considering. The most urgent problem today is to define and decide upon our objective, analyze proposals in the light of that objective, and adapt our policies and legislation to that objective. Otherwise, more confusion, or even economic chaos, may result. If we desire to repair our economic system, let us do it intelligently and with knowledge of what we are doing. If we decide to abandon the system, let us do that intelligently and knowingly rather than ignorantly and inadvertently. In other words, our problem is to ascertain the acute or chronic defects in our economic and financial machinery, to decide whether we want to repair or abandon that machinery and then, having defined our objective, to proceed in accordance with our decision.

### THE UNPRECEDENTED COLLAPSE OF 1931–1932

The decline in the physical volume of industrial production and trade in the United States (including manufacturing, wholesale and retail trade, railroad freight traffic, building construction, mining, quarrying and petroleum output, and electric power production) between June 1929 and January 1931 was precisely one third. This decline is of a magnitude corresponding to that of the most severe major economic crises of the past. The decline in the volume of industrial production and trade was paralleled by correspondingly drastic declines in employment, commodity prices, security prices, and other indexes of business and finance. In other words, between the summer of 1929 and the winter of 1930–31 business in the United States experienced the devastating effects of a major economic crisis.

But the drastic contraction of 1929–30 represented less than half of the evil effects that industry and trade in the United States were destined to experience. Between January 1931 and July 1932 the physical volume of industrial production and trade suffered an additional contraction of precisely one third. In brief, during the three years from July 1929 to July 1932, inclusive, industry experienced a major economic collapse followed by a second major collapse.

If the figures just quoted were the only ones we had before us we would know that industrial contraction of such magnitude would be accompanied, in our present economic system, by cataclysmic declines in profits, employment, wage payments, commodity and security prices, and bank credit and increase in the burden of private and public debt, in commercial and financial failures, in political and economic unrest, and in intense dissatisfaction with an economic order which can permit widespread poverty and want in the midst of abundant natural and human resources. Furthermore, we would expect to find great irregularities, as compared with the previous period of prosperity, in our structure of prices of raw materials, partly manufactured goods, and consumers' goods, of prices of various types of securities of various industries, of wages, and of rates for services of all kinds. In fact, we have experienced a double dose of these economic phenomena of major depressions. To present the detailed data here would be to dwell needlessly upon unpleasant facts with which everyone is familiar.

### OUTSTANDING FEATURES OF THE COLLAPSE OF 1931–JULY 1932

But there have been other features of the developments of the past 3 years, the analysis of which, I believe, will serve two purposes, that is, first, to give use the reasons why we have suffered two consecutive major depressions and, second, to indicate the main defects in our economic system which must be remedied if we are to avoid similar depressions in the years to come. When we review the developments of 1931–1932 we find certain features that are peculiar, either in kind or degree, to the current depression. These unique features are:

First, the financial panic of June-October 1931, when it became clearly evident that Germany would not be able to meet her reparations payments and that other foreign debtors would not be able to meet the service on long-term loans or liquidate the short-term credits extended to them by banks and investors of this country. This was accompanied by an unprecedented increase in the hoarding of currency, requiring an expansion of over a billion dollars of Federal Reserve notes outstanding during a period of contracting needs for a medium of exchange for business transactions. The hoarding of currency was both an effect and a cause of the unprecedented volume of bank failures in 1931. In that year the deposits of suspending banks amounted to over 3 percent of total deposits of all banks in the United States.

Second, the financial panic of May-June 1932, accompanying the discussions of the difficulties of balancing the Federal Budget, proposals that the United States issue irredeemable currency, and withdrawals of gold from the country by foreign central banks and other depositors. Domestic hoarding again began to increase.

The financial panic of the summer and autumn of 1931 was characterized, in international markets, by panicky withdrawals of gold, at first centering on Germany and England, and later, on the United States. In the month of October the gold stock of this country dropped nearly 450 million dollars. Meanwhile numerous domestic bank failures, totaling 1,611 for the second half of 1931 and 2,298 for the year, were naturally accompanied by greatly increased hoarding of currency. During the period of greatest stress Federal Reserve bank credit was increased nearly a billion and a half dollars. It was only through such an expansion that utter collapse of finance was averted.

The panic of May-June 1932 was characterized by a decline in the gold stock of this country by about 450 million dollars. During an interval of 25 weeks preceding and following the critical period of May-June 1932 the Federal Reserve banks purchased $1,110,000,000 of United States Government securities to finance the export and earmarking of $450,000,000 gold, the reduction of nearly $400,000,000 in member bank indebtedness, an expansion of nearly $100,000,000 in currency, and to enable member banks to pile up nearly $250,000,000 in excess reserves. Foreign bank and other short-time credits in this country have now been reduced to a point where further large withdrawals need not be feared.

I have dwelt on the financial features, just described, of the history of the 3 years ending in July 1932 because I believe that they point to the principal defects of our economic system which must be remedied if we are to avoid or greatly diminish the fluctuations such as we have experienced. Foreign withdrawals of gold from this country and domestic hoarding of currency have resulted in part from, first, large foreign bank balances in this country; second, the freezing of our short-term credits abroad; and third, domestic bank failures. But an additional powerful incentive for both foreign withdrawals and domestic hoarding has been the continuous decline in the general level of commodity prices and the collapse of security prices. The increasing purchasing power of the dollar, or in other words, the appreciation of the gold dollar, has made hoarding a profitable operation. Hoarding means, to the extent to which it occurs, the abandonment of the credit system.

In the face of the facts I have presented and the history of the year and a half ending June 1932, I cannot avoid the conclusion that the most serious and urgent problem, the paramount problem, we now face is, first, to stabilize our monetary unit in terms of general commodity prices and, second, to make bank deposits so safe that depositors will not consider withdrawals except in the usual course of business. Only by accomplishing these results can we remove the incentives to hoarding, avoid the disruption of our credit system, and remove the deadening effects on debtors, creditors, employers, and labor of drastically declining price levels. Only in this way can we make industrial and credit expansion and reemployment of men and equipment safe for private initiative.

### THE BREAKDOWN OF OUR ECONOMIC SYSTEM—TEMPORARY OR PERMANENT?

The liquidation, by the middle of June 1932, of practically all foreign short-term balances in the United States (not necessary for current business) marked the end, for the time being, of the flight from the dollar. After this liquidation a 12 percent increase in the physical volume of business ensued in August-September. But bank failures increased again in December 1932 and January 1933. Runs on banks were resumed, the hoarding of currency increased; it became evident that the Federal Budget was badly out of balance; gold was withdrawn from banks and hoarded; balances were transferred from the United States to other gold-standard countries by domestic as well as foreign holders, and it became necessary to declare a national bank holiday and place an embargo upon gold exports. Meanwhile, between December 1932 and March 1933, the physical volume of industrial production and trade fell 11 percent to a new low level, slightly below that of July 1932.

The serious character of the current situation is briefly and accurately indicated by the following facts:

1. The physical volume of industrial production and trade is only 43 percent of that in June 1929 and only 48 percent of the figure that represents our annual production capacity at the present time.
2. The number of unemployed is at the peak, estimated at 12 or 13 millions.
3. The national income accrued in 1932 was less than $40,000,000,000, or only 73 percent of that of 1931 and 45 percent of that in 1929.
4. The total interest-bearing debt of the people of the United States in 1933 has declined only 13 percent from that of 1929, whereas the burden of the principal of the debt (now $142,000,000,000, as compared with 163 billions in 1929) in dollars of current purchasing power has increased 37 percent as compared with 1929. The relative burden is even heavier now than these figures indicate because of the decline of income and earnings. Further, the burden of the interest payments has also increased. An interest rate of 6 percent is equivalent now, at current wholesale prices, to a rate of about 9½ percent as compared with 6 percent in 1929. For an equivalent purchasing power a rate of 6 percent in 1929 should be reduced to less than 4 percent in 1933 on loans made in 1929.
5. Expenditures of Federal, State, and local governments in 1932 amounted to $15,000,000,000, or about 40 percent of the total national income. This means that only 60 percent of the National income is available for other purposes than the payment of taxes.

It also means that a person who has mortgages upon his property amounting to 60 percent of its 1929 value, at present has no equity after paying taxes. Taxes constitute a prior lien so that the property of the average debtor mortgaged in 1926–1929, would be expropriated through the enforcement of the rigid or increasing claims of creditors and the Government. Widespread tax defaults and the shift of the ownership of property to creditors and the purchasers of tax deeds would be the necessary consequence of enforcement of the claims of creditors and the Government. The debtors are not only farmers and other individuals with mortgaged property, but business men with fixed leases as well as mortgages, and corporations, partnerships, employers and dealers of all kinds with outstanding bonds, leases, and other fixed obligations. Can business men and employers be blamed for not wishing to expand production and increase their fixed obligations when the purchasing power of the monetary unit is continually increasing and, likewise, the burden of fixed debts? Can bankers be blamed for hesitating to lend for business purposes when their security is being impaired by declining commodity prices? Can hoarders be blamed for withdrawing currency or gold from banks when the solvency of banks is in question and the Federal Budget is unbalanced?

6. The situation just described means a substantial breakdown of the credit system on which industrial and business activity are dependent. In this age of credit, distrust has replaced confidence. Confidence by lenders in the ability of debtors to meet their fixed obligations will not reappear until the solvency of debtors returns.

The future solvency of debtors with fixed obligations will be in doubt until prices stop falling, that is to say, until the purchasing power of the dollar ceases to rise.

Leading merits of our economic system of private property and individual rewards for individual incentive for industrial activity were supposed to be (*a*) efficiency in the production of goods (*b*) jobs for all able workers who desire to work, and (*c*) a wage enabling them to maintain a "decent standard of living" without doles or charity. At present, factories and workmen are idle and the unemployed are receiving, not wages, but "relief." Our economic system has broken down. Can it be rehabilitated? Can future breakdowns be avoided?

### THE SOCIAL OBJECTIVE—INDIVIDUAL LIBERTY AND ITS FRUITS

As a basin for judging measures to rehabilitate our economic system we must begin by defining the social objective. This is paramount if we are to avoid utter confusion in our thinking.

What is the most valuable thing that past civilizations have achieved and what is the secret of that achievement? Nations that live in history—Egypt, Greece, Rome—are remembered, not for their wealth, but for their contributions to art, music, science, government. These achievements were made possible because these nations gave a degree of individual liberty sufficient to enable their citizens to develop the talents that were in them. The greatest resource of these nations, or any nation, is the mental capacity of its people. These capacities are suffocated by curtailment of the liberty of thought; they develop and bear fruit in freedom. The theory on which our Nation was founded is that individual freedom in body and thought is the most important guaranty of government. I hold that the preservation of individual control of one's body by one's self, liberty to develop one's talents, freedom of thought (and all that these mean in happiness to individuals and the advancement of what we call civilization) constitute the most important objective of our Government.

The nations of the past grew strong and wealthy. The economic organizations grew complicated. Egypt, Greece, Rome, declined and fell. Though they contributed to the solution of problems in science, art, government, they contributed little to the solution of the problem which now confronts the nations of the world—that presented by a complex economic organization.

### INDIVIDUAL LIBERTY RESTS ON INDIVIDUAL ECONOMIC INDEPENDENCE

A nation of paupers or of dole receivers is not a free nation. A legal code alone cannot give liberty. Individual freedom is dependent upon individual economic sufficiency and security. A debtor may be a slave of his creditors. Today in the midst of abundance natural resources, with available skilled and intelligent workers, 13,000,000 of our workers and their families have lost their independence because they are no longer able to support themselves. We are wasting our factories, equipment, machinery, and appliances. We are not fully utilizing our vast natural resources. But more serious than this, we are wasting the most valuable resource which the Nation possesses—the esprit, the economic morale, the self-respect of its citizens who know how to work, want to work, and cannot find work.

Russia, Italy, and Germany are all attempting to solve the difficult problem of constructing a stable economic structure in a complicated economic society. The Soviets of Russia, the Fascists in Italy, and the Nazis in Germany have all approached this problem by first curtailing individual liberty. Stalin, Mussolini, and Hitler are tyrants. Is tyranny the only way out? In order to be individually secure in getting a living must we surrender our freedom of thought and action? Cannot intellectual and religious freedom, on the one hand, and individual economic security, on the other, coexist? This is the problem which the nations of the world face today.

As I see it the chains which bind us today are not those called "natural economic law," but man-made rules of the economic game. We have ourselves forged the economic chains which bind us and we can, by intelligently altering our laws, break our fetters.

EFFICIENCY: THE ACID TEST FOR THE PRODUCTION OF ECONOMIC GOODS AND SERVICES

The end of production is consumption. Man produces goods in order to consume them. The smaller the effort required to produce goods and services, the lower the cost, the more efficient is production. This is what "economy" means. Efficient production and distribution mean that consumers' wants are well satisfied at low cost. Economy in production means the maximum satisfaction of human wants with the least expenditure of human energy. To obtain the maximum consumers' surplus of satisfactions with the least effort expended on the part of the producer is the economic objective. The acid test of any system of production—whether it be under sovietism, under fascism, under municipal or government ownership and operation, or under private ownership and operation—is this: Is the given system more efficient in producing goods and services that consumers desire, does it contribute to a larger consumers' surplus of satisfactions than other methods of production? Systems of production are rated in accordance to their efficiency.

Cooperative production has been demonstrated to be efficient production. Two men working together have found that they can produce more than double the amount produced by one of them working alone. Division of labor is efficient. Also, men have found that aided by tools, machinery, and power they can produce still more efficiently.

But just as soon as two workers join in production the problem of the equitable division of the output appears. Just so soon is a contract, expressed or implied, necessary for the division of the product of their joint labor. Men have also found by experience that the efficient worker must be rewarded for his efficiency if he is to remain efficient. Likewise, just as soon as men working together also work with machines and appliances, part of the reward must go to those workers who have furnished the machines and appliances. Our legal structure is largely made up of rules for the division of the economic product of a system of production that has grown from simplicity to vast proportions and complications. After keeping the peace and securing property against violence and fraud, the enforcement of good faith in matters of bargains and promise is most essential for the conduct of business. In the economic situation in which we find ourselves today, however, the enforcement of the letter of the contract (expressed in fixed amounts of a changing unit of value) works, not justice, but injustice.

THE LEGAL FRAMEWORK WITHIN WHICH BUSINESS IS CONDUCTED UNDER THE SYSTEM OF INDIVIDUAL FREEDOM, PRIVATE OWNERSHIP, AND INDIVIDUAL REWARDS

During the centuries of evolution of our current economic system from primitive times through the beginnings of the factory system, the utilization of steam and electric power, and the growth of giant manufacturing plants and nationwide transportation systems, it has been necessary to alter the legal structure under which business is conducted to correspond to changes in the methods of production. In the time of Adam Smith, business units were small, owned by one man, and the owner was also the manager. When the factory system came into being the corporation was devised to enable the organizers of a business to command the large amount of capital necessary for efficient production.

Management thus became separated from ownership. As industrial units continued to grow one corporation was empowered to own shares of another corporation. The holding company developed.

If we examine the legal framework which has been set up and altered from time to time for the conduct of industry, we will find certain features that, in importance, outrank all others. The legal framework of the economic system under which business is being conducted today has the following dominant features:

1. Individual freedom; to gain a living in accordance with the rules of the game and in the way that one's aptitudes make possible.
2. Private property; all economic goods are owned by someone; titles and claims of various sorts are defined by law.
3. Contract; contracts, expressed or implied, are concurrent with production, the transfer of title by purchase and sale, and business transactions of all kinds.
4. Corporations and corporate securities; these make possible the aggregation of capital necessary for large-scale production; corporate securities, stocks and bonds, are merely the legal titles to ownership.
5. Money and bank credit; these have been set up to facilitate the production and exchange of economic goods. Such goods are exchanged on the basis of relative values.

I cannot escape the conclusion that the primary cause of the world-wide collapse of industry, which we are now witnessing, is to be found in the legal provisions governing monetary units and bank credit.

The exchange of economic goods is an exchange of values. A unit of value, therefore, is necessary. The most important unit in any country is the legal unit which has been adopted as the unit of value in which all contracts are expressed. The unit adopted by the United States and other large commercial countries of the world is a fixed weight of gold—not a fixed unit of value. The dollar is an unchanging weight of a definite substance—gold. We use a weight of gold to measure value. This is like using a unit of weight to measure length. Length and weight do not belong to the same category, neither do a fixed weight of gold and exchange value.

Starting with an illogical "unit of value," we have constructed on this unit a credit system, and we must not forget that a credit system is also a debt system. Under this system bank checks constitute the medium of payment for 90 percent of business transactions.

By law we have empowered banks to expand or contract credit. Bankers are in business for profit. The expansion and contraction, therefore, of bank deposits, the chief means for carrying on industrial production and exchange, are ruled not only by the needs of business but also by the incentive of profit to the banker. Vaguely seeing this, we have set up the Federal Reserve System, the conduct of which is supposed to be dominated, not by the profits which may accrue to member banks or to the Federal Reserve System itself, but by the needs of agriculture, manufacturing, trade, and business in general.

As a result of the establishment of (*a*) a fixed weight of gold as a unit of value and of a (*b*) credit system in which the expansion and contraction of bank credit are induced by private gain, we have also established the basis for widely fluctuating general levels of prices. The primary causes of these fluctuations is on the side of money and credit and debts rather than upon the side of commodities and labor.

### OUR MONETARY AND CREDIT MECHANISM HAS RESULTED IN A SUBSTITUTION OF FORTUITOUS GAINS AND LOSSES FOR ECONOMIC REWARD

In setting up the legal rules for economic activities we have carefully safeguarded individual freedom, private property, contract, corporations and corporate securities in order to secure efficient production and distribution, by rewarding individual efficiency. After having carefully done this we have instituted a money, credit, and debt system which has substituted fortuitous gains and losses for rewards for efficient production.

Let us take a simple illustration: Two brothers, one 60 years old, one 30 years old, owned in 1929, adjoining farms in Iowa of 300 acres each. The first, being ready to retire, sells his farm to his brother, takes a mortgage on the entire 600 acres at 50 percent of the total value, and retires, holding the mortgage. In 1933 the younger brother finds that his equity is zero and the older brother owns both farms. It was through no foresight of either brother that the first became creditor and the second debtor; the first brother now owns both farms because he happened to cease producing and retires; the second brother has lost all because he continued in the production of goods. The collapse of the price level since 1929 has changed the business contract made by two brothers into a gambling contract. Neither foresight nor economic efficiency have been rewarded.

It is not the quest for profits which has brought about the present cataclysm, but rather the profit motive operating in a defective monetary and credit system.

The features of our legal framework which have undone us are: (*a*) A monetary unit which is a fixed weight, but a fluctuating unit of value and (*b*) a credit system which emphasizes and exaggerates the defects of the monetary unit.

### UNTENABLE THEORIES OF THE COLLAPSE OF 1931–33

1. The theory of overproduction. The theory that there has been general overproduction in the United States or in the world is denied by the facts. I will not attempt to summarize the evidence at this point, but submit the facts in the shape of numerous charts and tables covering the volume of production of agriculture and industrial production and trade in the United States since 1899. From these charts it will be seen that there was no unusual increase in production following the war; rather the annual percentage rate of increase in production has been decreasing. The figures presented are inclusive. Thus the index of the volume of manufacture is based upon the study which I began some 13 years ago in which comprehensive figures of the products of the various groups of manufacture covered by the United States Census were combined for census years. The comprehensive figures for these years were joined together by using the available annual data for intervening years. A complete description of the method of constructing these indexes and of sources are given in the table attached to this memorandum.

