AN

INQUIRY

INTO

THE NATURE AND EFFECTS

OF

THE PAPER CREDIT

OF

GREAT BRITAIN.

BY HENRY THORNTON, Esq. M. P.

PHILADELPHIA:

PUBLISHED AND SOLD BY JAMES HUMPHREYS,
CHANGE WALK,
Corner of Second and Walnut-streets.

1807.
INTRODUCTION.

THE first intention of the Writer of the following pages was merely to expose some popular errors which related chiefly to the suspension of the cash payments of the Bank of England, and to the influence of our paper currency on the price of provisions. But in pursuing his purpose, many questions occurred which it seemed important to discuss, partly on account of their having some bearing on the topics under consideration, and partly because they appeared to be of general importance, and had either been left unexplained, or had been inaccurately stated by those English writers who have treated of paper credit. This work has, therefore, assumed, in some degree, the character of a general treatise.

The first Chapter contains a few preliminary observations on commercial credit. The object of the two following Chapters is distinctly to describe the several kinds of paper credit; to lay down some gene-
ral principles respecting it; and, in particular, to
point out the important consequences which result from
the different degrees of rapidity in the circulation of
different kinds of circulating medium, and also in the
circulation of the same medium at different periods of
time.

The nature of the institution of the Bank of Eng­
land is then explained; the necessity of maintaining
the accustomed, or nearly the accustomed, quantity of
its notes, however great may be the fluctuation of its
cash, is insisted on; and the suspension of its cash pay­
ments is shewn to have resulted neither from a defici­
cy in its resources, nor from a too great extension of
its loans to government, nor from rashness or improvi­
dence in its directors, but from circumstances which
they had little power of controuling: this event being
one to which a national establishment, like the Bank of
England, is, in some situations of the country, una­
voidably subject.

The manner in which an unfavourable balance of
trade effects the course of exchange, and in which an
unfavourable exchange creates an excess of the market
price above the mint price of gold, and a profit on the
exportation of our coin, are the subjects of a succeed­
ing Chapter.

The circumstances, also, which have led to the mul­
tiplication of our country banks, and the several ad­
vantages and disadvantages of those institutions, are
fully stated.

The earlier parts of the work having tended to shew
the evil of a too great and sudden diminution of our
circulating medium, some of the latter Chapters are
employed in pointing out the consequences of a too
great augmentation of it. The limitation of the amount
of the notes of the Bank of England is shewn to be the means of restricting the quantity of the circulating paper of the kingdom, of preventing a rise in the price of commodities in Great Britain, and of thus extending our exports and restraining our imports, and rendering the exchange more favourable. Some objections to the limitation of the Bank of England paper are likewise stated and answered.

The last Chapter treats of the influence of paper credit on the price of all the articles of life: a subject, the difficulties of which are in some degree removed by the antecedent discussions.

In the course of this inquiry, several passages in the work of Dr. A. Smith on the Wealth of Nations are animadverted on, as are also some observations made by Mr. Hume in his Essays on Money and on the Balance of Trade, and by Sir James Stewart in his book on Political Economy, as well as some remarks in the writings of Locke and Montesquieu.

The mode in which the subjects of coin, of paper credit, of the balance of trade, and of exchanges (subjects intimately connected with each other), have been treated by those writers, was suggested by the circumstances of more early times: and we ought not to be surprised, if, in treatises necessarily in some degree theoretical, or written for the purpose of establishing a particular truth, certain incidental observations should not be just, nor even if some main principles should have been laid down in terms not sufficiently guarded.

A person who presumes to differ from the authorities which have been mentioned, and who proposes to correct the public opinion on the important subject of our paper credit, ought, undoubtedly, to be very cautious
lest he should propagate new errors while he is endeavouring to remove the old. A sense of the duty of mature consideration has caused some delay in the publication of the following work. That its leading doctrines are just, the writer feels a confident persuasion. That it may have imperfections, and some, perhaps, which greater care on his part might have corrected, he cannot doubt. But he trusts, that a man who is much occupied in the practical business of life, will be excused by the public, if he should present to them a treatise less elaborate, and, in many respects, more incomplete, than those on which he has found it necessary to remark. Future inquirers may possibly pursue with advantage, some particular topics on which he has felt a certain degree of distrust.