2. The theory of the maladjustment in the production of various commodities. That overproduction of some commodities relative to others causes minor disturbances and makes adjustments necessary is true—but that such irregularities can or have caused a decline in the physical volume of production of the magnitude witnessed since 1929 is untenable and cannot be demonstrated.

3. The theory of underconsumption. This theory usually ascribes economic crises and depression to deficiencies in the purchase of commodities resulting from the maldistribution of the income from industry. I may say that if there be such a failure to buy, the failure is caused primarily by the changing general price level.

4. The theory of the maladjustment of prices. The prices of individual commodities register simultaneously the conditions of supply and demand for that commodity and the value of the monetary unit. Drastic price changes covering many commodities result not from conditions in individual commodity markets but from changes in the unit of value.

5. The theory that our difficulties have resulted from the mistakes and dishonesty of individuals. It is only as the mistakes and dishonesty of individuals have resulted in the extreme expansion and contraction of credit, which our present system tolerates, that these are of importance in discussing the present collapse.

6. The theory that our difficulties have all originated from the war. The war resulted in inflation, through bond issues, in the United States, in fast money inflation in other countries and in the creation of a tremendous international governmental and private debt. The difficulties thus created are the difficulties of fluctuating units of value and of international payments in gold; of thus first on one country, then another; and of loss of confidence in the stability of monetary systems. The troubles at present are primarily of monetary and banking nature.

### A PROGRAM FOR THE REHABILITATION OF OUR ECONOMIC SYSTEM

1. Continue the embargo on gold and the suspension of gold redemption in the United States.

2. Remove the restrictions on foreign exchange in so far as they do not involve the export of gold. Discontinue the efforts to keep the gold dollar at par with other currencies.

3. Announce now that it is the intention of the United States Government to adopt measures which will restore the general price level to, say, 90 percent of the level of 1926.
4. Also announce that the gold content of the dollar will later be changed to maintain that level.
5. Abandon a fixed weight of gold as the monetary unit and substitute therefor some form of the tabular standard.
6. Appoint a stabilization board for carrying out this objective.
7. Announce that measures will be immediately adopted to secure the reemployment of idle men at their old jobs; and to this end
8. Adopt the plan suggested by Fred I. Kent for restoring confidence and initiating industrial and credit expansion.
9. Tax the holders of bonds carrying the clause "payable in gold dollars of the present weight and fineness", who elect to demand payment in gold, an amount equal to 100 percent of the gains resulting from such payment as compared to payment in currency. Distribute the proceeds of such tax among the payors of the bonds.
10. Do not wait for the International Economic Conference before taking the steps above enumerated. Let the United States take immediate independent action.

---

## Statement of Arthur C. Peters, of New York

The Gordian knot of the world is the gold dollar and we must cut it! Few now dispute this fact, though many differ as to method. Even the President has made belated public admission that a frontal attack on the gold problem is a first essential to recovery.

The simple facts necessary to understand the situation are these:

On a pin point of gold we have during the last century pyramided a colossal credit structure so vast in scope that a "technical corner" has been created which affects the entire world. In other words, contract promises to pay gold are a thousand fold greater than the gold supply. It doesn't require a mathematical genius to discover that some will be unable to keep their promises. Our own Government debt is almost twice the world's twelve billion dollar gold supply, and our bank deposits are about forty-six billions of dollars, to mention only a few of the fantistic figures made possible by piled up promises or credits.

### AT MERCY OF GOLD

Things equal to the same thing are equal to each other. Through the convertibility of dollars into gold on demand at a rate arbitrarily fixed in civil war days at 23.22 grains per dollar—this is the essence of the gold standard as applied in America—we have made potential quick gold claims of every stock, bond, acceptance, promissory note, bank deposit, and other credit instruments in existence, not to mention foreign exchange, commodity contracts, real estate, and other products having established markets. Therefore, our entire price structure is threatened every time gold goes out of circulation in large quantities either through export or hoarding. Men who control a small gold supply thus control a gigantic credit and price structure. We are at their mercy.

Our medium of exchange has become a medium of extortion. The evidence is all around us that anyone who has a debt in dollars may find himself at any time in a position where the price of his collateral, be it wheat, corn, silver, farm lands, city real estate, or securities, has shrunk so severely in dollar or gold prices as to make payment of the debt impossible. The injustice of the situation is obvious.

The beneficiaries are those comparatively few people who are completely out of debt and have a surplus of dollars. The injured are the other 99 percent of the public.

### DEBTS MUST BE LIFTED

Common sense dictates that the debt burden be lifted promptly, and this can be accomplished only by bankruptcy and redistribution of wealth through this dire process or by a rise in the price level which will permit debts to be discharged with the same quantity of goods and services as when they were contracted. No farmer should be asked to pay a loan which involved 10 bushels of wheat when it was contracted with 100 bushels of wheat at today's prices.

Yet most proffered panaceas, such as abandonment of the gold standard in the form of "managed currency", etc., are demonstrably unwise, unless we wish to destroy the capitalist system itself. This Americans are decidedly not ready to do. The defects of bimetallism have also been well aired. But perhaps it might be useful to ask those who favor a fixed rate of exchange between gold and silver (at 16 to 1 or any other ratio) how they can be sure this procedure "will open up the markets of the Orient", as they now affirm, and "permit large sales of surplus agricultural products in those vast countries."

Without dwelling on the fact that a rise in silver means a fall in local Chinese prices, just as a rise in gold has broken our price levels, let us suppose a Chinaman decides that since his silver suddenly has acquired buying power in the American market he will use the silver not to buy corn, wheat, and other surplus products, but gold itself, that scarcest of all commodities! Remember our western farmers have corn and wheat, not silver nor gold. What happens to wheat and to our gold supply?

### EXPANSION OF CREDIT FLAYED

Those who urge inflation, and mean by that much abused word the forced expansion of credit money, are asking a drunken man to sober up by having another drink!

No man can borrow himself out of debt. Not even the United States Government can do that. Relief measures applied today are all measures which increase the Government's debt. Ultimately that means the individual's debt, for the Government is not a profit-making institution and the debts must finally be paid by taxpayers. A man may shift his debt burden from his friend next door to his banker, or from his banker to the Reconstruction Finance Corporation, but the debt still has to be paid in goods, services, or gold belonging to the taxpayer.

A cut in the gold content of the dollar is one certain way to increase the amount of money in circulation without creating inflation of an uncontrollable nature. No radical changes in our institutions or systems are necessary to apply these measures quickly. And relief is needed at once. No economist or financier has denied that the sudden discovery of new billions of gold deposits would substantially raise the world's gold price level. Nor have economists yet denied that reducing the gold content of the dollar would accomplish the same purpose.

The main objections offered, aside from the ridiculous charge of "repudiation", have been, first, that "if we cut it once we shall have to do so again", and second, that "it would be dangerous to have the public learn that price levels can be manipulated upward in this manner".

The experience of France indicates that a cut in the gold value of the currency need not be inimical to the public welfare.

### DEBTOR-CREDITOR ADJUSTMENT

Meanwhile, until a voluntary and fair adjustment of the debtor-creditor problem is made, we, as individuals, helplessly tied by the unbreakable thread of gold contracts, must stand by and watch failure after failure, cheat our fellow human beings of their possessions, as the spiral of bankruptcy widens and the deflationary process continues. For, it must be remembered, deflation cheats the debtor far more than inflation cheats the creditor. Restoration of prices to 1929 levels, where most debts were created, would not, in any case, cheat the creditors of 1933.

Two years ago these sentences were typed:

"It is now obvious that it isn't possible, without untold misery, to deflate prices near enough to the present gold base to restore confidence. Yet some people still urge 'Let's deflate further and clean up the situation.'

"True, the country will still have its mines, its farms, its factories when such a vicious deflationary process is completed and persons then living may regain the trade road which leads to prosperity. But—and this is a big but—the same people will not own these farms, mines, factories, and railways!

They will have passed into the hands of a limited few by forced sale, foreclosure, and bankruptcy, or perhaps into the hands of the Government itself through inability to pay taxes. We shall witness a succession of bank failures and this will happen because of the contraction of credit as the demand for gold increases. As gold goes up in price everything else goes down—except debt! That is fixed by contract! The contract is not only unfair but impossible of fulfillment without the sacrifice of all other values.

#### WORTHY PERSONS SUFFER

"The worst part of the situation is that many worthy persons who did not speculate or gamble, who did not borrow other people's money, and who produced and saved something for their hour of need are caught in the same whirlpool. They lose their savings, their properties, and their jobs. It is they who have a right to protest against a continuance of this vicious deadlock of the gold barons."

Is there a just reason for not declaring a temporary moratorium on gold payments while the corner is broken and a reasonable readjustment of the gold value of the world's currencies is made by mutual consent? Can't we bring the monetary systems nearer to a metallic base and hence farther away from collapse? For currencies, as 35 countries know, finally go the way of commodities—down in relation to cornered gold!

To retain a workable gold standard we must strengthen the foundation. We ought not to further increase the superstructure.

#### BASE SAFE FROM ATTACK

One of the most important benefits which would result from the reduction of the gold content of the dollar is this: Our foreign friends would no longer be entitled to receive the same amount of gold for their dollar balances in this country and our monetary base would be safer from attack. In return, however, these foreign friends would have their burden of debts to the United States proportionately reduced and their ability to resume normal trade with us restored as a consequence. Who will deny that trade is our one most urgent need?

International trade without a mutually accepted medium of exchange is next to impossible and on a revalued basis gold may readily resume its traditional position as international money.

If the world's leading nations were far-seeing enough to revalue their currencies in direct proportion to a change in the gold content of the American dollar, the burden of internal debts would be lifted everywhere without changing the relative international position of the countries involved one iota.

Shall we continue to destroy confidence by insisting upon the sanctity of one unfair contract while the lives and hopes of honest millions are destroyed, or shall we apply the rule of reason and the police power of the State?

---

### Statement of E. C. Romfh, President First National Bank, Miami, Fla.

My views on the way out are about as follows:

1. *Banks.*—A capital structure in a ratio of not over 1 to 4 of loans and investments, excluding Government bonds and cash and due from banks, plus, cost of volume (service charges, analysis of item cost) and accruals, to ascertain rate of interest on earning assets and expense costs. This bank had deposits shrink from $70,000,000 (1925) to $6,700,000 (1931) and never borrowed a dollar, while some 40 banks in this section closed.

2. *Reserve banks.*—Should get out of check collecting and transfer of funds and permit banks in various centers to function through clearing houses, as they did in 1893 and 1907. Banks have not been able to make a stand because of the ease with which checks credits can be converted into currency or Federal funds and yet when a 20 percent strain was placed on the system as a whole, it closed all of us. Glass-Steagall bill is unsound in that Government bonds can be deposited and Federal Reserve notes issued redeemable in gold—should be lawful money.

3. *Taxation.*—No amount of inflation will for long obscure the unsound tax base and the fact that there are too many on public pay rolls for the people to

support. It cost the average family in Dade County, Fla., in taxes, direct or indirect, as cost our family to live here in 1900.

4. *Transportation.*—The people cannot support the present high freight rates—they must come down along with taxes—capital structure excessive, tax base unsound, and wage scale out of line with other lines and too much waste through the higher ups.

5. *Tariffs.*—These must be adjusted, along with debts, in order that we will not have to contend with depreciated currencies, and natural trade relations resumed.

6. *Debts.*—Old debts die or are adjusted as best you can.

*In conclusion.*—The States could tax exempt modest homes, and farms; all improved or rentable property should be taxed from a revenue percentage as collected and all unimproved property should bear a small tax and unless paid should revest to the State for home or homestead purposes.

All bonds should be taxable, along with incomes, and selective sales taxes in order to get as wide tax base as possible.

There should be a profit-finding commission in an effort to prevent too much profit going to a few at the expense of the many or a too high wage scale in certain industries which will cause dislocation and suffering in future. Excessive profits could be placed in reserve for use in slack period to take care of unemployed to give them some means of earning a livelihood, either on the lands, reforestation, etc.

---

## Statement of Alvan T. Simonds, Fitchburg, Mass.

United States Senate,
*Committee on Finance:*

Referring to your request of March 30, 1933, I herewith enclose my recommendations as follows:

1. Reduce the weight of gold in the dollar by 30 percent[1] immediately. As a corollary to this, if necessary tax the income from gold contracts for the Government or otherwise an equal amount.

Devise a commodity index by leaving this matter with the Bureau of Standards, one half way between the Irving Fisher index of 200 and the Department of Labor as 700 or 800; for instance, 300 would not be too unwieldly and would be quite representative. After this has been devised, have an automatic changing of the weight of the gold dollar so that the commodity index would practically stand still in this country at least. Take the embargo off gold as soon as possible. If the temperature of a house can be made to fluctuate around a desired level within 1 or 2 degrees, the commodity index in terms of money can practically be made to stand still. This will enable both long- and short-term contracts to be made in terms of the commodity index instead of in gold. As a temporary measure set up a stabilizing fund after the embargo is taken off to regulate the flow of gold until the desired level is estimated by the Bureau of Standards.

3. Revise the entire banking system of the United States by separating the different banking functions, for instance, into (*a*) commercial banks; (*b*) real-estate or savings banks; (*c*) security-promotion banks; (*d*) compel commercial banks to divorce savings departments and security affiliates; (*e*) abolish State banks; (*f*) set up a supreme court of business with five members elected for life, at a retirement age of not over 75 years old. Let this court take over the functions of the Federal Reserve Board, antitrust laws, and all other departments having to do with the direct regulation of business and business policy; (*g*) form a branch banking system in, roughly, nine regions, taking region no. 1, for instance, as New England; evolve a scheme for tying each original system into the welfare of all of the others with a certain percentage of loans in each region in order to obtain a better diversity factor in different lines of business and commodities in the different regions. In order to integrate with other nations, tie all of these systems in with gold and foreign exchange.

4. Give the farmer better treatment by some equalization basis with the rest of the country against foreign competition, or reduce by agreement with other

---

[1] The reason for 30 per cent reduction in the contents of the gold dollar is that wholesale commodities even in times of prosperity will probably not rise above the 1913 level which is 25 per cent above the present level, whereas according to the Department of Labor the present cost of living is about 25 per cent above the 1913 level. This would represent an equitable distribution of the burden between the debtor and creditor positions.

nations the tariff on manufactured goods. Personally, I prefer the latter to the former.

5. The reduction of the weight of gold in the dollar will in a short time cancel the necessity of the Reconstruction Finance, which in essence is inflationary but also discriminatory.

6. Let the two Houses of Representatives remain, the Representatives representing the country by districts, but reduce the number of Senators by 50 per cent and have all Senators elected at large, giving the Senate virtually the same power as it has now. The reason for this is that we have in Washington only one man representing the United States, whereas all the other elected Representatives often work against the best interest of the United States in favor of a particular district.

---

## Statement of Dr. Walter L. Wilson, Kansas City, Mo.

It is indeed a great pleasure to have the honor of presenting to you some thoughts in regard to the present distress which has been occupying the thoughts of each of you gentlemen through the past months.

In seeking to diagnose the case which we may call the "sickness of society", I have made contacts with a very wide circle of friends throughout the Middle West, including farmers, school teachers, laborers, miners, professional men, manufacturers, and housewives. I have noticed two things looming up in all the conversations and it deserves our particular attention. One of these is the lack of contentment and the other the lack of confidence.

Discontent seems prevalent in young and old, in rich and poor, in the sick and the well. National discontent prevails. There is discontent with wages, with military strength, with treaties, with taxes, and duties. There is discontent among the students and scholars of our schools and colleges with the respect to laws imposed upon them, class arrangements, social prohibitions. There is discontent between the laborer and his master on every subject that is properly related to this situation.

With all of this discontent there is a lack of confidence, both in the ability and in the willingness of the parties concerned. Suspicion fills the heart of the customer who enters the store to purchase. Suspicion fills the mind of the student as he receives the grade from the teacher; suspicion fills the hearts of patients as they think of the doctor's services. There is distrust in all human relationships and this is international in its scope.

The reason for the existence of these conditions in my judgment lies in a departure from the word of God and a repudiation of relationships with God. Our country was built upon the Bible and its godly principles. Our society has been knit together and our Nation has grown to its present proportions because of the principles and the propagation of the principles of righteousness given by the Lord Jesus Christ and embraced by our people.

The Bible is the only antidote for sin, the only preventive of crime, the only remedy for moral decay. We must turn our ways toward God and promote again the principles and practices of His word.

In order to bring this about, I recommend that there shall be issued to the peoples of our land over the signature of those who are in position to command respect, a call to restore the reading of the scriptures to the family fireside, in the schools and colleges of our land, in our clubs and social organizations, and in the public reading rooms, provided by various social service groups.

I recommend that a plea be made to the preachers of our country to leave the present plan of giving book reviews and lectures on matters of national or international interest while in the pulpit of the church and to return again to the preaching of the word of life and the exaltation of the Lord Jesus Christ.

I suggest also that a request from proper prominent sources be sent to our national magazines and great daily papers requesting that a certain portion of their publications, and a prominent portion, be given to printing the word of truth. There is a peculiar power in the word of God which brings about in human hearts righteousness and honesty. Those who read it obtain from it desire for right relationships with others and right condition within the heart.

I suggest further that an honest endeavor be made to keep the word of God in some form prominently before the minds and hearts of law enforcement bodies, both Federal, State, and municipal. The Scriptures thus displayed or presented will have a cleansing and sanctifying power in the lives of this great group upon whose efficiency and honesty so much depends.

Greece and Rome both took the path that we in this country apparently are pursuing. They promoted military strength, physical improvement, great games; they advanced in arts such as painting, sculpturing, and music; they promoted the building of roads and the development of agriculture; but with all of this they neglected to prepare the heart for the ravages of sin and the evils of immorality which wrecked both of these mighty nations.

Gentlemen, we must make some provision for preservation from the defiling, decaying, destroying results of sin. A proper financial structure will not save society. Good government will not change the human heart. The restoration of the Scriptures in the homes and the hearts of our people will do all of this and will establish again confidence in God, confidence in men, confidence in our rulers, and contentment with such things as we have. I sincerely trust that in some manner your honorable body may devise a program that will exalt and extol the living word of the living God.

---

STATEMENT OF IVAN WRIGHT, PROFESSOR OF ECONOMICS, UNIVERSITY OF ILLINOIS

In brief, I should say some of the steps toward economic and financial recovery are:

Adjust international trade barriers until trade can be carried on under fair competition. We must buy the goods of other countries if they are to buy ours.

Cooperate with other countries as in 1922 in stabilizing currencies and trade relations.

Reinvest foreign credits, both public and private, now owed the United States in the capital of those countries.

Reduce our own governmental expenses and taxes and thus restore confidence at home and abroad in the American dollar as the standard of world value.

Adjust domestic debts to present price levels.

Establish sound banking and investment banking based on the English principles and set up standards for engaging in banking and investment banking that will give the customer some reason to have confidence.

INTERNATIONAL DEBTS

At present the Allied debts due the United States, as a result of the war and its consequences, would probably amount, in round sums, to about 12 billion dollars.

The foreign private debts owed to investors and lenders in the United States is variously estimated from 12 to 20 billion dollars. Perhaps the value of these private debts, at the present time, would not amount to more than 10 or 12 billion. Estimates have placed the present value of these debts as low as 7 billion. The foreign governments have objected to paying the debts contracted to the United States Government during and immediately after the war on the ground that the debts grew out of a common cause, and the United States should bear its share in the costs of the war. Moreover, the claim has been made by both foreigners and Americans that the payment of these debts to the United States, as arranged for over the next 60-odd years in small annual sums with interest, amounting to at most only 300 or 400 million dollars a year, is the fundamental cause of the present world depression, resulting from a drain of gold out of the debtor countries, causing the depreciation of their currencies and the breakdown of the price system throughout the world.

PRIVATE DEBTS AND TRADE BARRIERS MORE IMPORTANT THAN WAR DEBTS

When the facts are analyzed, we find that the private debts due the United States are larger in amount than the Government debts. The installments are larger and the interest rates are higher.

In addition, the trade barriers have created a maladjustment in the trade between countries and in the balance of payments favorable to the United States, wholly out of proportion to the installments on foreign government debts.

It seems, therefore, rather unfair to ask the American taxpayer to pay the bill for the part the United States played in the war, and then pay a part of the costs of the Allies in the war, represented by the debts due the United States, in order that private debts, contracted in part for speculative purposes, may be paid, and in order that special industries may be protected for the benefit of certain interests, when the public, in general, who pay the taxes, would be better off if these industries were not protected and there was a freer exchange of goods between countries.

It is indeed difficult to understand the patriotism and economic sense of an international banker, who points out in one paragraph, correctly, that the part of restoring balanced conditions between countries lies in the American investor being willing to invest abroad in the capital of the debtor countries, and then, in the next paragraph, urging a cancelation of the debts these countries owe the United States, and further protection for sheltered industries. The only justification for this point of view is that the United States, the Government, and the people exist for the exclusive benefit of this sheltered few, who anticipate large profits for underwriting foreign securities that would not be possible in the near future if the installments on the debts were reinvested instead of refinanced through new capital issues.

### WAYS OF SETTLING THE INTERNATIONAL DEBTS

There are several ways of bringing about a solution to the foreign governmental debts:

1. They may be canceled.
2. Debtor countries may repudiate.
3. Debtor countries may pay the United States, in part, with trade advantages.
4. United States may receive part in territorial concessions.
5. The United States Treasury may invest installments and interest due the United States on the debts in private and public securities of the debtor countries, and when the market is acceptable, resell these securities to investors both in the United States and foreign countries.
6. Payment of a cash lump sum over the next 3 to 5 years.

Any one, or a combination of these possibilities, may solve the debt situation. It seems to the writer that investing in the capital of foreign countries is the soundest disposition of the debts. This is the way England, Germany, France, and Holland collected on the debts the United States owed these countries when we were a debtor country and could not pay. Time and economic conditions worked out the solution.

When the next major depression occurs, the United States may not have half the world's gold. In fact, the next major depression may start when our gold supply has been reduced to the minimum requirements. Under such conditions a backlog of foreign investments will prove of inestimable value. It seems that the English financial system would have long ago completely collapsed had not it been for her protection through foreign investments. The United States should take a lesson from this situation and increase foreign investments of this country in foreign countries as security in times of future crises.

"Would canceling the war debts restore international balances of payment, enable foreign countries to stabilize their currencies, and again start goods flowing between countries in normal course of trade?"

Canceling the debts would have little effect upon these fundamentals, because the installments and interest due is a small item in the unbalanced situation. The chief items creating the maladjustments are tariffs, trade restrictions, and the foreign debts as an item are of less importance than the private debts.

Moreover, all the benefits that could be obtained from canceling the foreign debts can be obtained by reinvesting principal and interest for the time being. Insofar as the debts are a factor, this would leave the funds in debtor countries.

Foreign propaganda in the United States to reduce the debts or cancel them, is supported by statesmen and representatives of foreign countries who have everything to gain and nothing to lose by such acts on the part of the United States; those who have large private investments in the speculative enterprises of foreign countries and who see a greater chance of payment provided the American taxpayer will pay the war debts so European industries can pay their private debts.

Will the American people fall for this propaganda?

STATEMENT OF GEORGE W. YORK, ALBUQUERQUE, N.MEX.

The objective of American business should be to satisfy the "desire" of the American people in terms of goods, and every aid which can be provided by agencies of business and by government should be afforded by those agencies. The following plan is respectfully presented:

I. Permit complete integregation of "big business." "Big business" is defined for the purpose of this suggestion as any business or service which has up to now found expression in terms of national organization.

(*a*) Each industry or service must agree to operate in every variety and potency of form constructively and with efficiency. This agreement should be made between each industry and service with all others and with the Government of the United States. If this were done such an agreement would entail upon the parties to the agreement the obligation of each and every industry and service to so conduct its affairs as to leave no undue surpluses in the market.

(*b*) The prices for goods and service should be fixed for a period of say 18 months or 2 years, and since it is impractical to await an examination of prices for such a time as might be required for such a study and investigation, it is suggested that the prices for say the year 1925 be adopted. During the period in which these suggested prices are in force a complete study of the costs in each service and industry should be made so that at the end of the period the absolute cost for each service and industry should be determined. A fair profit to be determined after the cost has been ascertained could be easily and profitably left to the industries and services which would provide a basis for adoption of new prices and for a period in which those prices should endure.

II. The legislation which would be required would be, it is believed—

(*a*) Repeal and/or suspension of all National and State antitrust legislation.

(*b*) Pass such National and State laws as would in effect permit each and every industry and service where three quarters of the whole of such industries and service-made rules and regulations as well as prices to absolutely govern and deny to minorities the right to buy and sell in a market made by the agreement noted in I (*b*) above.

(*c*) 1. In order to obtain the results desired it is believed that the Government should pass laws which in effect embargo all products wherein such products produced in the United States were adequate to our uses.

2. Where there is produced in America insufficient goods in any line, tariff based on American money should be applied against foreign goods adequate for the protection of the American producer and laborer.

3. All goods not produced in the United States should be admitted free of duty.

(*d*) As to the foreign debts owned by the Federal Government, the debtor governments should be permitted to pay these debts when and as they were able to do so. It might be appropriate to call upon such debtors as provide goods or service which are unobtainable in the United States to pay on their indebtedness on some ratio that their imports free of duty bear to the indebtedness of such importing nations.

COMMENTS

The appropriate instrumentality for the organization of business in the fashion suggested in the above-mentioned plan is the United States Chamber of Commerce. It would seem appropriate that the business integration above suggested should be effected through the instrumentality of such an organization as say, the "Institute of American Business" which would be formed by the election of members of each of the above-mentioned service and trade associations, and the home of that institute should be the National Capital. Such a program would, it would seem, work equity which in turn would be for the public good. To begin with, it would seem entirely appropriate that the United States Government should have representation in that organization.

It would seem that for a continuance of business and government a "unit of value" wholly responsive to the laws of nature should be evolved, and that during the 2 years in which the 1925 prices are to prevail in accordance with the suggestion this unit of value should be determined by agreement between the parties.

If such a program were adopted, it would seem very much less expensive than remedies arising from such agencies as the Reconstruction Finance Corporation and other now proposed remedies.

## REPORT OF THE NATIONAL TRANSPORTATION COMMITTEE

### INTRODUCTORY

Herewith are presented:

A. The conclusions of the National Transporation Committee.

B. The report of the committee.

C. Supplemental report by former Gov. Alfred E. Smith who prefaces it, "While I am in substantial agreement with the greater part of the committee report, this supplementary memorandum states my conclusions in my own language, placing the emphasis where I think it belongs."

D. Special studies by the research staff to be published shortly by the Brookings Institution, Washington, D.C.

The committee associated itself at the request of certain business associations, savings banks, insurance companies, and fiduciary and philanthropic institutions interested in railroad securities (see appendix 1) in response to an invitation in essental part as follows:

"We, the undersigned organizations, representing many of the interests concerned, believe that there is no more important present task than a thorough and satisfactory solution of the railroad problem as an integral but the most urgent part of the entire transportation problem. We beg that you examine all phases of the problem and recommend a solution which, with due regard for the public interest, will insure an opportunity for the railroads of this country to be put on a business basis, so that neither now nor in the future will they constitute a present threat to the invested savings of our citizens, to loss of employment to our wage earners, and to the stability of the insurance companies and savings banks, and so that the present burden on the Federal Treasury and the American taxpayer may be in a fair measure removed."

The committee met and organized on October 7, 1932. It was composed of Calvin Coolidge, chairman; Bernard M. Baruch, vice chairman; former Gov. Alfred E. Smith, Alexander Legge, and Clark Howell. John W. Power acted as secretary. The committee selected Dr. Harold G. Moulton, of the Brookings Institution, to organize a research staff.

Just as the committee's work was nearing a close, it lost the distinguished director of its deliberations who was giving his great talents unsparingly to this work. The report had not taken form at the time of his death, but the committee has tried to carry on in the spirit of his leadership.

The committee gathered its facts from three sources:

(1) Open hearings.

(2) Studies by other investigating bodies, memoranda, briefs, and specific suggestions.

(3) The work of Dr. Moulton and the staff.

This mass of material is too voluminous and varied to publish in full, but the work undertaken by the research staff will be published shortly by the Brookings Institution. Dr. Moulton's conclusions are his own.

The transport problem has been with man since the first rude trails of prehistory. It has shaped the destiny of humanity. The closing of the caravan routes to the East Indies discovered America. History is full of similar consequences. Just now, largely due to the recent rapid development of new forms of transportation, the railroad problem is acute in nearly all important countries, including our own. Commissions more or less similar to this committee have been at work in England, Canada, and the Argentine Republic, and we have considered their reports and analyses. There are railroad commissions in nearly every one of our 48 States and similar bodies in many other countries. These, the Interstate Commerce Commission and the very able congressional committees on these subjects, have all been devoting themselves to the problems created by these rapid shifts. Much of this work and a great mass of other data have been assembled and given careful study by the committee. The problem is very complex, and while the committee is in substantial agreement as to conclusions, it is too much to expect that four men of independent mental processes would all arrive at decisions by identical paths, or with equal emphasis on various factors.

### A. CONCLUSIONS OF THE COMMITTEE

I. The railroad system must be preserved. Changed conditions require new policies but not abandonment of railroad regulation. The development of regulation and of new methods of transport make it necessary for Government further to create and foster competition with or among railroads as a defense against monopoly. That is an expensive and ineffective attempt to do indirectly what Government has shown its ability to do directly. Regulation is sufficient. Government policies should be freed of any purpose either to favor or to handicap any form of transportation with relation to any other form. We cannot solve the problem on the theory upon which horses are handicapped in a race. In a fair field and no favor competition should be permitted to decide the result. Regulation should not attempt to "run the business" of transportation. It should concentrate on protecting the public against discrimination and extortion and on requiring the most efficient service at the lowest competitive cost.

(1) Parallel lines and systems are wasteful and unnecessary. Regional consolidations should be hastened and, where necessary, enforced, looking eventually to a single national system with regional divisions and the elimination of all excess and obsolete lines and equipment. Neither holding companies nor any other device should be permitted to hinder consolidation or evade the letter or the spirit of regulatory law.

(2) Unprofitable railroad services should be replaced by cheaper alternative transport methods.

(3) Railroads should be permitted to own and operate competing services, including water lines, but regulatory jurisdiction should be extended to water rates and practices in coastal, intercoastal, and lake shipping to relieve commerce of present chaotic conditions. Congress should promptly clarify its intention on the long- and short-haul clause of the Transportation Act.

(4) Government assumption of all or part of the costs of inefficient competing transport as a defense against monopoly is no longer warranted and should be abandoned. As a general principle inland waterways should bear all costs of amortization, interest, maintenance, and operation of the facilities for their navigation. If they cannot bear such charges and compete with other forms of transport, they should be abandoned. The St. Lawrence waterway should be tested by this rule of self-support and if it fails in that test the pending treaty with Canada should not be ratified. Governmental commercial operation of the actual facilities of transportation, such as barge lines, should not be continued.

(5) Automotive transportation should be put under such regulation as is necessary for public protection. It should bear its fair burden of tax but only on a basis of compensation for public expenditure on its behalf, plus its share of the general tax load. Neither tax nor regulation should be applied for any purpose of handicapping the march of progress for the benefit of the railroads.

(6) Wages and working conditions of labor in transportation are determinable by established procedure in another forum and are not within the scope of this inquiry. There should be no heavier burdens on the railroads in employing labor to operate automobiles than on their competitors. In the railroads (as in other industries) rates, capitalization, salaries, and wages must all follow changing economic conditions, but none should be sacrificed for the benefit of others.

(7) Beacons, weather service, and similar auxiliaries to air traffic should be maintained at public expense, and air transport should be encouraged during its development stage but we believe that every such service should ultimately pay its own way.

(8) The committee has no recommendation to make on pipe lines.

II. The policy of trying to appraise railroad properties on some selected basis of valuation and then saying that they are entitled to earn a fair return on this appraisal should be reconsidered. Where competition with trucks and other method exists it will determine rates. In other cases rates must be regulated, but the basis of costs of operation under efficient management is a better general guide than any attempt to preserve capital structures regardless of economic trends. We see no reason why the rate-making rule should say in plain English that railroads are entitled to make a reasonable profit based upon costs of efficient operation and that they are not entitled to earnings merely to preserve present structures if overcapitalized.

III. The railroads should do much that they have not done to improve their condition without any Government help at all. They should promptly be freed of all unnecessary restrictions on the doing of it. It has been estimated that less than a 20 percent increase in traffic would put most of them on an earning basis. In view of the narrowness of this margin of loss and of the very great savings possible in railroad operation, we regard their outlook as far from hopeless.

(*a*) Railroads should adopt the competing methods of which they complain.

(*b*) Railroads should cooperate to reduce competitive expense.

(1) Unnecessary services should be abandoned.

(2) Metropolitan terminals should be consolidated and unnecessary facilities scrapped.

(3) Circuitous haulage should be eliminated.

(*c*) Financial management should be improved.

(*d*) Transport methods and equipment should be brought up to date.

(*e*) In view of what could be done by better management, the general outlook seems far from hopeless.

IV. Regulatory jurisdiction should be extended to the whole national transportation system but applied only to the extent necessary for public protection. The existing regulatory mechanism of the Interstate Commerce Commission is inadequate and should be improved by reorganization without expansion or increased expense.

V. Emergency recommendations:

(1) Corporate reorganization can and should be facilitated by revision of the bankruptcy procedure.

(2) The recapture clause should be repealed retroactively.

(3) The statutory rule of rate making should be revised.

(4) "Adequate security" does not necessarily mean "marketable collateral."

B. THE REPORT

I. The railroad system must be preserved. Changed conditions require new policies but not abandonment of railroad regulation. The development of regulation and of new methods of transport make it unnecessary for Government further to create and foster competition with or among railroads as a defense against monopoly. That is an expensive and ineffective attempt to do indirectly what the Government has shown its ability to do directly. Regulation is sufficient. Government policies should be freed of any purpose either to favor or to handicap any form of transportation with relation to any other form. We can not solve the problem on the theory upon which horses are handicapped in a race. In a fair field and no favor competition should be permitted to decide the result. Regulation should not attempt to "run the business" of transportation. It should concentrate on protecting the public against discrimination and extortion and on requiring the most efficient service at the lowest competitive cost.

At the foundation of our system of communication is the railroad web. It is the most important single element in our social and economic life. Its rapid extension enabled us to cover the greater habitable part of a continent with a cohesive form of liberal government of 125,000,000 people united in a common language, purpose, and ideal and to maintain national solidarity through periods of stress. Both security and material welfare are involved in its continued efficient existence. The public interest is deeper than its investment or its need of good service. We are addressing a matter of national concern of the first magnitude. The railroad system must be continued and its efficiency preserved because of national necessity—economic, social, and defensive.

(*a*) Governmental fostering of competition is no longer necessary as a defense against monopoly.

Above all other enterprises, railroads are, therefore, "affected with a public interest" and, under an ancient doctrine of our law, peculiarly subject to Government regulation. In earlier development, the railroad franchise created an effective and complete monopoly against which industrial and social segments had no defense. Rigorous governmental control was inevitable. It took two forms: First, an effort to foster competition among different railroads and to create and maintain, by Federal financial aid, other forms of competing transportation such as waterways; second, an intense regulatory control of the railroads themselves. The latter has been practiced long enough and sufficiently extended to prove that it dominates competition or any other influence as the governing law of railroad practice. To the extent that the monopoly inherent in the railroad franchise was a menace, it is of the utmost importance to recognize that current railroad regulation safely controls it. Other safeguards have appeared. With increasing effect, new methods of transport are invading customary fields of railroad patronage. On a basis of economic efficiency, independent of Government aid, pipe lines, motor transport, and airways are all making bids for business which the railroads can retain only by offering equivalent service at competitive rates. In these areas of competition there is no longer complete monopoly. These two developments—perfection of regulation and appearance of competing methods—have created a new principle, viz:

In so far as Goverment policies have been designed by Federal intervention to create and maintain competition with or among railroads as a defense against monopoly, they should be abandoned as wasteful and unnecessary. Regulation is sufficient.

(*b*) Regulation should provide a fair field and no favor.

The railroads complain that they are shackled by regulation while their competitors are free and unduly advantaged by various forms of discrimination in their favor. To the extent that this is true, it is unfair. But it must be equally clear that, notwithstanding the deep public interest in our railroads, the Government cannot stand in the way of progress. Certain regulation of competitive methods is necessary. They cannot be permitted to escape their just tax burdens. They ought not to be artificially advantaged by subsidy or otherwise. But regulation of them must arise from its own necessity, and burdens upon them must derive from justice. The Government cannot, for the sake of the railroads, invent and apply to their competitors either regulation or burden on the theory upon which horses are handicapped in a race. A similar principle applies to railroads, and to the extent that they are handicapped by burdens for which the reason is obsolete or nonexistent, Government has a positive duty to remove them. The guiding rule of the whole matter seems to us quite clear:

With the danger of railroad monopoly going or gone and (whether going or gone) completely controlled by regulation, Government has a positive duty to see to it that neither the railroads nor their competitors are either unduly handicapped or unduly advantaged. Thereafter, in a fair field and no favor, economic competition must decide the question of survival under private ownership and operation.

(*c*) Regulation should not be abandoned. It should be put on the simple basis of public protection.

There is respectable opinion that the development of effective competitive methods argues for the abandonment of all railroad regulation. The committee cannot concur. Competition of parallel methods is as yet limited and localized and, while it is a powerful and growing force against monopoly, it does not relieve the necessity for railroad regulation and, because of other aspects of public interest and dependence already mentioned, in our opinion, it never will. On the contrary, we regard regulation as necessary in the interest of both the railroads and the public and we think that it should be extended to other forms of transportation.

But, for reasons stated hereinafter, more care must be taken to maintain managerial initiative. Regulation, whether of railroads or other forms should not attempt to "run the business" of transportation. It should concentrate on protecting the public against discrimination, extortion, and other abuses of monopoly and on insuring the most efficient service at the lowest competitive cost.

If these conclusions on general principles are correct, several changes in policy flow inevitably therefrom, viz:

(1) Parallel lines and systems are wasteful and unnecessary. Regional consolidations should be hastened and, where necessary, enforced, looking eventually to a single national system with regional divisions and the elimination of all excess and obsolete lines and equipment. Neither holding companies nor any other device should be permitted to hinder consolidation or evade the letter or the spirit of regulatory law.

The policy of maintaining parallel and competing lines or systems on the theory that thus extortionate rates and discrimination may be restrained is wasteful and, of course, untenable under a system which controls rates and practices to the ultimate.