It may not be irrelevant or improper to observe, that the present work has been written by a person whose situation in life has supplied information on several of the topics under discussion, and that much use has been made of those means of correcting the errors of former writers which recent events have afforded.
CONTENTS.

CHAPTER I.
OF Commercial Credit; of Paper Credit arising out of it. Of Commercial Capital

CHAPTER II.
Of Trade by Barter. Of Money. Of Bills of Exchange and Notes. Of Bills and Notes, considered as discountable Articles. Of Fictitious Bills, or Bills of Accommodation

CHAPTER III.
Of circulating Paper. Of Bank Notes. Of Bills considered as circulating Paper. Of the different Degrees of Rapidity in the Circulation of different Sorts of circulating Medium, at different Times. Error of Dr. A. Smith. Difference in the Quantity wanted for effecting the Payments of a Country in Consequence of this Difference of Rapidity: Proof of this taken from Events of 1793. Fallacy involved in the Supposition that Paper Credit might be abolished

CHAPTER IV.
Observation of Dr. Smith, respecting the Bank of England: Of the Nature of that Institution: Reasons for never greatly diminishing its Notes: its Liability to be exhausted of Guineas: the Suspension of its Cash Payments not owing to too great Issue of Paper, nor to too great Loans. Propriety of Parliamentary Interference

CHAPTER V.
Of the Balance of Trade. Of the Course of Exchange: Tendency of an unfavourable Exchange to take away Gold: of the Probability of the Return of Gold: of the Manner in which it may be supposed that the exported Gold is employed on the Continent. Reasons for having renewed the Law for suspending the Cash Payments of the Bank of England
CHAPTER VI.
Error of imagining that Gold can be provided at the Time of actual Distress. Reasons for not admitting the Presumption that the Directors of the Bank must have been to blame, for not making, beforehand, a more adequate Provision.

CHAPTER VII.
Of Country Banks: their Advantages and Disadvantages.

CHAPTER VIII.
Of the Tendency of a too great Issue of Bank Paper to produce an Excess of the Market Price above the Mint Price of Gold: of the Means by which it creates this Excess, viz. by its Operation on the Price of Goods, and on the Course of Exchange. Errors of Dr. A. Smith on the Subject of Excessive Paper. Of the Manner in which the Limitation of the Quantity of the Bank of England Paper serves to limit the Quantity, and sustain the Value of all the Paper in the Kingdom.

CHAPTER IX.
Of the Circumstances which cause the Paper of the Bank of England, as well as all the other Paper of the Country, to fail of having their Value regulated according to any exact Proportion to the Quantity of Bank of England Notes.

CHAPTER X.
Objections to the Doctrine of the two preceding Chapters answered. Of the Circumstances which render it necessary that the Bank should impose its own Limit on the Quantity of its Paper. Effect of the Law against Usury. Proof of the necessity of restricting the Bank Loans, drawn from the Case of the Transfer of Capital to Foreign Countries.

CHAPTER XI.
Of the Influence of Paper Credit on the Price of Commodities. Observations on some Passages of Montesquieu and Hume. Conclusion.
AN INQUIRY

INTO THE NATURE AND EFFECTS

OF THE

PAPER CREDIT OF GREAT BRITAIN.

CHAPTER I.

Of Commercial Credit. Of Paper Credit, as arising out of it. Of Commercial Capital.