Duplication and unnecessary overheads, facilities, and services inherent in the present multiplicity of railroads are very expensive and consolidations should be hastened. In plans for this, consideration should be given to creating a single efficient system (rather than competing systems) for each natural trade area, even to the ultimate extent of a single national network with regional divisions. It has been estimated by good authority that several hundred million dollars, or enough to pay interest on a large part of the outstanding railroad bonds, can be saved. Consolidation is so vital to the public welfare that unless it is voluntarily accomplished within a reasonable time, the Government should compel it. Neither holding companies nor any other device should be permitted to hinder consolidation or to evade the letter or spirit of regulatory laws.

(2) Unprofitable railroad services should be replaced by cheaper alternative transport methods.

In view of the rapid development of automotive and other transport, there is no justification for maintenance by railroads of losing services and lines, and there devolves upon regulatory bodies and controlling interests something more than a negative duty to hasten their replacement by alternative methods, such as motor transport, which can render adequate service on a profitable basis in cases where rail transportation can operate only at a loss.

(3) Railroads should be permitted to own and operate competing services, including water lines, but regulatory jurisdiction should be extended to water rates and practices in coastal, intercoastal, and lake shipping to relieve commerce of present chaotic conditions. Congress should promptly clarify its intention on the long-and-short-haul clause of the Transportation Act.

Restrictions on the ownership by railroads of waterbourn, automotive, or other competing services seem anomalous in a regime which has demonstrated its effective control of both rates and practices.

There are certain competitive situations where railroad rates between two ports are fixed by regulation and unregulated water rates are in chaos. This is disturbing to commerce and unfair to railroads. For this and other reasons, we believe that the jurisdiction of the regulating body should be extended to cover intercoastal, coastal, and lake commerce. We do not mean to recommend that water rates, based on actual lower costs, should be regulated upward to equalize traffic in favor of railroads. But we do believe that in such a situation some stabilizing influence should be applied to the interest of commerce generally as well as in fairness to railroads.

The law prohibits a railroad from charging less for a longer than for a shorter haul over the same line in the same direction, the shorter being included in the longer, but permits the Interstate Commerce Commission a discretion to relieve this restriction.

The law is not altogether clear and the Commission's interpretation and decisions have been the subject of long and persistent controversy. Grave consequences affecting wide economic areas are involved and the situation requires prompt clarification. Two pending suggestions by the Interstate Commerce Commission and one by the House committee might contribute thereto. If jurisdiction of the Commission be extended to include intercoastal commerce, or if a new rule of ratemaking be adopted, the problem would be simplified. But if neither of these things is done, it is important that Congress act at once to declare its intention on this important application of the so-called "long-and-short-haul" controversy.

(4) Government assumption of all or part of the costs of inefficient competing transport as a defense against monopoly is no longer warranted and should be abandoned. As a general principle inland waterways should bear all costs of amortization, interest, maintenance, and operation of the facilities for their navigation. If they cannot bear such charges and compete with other forms of transport they should be abandoned. The St. Lawrence waterway should be tested by this rule of self-support and if it fails in that test the pending treaty with Canada should not be ratified. Governmental commercial operation of the actual facilities of transportation, such as barge lines, should not be continued.

Creation and maintenance by Government of competing methods of transport, where the result is not (as in the Panama Canal) to provide more efficient service at lower cost, but only (as in some inland waterways) to maintain at the taxpayers' expense more costly and less efficient service can no longer be justified as a defense against monopoly.

This Government has long been committed to the improvement and maintenance of shipways and of at least the outer harbors of ports accessible to great naturally navigable waterways. This involves expense, defrayed by taxation of the whole Nation, but applied at particular points, in the development of the instrumentalities of interstate and international commerce. To an extent these waterways are the railroads' competitors, and as far as they go these expenditures favor them. But in respect of accessories to naturally navigable waterways, such as ocean harbors and their approaches and the harbors and channels of the Great Lakes, this is a recognized function of government the world over, for naval as well as commercial purposes, and the railroads may be presumed to have been located, financed, and constructed with this in view. We have not heard it decried as an unjust handicap, and with these remarks it passed from our consideration.

But, with inland waterways in general, the case is otherwise. For the sake of illustration, let us imagine a federally constructed canal between, for example, Topeka and Oklahoma City—a stark ditch. If that canal fairly bore the burdens of its cost of construction and operation and yet could furnish transportation at an advantage over rails, nobody could complain, regardless of the extent to which it diverted railroad traffic. But if such was not the case and the canal could compete only if the public paid enough of these charges to undercut the cost of rails, it seems too obvious for argument that its creation and maintenance would be a direct impairment of the railroad system by public subsidy and distinctly inimical to the national interest.

Exactly the same principle of self-support seems applicable to any natural waterway upon which improvement and engineering devices are necessary to provide effective navigation. We think it is the very touchstone of the whole vexed problem and that every existing or projected improvement should be tested by its application. Any project which fails to answer that test should be abandoned, without hesitation, as an unwarranted waste of public money.

(*a*) *The Great Lakes Waterway.*—The connecting channels of the Great Lakes were not navigable in the modern sense in their natural state, but the Great Lakes Waterway now stands as a fully created, implemented, and efficient system of navigation which, in many respects, falls under the considerations governing Federal improvement of ocean ports, harbors, and shipways.

(*b*) *The St. Lawrence Seaway.*—There are obviously not at present any facilities for navigation, by ocean-going vessels, of the restricted waterways connecting the Great Lakes with each other and with the sea. The project to create such a shipway to the head of Lake Superior is a major engineering project of stupendous magnitude and very great cost. There is diversity of opinion as to whether the project is practicable. It is clear from our studies that the peculiar type of lake bulk carriers is far more efficient than any ocean freighter and from this fact that the area of economy is restricted practically to savings in cost of transshipment. But our studies also show that in no reasonable probability could this minor saving be enough to approximate even the carrying charges on this project.

In conformity with one of the general principles already announced, if this seaway could be shown to be the march of progress and if cheaper and more efficient transportation can thus be achieved, no barrier should be imposed against such a development. But we think that, before ratification of the pending seaway treaty with Canada bargaining away valuable American rights, this project should be fairly tested on the rule of self-support; and if it fails, the treaty should not be ratified.

(*c*) *Government barge lines.*—Argument for and against Government operation of barge lines was strongly pressed before us. In this case not only is the waterway itself provided and maintained at public expense but the actual business of transportation thereon is in part financed by the Government. The claim is made, and in our judgment sustained, that if the methods of accounting used by the Government in respect of the Panama Canal were applied, they would reveal operating losses which are charged to the taxpayer. We think that actual Government operation of the facilities of transportation, wholly or partly at public expense, is unjust to the vast majority of people and unwarranted by any argument that has come to our attention.

(*d*) *Inland waterways in general.*—We recommend that the Congress give consideration to the formulation of a consistent policy on inland waterways. We think that the test of self-support should be applied to every existing or proposed inland waterway.

Unbearable tax burdens are generally recognized as a principal hindrance to economic recovery. Our waterway policy for the past few years has averaged a cost of about $100,000,000 annually and tremendous projects involving hundreds of millions are being considered. Our studies show no commensurate economic benefit resulting from much of this spending. In such circumstances we think that a large part of this activity should be abandoned or at least suspended. It bears heavily on the taxpayer as a direct burden and even more heavily on the whole community in its contribution to the postponement of prosperity. At a time when the very stability of our system depends on the balancing of Federal expenditures with revenue and the sources of taxation seem almost dry, we find it difficult to justify this wasteful outpouring of hundreds of millions of dollars for results so barren of economic returns.

(5) Automotive transportation should be put under such regulation as is necessary for public protection. It should bear its fair burden of tax but only on a basis of compensation for public expenditure on its behalf, plus its share of the general tax load. Neither tax nor regulation should be applied for any purpose of handicapping the march of progress for the benefit of the railroads.

The problem of the automobile is very difficult. Its roadbed is provided at public expense and it requires few, if any, terminal or similar facilities. It need not—as must railroads—load any part of its cost of operation with a charge for this construction and maintenance. It can make rates which do not involve charges for depreciation and amortization. It can pay whatever scale of wages and exact whatever hours of labor it can make effective. It can bargain closely and instantly and can walk away with business while the railroads are involved in a prescribed process before their regulating overseers. It is not attached to rails and can furnish a swift door-to-door service which railroads as such cannot even approximate. It may be a common carrier, a contract carrier, or a private operator. It moves intrastate and interstate and may change its character in these matters instantly. It need not maintain continuous schedules and service. It can pick its business and is prone to take the cream of the traffic and leave the rest for the railroads, which must receive whatever is tendered. It can be permanently or sporadically in business and competition. With these advantages it has made inroads into railroad business and the difficulties are only partly suggested by this short recitation of complexities.

The problem thus presented has been regarded as serious in every important country and commissions similar to this committee have been convened in several of them. The difficulty is not solely in the amount of tonnage diverted but resides also in the chaotic rate conditions presented to commerce in general and in many new necessities for public protection. It has been a matter of primary concern to our Interstate Commerce Commission, to State commissions everywhere, to the Congress, to the highway users themselves, and to all who have given great study to the transport problem.

One thing is certain. Automotive transportation is an advance in the march of progress. It is here to stay. We cannot invent restrictions for the benefit of railroads. We can only apply such regulation and assess such taxes as would be necessary if there were no railroads, and let the effect be what it may.

On the question of whether public financing of roadbeds operates as a subsidy, there is a vast variety of circumstance. The automobile itself, its fuel, lubricants and operations are all heavily taxed. Does the total of these assessments bear its share of the general tax load and also sufficiently reimburse the public expenditure of the roads it uses? If it does, the circumstance that the charge is not comparable in amount to railroad costs of construction and maintenance of terminals and roadbeds is immaterial. The purpose is not to handicap automotive competition, but only to do justice.

These questions are of mixed State and Federal bearing and very difficult of determination. Both taxes and regulation on motor transport vary among the States and, while it has been strongly urged as the only solution, the committee believes it impracticable to get uniformity by any plan for concert of State action. Our studies clearly indicate that in some States automotive vehicles do not bear their full burden of taxes. We think they should pay the carrying charges and cost of maintenance of the highways they use and also their share of the general tax load. The Interstate Commerce Commission recommends regulation of interstate buses and extension of their jurisdiction to include interstate trucks. The committee believes that the situation requires general Federal jurisdiction of motor transport. It recognizes that no such intricacy of regulation as characterizes railroad supervision can ever be extended to this field, but it is convinced that a broad measure of Federal and uniform State control can and should be applied.

A valuable advance is registered in the recent report of the joint committee of railroads and highway users on the regulation and taxation of highway transportation recommending principles governing the subject which have been agreed to by these diverse interests. This kind of public-spirited cooperation is one of the most hopeful aspects of this difficult problem.

(6) Wages and working conditions of labor in transportation are determinable by established procedure in another forum and are not within the scope of this inquiry. There should be no heavier burdens on the railroads in employing labor to operate automobiles than on their competitors. In the railroads (as in other industries) rates, capitalization, salaries, and wages must all follow changing economic conditions, but none should be sacrificed for the benefit of others.

It is asserted in behalf of the railroads that certain restrictions imposed on them in the matter of hiring labor for truck and bus operation which automotive transport escapes, unfairly prejudice the railroads and that labor in this competing industry is not properly protected. The committee thinks that the railroads should be under no greater restrictions in employing labor for automotive operation than are other automotive users, but it would prefer to see equalization by improving conditions in automotive labor rather than by impairing conditions of employment in railroads.

The committee regards the particular wages and conditions of labor generally as beyond the scope of its inquiry. It merely offers the suggestion that, while Governments cannot and should not attempt to regulate the use by owners of their own automotive property, they might, in assessing taxes or issuing licenses, impose conditions of employment on vehicles not operated by owners.

The committee believes that a permanent and universal liquidation and downward adjustment of values and incomes of all kinds have occurred in this country and that railroad rates, capital structures, salaries, and wages must all respond to this generally changed condition, but that none should be sacrificed for the benefit of others.

A considerable number of obsolete rules governing overtime, hours constituting days' work, and restrictions on service, survive in the railroad wage structure. The committee does not wish to see labor lose any of its hard-won improvement in conditions, but it believes that the just substance of them can be retained without adherence to obsolete forms, and that labor is as eager as railroads to modernize and simplify the structure of wages and working schedules.

We regret that the labor organizations did not see fit to avail themselves of the committee's invitation to submit their recommendations on the general subjects of our investigation. We had hoped to have the benefit of their wide knowledge concerning railroad labor conditions and also their views on the best methods of protecting labor in railroads from conditions in competing methods and of improving conditions in the latter field. It is only fair to call attention to the fact that our material does not include any presentation by the labor organizations of any facts that might have seemed pertinent from their point of view.

(7) Beacons, weather service, and similar auxiliaries to air traffic should be maintained at public expense and air transport should be encouraged during its development stage but we believe that every such service should ultimately pay its own way.

Air service is diverting some traffic from railroads and threatens greater inroads. Here again the railroads are confronted with a development of human progress. It cannot be handicapped in their behalf. The most that they can ask is that it be not unfairly advantaged and, for reasons stated herein, we think that the real railroad remedy against this competition is to enter and help develop it.

Existing American airways are unquestionably subsidized at public expense. Various forms of flying aids are maintained. Mail contracts, paying much more than receipts from air postage, are in effect with a deliberate purpose of subsidy and there is no doubt that lower rates on all air service are thus made possible at public expense.

The committee believes that beacons and flying aids are like lighthouses and navigation aids at sea and cannot be abandoned or charged for. The railroads were themselves subsidized in their development period. We cannot condemn Government aids to the inauguration of this valuable service. But, however much subsidy may be justified in a development period, we feel that every established transport service should ultimately be self-sustaining, that air service has a definite place, that it will inexorably take that place without the continuing necessity for the subsidy granted in the early stages of development and that the necessity for such aid is even now decreasing. It is of the utmost importance that such aid as is given should be fairly and economically distributed.

(8) The committee has no recommendation to make on pipe lines.

There are projects for a wider use of pipe lines as a transportation agency but at present they do not constitute a problem. They are not subsidized and they are effectively regulated. The subject has been ably and exhaustively studied by the House Committee on Commerce in a forthcoming report. From our own studies we do not recommend further present affirmative action.

II. The policy of trying to appraise railroad properties on some selected basis of valuation and then saying that they are entitled to earn a fair return on this appraisal should be reconsidered. Where competition with trucks and other methods exists, it will determine rates. In other cases rates must be regulated but the basis of costs of operation under efficient management is a better general guide than any attempt to preserve capital structures regardless of economic trends. We see no reason why the rate-making rule should not say in plain English that railroads are entitled to make a reasonable profit based upon costs of efficient operation and that they are not entitled to earnings merely to preserve present structures if overcapitalized.

Notwithstanding social and economic dependence on railroads—right or wrong—we have, since the beginning, relied on private initiative for their development and financial support. Profit is the only incentive to private investment. Unless the railroads are permitted reasonable earnings on the cost of efficient operation, there is no alternative to Government ownership and complete socialization of our railroad system. But that does not mean that railroads, any more than other industries, are entitled to a guarantee of earnings on their investments in property. In early periods of railroad development and unregulated monopoly, the profit incentive was overemphasized and resulted in unconscionable abuse. Extravagant profits, or the hope of them, contributed to the rapidity of the extension of the system, but they also got a sharp rebuke in certain instances of attempted confiscatory rate regulation. The courts intervened with an opinion that rate making must be limited by the right to a "fair return" on the value devoted to public service. Though originally probably intended as a protection against confiscation in individual cases, this principle, by a process of evolution, became a rule governing the general level of rates.

We think this rule should be abandoned. Nobody ever thinks of saying that the cost of bricks and mortar in an industrial plant should determine what it shall charge for its products. If it can keep its costs low enough to earn a profit on what its product is worth to the public in competition with other products, then it is worth from 10 to 20 times what it can earn. If it cannot do that, it is as apt to be a liability as an asset.

In his sense, the present railroad rule puts the cart before the horse. It tends to ununiformity of results, perpetuation of debt and of obsolete and exeggerated capital structure, insufficiency of allowance for obsolescence and depreciation, inadequacy of surplus and reserves, and maintenance of unnecessary properties and facilities. The results are unjustifiably high rates in some cases and low rates in others. It evolved on the theory that, if not so restricted, the railroad monopoly would earn inordinately. That theory is becoming obsolete. The day is not far distant, if indeed it has not already arrived, when, even if wholly unregulated, some of our railroads may have difficulty in earning a "fair return" on asset values, no matter by what rule such values are defined. These competitive developments are inexorable. The public is entitled to all benefits of the march of progress and nothing will prevent that consummation. We think that the right principle of rate making is as follows:

Wherever there is fair economic competition it will decide the rate question andi t should be permitted to do so freely. Where there is no such competition the problem of rate regulation arises, but costs of service under efficient operation are a better general guide than some arbitrary determination of asset values.

If, on that basis, a railroad cannot earn eonugh to support its capital structure, the remedy is not to raise rates. It is to revise the structure. And if on no reasonable revision can the capital structure be maintained, it is an economic misfit. Parts of it that cannot live should be abandoned and the rest either set up in a new system or consolidated with other groupings.

Fixed railroad indebtedness is not commonly retired. It is refunded. It is a universal rule of financing that any debt for purchase of productive facilities should be amortized during the lives of those facilities out of returns from their use. Railroads are not exempt from this well-established principle and rates should be subject to no restriction which contravenes it. A cause contributing to the present crisis is the unwieldy proportion of interest-bearing debt in railroad capitalization, much of it representing facilities long ago scrapped. We distinctly do not believe that past mistakes as represented by present unwieldy debt structures should be salvaged by increased rates. The present debt structure must be revised and losses written off. But, as to the future, we do think that rate making should look to the retirement of new debt incurred for purchase of productive facilities during their lives and out of returns from their use.

The Interstate Commerce Commission petitions for "A simple rule which shall make it clear that in regulating the general level of rates we shall always keep in mind and be guided by the need for producing, so far as possible, revenues which are sufficient for the maintenance of an adequate national railway transportation system, and also recognize the principle that the railroads may justly earn a surplus in time of prosperity to offset deficiencies in time of depression."

The Interstate and Foreign Commerce Committee of the House of Representatives recommends the following: "In the exercise of its power to prescribe just and reasonable rates the Commission shall give due consideration, among other factors, to the effect of rates on the movement of traffic, to the need, in the public interest, of adequate and efficient railway transportation service at the lowest cost consistent with the furnishing of such service; and to the need of revenues sufficient to enable the carriers, under honest, economical, and efficient management, to provide such service."

It will thus be seen that those who have given the subject of rate making the closest attention have abandoned the theory of making rates on some basis of valuation. It is said that the principles just dicussed are implicit in both of these suggested rules. If so, we approve them; but the committee sees no reason why a rule for rate making should not say in plain English that railroads are entitled to make a reasonable profit on costs of efficient operation and that they are not entitled to preserve overcapitalized corporate structures.

III. The railroads should do much that they have not done to improve their condition without any Government help at all. They should promptly be freed of all unnecessary restrictions on the doing of it. It has been estimated that less than a 20 per cent increase in traffic would put most of them on an earning basis. In view of the narrowness of this margin of loss and of the very great savings possible in railroad operation, we regard their outlook as far from hopeless.