COMMERCIAL credit may be defined to be that confidence which subsists among commercial men in respect to their mercantile affairs. This confidence operates in several ways. It disposes them to lend money to each other, to bring themselves under various pecuniary engagements by the acceptance and endorsement of bills, and also to sell and deliver goods in consideration of an equivalent promised to be given at a subsequent period. Even in that early and rude
state of society, in which neither bills nor money are as yet known, it may be assumed, that if there be commerce, a certain degree of commercial credit will also subsist. In the interchange, for example, of commodities between the farmer and the manufacturer, the manufacturer, probably, will sometimes deliver goods to the farmer on the credit of the growing crop, in confidence that the farmer will come into possession of the fruits of his labour, and will be either compelled by the law of the land, or induced by a sense of justice, to fulfil his part of the contract when the harvest shall be over. In a variety of other cases it must happen, even in the infancy of society, that one man will deliver property to his neighbour without receiving, on the spot, the equivalent which is agreed to be given in return. It will occasionally be the interest of the one party thus to wait the others convenience: for he that reposes the confidence will receive in the price an adequate compensation for the disadvantages incurred by the risk and the delay. In a society in which law and the sense of moral duty are weak, and property is consequently insecure, there will, of course, be little confidence or credit, and there will also be little commerce.

This commercial credit is the foundation of paper credit; paper serving to express that confidence which is in the mind, and to reduce to writing those engagements to pay, which might otherwise be merely verbal. It will hereafter be explained in what manner, and to how very great a degree, paper credit also spares the use of the expensive article of gold; and how the multiplication of paper securities serves to enlarge, confirm, and diffuse that confidence among traders, which,
in some measure, existed independently of paper, and would, to a certain degree, remain, though paper should be abolished.

If there may be a convenience in giving credit in the infancy of society, when the interchange of commodities is small, there may be, at least, the same convenience when goods begin to be multiplied, when wealth is more variously distributed, and society is advanced.

The day on which it suits the British merchant to purchase and send away a large quantity of goods, may not be that on which he finds it convenient to pay for them. If it is made necessary for him to give ready money in return, he must always have in his hands a very large stock of money; and for the expense of keeping this fund (an expense consisting chiefly in the loss of interest) he must be repaid in the price of the commodities in which he deals. He avoids this charge, and also obtains time for preparing and adjusting his pecuniary concerns, by buying on credit; that is to say, by paying for his goods not by money, but by the delivery of a note in which he promises the money on a future day. He is thus set more at liberty in his speculations: his judgment as to the propriety of buying or not buying, or of selling or not selling, and also as to the time of doing either, may be more freely exercised.

The general principle, according to which the length of the customary credit in different trades has adjusted itself, seems clearly to have been that of mutual advantage and convenience. For example, if we suppose the merchant importers of any particular article for home consumption to be generally rich, and
the retailers of it to be poor—that is, to have a capital insufficient to enable them to keep the assortment and stock of goods necessary in their retail commerce—the credit customarily given by the importers, and taken by the retail traders, will naturally be long. In other words, it will be the custom of the importers to lend part of their capital to the retail dealers, in consideration of an advantage in the price proportionate to the benefit conferred by the loan. Sometimes two or more customs prevail, as to the period of credit, in the same trade; and to each custom there are individual exceptions. The deviations from the rule obviously arise out of that principle of mutual advantage and convenience on which the rule itself has been founded.

The option of buying and of selling on longer or shorter credit, as it multiplies the number of persons able to buy and to sell, promotes free competition, and thus contributes to lower the price of articles. A variety of degrees in the length of credit which is afforded, tends more especially to give to some of the poorer traders a greater power of purchasing, and cherishes that particular sort of competition most adapted to lower prices, namely, the competition of dealers likely to be contented with a very moderate rate of gain. Opulent merchants sometimes complain of the intrusion of dealers who possess a small capital and take long credit, for this very reason, that such dealers reduce the profits of trade.

But the custom of taking and giving long credit has its inconveniences as well as its advantages. It increases the amount of the bad debts incurred in the course of commercial transactions. The apprehension
of loss, is, therefore, continually operating on the mind of the lender as a restraint on the custom of giving credit, while the compensation he receives for the use of the capital which he supplies, acts as an encouragement to the practice. The subsisting state of credit may, in general, be considered as resulting out of a comparison made both by lenders and borrowers of the advantages and disadvantages which each discover that they derive from giving and taking credit.

Mercantile confidence, however, is not always dealt out in that proportion in which there is reasonable ground for it. At some periods it has risen to a most unwarrantable height, and has given occasion to the most extravagant and hurtful speculations. Of these the cases of the Ayr bank, and of the South Sea scheme, are instances. Evils of this kind, however, have a tendency to correct themselves. In a country possessed of commercial knowledge and experience, confidence, in most instances, will not be misplaced.