The effect of protracted depression is to reveal the underlying trends of an era. While part of our transport difficulties are, like other troubles, no more than reflections of depression, continued traffic stagnation has uncovered organic difficulties. It by no means follows, however, that this condition was either caused or can be cured by Government. In this time of extreme stress on everybody the public has a right to expect the railroads to do what they can for themselves before they call on the rest of us, and we are convinced that there is a great deal which the railroads have left undone. It has been said by experienced and informed observers that—because of enforced reduction in expense—a 20 per cent or even a lesser increase in traffic volume would put most of the railroads on an earning basis and that less than a 50 percent increase would restore them to net earning levels of 1929. Passing the question of strict accuracy in these broad assertions, the fact is that here as elsewhere there has been such liquidation of the general extravagance of the 1929 delusion that a very moderate movement on the upward business spiral would dissipate much of the seeming cloud on the solvency of many railroads. The committee is not proceeding on conjectures of unwarranted optimism, but it does seem that if the margin of loss is as scant as this, it is narrow enough to invite some robust action in railroad administration to improve earning statements—not by increased traffic or Government intervention—but by economies and improvements in operation, and perhaps by a reduction in rates to attract more business. That has been the universal action in sister industries and that is the view of some of the leading authorities in railroad management.

Against this view it is urged that railroads have been prevented by statutes and regulations from acting freely or that, where they have been permitted to act, restrictions legally imposed upon them as railroads have been extended to them in new fields. While we believe that this argument is too much emphasized, we have found some substance in this complaint. The committee believes that railroads should be permitted to act along the lines suggested herein subject to no more and no heavier restrictions than their competitors and that the Congress and regulatory bodies owe them a positive duty to relieve them promptly of any handicap whatever in this regard.

(*a*) Railroads should adopt the competing methods of which they complain. Much of the difficulty which the railroads ascribe to automotive and potential air and pipe-line competition should and could have been relieved by an alert and aggressive railroad policy. We believe that if the railroads had regarded themselves more accurately as purveyors of transportation rathen than as guardians of a monopoly, they would have been more alert to take advantage of every development in their field and that a more progressive policy might have turned to their own distinct advantage the very things they now regard as a burden and a threat.

Resort to government as an alternative to self-help is to be deplored. The early transport pioneers did not go to Washington to have their ferries and steamboats protected against rails. They developed the rail service and became controlling figures in the new field. We think it is quite clear that the railroads have been distinctly remiss in not getting the most out of the new methods. It seems to us that the truck, in local and terminal service, motor-drawn equipment on rails and highways in many cases, and the airplane, where rapid transit is required, afford a way to a beneficient transport revolution, that the railroads themselves owed a duty to the public to have led, and that the quicker they do so now the better it will be for all concerned. After they have taken this logical step, we wonder whether they will be so eager to restrict these other forms of transportation as they are now.

(*b*) Railroads should cooperate to reduce competitive expense.

(1) Unnecessary services should be abandoned.

We think that there has not been sufficient cooperation among the railroads. As an example, we quote from the Interstate Commerce Commission's 1932 report, page 37:

"The expenses so chargeable to passenger and allied services for the year 1931 before taxes, rentals, and interest were 110.82 per cent of the revenues from those services. For the freight service the corresponding figure was only 68.62."

The public is familiar with the spectacle of "crack" passenger trains shuttling back and forth across the country empty or nearly so and perhaps, also, with the explanation that this "is necessary to retain the competitive reputation for service"—in other words, for sales promotion or advertising. The committee believes that agreements in good faith and within the law could relieve this expense. We think empty trains should either be filled by reduced rates or taken out of service. With our whole economic structure at stress, sympathy with such extravagance is difficult.

(2) Metropolitan terminals should be consolidated and unnecessary facilities scrapped.

Terminal expenses constitute an astonishing proportion of railway costs. Great economies, and much improved service, are possible through the use of trucks in terminal areas and further large savings by unification of railway and other terminal facilities. Railroads have insisted on separate terminals in metropolitan areas for purely competitive advantage. The resulting multiplicity has imposed high costs, poor service, and great waste. This burden upon shippers is indefensible. Reform is as necessary to modern metropolitan convenience as to railroad economy. It is impossible to deal effectively with the manifold problem of a modern city without a unified plan of development for all forms of transportation. This problem differs in different cities and there are legal and other difficulties involved, but much could be accomplished at once by cooperation among railroads and a complete solution would be greatly facilitated if all forms of transportation were placed under a single regulatory agency and if railroad consolidation were worked out along regional lines.

These improvements would entail wholesale scrapping of some facilities. We cannot follow the argument against the writing off of obsolete, nonearning, and unnecessary properties. We think that there are thousands of miles of trackage and many other facilities, both in terminals and elsewhere, which serve no necessary purpose and which do not now earn and never can. They are handicaps on efficient operation and burdens on the public. Their elimination would reduce capital assets, but it would result in lower rates, better earnings, and improved service.

(3) Circuitous haulage should be eliminated.

Circuity in haulage to keep traffic on the rails of a single system entails great waste for which the committee can find no sufficient excuse. As in all attempts to apply general principles to the infinite variety of circumstance in a great nation, a flat rule requiring freight to be routed by the most direct route, letting the revenue fall where it may, would result in some hardship; but the present practice leads to grotesque results. It is not easy to reduce the effect to figures, but the unnecessary haulage of freight has been estimated at a large percentage of total ton-mileage. Until the railroads are willing, by cooperation, to eliminate this kind of waste, it is difficult to share their apprehension of competing methods.

(*c*) Financial management should be improved.

We have discussed our view of the contribution of existing rate-making rules to present financial distress, but we also question the policy of some railroads in applying too great a proportion of earnings to dividends and too little to the retirement of debt and the accumulation of surpluses and reserves—a practice which we regard as responsible, at least in part, for the existing unfortunate condition of some roads.

(*d*) Transport methods and equipment should be brought up to date.

We acknowledge the restrictions on railroad initiative through regulation of appliances and on railroad resources through rate regulation. We are also aware of the progress that has been made in speed, quality of service, and increase in the radius of use of material equipment. Nevertheless, it cannot be fairly said that railroad advance in applied science is abreast of that in other industrial fields. For example, the improvements in Germany with stream-lined Diesel and electric trains of very light tonnage maintaining schedules of 96 miles per hour to offset motor transport has no counterpart here. The committee has not found it practicable to make exhaustive studies on this subject, but offers the suggestion that the Interstate Commerce Commission authorize, and the railroads set up, one or more central research and engineering organizations to which all railroads in certain groups shall contribute—their products to be available to all contributors.

(*e*) In view of what could be done by better management, the general outlook seems far from hopeless.

Generally speaking, it must be recalled that in railroads—almost alone among sister industries—rates remain at boom-time levels. Adjustment to new economic horizons lags. It is hard for us to believe that whole-hearted cooperation and vigorous application of contemporary principles of industrial management and control, within the various railroad companies themselves, along lines just discussed would not do more than can Government or any other outside force to rehabilitate this most important of American industries.

In depths of depression, as at peaks of prosperity, fundamental values become distorted by the fog of gloom, on the one hand, and the rosy haze of hope on the other. These opportunities for aggressive policy and management coupled with at least some of our suggestions in aid of the transportation situation as a whole seem to us to indicate a distinctly hopeful (rather than a despairing) prospect for the railroads, and we think that both regulating agencies and others having interest and influence in the railroads should act promptly to overcome what seems to us a degree of inertia in this regard.

**IV. Regulatory jurisdiction should be extended to the whole national transportation system but applied only to the extent necessary for public protection. The existing regulatory mechanism of the Interstate Commerce Commission is inadequate and should be improved by reorganization without expansion or increased expense.**

The work of the Interstate Commerce Commission is a contribution to the advancing science of political economy. One has only to read its most recent report to realize the sympathy and intelligence with which it addresses the problems confronting it. It has pioneered a complex subject and, if it has recently operated on principles which this committee regards as in part obsolete, it is important to remember that they are statutory principles. We think that if critics would give more attention to the legal limitations upon the commission and its own repeated recommendations thereon, they would find less ground for complaint.

The studies of the committee clearly indicate the advisability of extension of regulatory jurisdiction to the whole transportation system. The committee feels that a judicial type of organization, such as the Commission now has, is inappropriate to its present work and wholly inadequate to a wider jurisdiction. In extending its powers, it is not necessary to expand its personnel and expenditures. What is needed is to reorganize its functions, divide its work, and give it a form and method more appropriate to the tasks before it. At present they include rate making, and that is at least a quasi-legislative function; decisions in conflicting causes, and that is distinctly judicial; and supervision of administration, and that is certainly executive. From another angle of analysis, we find it attempting to plan, and that is a staff duty, and to carry plans into execution, and that is purely operative. For all these inconsistent purposes, it must finally act in a body on many questions, with no sufficient latitude for delegation, and that is utterly inconsistent with any modern theory of operation except for legislative and judicial action of the very highest order.

The data before us indicate that (whatever may be the limits to which actual regulation or administration is extended) the necessity for planning and for comprehensive information on the whole transport problem is absolute. A cogent railroad argument is to the effect that the Government has regulated the initiative out of the railroads, and that by reason thereof they are in their present plight. While there is a tendency to overemphasize this, three facts remain: First, that the Government, principally through the agency of the Commission, has for many years assumed to dominate railroad administration; second, that railroad policy and management are not abreast of sister industries; and third, that some railroads are in a perilous condition. Nobody can assume authority without accepting responsibility. The existing railroad condition speaks for itself to say that regulation by the Commission has left something to be desired.

The lack of incentive or authority in the Commission to plan and to act affirmatively is evident throughout its most recent report. It hopes that "efforts have been or will be made to bring the rival transportation agencies into some measure of agreement." It thinks that "no rival transportation agency should be given unfair advantage," but complains that "there is no adequate information * * * nor do we know of any comprehensive and definite plan for a cure * * *." It believes that the public "safety and convenience" should be protected by regulation of automotive agencies but asks for "a thorough investigation under authority of Congress." It says of regulation of port-to-port rates, "We have not investigated this subject, but are convinced that it merits serious consideration by Congress." Speaking of restrictions on railroad ownership of water-carrier lines, "If the railroads wish this prohibition removed, they should so request the Congress without further delay. Until the reasons for such a change have been fully presented, we have no opinion to express upon it." On the question of stifling of railroad initiative, there is the suggestion that the railroads "ask the appropriate authorities for definite relief." Without unduly extending these quotations, it is fair to say that the whole report is eloquent of a somewhat passive attitude toward acknowledged evils and also of grave difficulties that have arisen from drastic regulation verging on administration by an authority which sits and hears but has only a limited scope in which to inquire and plan and act.

If, as we think it should, the regulating body should pass on railroad corporate reorganization, there would be a new and expert function for which we think the Commission is not now equipped or organized. There should be a separate department and an appropriate expert personnel for this work. This is an emergency matter.

The organization should be reformed without expansion to act along wider and more affirmative lines with less attempt to run the business of transportation and with more concentration on protection of the public, and maintenance of a healthy national transport system. It should have inquisitorial powers and duties to keep constantly abreast of changing developments and should be required to report annually to Congress on the state of the Nation's whole transport system with its recommendations for betterment.

Its activities should be reorganized with appropriate separate departments, with a chief at the head of each, for its legislative, executive, and judicial functions, and for each major special function such as control of corporate reorganization. It should have also a planning department with a research staff and such other departments as experience indicates. Except in the exercise of its more important legislative and judicial functions, departmental hearings and decisions should be sufficient and action as a body should not be required. While all heads of departments should sit in council on basic policies and important problems, the body should have a vote only on the most important legislative and judicial decisions. Either one man, or at most an executive committee of three, should have exclusive responsibility and authority in all executive functions, and final decision in all but the more important legislative and judicial functions of the separate departments.

This form of organization and method divides, decentralizes, and so speeds works, permits specialization, yet assembles special views on general policies. It retains the advantage of the committee form for council but secures the advantage of a compact responsible group for action. All these attributes will be needed in the tasks inevitably confronting future transport regulation and only a few of them are available now.

V. Emergency recommendations.

(1) Corporate reorganization can and should be facilitated by revision of the bankruptcy procedure.

Present railroad distress is sufficiently shown in the current report of the Interstate Commerce Commission, that 122 class I railways failed to earn fixed charges in the first three quarters of 1932. The financial structures of many railroads carry too many inflexible charges and too few liquid surplus assets to survive protracted nonearning periods. This condition cannot be cured by increasing rates to salvage old mistakes or by lending Government money to preserve them. They require realistic reorganization in accordance with the facts. Some railroads can hope to survive only on drastic reorganization and scaling down of fixed obligations.

The Reconstruction Finance Corporation was created to tide over an emergency, in the hope of some recovery, but this use of Federal credit encountered a link between the emergent and the more permanent problems. The fixed charges of some roads are heavier than any fair prospect of restored traffic will bear. The corporation cannot pour public treasure into situations where, instead of temporarily supporting operations and loaning to maintain prudent interest payments, there is a wasteful delta of outflowing streams of interest on unsupportable capital structures. That would postpone inevitable readjustments at public loss to no good purpose. There is need to reform these topheavy structures to make them available for emergency aid before it is too late and the present legal mechanism is too slow and cumbersome to serve.

We recommend revision of bankruptcy procedure to permit prompt and realistic reorganization of overcapitalized corporate structures without destructive receiverships and judicial sales on depressed markets to the end that the railroads' justizable borrowing requirements may be met with safety to the lender under adequate protection.

(2) The recapture clause should be repealed retroactively.

The so-called "Recapture clause" of section 15-a of the transportation act is based on an economic misconception and has proved to be an element of uncertainty in railroad financing. We join the recommendation of the Commission for its repeal "both for the future and retroactively."

(3) The statutory rule of rate making should be revised.

Reasons and suggestion for amending the present rate-making rule are discussed beginning at page 21. As was there stated, rate making cannot be made to preserve unsound capital structures or to "attract capital" regardless of what the service is worth but if the rule is put on a common-sense and forthright basis, we can approach the railroads' financial problem with more intelligence. While this is a permanent as well as an emergency reform we think it is important to a prompt and sound solution of the railroad problem. We understand that both the Interstate Commerce Commission and the House Committee on Interstate and Foreign Commerce recommend a change and regard its necessity as emergent. Indeed the committee found no opposition to change in any of the evidence or representations before it.

(4) "Adequate security" does not necessarily mean "marketable collateral."

The Reconstruction Finance Act requires "adequate security" for railroad loans. It should do so and we recommend no change in the law. As a matter of interpretation, however, if, upon reorganization of overcapitalized structures or on sound existing structures, a particular loan is sufficiently protected by priority of lien and reasonable prospects of earnings available to its priority of payment, we do not regard marketable collateral as a determining factor. In fact we believe that, with prompt improvement of capital structures where necessary, private capital will be available for necessitous railroad loans.

BERNARD M. BARUCH, *Vice Chairman.*
CLARK HOWELL.
ALEXANDER LEGGE.

NEW YORK, *February 13, 1932.*

## SUPPLEMENTAL REPORT OF ALFRED E. SMITH

While I am in substantial agreement with the greater part of the committee's report, this supplementary memorandum states may conclusions in my own language, placing the emphasis where I think it belongs.

### EMERGENCY ACTION

As to emergency action, I recommend the following:

1. The recapture clause of the Transportation Act should be repealed retroactively.

2. A debtor relief act with a special provision governing railroads, which will have for its object scaling down debts and composing differences without bankruptcy receiverships, should be passed, but its operation should be for the period of the emergency only, which for the purposes of this act should be declared to end on January 1, 1935.

After most careful consideration I cannot recommend as an emergency measure that there is immediate need of action by Congress to make a new statutory rule of rate making, nor that the present powers of the Reconstruction Finance Corporation to make loans to railroads should be extended or materially changed. Specifically I believe no useful purpose will be served at this time by an extension of the powers of the Reconstruction Finance Corporation with regard to railroads so that they can make additional loans without full collateral, upon the assumption that railroad rates will be adjusted in such a way that these loans are bound to be repaid.

Coming now to the basic troubles which afflict the railroads I have considered carefully the diagnosis offered by numerous groups and individuals, and the corresponding cures. No purpose would be served by extended analysis and comment because this subject is fully covered in the report of the staff. My conclusions are stated herein in summary form.

### THE RAILROAD'S COMPETITORS

As to the subject of competition by air, water, pipe, and highway lines, I believe that the effect of competition of these lines upon the railroads has been exaggerated. Drastic regulation of competing services is not the solution of the railroad problem, and such regulation should be established only in the general public interest. Regulation is expensive. It is bureaucratic. Once established it expands, and it paralyzes private initiative without offering constructive leadership. I believe that the air lines should be left as they are at the present, with no more regulation than is now provided for. This is a new field, and the less private initiative is interfered with the better it will be in the long run. The railroads had their day of freedom from restriction coupled with enormous Government subsidies. That day is over, and individual initiative in blazing trails and laying ties for railroad lines across the Rocky Mountains and the Sierras is no longer needed. Air lines are an infant industry and are entitled for the present to some Government help without undue regulation.

The pipe lines are built. They serve a very limited purpose. They present no serious menace to the railroads. I see no advantage in extending regulatory control over them.

As to water transportation, with particular reference to inland waterways, I believe that Government subsidies in this field should be curtailed, not primarily because they result in unfair competition with the railroads but because these subsidies have not proved effective. Certainly the New York State Barge Canal cannot be said to compete with the existing railroads, because in spite of construction and maintenance by the State and free tolls, the barge canal carries so little freight that it presents no problem to the railroads. The New York State Barge Canal is an heirloom. Sentiment rather than common sense makes us keep it up. I am opposed at this time to the construction of the St. Lawrence Waterway, because it would be a waste of public funds. Present rail facilities are more than adequate to provide for everything which the proposed canal can accomplish. The cost of moving grain would not be lowered by this canal sufficiently to justify the enormous expenditures which it would involve, keeping in mind also that this waterway would be open only for a part of the year and that the railroads would have to be used anyway the rest of the year. I believe that a special investigation should be conducted into the Inland Waterways Corporation to discover exactly what it costs the War Department to operate this corporation and whether or not further expenditures for this purpose should cease.

As to competition by motor trucks and busses, the testimony given before us does not indicate to me that the competition is at this time as serious a menace to the railroads as they claim it to be. Interstate trucks and busses as yet carry only a comparatively small part of all freight and passengers. On the other hand it is unquestionable that this form of transportation will soon be used more and more, because it is economical and efficient. In a number of cases busses and trucks have actually relieved the railroads of burdens on short hauls and have enabled them to cut down train service where these could not possibly pay.

Extravagant claims are made as to the penalizing of railroad as contrasted with highway transportation by taxes and by numerous regulations affecting service and labor. Trucks and busses are already substantially taxed through license, gasoline, and oil taxes, and these are being steadily raised so that within a short time, in the course of normal events, the users of highways for commercial purposes will be paying their full share of the cost of construction, reconstruction, and maintenance. The tendency in every State is to make them pay their way, and the Federal Government is already taxing them for gasoline. In fact, at the present time in many States of the Union gasoline and license taxes are being diverted from highway maintenance and construction to other fields of Government expenditure.

While there is much to be said for regulation of all common carriers on highways by the Interstate Commerce Commission or some other Federal agency and by the appropriate State regulatory agencies, it should be noted, however, that such regulation cannot reach the individual farmer, merchant, and owner who is not a contract or common carrier. I believe that such regulation should for the present befor the purpose of insuring responsibility and fixing the physical standards for vehicles and for similar purposes, rather than for the fixing of rates. This is practically what the railroad and bus representatives themselves have recently agreed on. The plan for a Federal license tax with a return to the several States of their respective shares, suggested by various witnesses, seems to me to be impractical, undersirable, and at present unjustified. I believe that the railroads should go into the bus and truck business on a larger scale and that they should be encouraged to do so by appropriate legislation.

## GRADE CROSSINGS

As to elimination of crossings at grade of highways and railroads, I believe that the railroads' shares of the cost should be materially reduced. In many States the railroads' share is as high as 50 percent. This is unduly burdensome and unfair to the railroads, and it has naturally resulted in bitter opposition to elimination orders and the general slowing up of the crossing-elimination program. This reduction cannot, however, be accomplished by Federal legislation or fiat. It must be brought about by persuasion in the several States.

I cannot subscribe to the recommendation made to the committee that Congress should fix a maximum rate of taxation on railroad property beyond which any State and local levies would be invalid.

### VALUATION

Coming now to valuation, I have not been able to give this subject sufficient study even to attempt a solution. The questions involved are exceedingly intricate. Members of Congress and experts outside of the Government have been studying them for years without coming to a satisfactory conclusion. From a superficial study, I am not entirely satisfied that the prudent-investment theory is unworkable. The reproduction-cost theory is obviously obsolete and must be discarded. I cannot subscribe to the idea of basing railroad rates on ability to attract new capital, on the present-cost theory, or on the theory of the natural rule of survival. I doubt whether the courts would sustain or the public tolerate the survival theory. The present-cost theory would tend to put the seal of approval on existing chaotic and wasteful railroad organization. The theory of fixing rates to attract new capital begs the whole question. It starts with a conclusion and adjusts all the facts to meet it. Moreover, this theory would defeat itself because the public would not be able to pay the high rates which it would bring about. In the end there would be less traffic and less revenue than before. Moreover, even if the public were able to pay the bill, I believe that the adoption of this theory would perpetuate bad management, write up values of many railroad securities beyond their actual worth, and take away the incentive to consolidation and good management.

A new principle of valuation has recently been proposed by the Committee on Interstate and Foreign Commerce of the House of Representatives which seems to me to have considerable merit, but which is in such general language that it is difficult to see how it can be made the basis for the scientific determination of rates. It seems to me, however, that this is a subject which Congress should decide.

Whatever principle is adopted, I am satisfied that the general public will not tolerate writing up values or increasing rates merely upon the theory that a great many railroad securities are held by savings banks, trustees, and insurance companies as security for widows, orphans, and other beneficiaries of trust. It must be recognized that many railroad bonds are worth less than par, in the light of conditions entirely separate from the depression, and that railroad stocks have declined even more in value. These assumptions are based upon any common-sense theory of true valuation, whatever it may be. Similarly, I do not believe the public will approve the proposal that railroad rates should be high enough to retire a substantial part of outstanding bonds, because this will be regarded as just another way of attempting to give present bonds artificial values.

### THE INTERSTATE COMMERCE COMMISSION

Taking up now the general question of Federal regulation, we are all agreed that effective regulation is an indispensible feature of the solution of the transportation problem. I find, however, little in recent history to justify the continuance of the Interstate Commerce Commission as now organized. This implies no criticism of its members. They have attempted to function under an obsolete and unworkable law, and in the face of conditions which call for intelligent planning and leadership as distinguished from endless debate on details. Everyone admits that more and more of the work of the Board must be delegated anyway, and if this is so, the question arises as to why a board is needed at all. I believe that too much emphasis has been placed on the judicial functions of the Interstate Commerce Commission, especially on valuation and rate making, and too little on planning and administration. The complete break-down of the present valuation formula has left the Commission in a condition which would be laughable if it were not so serious. The scrapping of the present formula opens up some very interesting questions for taxpayers. What, for instance, becomes of the tons of statistics and other data collected on the basis of the old formula? What of the pay-roll army of Federal commissioners, counsel, experts, and clerks? What of the wasted time of local officials, railroad representatives, farmers, business men, and commercial organizations? Suppose that just a little common sense had been substituted for all this scientific hash, this maze of regulation and red tape? I favor the abolition of the Interstate Commerce Commission and the creation in its place of a new department of transportation headed by one man, or a one-man bureau head in the Department of Commerce, determining policies with the approval of the Secretary of Commerce. What we need is a new transportation system, not endless hearings on a system that does not work.

THE FUNDAMENTAL PROBLEM

I a convinced that the fundamental problem of the railroads is that of nation-wide consolidation and reorganization to reduce costs and rates, and to write off losses. The era of railroad pioneering and competition is over. The roads must reduce overhead and operating expenses. They must scrap unnecessary, competing, and weak lines. They must get rid of obsolete equipment. They must cut out unnecessary services. They must use trucks and busses, eventually air transportation, and, if necessary, waterways and pipe lines as a supplement or substitute for rails wherever these new forms of transportation are more economical. The establishment of a limited number of strong regional railway systems would be a start in the right direction. Even this will leave a certain amount of wasteful and unnecessary competition.

Whatever may be the basis of valuation and rate making, there must be a scaling down of many railroad securities. I believe that the banks, trust companies, insurance companies, and other holders of railroad securities must be realistic about this phase of the problem. The public will not stand for making them a preferred class of investors, who must get a hundred cents on a dollar, irrespective of the true value and condition of the business they have invested in, when values in all other fields are being readjusted and cut down.

The question for the railroad executives, directors, and security holders to decide is whether the steps taken in this direction should be compulsory or voluntary. To date voluntary regional consolidation under the auspices of the Interstate Commerce Commission has made little progress. The question has been raised whether compulsory consolidation is constitutional. As distinguished an authority as the late Senator Cummins thought it was, but there is no decision of the United States Supreme Court squarely on this subject. There is much to be said for the theory that we are moving inevitably toward one national railroad system. Upon this theory, the major railroad systems might well give serious consideration to the appointment of some sort of an impartial chairman, arbitrator, or director general to coordinate their present activities and to prepare a plan of permanent consolidation.

If the railroads show no willingness to reorganize, reorganization can surely be brought about by some form of condemnation or eminent domain. I believe that the railroads will be unsuccessful in attempts to maintain their present physical, operating, and financial structure at the expense of the general public by penalizing competitors and raising competing transportation costs, inflating securities, raising rates, limiting taxation by States and muncipalities through Federal legislation, borrowing Government money without adequate security, and other like devices. Similarly, attempts to bring about economy largely at the expense of railroad labor will prove unsuccessful unless this is part of a logical general reorganization in the interest of the public. Undoubtedly many wasteful and unjustifiable regulations have been made governing railroad wages, hours, and conditions of labor, and others which, however admirable in themselves, the country simply cannot afford today, but the railroads cannot expect public support in changing these regulations merely as a means of retaining and perpetuating other conditions which are equally wasteful. They cannot expect to make labor the only scapegoat.

Those who are responsible for present railroad management need not complain of radical or drastic governmental action in the near future if they are unwilling even to attempt to meet their problems in a bold, forthright way through their own initiative and cooperation. They have an unrivaled opportunity to do themselves and the country a great service. They should have the guidance and help of the National and State Governments in this effort.

ALFRED E. SMITH.

## APPENDIX 1

### LETTER OF INVITATION

Hon. CALVIN COOLIDGE,
Hon. ALFRED E. SMITH,
Mr. BERNARD M. BARUCH,
Mr. CLARK HOWELL,
Mr. ALEXANDER LEGGE,

GENTLEMEN: The present financial position of the railroads of the United States is a matter of grave concern. Collectively the greatest and most important industry of our country, the railroads have operated in this year at staggering deficits. Only wise and timely Federal aid has averted the financial breakdown of important systems.

This situation touches every citizen. It affects directly the security of wage and employment of the 1,500,000 railway workers. It affects equally the many and important industries supplying railway equipment and supplies. It touches the financial problem of local, State, and National Government, to the support of which the railroads contribute over $300,000,000 annually in taxes. It has given rise to a severe decline in the value of the $19,500,000,000 of railroad obligations and shares, and has occasioned concern to institutions which hold such obligations among their assets, representing in part the savings of that thrifty portion of our population which is to be found among the policyholders of insurance companies and the depositors in savings banks. The relief that the present emergency has made it necessary to grant to the railroads is a drain on the Federal Treasury, and any ultimate loss will constitute a burden on every taxpayer.

The present deplorable position of the railroads is not due wholly to the stagnation of traffic resulting from the long-continued depression. Many of the present ills are due to governmental, financial, labor, and management policies, some wrong in conception, some wrong in application, and others rendered obsolete by radically changed conditions. As a result, the railroads have not been in a position to adjust themselves, as well as have other industries, to present conditions.

There are many disagreements as to causes, many disagreements as to remedies, but unanimous agreement as to the urgent necessity of some thoroughgoing solution of the problem. No solution, however, will be effective unless the problem of the railroads is considered as an integral part of the entire transportation problem of the United States, whether by rail, highway, waterway, pipeline, or air.

Every industry in the country is entitled to fair treatment—the railroads no less than the others. The public interest must certainly be protected, but regulation should not place the railroads at a hopeless disadvantage with competing agencies and destroy flexibility of operation and management initiative. The railroad workers are entitled to a fair wage and the greatest possible security of employment. The holders of railroad securities are entitled to a fair and stable return on the true value of their investment.

But more important than the interests of any one group, the people of the United States are entitled to the most effective and economical form of transportation to meet their various needs, whether by land, water, or air. Each form of transportation should be unhampered to provide effectively at a reasonable cost and at a fair profit the service for which it is best fitted. No form of transportation should be favored either at the expense of another agency or at the ultimate expense of the people of the United States.

We, the undersigned organizations, representing many of the interests concerned, believe that there is no more important present task than a thorough and satisfactory solution of the railroad problem as an integral but the most urgent part of the entire transportation problem. We beg that you examine all phases of the problem and recommend a solution which, with due regard for the public interest, will ensure an opportunity for the railroads of this country to operate on a business basis, to the end that there may be a stabilization in employment of wage earners and in the values of investments made in behalf of insurance policyholders and savings-bank depositors and a general enhancement of the prosperity of the country which to so great a degree depends upon the prosperity of the railroads and of the many lines of business which in turn depend upon them.

## Statement of John R. Waller, President International Bank, Washington, D.C.

A study of the economic problems of the United States brings us face to face with a depression that is world-wide, and in order to outline a sound program of relief and recommend remedial measures it is necessary to analyze the economic conditions affecting the Nation. Under modern conditions international cooperation is essential to maintain the equilibrium of any country. Our Nation is so constituted that most of our large industries cannot be permanently successful unless they can sell in foreign markets. Extreme nationalism has become an economic impossibility. No nation, state, or even city can prosper indefinitely while its neighbors are impoverished.

For years this country was able to avoid the devastating effects of world deflation and the results of domestic maladjustment but was finally engulfed. It was found impossible to maintain prosperity levels in the United States in the face of demoralized world prices. Since the latter part of 1929 liquidation, credit deflation, and falling commodity prices continued to an unprecedented extent. Two hundred billions in property values crumbled away. Public confidence vanished and pessimism and fear became the general attitude. We are in the midst of the Nation's most serious crisis, and, save for the stimulation beer may give, nothing has been done toward reviving business.

While opinions as to the primary cause of the world depression differ, there can be no doubt that the fundamental causes flowed from the Great War with its appalling toll of 10,000,000 lives and 20,000,000 maimed, in addition to the destruction of over $300,000,000,000 of wealth, augmented by debts of $200,000,000,000. In the United States the proximate cause may be attributed to world conditions and the collapse of overextended credit, which had resulted in overexpansion, with a $50,000,000,000 construction boom ending in an orgy of reckless extravagance and wild speculation.

In addition to these factors the Nation experienced unparalleled commercial and social changes. During the last 20 years business and industry passed from a condition of comparative simplicity to the complexities of the present day. Never before have fundamental conditions changed so rapidly in so short a period. The outbreak of the Great War prevented a depression which seriously threatened the United States. Since then practically every field of commercial activity has been revolutionized. Sweeping changes were made in our industrial policy, with leaders of the new order advocating low unit costs by labor-saving machinery, mass production, standardization of output, and elimination of waste. Motor-car production increased from 900,000 in 1918, to nearly 5,000,000 in 1929, and in the same year automobile registration reached a total of 26,500,000. Industrial supermechanization resulted in a steady increase in technological unemployment. American inventive genius progressed and machinery and equipment often became obsolete over night. Chain stores superseded the independent retailer. Chemistry furnished constantly new miracles. Oil supplanted coal to a large degree.

During this period the business of brewers and distillers was confiscated by the eighteenth amendment and the value of their plants decimated. Motor transportation became a crushing rival of steam and street railways, and brought to an end the business of carriage, wagon, and allied manufacturers. Dozens of other industries were annihilated by the evolution of new processes. Automobiles also displaced several million horses, and the produce of nearly 50,000,000 acres which would have been required for their maintenance, has been thrown upon an overburdened agricultural market. The automobile has much to answer for in the current depression, although it appeared as one of the main factors in the recent boom.

An examination of production and indebtedness during this period establishes the startling fact that for years our debts have been increasing at a rate faster than production, and both of them faster than the ratio of population. Cities, States, and the Nation vied with each other in reckless expenditures. Combined Federal and State indebtedness increased from a few billion to over thirty billion dollars. Taxes have become excessive and in many cases confiscatory. In 1929 the national income was nearly $90,000,000,000, while in 1932 it fell to less than $40,000,000,000—about equal to tax levies, together with interest on private debts. The total revenue from income taxes for the fiscal year 1931–32 did not equal the cost of our Veterans' Administration service. We have reached a point when the total income of the people is insufficient to pay taxes and interest on indebtedness.

And yet, only a few years ago, confidence and prosperity in the United States reached the highest point in its history, and the long-hoped-for ambition of the Nation to abolish insecurity, drudgery, and poverty appeared within the realm of accomplishment. However, this magical prosperity, "the new era," as termed by some economists, was accompanied by many vicious characteristics, and gradually the moral fiber of the people was undermined. In many instances business ethics became those of the racketeer and executives thought in terms of big salaries, bonuses, and stocks. Financial manipulations and dishonest promotions became a national scandal. Bankruptcy and receivership rackets were countenanced by the courts, while corruption of public officials became commonplace. Prohibition brought the bootlegger, the speakeasy, and the racketeer, while churches fought a losing fight and struggled to keep the spark of faith alive. It has been estimated that the annual loss in the United States through crime is in excess of $12,000,000,000. The morals of the people reached a low ebb in an effort to conform to the ideals of the cinema and theater, controlled by an alien race. So much for the social and industrial aspects of this period, with which we must become familiar if we would attempt to solve our economic difficulties.

As to "constructive suggestions with respect to the solution of these problems," we must realize that in the language of Justice Stone of the United States Supreme Court, "The people of the United States are now confronted with an emergency more serious than war. * * * Some people believe that the existing conditions threaten even the stability of the capitalistic system." It is evident that drastic measures are essential to defeat this enemy within our borders. Heretofore, we have been trying to work out of our difficulties by adopting ideas derived from past ages, in days of hand labor, to a complicated society in a machine era. The methods of procedure must change to meet existing conditions. It is imperative that the purchasing power of the people be increased, so that the price level can be restored. Confidence must be reestablished and poverty and fear destroyed. The relief of unemployment, the profitableness of all enterprise, and the stability of the Government itself depend on this being done.

Fortunately, we are in a more favorable position to overcome the depression than any other nation. We have a preponderance of the basic wealth of the world and a market created by over 120,000,000 inhabitants who normally use 90 percent of the products of our mines, mills, farms, and factories. The present administration is giving the people new hope, and for the first time in 3 years preliminary indications of vigorous action have aroused an enthusiastic response in the Nation. Governmental economies directed toward a balanced Budget, together with a strengthening of the banking system, and restoring confidence in the security markets are the first logical steps in the "new deal." When the program gets well under way, it is likely to shock conservatives, but all orthodox remedies have been tried and found ineffective, and we may as well realize that depressions do not cure themselves. It is a testimonial to our unemployed that they have waited patiently through four long winters, and human endurance, so far as they are concerned, has almost reached its limit. The Nation is prepared for bold experiments, but it will not tolerate further inaction. Promptness is essential, otherwise a complete social and economic debacle is inevitable.

As existing policies are ineffective, what practical plan is available by means of which the unemployed may speedily be put back to work, purchasing power increased, and economic recovery assured? For the outline of this plan I am indebted to W. Jett Lauck, of Washington, D. C.

## NATIONAL PLANNING

It is obvious that industry can not and will not resume operation unless it is assured that its operations will not result in a loss. This means that industry must have assurance that output can be sold at a price sufficient to cover operating expenses plus a reasonable return on capital invested. To meet this fundamental requirement, stabilization of prices and production under Federal supervision is the only practical method which can now be adopted for economic recovery.

The agencies for successfully carrying through such a program should consist of governmental stabilization boards with administrative powers to arrange production and price schedules, operating under the advice of a national economic council composed of members representative of all branches of business and finance assisted by the best expert assistance obtainable.

Separate stabilization agencies, as recommended by the United States Chamber of Commerce, should be permanently created for each of the natural resource industries, such as bituminous coal, oil, and lumber.

As to the manufacturing industries, one general stabilization board would be sufficient, under the general direction of which separate boards for each basic industry could be created.

The development of disastrous competition from abroad would be prevented by giving authority to the general stabilization board to exclude all foreign products the importation of which tended to interfere with its program.

Let us assume the necessary legislation has been passed, an organization perfected, and an economic council set up. After a careful survey it could inaugurate cautiously the new policy by increasing production and employment 20 per cent for a period of 3 months. Different classes of producers would then be authorized to form trade associations, agree upon the price based on the new production schedule, allocate the quota among themselves, and submit their agreed-upon procedure to the stabilization board for their industry. After examinations and hearings, the schedules would be approved and licenses issued. The requirements of licensees could be certified by the stabilization boards to the Reconstruction Finance Corporation and the necessary credit would be forthcoming.

Failure of the program thereafter would be impossible. A stable price to yield a fair profit would be assured and net income would be at once developed by producers. The national pay roll or the combined purchasing power of the country would be increased 20 per cent, or approximately $800,000,000 per month. Employees would be assured of steady employment and would freely spend. Fear and hoarding would cease.

The study being made of economic problems by the Committee on Finance of the United States Senate has resulted in the testimony of a great many witnesses whose views are widely at variance. It will be generally agreed, however, that public confidence will respond promptly to appropriate legislation on the following subjects.

### PUBLIC WORKS

A large program of public and semipublic works is necessary to commence the restoration of national purchasing power. Funds should be made available at low rates of interest for self-liquidating quasipublic projects. This will be a strong factor in the restoration of public confidence. The Government has not met its responsibility for relief of the unemployed. National works on a major scale will expand wages and revive business. The sale of necessary bonds to the public can be made certain by using the methods used successfully in the Liberty loan issues.

### AGRICULTURE

The American farmer has been the greatest sufferer from this depression. Facts and figures cannot picture the acute distress of a large portion of our rural population; as a class they are bankrupt. There are approximately $10,000,000,000 in farm mortgages, most of which are in default. An effectual moratorium of farm indebtedness, including tax liens, should be made operative to augment the emergency farm mortgage act of 1933, with comprehensive legislation for the protection and reorganization of agriculture. While the tiller of soil cannot be rescued by legislation alone, he can be helped. It is imperative that the price of farm commodities be increased to enable farmers to receive a profit above the cost of production. At the present time all commodities that are grown or mined, except gold, are being sold below cost. The solution of the present problem of agriculture lies wholly in increased prices. It is difficult to believe that the so-called "domestic-allotment plan" to aid agriculture is workable. It places an impossible burden on the Government and is an attempt to prevent by legislation a natural economic development of the past 50 years.