Some persons are of opinion, that, when the custom of buying on credit is pushed very far, and a great quantity of individual dealings is in consequence carried on by persons having comparatively little property, the national commerce is to be considered as unsupported by a proper capital; and that a nation, under such circumstances, whatever may be its ostensible riches, exhibits the delusive appearance of wealth.

It must, however, be remembered, that the practice of buying on credit, in the internal commerce of the country, supposes the habit of selling on credit also to subsist; and to prevail, on the whole, in an
exactly equal degree. In respect to the foreign trade of a country, the practice of dealing on credit indicates poverty or riches, in proportion as the credit generally taken is longer or shorter than the credit given. The custom which tradesmen have of selling to the consumers on credit, is also an indication of wealth in the commercial world: the traders must possess a surplus of wealth, either their own or borrowed, which bears an exact proportion to the amount of debts due to them by the consumers. Thus that practice of trading on credit which prevails among us, so far as it subsists between trader and trader, is an indication neither of wealth nor of poverty in the mercantile body; so far as it respects our transactions with foreign countries, is an indication of extraordinary wealth belonging to the merchants of Great Britain; and so far as it respects the trade between the retailer and the consumer, and implies a deficiency of wealth in the consumers, and a proportionate surplus of it among commercial men. The existing customs imply, that, on the whole, there is among our traders a great abundance of wealth.

It may conduce to the prevention of error, in the subsequent discussions, to define, in this place, what is meant by commercial capital. This consists, first, in the goods (part of them in the course of manufacture) which are in the hands of our manufacturers and dealers, and are in their way to consumption. The amount of these is necessarily larger or smaller in proportion as the general expenditure is more or less considerable, and in proportion, also, as commodities pass more or less quickly into the hands of the consumer. It further consists in the ships, buildings, machinery, and other dead stock maintained for the
purpose of carrying on our manufactures and commerce, under which head may be included the gold found necessary for the purposes of commerce, but at all times forming a very small item in this great account. It comprehends also the debts due to our traders for goods sold and delivered by them on credit; debts finally to be discharged by articles of value given in return.

Commercial capital, let it then be understood, consists not in paper, and is not augmented by the multiplication of this medium of payment. In one sense, indeed, it may be increased by paper. I mean, that the nominal value of the existing goods may be enlarged through a reduction which is caused by paper in the value of that standard by which all property is estimated. The paper itself forms no part of the estimate.

This mode of computing the amount of the national capital engaged in commerce, is substantially the same with that in which each commercial man estimates the value of his own property. Paper constitutes, it is true, an article on the credit side of the books of some men; but it forms an exactly equal item on the debit side of the books of others. It constitutes, therefore, on the whole, neither a debit nor a credit. The banker who issues twenty thousand pounds in notes, and lends in consequence twenty thousand pounds to the merchants on the security of bills accepted by them, states himself in his books to be debtor to the various holders of his notes to the extent of the sum in question; and states himself to be the creditor of the accepters of the bills in his possession to the same amount. His valuation, therefore, of his
own property, is the same as if neither the bills nor the bank notes had any existence. Again; the merchants, in making their estimate of property, deduct the bills payable by themselves which are in the drawer of the banker, and add to their estimate the notes of the banker which are in their own drawer; so that the valuation, likewise, of the capital of the merchants is the same as if the paper had no existence. The use of paper does not, therefore, introduce any principle of delusion into that estimate of property which is made by individuals. The case of gold, on the other hand, differs from that of paper inasmuch as the possessor of gold takes credit for that for which no man debits himself. The several commercial capitals of traders, as estimated in their books, would, unquestionably, be found, if deducted from their other property and added together, to correspond, in amount with a general estimate of the commercial stock of the country, calculated under the several heads already stated.

It is true, that men, in estimating their share in the public funds of the country, add to their estimate a debt due to them which no individual deducts from his valuation, On this head, it may be observed, that the nation is the debtor. But the commercial capital, which has been described, exists independently of capital in the public funds. The man in trade has property in trade. If he has property in the stocks, he has the property in trade in addition to it. In speaking, therefore, of the commercial capital, whether of the nation or of an individual, the idea that any part of it is composed either of the paper credit or of the stocks of the country, is to be totally excluded.