### LABOR

The confidence of our workers must be reestablished. American productive enterprise has far surpassed the ability of industrial leaders to devise methods to distribute the products of American labor. This is the problem of the future and with it should go a wider distribution of wealth. This will be the economic salvation of the Nation. We must dedicate our energies to a program for the common good. To make this effective appropriate labor legislation affecting working conditions, minimum wages, and maximum hours is essential. The 6-hour day is now being tried with satisfactory results to the employer. "Play fair with labor" must be our national policy.

### SECURITIES

An enactment with reference to the sale of securities should be effected, providing for strict regulation of stock and commodity exchanges, with publicity features as to short sales. Washington is the only world capital which does not have an exchange, and there should be established such an institution at the National Capital, under supervision of the United States Government. This would give the people an honest market and prevent manipulation. The measure now before Congress should provide that the annual reports of corporations to the shareholders should contain list of salaries of executives and directors, with information as to any bonuses paid and the methods by which they are computed. Recent publication of Railroad Salaries S.Doc. No. 129) and those of insurance executives (Cong. Rec., Apr. 6, 1933) have created a very unfavorable reaction throughout the Nation. While hundreds of millions of dollars of public funds were being placed at the disposal of banks, railroads, and insurance companies to save them from insolvency, their executives continued to draw salaries which could scarcely be justified in the most prosperous days of the recent "new era."

BANKS

The recent failure of several thousand banks, tying up over $15,000,000,000 deposits, although due in many instances to public fear and hysteria, is a serious reflection on our banking system. No other nation has suffered a similar misfortune. The fact remains that comparatively few banks that were properly supervised by a qualified board of directors under competent management have failed. Practically all closed banks had been under criticism of the Comptroller of the Currency or of State banking departments. Our banking system is the economic life of the Nation. It controls the cash and credit of the people and in effect dominates their lives and fortunes. One of the primary functions of a free government is to provide a safe repository for the savings and accumulated surplus of its citizens.

At the inception of the depression, the abnormal efforts of banks for liquidity did much to augment the crisis. The request of the President for cooperation was ignored; loans were called and credit stopped, bringing ruin to thousands. A new national banking system should be made effective, entirely divorcing savings and commercial banks. All banks should be brought under Federal control and compelled to maintain a higher reserve ratio. There should be stricter limitation of bank charters. The adoption of bank legislation establishing an insurance fund to guarantee deposits will greatly aid in restoring confidence.

The following subjects are indissolubly linked with the economic welfare of the Nation.

MONEY

The value of gold is determined by the world supply and demand, and at present the fluctuations in its purchasing power is directing the destinies of most of the nations of the earth. Throughout history, an increase in the supply of gold has brought increased prosperity, and the fact that the general level of world commodity prices has followed the ratio of monetary stocks of gold to commodity production, indicates that we have allowed ourselves to become slaves of this precious metal. Our economic affairs can best be served by a sound monetary system capable of expanding promptly to meet the needs of the Nation. The stability of our monetary system does not depend on gold reserves, but on the promise of the Government to pay. The world's gold supply is only sufficient to meet a small portion of the outstanding indebtedness payable in gold in the United States alone, and our Nation has not sufficient gold to redeem its own paper money. If gold were all destroyed our currency system would continue to function because we still have the promise to pay of a sound Government.

The fundamental cause of the drastic decline in all price levels has been the international scramble for gold. The welfare of a great portion of the world's population depends on the so-called gold standard. But in the strict acceptance of the term, this standard no longer exists anywhere in the world, and more than 30 nations have definitely abandoned the gold standard. At the rate gold currency was withdrawn prior to President Roosevelt's Executive order, the national reserves of approximately $4,000,000,000 would have disappeared in less than a fortnight. As a result, the Government nationalized gold, and we are in fact off the gold standard, as there has been a suspension of specie payments. Therefore, it will readily be seen that there is not sufficient gold to support the present volume of world credit, and yet those who control this gold supply can direct the expansion or contraction of currency, dominate markets, fix prices, and to a large measure direct the affairs of the world.

It is necessary in the present emergency to adopt a standard sufficiently elastic to meet the needs of the vast pyramid of world debts. The present combination of low sterling and low silver are preponderant factors in establishing a low world price level. The demonetization of silver made a fettish of gold, of which there is about one fifteenth of the total volume of silver. The solution should be a bimetallic monetary unit based on both gold and silver, and since silver production is less erratic than gold production, such a money would be more stable than gold. If once established it would work in the same way in which the gold standard works, except for greater stability. This will make it possible to establish any desired commodity price level. More than half the population of the world now uses silver as a medium of currency, and an international agreement to remonetize silver is recommended. It should be noted that the United States is one of the great silver-producing nations. Heretofore, there has never been international cooperation in money matters. The same coinage ratio should be agreed upon by the principal nations. An international agreement to this end could be effected at the forthcoming conference called by the President. In this connection, I append an article on the remonetization of silver by Mr. South Trimble, one of the leading American authorities on the subject.

THE BUDGET

While the President has resolutely set out to balance the national budget by effecting economies and encouraging further deflationary measures, it is certain that the best way to balance the budget is to put the idle millions to work. It is just as unnecessary and impossible to live within the reduced income of the Government now as it was during the war. The budget will be self-balancing if we restore commodity prices.

REFLATION

There is a universal demand for an increase in commodity prices and this can only be accomplished by reflation. We must choose between deflation and reflation. The former means the continuation of bankruptcies, foreclosures, and defaults, and the latter will increase the purchasing power of the Nation and insure a gradual recovery.

---

## Remonetization of Silver

(By South Trimble)

It seems to be the universal opinion that property and commodity prices must be reflated to just and equitable values before we start on the permanent road to prosperity. In my opinion the only remedy is to either revalue gold or remonetize silver. By cutting the gold dollar in two would double the amount of gold dollars. That would have the effect of doubling the value of commodities and property. By remonetizing silver at the ratio of 16 to 1 and making it a primary or basic money, a money of redemption the same as gold, would have approximately the same effect as it would double the amount of basic or primary dollars.

Why should we for a moment consider the revaluation of gold in order to increase the volume of our basic money when the remonetization of silver will have the same practical result. The revaluation of gold would produce chaos in the business world, as we have billions of obligations, including all of our Government bonds payable in gold dollars of the "present standard weight and fineness."

Why not repeal the law of 1873 which demonetized silver and make our own precious metal a basic money, a money of redemption on an equality with gold? The Western Hemisphere produces 84 percent of the silver of the world. The Eastern Hemisphere produces 75 percent of the gold.

In 1929, the peak of production of silver in the history of the world, the United States alone produced twice as much silver as all of Europe, Asia, and Africa combined. But we, by law of our own making, destroyed its value as money, depriving it of free and unlimited coinage and full legal tender privilege in the payment of all debts, both public and private (which it had always enjoyed from the foundation of the Government), and automatically making all of our Government obligations contracted before and during the Civil War, which were payable in coin, payable in gold. Four fifths of said obligations were held by European bankers. Thus the conspiracy to destroy silver by the international bankers, which doubled and trebled the purchasing power of our coin obligations held by them.

159450—33—PT 8——11

It is not my purpose now to discuss the general question involved in the proposition to remonetize silver by restoring it to the privileges it enjoyed from the foundation of our Government to 1873, at which time it was destroyed without the knowledge or consent of the American people. However, it is my honest conviction that if President Roosevelt were to come to Congress with a message to restore silver to its ancient place in our monetary system, Wall Street, the barometer of business, would immediately respond with rapid advancing prices, hoarded money would come from hiding to be invested, realizing that the purchasing price of the dollar was going down and commodities and prices automatically going up.

If the remonetization of silver be the inestimable boon which its advocates claim it to be, it will enable us to realize it. But if, on the contrary, it shall prove to be an unmixed evil as its opponents assert, then we shall not have gone so far that we cannot retrace our steps without serious derangement to the business of the country. A fair trial and honest effort to solve the problem is all that reasonable men can or ought to require.

We should consider this momentous question not from a political standpoint, but from a patriotic one. We must not forget that ever since the organization of our Government until 1873 silver dollars were a legal tender and recognized as the money of the country and up until 1873 the silver dollar was always at or above par with gold and would be so today only for the crime perpetrated by its fraudulent demonetization.

The chief argument of the gold monometalists, the single gold standard advocates, sponsored by the international bankers who are absolutely responsible for our present economic conditions, are that the advocates of bimetallism are fools, lunatics, idiots, repudiators, etc.

Now, in order to disabuse the mind of the great body of the American people who have been born since silver was demonetized, I am going to submit party platform planks and observations of a few of the great men of both political parties that have long since passed away.

The Democratic plank in 1884 (Cleveland and Hendricks, candidates) was: "We believe in honest money, the gold and silver coinage of the Constitution, and a circulating medium convertible into such money without loss."

The Republican plank (Blaine and Logan, candidates) was:

"We have always recommended the best money known to the civilized world, and we urge that efforts should be made to unite all commercial nations in the establishment of an international standard, which shall fix for all the relative value of gold and silver coinage."

In 1888 the Democratic platform (Cleveland and Thurman, candidates): No financial plank.

The Republican plank (Harrison and Morton, candidates) was:

"The Republican Party is in favor of the use of both gold and silver as money, and condemns the policy of the Democratic administration in its efforts to demonetize silver."

In 1892 the Democratic plank (Cleveland and Stevenson, candidates) was:

"We denounce the Republican legislation known as the Sherman Act of 1890 as a cowardly makeshift, fraught with possibilities of danger in the future which should make all of its supporters, as well as its author, anxious for its speedy repeal. We hold to the use of both gold and silver as the standard money of the country, and to the coinage of both gold and silver without discriminating against either metal or charge for mintage, but the dollar unit of coinage of both metals must be of equal intrinsic and exchangeable value."

The Republican plank (Harrison and Reid, candidates) was:

"The American people, from tradition and interest, favor bimetalism, and the Republican Party demands the use of both gold and silver as standard money, with such restrictions and under such provisions, to be determined by legislation, as will secure the maintenance of the parity of values of the two metals."

It was in February 1891 at Toledo, Ohio, that President McKinley, then Senator, in criticizing ex-President Cleveland's opposition to silver, said:

"During all these years at the head of the Government he was dishonoring one of our precious metals, one of our own great products, discrediting silver and enhacing the price of gold. He endeavored, even before his inauguration to office, to stop the coinage of silver dollars, and afterwards and to the end of his administration, persistently used his power to that end. He was determined to contract the circulating medium and demonetize one of the terms of commerce, limit the volume of money among the people, make money scarce, and therefore dear.

"He would have increased the value of money and decreased the value of everything else—money the master, and everything else the servant. He was not thinking of the "poor" then. He had left their side. He was not standing forth in their defense. Cheap coats, cheap labor, and dear money; the sponsor and promotor of these professing to stand guard over the poor and lowly. Was there ever more glaring inconsistency or reckless assumption? He believes that poverty is a blessing to be promoted and encouraged, and that a shrinkage in the value of everything but money is a national benediction."

During all these years a conflict between silver and gold (which is, in fact, the struggle of the great common people against the money trust) the Democratic Party has, until this act, professed to desire the full restoration of silver as "standard money."

In 1890 President McKinley declared on the floor of the House:

"I would give it [silver] equal credit and honor with gold; I would make no discrimination; I would utilize both metals as money and discredit neither; I want the double standard."

When Mr. Harrison wrote his letter of acceptance September 3, 1888, he said:

"The resolution of the convention in favor of bimetallism declares, I think, the true and necessary condition of a movement that has upon these lines my cordial adherence and support. I am thoroughly convinced that the free coinage of silver at such a ratio to gold as will maintain the equality in their commercial uses of the two coined dollars would conduce to the prosperity of all the great producing and commercial nations of the world."

Quotation from Mr. Garfield's inaugural address of March 4, 1881: "By the experience of commercial nations in all ages it has been found that gold and silver afford the only safe foundation for a monetary system."

"I am certainly of opinion," said Mr. Webster, "that gold and silver, at rates fixed by Congress, constitute the legal standard of value in this country, and that neither Congress nor any State has authority to establish any other standard or to displace this standard."

Hon. James G. Blaine, from the floor of the Senate, February 7, 1878: "I believe the struggle now going on in this country and in other countries for a single gold standard, would, if successful, produce widespread disaster in the end throughout the commercial world. The destruction of silver as money and establishing gold as the sole unit of value must have a ruinous effect on all forms of property except those investments which yield a fixed return in money."

Hon. John G. Carlisle, on February 21, 1878, House of Representatives: "According to my view of the subject, the conspiracy which seems to have been formed here and in Europe to destroy by legislation and otherwise from three-sevenths to one-half of the metallic money of the world is the most gigantic crime of this or any other age.

"The consummation of such a scheme would ultimately entail more misery upon the human race than all the wars, pestilence, and famines that ever occurred in the history of the world."

Excerpt of letter from Thomas Jefferson to Alexander Hamilton, January 1791. (Hamilton's Works, vol. 4, p. 96): "Dear Sir: I return you the Report on the Mint, which I have read over with a great deal of satisfaction. I concur with you in thinking that the unit must stand on both metals."

Excerpt from Alexander Hamilton's communication relating to our first monetary system, submitted to Congress in 1791: "To annul the use of either gold or silver as a money is to abridge the quantity of circulating medium, and is liable to all the objections which arise from the comparison of the benefits of a full circulation with the evil of a scanty circulation. * * * It seems most advisable not to attach the unit exclusively to either of the metals, because this cannot be done effectually without destroying the office and character of one of them as money and reducing it to the situation of mere merchandise. * * *" Mr. Hamilton wisely concludes that this reduction of either of the metals to mere merchandise "would probably be a greater evil than occasional variations in the unit from the fluctuations in the relative value of the metals."

The gold standard has bankrupt the world. Strictly speaking, there is not a gold-standard nation on earth today. The predictions made by those two great men, Carlisle, Blaine, and scores of other statesmen confront us. For the great army of farmers, mechanics, laborers, and merchants who have been reduced to bankruptcy, hunger, rags, and wretchedness by the operation of the single gold standard manipulated by avaricious, greedy, grasping capitalists, there is no remedy. To those who yet stagger under the load thus laid upon them, speedy relief can and should be given. Nature was never more bountiful, the earth never yielded more abundant harvest, human hands were never more willing. What then has produced the present state of affairs? The advocates of the gold standard may avow that it is not responsible for getting us into our present deplorable condition but there is one thing certain, they cannot say that it has done anything to get us out.

SOUTH TRIMBLE.

---

STATEMENT OF D. WALTER TURNER, PRESIDENT CAROLINA STORES, INC., OF LENOIR, N.C.

PROSPERITY IS PROFITS, DEPRESSION IS LACK OF PROFITS

Only a few days ago one of our chief financial advisors appeared before the Senate Finance Committee and told them that all that was needed to bring back prosperity was to balance the Budget and keep sound money. This is not mentioned with any intention of criticizing this highly experienced gentleman, but for the purpose of driving a point. I will not enter into the subject of what constitutes sound money as that would be very questionable, and since we have the same kind of money we have always had, or I judge it is the same, when and if we find any of it.

As to balancing the Budget, I would like to ask this question: Was the Budget not balanced when this depression started upon us? Is it not a fact that the same thing that unbalanced the Budget brought the depression; or, putting it another way, is it not a certainty that the depression is the identical thing that unbalanced the Budget? Then is not the proper advice, let us find the thing that unbalanced the Budget and we will have found the thing that is causing the depression? It is my opinion, and the opinion of millions of others, that a balanced Budget can be forced in some way or other at the present without doing anything about the cause of the depression, and it will stay balanced about as long as a snowball will stay in hades.

Putting this thing another way, is it not a plain fact that a balanced Budget, one which will stay balanced, and prosperity are one and the same thing? Governmental budgets are balanced by taxation on incomes of one kind or another, and if incomes are diminishing, getting worse all the time, how can we make any sort of budget stationary? To say that all we need is to balance the Budget is just like a physician telling a badly sick patient, "all you need is to get well, and when you are well I shall undertake to treat your trouble."

Coming to the point, what we need is prosperity, so that we can balance the Budget and keep it balanced. Now let us analyze this thing. It is purely a mathematical matter and a most simple one. What is prosperity? Can prosperity be but one thing, profits equitably or fairly distributed? The prosperity of the professional man is dependent upon the profits or prosperity accruing to the trader in the products of mother earth, in whatever capacity he may be working. Then is it not a fact that our trouble is lack of profits all along the line from primary producer to ultimate consumer?

Big business itself must eventually suffer and go bankrupt, as it is now doing, unless profits or prosperity is permitted individuals and small business. None of us can prosper alone, small or great, not for long. I believe that we all will agree that profits is the one and only thing that makes prosperity, whether it accrues to the laborer or to the millionaire. Then let us be serious and diligent in this matter of finding the trouble with profits, correct it, which is so simple to do, and we shall have a balanced Budget and one that will stay balanced; we shall have prosperity and, what is paramount, we shall have a lasting prosperity.

I contend that retail monopoly is much more vicious than wholesale or manufacturer's monopoly and because they dominate the "profits" or the price of merchandise all back the line to the producer, except where they deal with a manufacturer's monopoly, but even then, we find today the manufacturer's monopolies and the retail monopolies working together to tear down and destroy the producer and small business, determined to allow no one a profit but themselves. As just one example of this, we find the tobacco farmer getting less than cost for his product and we find further the tobacco monopolies, with the cooperation of the A.&P. Tea Co. forcing the jobbers and retailers to suffer a tremendous loss on the sale of all tobacco products.

The cost of cigarettes to the jobber is 9.9 cents per package and the list to the retailer is 11 cents per package. The American Tobacco Co. is advertising them at 11½ cents per package and the A.&P. Tea Co. is selling them at 10 cents per package. Tobacco products constitute one of the largest sale volume items in the world and is up toward the top in America's farm products. And it does not stop here. Every important product of the farm is so affected, possibly not in cooperation with the manufacturer as above, but by retail dominance, as I shall prove further in this brief. Only a few days ago one of the large flour millers made the statement to one of my associates, that every miller in the State, not already bankrupt, had been ruined by the national chain grocery stores and one in particular. It is retail monopoly that has made a buyers' market out of every product of the farm and practically all products of mother earth, ruining not only the country, but most surely themselves eventually.

It was the Wilson administration which caused the packer's consent decree, when the five major meat packers started to enter the wholesale manufacture and sale of groceries. I well remember that President Wilson said "No five corporations shall dominate the food industry of the United States so long as I am President." Think of that and then think what we have today, two or three retail combines positively dominating the food industry and it can be easily proven that they control the price of practically all products they handle, allowing no profit to anyone, not even themselves, except on their own private brands, and no one except themselves makes a profit on them, that is there is no primary profits on them. It is proven that price regulation as controlled by supply and demand has been killed.

It is said that a dollar changes hands, in normal times, over 70 times a year. For full prosperity, each and every change should cause a profit to someone, starting with the primary profits accruing to the farmer, producer, laborer, etc., and on up the line. Kill these primary profits and this will automatically kill further profits up the line and because the primary factor, represented by over three fourths of our population, do not have money or profits to trade with the rest of us. Profits come from trading in the products of the earth. There is a chance of just so much to be distributed. The more profits we have, well distributed, the more prosperity we will have. Now with factors in the country dominating these products and allowing no profit to anyone, how are we to expect any semblance of prosperity?

With the slightest investigation we can find that the depression did not start from lack of business but from lack of profits in business, a situation forced upon practically all business. Of course, sales were eventually forced to fall off, and because of lack of profits which must accrue to the public as a whole before they can buy. The so-called prosperity of 1928–1929 was balloon or paper profits, accruing from trading in stocks of the new forming and fast expanding chains, syndicates, mergers, combines, "monopolies," which concerns were showing very small, if any, real operating profits, their expansion being largely the sale of new stock and with this stock in some cases selling for ten times its book value. Some investors found out the proper profits or earnings to justify such values were missing, stuck a pin in the balloon, and since then we have been looking for prosperity, "just around the corner."