SOCIETY, in its rudest state, carries on its trade by the means only of barter. When most advanced, it still conducts its commerce on the same principle; for gold and silver coin, banker's notes, and bills of exchange, may be considered merely as instruments employed for the purpose of facilitating the barter. The object is to exchange such a quantity of one sort of goods for such a quantity of another, as may be deemed, under all circumstances, a suitable equivalent.*

* By the term suitable equivalent, is not intended that equivalent which an impartial umpire, determining according to the strict rule of equity, might dictate. The equivalent obtained by men dealing in the way of barter is not exactly of this sort; for that power which the proprietors of a scarce and necessary commodity have over the consumers of
Barter being soon felt to be inconvenient, the precious metals are resorted to as a measure of value, they being, at once, portable, steady in their price, and capable of subdivisions. The state fixes a stamp upon them, in order thus to certify the quantity and fineness of each piece.

The precious metals, when uncoined (or in the state of bullion), are themselves commodities; but when converted into money they are to be considered merely as a measure of the value of other articles. They may, indeed, be converted back into commodities; and it is one recommendation of their use as coin, that they are capable of this conversion.

We shall now advert to some of the simplest forms in which it may be supposed that paper credit will first exist.

To speak first of Bills of Exchange.

It is obvious, that, however portable gold may be in comparison to any other article which might be made a measure of value, to carry it in quantities to a great distance must prove incommodious. Let it be supposed, that there are in London ten manufacturers who sell their article to ten shop-keepers in York, by whom it is retailed; and that there are in York ten manufacturers of another commodity, who sell it to ten

it, will always lead them to demand a much higher price than the production of it may have cost.

In Africa, for example, where the mode of barter prevails, the price of rice is at some times equal to about two pounds, and at others to about sixteen pounds per ton. It cannot be supposed that the variations in the crops of different seasons can bear any proportion to this variation of prices. Monopoly also is an evil which is incident to trade as trade. It is, indeed, more particularly apt to exist in the infancy of commerce.
shopkeepers in London. There would be no occasion for the ten shopkeepers in London to send yearly to York, guineas for the payment of the York manufac-
tures, and for the ten York shopkeepers to send yearly as many guineas to London. It would only be ne-
necessary for the York manufacturers to receive from each of the shopkeepers, at their own door, the money in question (for we may assume a sufficient quantity to be usually circulating in the place): giving in re-
turn letters which should acknowledge the receipt of it; and which should also direct the money, lying ready in the hands of their debtors in London, to be paid to the London shopkeepers, so as to cancel the debt in London in the same manner as that at York. The expense and the risk of all transmission of money would thus be saved; and the traders in question would of course be, on the whole, enabled to sell their article at a price proportionally lower than that which they would otherwise require. Letters order-
ing the transfer of the debt, are termed, in the lan-
guage of the present day, bills of exchange. They are bills by which the debt of one person is exchanged for the debt of another; and the debt, perhaps, which is due in one place for the debt due in another.

To speak next of Promissory Notes.

When goods are delivered in consideration of an equivalent in money to be received at a subsequent period, it becomes desirable that, for the sake of pre-
cisely recording the day on which payment is to be made, and the exact amount of the sum, a note, ex-
pressing each of these particulars, should be given. The term "value received" is introduced into the note, as also into every bill of exchange; that ex-
pression being deemed necessary in law to make the bill or the note binding.

Bills of exchange and notes have been hitherto considered as created only for those simple purposes for which they seem originally to have been drawn, and which are professed by the form always used in drawing them. Both these sorts of paper must now be spoken of as possessing an additional character, namely, that of being *Discountable Articles*, or articles which there is an opportunity of converting, at any time, into money; such a discount or deduction from the amount of the bill or note as is equal to the interest upon it, during the period for which it has to run, being paid as the price of the conversion. The bills of exchange, which were described as drawn from York on London, and as serving to transfer debts, would equally answer that purpose at whatever date they might be payable. It is customary, however, to make almost all bills payable at a period somewhat distant. Country bankers, for instance, and shopkeepers, who often act in this respect as bankers, indemnify themselves for the trouble and expense attending the drawing of bills, not by a commission, but by a protraction of the time at which the bills are to become payable. Thus is created a paper credit, which shall remain in existence for perhaps one or more months, and may serve, during any part of that time, as a discountable article.

Promissory notes were before represented as drawn on the occasion of the sale of goods, and made payable at a distant period. In returning to the more careful consideration of them, we shall discover the existence of the same disposition to multiply paper credit.
When a merchant in this country sells his goods on credit, it is, perhaps, not very important to him that he should receive from the buyer a promissory note (or an accepted bill, which is the same thing), if the only object of taking the note or bill is the ascertainment of the exact amount of the debt, and of the period of payment. It is true that the law gives superior facility to the recovery of debts for which promissory notes have been given. Nevertheless, if the sum be small, and the party in credit, all these advantages, in the present high state of confidence, would, in many cases, be thought scarcely to compensate even the trifling expense of the note stamp. The debt will be a book debt, if no note be taken; and, as such, may be sufficiently secure.

Notes, even for goods sold and delivered, are therefore to be considered as given chiefly for the sake of a convenience of another kind, which the seller finds in having them. The note, like the bill of exchange just spoken of, is a discountable article. It may be turned, if circumstances require, into money; or into bank notes, which answer the same purpose. It is not, perhaps, fully intended to turn the note or bill into money; they are taken rather as a provision against a contingency. The holder is rendered secure against the effect of disappointments in the receipt of cash. It is in this manner that his credit is fortified, and that he is enabled to fulfil with punctuality his pecuniary engagements; for there is a certain sort and quantity of bills and notes, on the turning of which into money, at the common rate of discount, the holder, if he be a man of credit, may almost as confidently rely on the changing of a bank note into guineas, or of a guinea into silver.
The interest which traders have in being always possessed of a number of notes and bills, has naturally led to a great multiplication of them; and not only to the multiplication of notes given for goods sold, or of regular bills of exchange, but to the creation of numerous other notes and bills. Of these, some are termed notes and bills of accommodation: and the term fictitious is often applied to them. It may be useful to describe them particularly.

It was before shewn, that the principal motive for fabricating what must here be called the real note, that is, the note drawn in consequence of a real sale of goods, is the wish to have the means of turning it into money. The seller, therefore, who desires to have a note for goods sold, may be considered as taking occasion to ingraft on the transaction of the sale, the convenient condition of receiving from the buyer a discountable note of the same amount with the value of the goods. A fictitious note, or note of accommodation, is a note drawn for the same purpose of being discounted; though it is not also sanctioned by the circumstance of having been drawn in consequence of an actual sale of goods. Notes of accommodation are, indeed, of various kinds. The following description of one may suffice:

A, being in want of 100l. requests B to accept a note or bill drawn at two months, which B, therefore, on the face of it, is bound to pay; it is understood, however, that A will take care either to discharge the bill himself, or to furnish B with the means of paying it. A obtains ready money for the bill on the joint credit of the two parties. A fulfils his promise of paying it when due, and thus concludes the transaction. This service rendered by B to A is, how-
ever, not unlikely to be requited at a more or less distant period by a similar acceptance of a bill on A, drawn and discounted for B’s convenience.

Let us now compare such a bill with a real bill. Let us consider in what points they differ, or seem to differ; and in what they agree.

They agree, inasmuch as each is a discountable article; each has also been created for the purpose of being discounted; and each is, perhaps, discounted in fact. Each, therefore, serves equally to supply means of speculation to the merchant. So far, moreover, as bills and notes constitute what is called the circulating medium, or paper currency, of the country (a topic which shall not be here anticipated), and prevent the use of guineas, the fictitious and the real bill are upon an equality; and if the price of commodities be raised in proportion to the quantity of paper currency, the one contributes to that rise exactly in the same manner as the other.

Before we come to the points in which they differ, let us advert to one point in which they are commonly supposed to be unlike; but in which they cannot be said always or necessarily to differ.