I submit as a fact and without fear of successful contradiction, that actual operating profits, properly distributed, started diminishing 10 or 11 years ago or exactly when the retail chains really started getting their present dominating grip upon the business affairs of our Nation, and I further contend that the brunt of the world troubles of today, rests in and with the United States of America. The United States is and has been the hub of the financial world and I submit that war-ridden Europe was coming back to the front as rapidly as could have been expected until this trouble burst forth in the United States. It is certainly thought of that way in Europe as they are looking to the United States alone for their chief relief. If they have fallen for the same merchandising errors that we have, then let us set the rest of the world an example, remedy our own errors, and the rest of the world will follow our example.

VOLUME MINUS PROFIT IDEA STARTED PRESENT TROUBLE

The idea of volume at less profit is the incentive behind the chain-store movement and started its really widespread some 10 or 12 years ago. It seems to me that a child could have seen destruction in such an idea and if not unlawful, certainly unethical means must be followed to carry out such an idea. Let us accept the fact that just so much business is possible with its accruing profits to our vast population, and the carrying out of the volume-short-profit idea is not possible except to those receiving "special privileges," and long to them, because it bites the hand that feeds them. And it immediately makes unsurmountable obstacles to all business and their laborers not receiving these same privileges. These "special privileges" will be dealt with in this brief under another heading or other headings, price discrimination, unfair trade policies, etc.

PRICE DISCRIMINATION CAUSE OF MONOPOLY

Ten years ago there were few, if any, manufacturers of any size who did not have a uniform price to their distributors, whether they sold to jobbers or to retailers or to both. It was somewhat of an unwritten law with all of them, or all that had any standing. Some unscrupulous manufacturers started giving secret concessions in price to the then small chains. This of course forced competitors to follow suit. This in turn caused the chains to grow by leaps and bounds and the destruction started.

The first big jolt or rebound to this unethical, if not unlawful, business system was the financial collapse of Wall Street. Today the system has ruined all other competition, yet the trouble is it does not stop with competition. If it did, we possibly could not find room for complaint. That is just the start of it. The manufacturer finds no solvent customers except the chains (and the solvency of many of them is getting more questionable all the time), and these chains are dominating the price of his products. He finds them in position to destroy him if he does not do their bidding. He must sell to them or at a price dominated by them in his last effort to stay in business. He is in truth putting no price on his own products but is accepting the price dominated by the chains, if he finds a market at all. And such offer or price always constitutes a loss to the manufacturer unless he cuts wages, buys his raw products cheaper, and what not. This situation gets worse and worse all the time and will continue to grow worse until the situation is handled by law. It is far beyond business being able to remedy the situation within itself.

Certainly I think the above explanation is clear, and I want to say here that, if there is any doubt about the accuracy of same in the minds of the committee, is it not your duty to thoroughly investigate the matter for yourselves by the appointment of a committee (one especially familiar with the workings of small- and medium-sized business) for this purpose. Let me try to impress upon the committee that we need action now and not six months from now. There are 14,000,000 souls out of employment, hungry, and naked because of this situation, and they will starve to death if we expect this damnable situation to correct itself. Certainly it must be seen that wages cut low stops buying power and shuts down plants. The whole thing is just a vicious cycle that will eat itself up eventually and cause revolution, wreck, and ruin unless the Government acts and acts quickly.

MONOPOLY SELLS LEADERS AT HEAVY LOSS TO RUIN COMPETITION

The national chain grocery stores are today attempting to make their profit on their own private brands or upon the goods they control, while they sell more than three fourths of all other items at an actual loss, counting overhead. By all other items I mean items handled by their competitors, and the only items their competitors have, since no small- or medium-sized merchant can successfully have private brands. You can see that this is not only taking all the "profit" out of these large sale items, but it is done to put out of business their independent competitors and which has all but been accomplished, perfecting the food monopoly and rapidly headed toward the same thing in every other line.

It is peculiarly true that these less-than-cost leaders constitute all important farm products, as I shall bring out under another heading. Now let us not forget the "profit" idea and the fact that this is taking all the "profit" out of all farm products, going on back to the soil, as I shall show later, and farm products, normally speaking, are the chief sources of income in the United States.

### SOME STORES OF A CERTAIN CLASSIFICATION WILL ENTER MERCHANDISE OF AN ENTIRELY DIFFERENT CLASSIFICATION, PURPOSELY TO SELL AT A LOSS, TO DRAW TRADE ON THEIR REGULAR LINE

One of the most damnable, destructive, and unfair things to develop during this price-cutting era is the system of thousands of unscrupulous and unfair merchants in a certain classification of merchandising who will enter into his store the most important items of his neighbor, who operates under a different classification, and sell those items at a heavy loss in order to get customers into his store to buy his regular line. This is especially done by dry-goods or department stores, who enter groceries or staple drug and advertised drug items for this purpose. Again you see the "profit" question and sure bankruptcy for the victims and the unfair merchant himself killing the goose that lays the egg. It is the most pitiful thing of all to see an honest hard-working merchant up against this sort of thing and to think it is permitted to go on and on in these United States, breeding anarchy.

Equally as bad is a system being practiced by eastern wholesale-drug firms. Their home States permit them to sell whiskey, within the State, of course, to retail-drug stores, up to an amount constituting a certain percentage of their entire sales. These firms are today selling staple drug items to their dry State chain-store customers at less than cost in order to build up their volume so as to permit the sale of more whiskey in wet Eastern States and on which whiskey, they, of course, more than make up the loss. This is not only a damnable and ruinous situation, but again we have that question of "profits", which is "prosperity." If we cannot accumulate enough brains in this country to stop in some way such things as above set out, then our country will and ought to go bankrupt.

### TWO OR THREE NATIONAL-CHAIN GROCERY STORES ARE TODAY DOMINATING THE PRICE OF FARM PRODUCT

I think that I have already proven the statement as contained in the above heading, but I wish to go into the matter in detail with you. I stand ready to furnish proof of my statements and evidence if you want it. We find today just 2 or 3 national chains so large and powerful that they control the price of products, not on just what they buy but on those particular products, even if bought and handled by the independent merchants. It is plain to be seen that all small business must do their best to buy so as to be able as nearly as possible to compete with the chains. Of course, they cannot do it, but their efforts bears all markets and regardless of the law of supply and demand. These 2 or 3 national chains are each one determined to buy cheaper than the other so that they can sell cheaper than the other. Now, as before set forth, they seem to select especially all staple and farm products, extremely large-volume items, as their less-than-cost leaders, determined to buy them cheaper and cheaper so that they can sell them cheaper and cheaper.

Now let us see; we find all the following products—and many more that I will not take space here to mention—selling far below cost, operating expense considered: All tobacco products, flour, lard from cottonseed, lard from pork, dry salt meat, sugar, canned milk, cheese, pork, beef, etc. Now listen, no one along the whole line of distribution, is getting a dime clear profit out of this whole thing, not even the man that raises it.

To claim that the lack of "profit" from these items, accruing to the farmers and to all the rest who touch it, is because of overproduction, is certainly idle talk until we have fed the hungry and clothed naked. The cutthroat methods as set out in this brief and as thoroughly described, are accountable for the fact that we have food and clothes by the millions and dirt cheap, and yet millions and millions, just about 90 percent of our population, unable to buy these things, or not all of them that they need.

I have seen with my own eyes and had to come under my own observation instances of where the A.&P. Tea Co. would break the market on local farm produce, with that particular produce short or scarce, not near enough to supply the demand. I have seen the early Carolina cabbage, very scarce, and selling to wholesalers at 3 cents, retailing at 5 cents, and yet I have seen the A.&P. Tea Co. buy two or three truck loads of this cabbage, pay 3 cents for it, throw it into their stores as quickly as possible and put a retail price of 2½ cents on it. Necessarily every competitor was sunk and then refused to pay more than 1½ or 1¾ cents for more cabbage, and yet the cabbage as scarce as hens teeth. Cabbage did not go up again that season, and had it attempted to do so they would have pulled the same trick again and broke the market. Now that is just a way of stealing the farmers' merchandise and getting away with it. The above is just one example. I could write a hundred pages of just such destructive methods and not get through.

NATIONAL RETAIL CHAINS SELL AT HEAVY LOSS IN NEW TERRITORY, MAKING PROFITS TO COVER THEIR LOSS IN OLD TERRITORY

National chains, some of them with thousands of stores well established in their old territory, go into a new town or into new territory and sell at a much lower price than in their established terirtory, in fact, at just any price to get the trade, get established, and incidentally freeze out competition. I have seen them put town after town on the rocks and now I have seen them put the Nation on the rocks. I understand that during Theodore Roosevelt's administration the Standard Oil Co. was made to stop this very thing under some sort of antitrust law. What has become of our antitrust laws?

Today's setup is entirely different from the obstacles confronting Theodore Roosevelt. The Standard Oil Co. was, for instance, a wholesale monopoly and in only one small item at that time, not all the products of mother earth. Those antitrust laws were good and should still be enforced, but they were primarily intended to stop one corporation from owning and controlling one product and to insure the public against excessive profits at the hands of such corporation. If those laws were enforced today they would be a big help toward controlling this situation, but we need something else. We need laws that will insure "profits" to all legitimate business, whenever nature or the law of supply and demand will permit profits. The monopoly of the Standard Oil Co. was not one tenth of 1 percent as destructive as the present day monopoly in control of all the products of the earth and permitting no "profit" (prosperity) to any one.

PROFITS MUST BE RESTORED, WELL DISTRIBUTED. LEADER MERCHANDISE, SELLING AT LOSS, MUST BE STOPPED

I have done my very best to show that profits, well distributed, and prosperity are one and the same thing. If we restore to the American people America, and give them that right which is expected by them, by the word and meaning of our Constitution, equal rights to all and special privileges to none, we need not worry about any concern or corporation profiteering. Good healthy, clean competition will take care of that. If the laws to remedy this terrible thing are questionable as to constitutionality, then for God's sake let us change the Constitution. But such laws are not questionable, they are more than fair to all, such laws will save the big business now getting these advantages, and they must be passed.

Certainly a law should be passed forbidding any merchant, distributor, or manufacturer from arbitrarily selling any piece or parcel of merchandise at less than cost, overhead expense considered, when it can be proven that such action on his part is not necessary to save a perishable item from loss or any other item from deterioration and when it can be proven that he is of his own accord and without any fear of loss from the above-mentioned things, putting this less than cost price on his merchandise. Cost should always incorporate overhead expense and each corporation or business could be required, if necessary, to furnish the commission with the average overhead expense per dollars sale, per year. There should be a heavy penalty for violation. The Government commission would not need to meddle into or trouble any business until they were suspected or reported as violating this law. Of course, market changes, either up or down, would be considered a change in cost and would permit of a like change in the selling price, if the merchant wanted to make such a change. Of course, competition could always be met without penalty.

Manufacturers must be given the privilege of controlling the resale price of their merchandise. The Capper-Kelly bill as I understand it, in its original form, covers this pretty well. This bill has been before the House and Senate for many years and I understand it passed the House long ago but has been held up by the Senate for some reason. I understand further that possibly it has been robbed of some of its most effective points. Certainly this bill should be passed without further delay. Many are the manufacturers who have been ruined by the national chains using their highly advertised and popular merchandise as a football, at less than cost, to aid in selling their own private brands and at the same time, ruin the manufacturer and the independent merchant. Given the privilege of controlling the resale price of his merchandise, there is not the least danger of the manufacturer permitting too much profit to the merchant.

### PRICE DISCRIMINATION MUST BE STOPPED

Is there any reason why the bigger and bigger should buy cheaper and cheaper. Does not sound reasoning and simple mathematics inform us vividly, even without the experience we are going through, that that thing alone will destroy a nation and the world if allowed to go on unhampered?

Whatever we do, let us not confuse "price control" with the stopping of price discrimination. Price control is not practical nor possible. Even in stopping the "less than cost selling", that is not controlling prices. If one company can be efficient enough to reduce its operating expense and overhead and thereby bring down its cost, it certainly must be allowed the advantage of that operation. By stopping price discrimination is meant the stopping of better prices, either direct or in the form of secret concessions, advertising allowances, free goods, and rebates going to only national chain stores and other monopolies. Now, it is, of course, evidence that quantity must be considered, but there must be a limit to this quantity. A better price should be allowed up to an amount, up to where the seller has a maximum natural economic saving in packing, drayage, freight, billing, etc. Of course a manufacturer cannot afford to sell a suite of furniture as cheap as a carload, but a carload should be the maximum quantity for the best price, in the case of furniture. I should say that a company buying a hundred pound shipment of needles, should get rock-bottom price, and so on. It can be seen that merchandise would have to be classified in respect to quantity shipments, but this would be relatively an easy job by anyone of experience. The owner of an obscure line, which might be left out of classification book, could be required to apply for a classification. It might be well to require, from companies doing a national business, to file price lists with the Commission, a new one with each change, showing quantity discounts, etc. Or any other way to see that this damnable discrimination is stopped. It will be worth a million times whatever it costs.

### STOP MONOPOLY AND THE POWER IT HAS TO KILL PROFITS, KILL COMPETITION, KILL THEMSELVES, AND THE NATION

Being against monopoly is far from being against big business. There is nothing against big business as big business, there is nothing against chain stores as chain stores, but there is very much against big business becoming big because of special privilege, whether that special privilege be in price advantage or otherwise. I am in favor of big business when it is clean and healthy and not a disease eating at the very vitals of our Nation. The laws suggested herein will not hurt big business, as a matter of fact it is the only thing that will save any business, big or little. I am sure that the manufacturers of this land would be delighted at the passage of the legislation suggested here.

The thing has gone so far now and has the farmer and laborer so badly on the rocks that there is possibly the need of temporary legislation, crop curtailment, etc., to tide the mover, but I believe that 90 percent, at least, of the permanent cure is herein suggested. And it is simply a mathematical problem. It does not cover all of our troubles, no, but I contend that these things must be done before we can sensibly or with confidence set our faces to a successful future.

Settling the war debts, neither canceling, collecting, or adjusting them, will get us out of this mess. Forcing a balanced Budget will certainly help none. Reducing Government expenses will hardly be noticed. The Reconstruction Corporation has not helped any and will not help any, and no other sort of such legislation will help. The people are not looking for a chance to borrow more money, they are looking for a chance to make once more a "profit", with which to pay back the money which they already have borrowed. We hear of instilling the country, with confidence. Confidence in what? You just as well ask them to have confidence in the statement that 2 from 3 leaves 5. The people know and they know well that this thing can be stopped, and they are expecting something to be done about it after March 4, and that right early. All of them cannot outline this thing, but they know full well, in their hearts, that something is bad, rotten in Denmark, as their votes indicated last November. They will not longer suffer and let their loved ones suffer in a land of plenty, yet they are long suffering; they have waited this long to give the Government a chance, and with their ballots they have spoken. If they are compelled to speak again, I hate to think of how it might be done. Permit us "profits", and you will give us prosperity.

## Statement of Dr. James Harvey Rogers of Yale University

The emergency measures since March 4, while extremely constructive, have nevertheless resulted in the taking away from spenders of, roughly, $6,000,000,000. In addition, $11,000,000,000 of saving-bank deposits have been so restricted as to make unavailable a considerable portion of this huge amount.

Moreover, through current declines in pay rolls, in salaries, and in interest and dividend payments, combined with growing unemployment, further reductions in the spending power of the public are apparently accumulating at the rate of several hundred millions a month.

The disastrous effects of such reductions in public spending power are not yet generally realized:

(*a*) Coming just at taxpaying time in many municipalities, these reductions are threatening revenues to such an extent that wholesale defaults of minor governmental organizations are in prospect.

(*b*) The resulting threat to insurance companies and savings banks is great and imminent.

(*c*) Simultaneously the investment-banking institutions which for a number of months have been held together largely by municipal financing, are threatened with such crippling as to be unavailable for immediate extensive use when required.

(*d*) With the increasing failures of insurance companies, a growing distrust of the commercial banks resulting in a gradual transfer of funds from weaker to stronger institutions can be anticipated. Such runs, while less spectacular than the recent ones, are in the long run just as damaging.

(*e*) The growing distrust of these basic financial institutions, coupled with municipal insolvency, can be expected to hasten the general breakdown of the private debt structure.

(*f*) Hence, while the funds of prospective buyers and investors are to a considerable extent frozen, and while much of the machinery of investment is being severely crippled, at the same time doubt as to the validity of debts in general impairs greatly the functioning of the entire credit organization.

Under such circumstances, the mere balancing of the National Budget, which, by bringing reassurance to the capital markets, has in the past frequently been sufficient to insure renewed flotations and hence increased purchasing power in the hands of ready spenders, can hardly be expected at this time to achieve this highly constructive result. The reasons are three:

The increasing impairment in the investment machinery makes progressively more difficult large flotations.

The normally liquid funds of savers held available for ready investment have become to a considerable extent frozen.

The growing distrust of credits in general is fast destroying the incentive for future investment.

To arrest the spiral of deflation above outlined, adequate spending power must be placed immediately into the hands of ready spenders.

Three questions arise:

How much is adequate?
How can it be gotten promptly to spenders?
How can the money be raised?

During the first 8 months of our participation in the Great War (April, 1917, to January, 1918) monthly flotations—public and private—averaged approximately $700,000,000. During the prosperous years 1925–1929, a similar volume of flotations accompanied the rapidly rising prosperity. Such capital issues represent the continuous turning over of approximately equal amounts of sustained purchasing power to ready spenders. A like volume of new spending at this time could be confidently expected to bring a like rise in business activity.

However, since the volume of private and municipal flotations is now virtually zero, for the first few months the entire burden would likely fall upon the National Government.

To get such large sums promptly to spenders, careful planning is necessary. To gain the desired effects, the expenditures should be constructive, widely distributed, and large but, above all things else, speedy. With these ends in view the following suggestions are made:

Expand reforestation camps.

Through agricultural plan give funds directly and quickly to farmers and to holders of farm mortgages.

Through the construction of grade crossings and of other highway improvements in every county of every State in the Union, get funds equally quickly to unemployed and to contracting firms.

Lend Government money directly at low rates of interest to bona fide builders of suburban and rural homes.

In order to float Government bonds on the large scale necessary, two requirements must be met:

Member-bank excess reserves must be kept high through Federal reserve "open market" purchases.

All earlier issues in the series must be at all times redeemable in any of the later issues which may carry a higher return.

---

## SUMMARY

Current and prospective deflation is at least temporarily so great as to preclude the normal functioning of our time-honored economic system.

A mere balancing of the National Budget, even though it restore confidence in the national credit and remove the threat of large Government flotations from the investment markets, can not at this time be expected, through stimulating new security flotations, to bring automatic business revival.

If the disastrous spiral of deflation is to be arrested, new funds must be gotten adequately and quickly to spenders.

New capital expenditures required to bring business revival estimated at $700,000,000 per month.

Promising projects for which expenditures might be made:

Expansion of reforestation camps.

Getting immediate funds to farmers and to holders of farm mortgages.

Construction of grade crossings and other highway improvements in every county of every State in the Union.

Government financing of bona fide home building.

Requirements for floating the necessary Government securities:

Excess reserves of member banks must be kept large ($500,000,000–$600,000,000).

All earlier long-term Government issues required to finance the program must be convertible into later ones carrying higher returns.

JAMES HARVEY ROGERS.