"Real notes," it is sometimes said, "represent actual property. There are actual goods in existence, which are the counterpart to every real note. Notes which are not drawn, in consequence of a sale of goods, are a species of false wealth, by which a nation is deceived. These supply only an imaginary capital; the others indicate one that is real."

In answer to this statement it may be observed, first, that the notes given in consequence of a real sale of goods cannot be considered as, on that account,
certainly representing any actual property. Suppose that A sells one hundred pounds worth of goods to B at six months credit, and takes a bill at six months for it; and that B, within a month after, sells the same goods, at a like credit, to C, taking a like bill; and again, that C, after another month, sells them to D, taking a like bill, and so on. There may then, at the end of six months, be six bills of 100\(\) each existing at the same time; and every one of these may possibly have been discounted. Of all these bills, then, one only represents any actual property.

In the next place it is obvious, that the number of those bills which are given in consequence of sales of goods, and which, nevertheless, do not represent property, is liable to be increased through the extension of the length of credit given on the sale of goods. If, for instance, we had supposed the credit given to be a credit of twelve months instead of six, 1,200\(\) instead of 600\(\) would have been the amount of the bills drawn on the occasion of the sale of goods; and 1,100\(\) would have been the amount of that part of these which would represent no property.

In order to justify the supposition that a real bill (as it is called) represents actual property, there ought to be some power in the bill-holder to prevent the property which the bill represents, from being turned to other purposes than that of paying the bill in question. No such power exists; neither the man who holds the real bill, nor the man who discounts it, has any property in the 'specific goods for which it was given: he as much trusts to the general ability to pay of the giver of the bill, as the holder of any fictitious bill does. The fictitious bill may, in many cases, be a bill given by a person having a large
and known capital, a part of which the fictitious bill may be said, in that case, to represent. The supposition that real bills represent property, and that fictitious bills do not, seems, therefore, to be one by which more than justice is done to one of these species of bills, and something less than justice to the other.

We come next to some points in which they differ.

First, the fictitious note, or note of accommodation, is liable to the objection that it professes to be what it is not. This objection, however, lies only against those fictitious bills which are passed as real. In many cases, it is sufficiently obvious what they are. Secondly, the fictitious bill is, in general, less likely to be punctually paid than the real one. There is a general presumption, that the dealer in fictitious bills is a man who is a more adventurous speculator than he who carefully abstains from them. It follows, thirdly, that fictitious bills, besides being less safe, are less subject to limitation as to their quantity. The extent of a man's actual sales form some limit to the amount of his real notes; and, as it is highly desirable in commerce that credit should be dealt out to all persons in some sort of regular and due proportion, the measure of a man's actual sales, certified by the appearance of his bills drawn in virtue of those sales, is some rule in the case, though a very imperfect one in many respects.

A fictitious bill, or bill of accommodation, is evidently, in substance, the same as any common promissory note; and even better, in this respect,—that there is but one security to the promissory note, whereas, in the case of the bill of accommodation,
there are two. So much jealousy subsists lest traders should push their means of raising money too far, that paper, the same in its general nature with that which is given, being the only paper which can be given, by men out of business, is deemed somewhat discreditable when coming from a merchant. And because such paper, when in the merchant's hand, necessarily imitates the paper which passes on the occasion of a sale of goods, the epithet fictitious has been cast upon it; an epithet which has seemed to countenance the confused and mistaken notion, that there is something altogether false and delusive in the nature of a certain part both of the paper and of the apparent wealth of the country.

Bills of exchange are drawn upon London to a great amount, from all parts, not only of Great Britain, but of the world; and the grounds on which they have been drawn in a great degree elude observation. A large proportion of them, no doubt partakes of the nature of bills of accommodation. They have, however, in general, that shape communicated to them, whatever it might be, which is thought likely to render them discountable; and it is not difficult, as the preceding observations will have shewn, to make use of some real, and, at the same time, of many seeming, transactions of commerce as a ground for drawing, and as a means of multiplying such bills.

The practice of creating a paper credit, by drawing and redrawing; has been particularly described by Dr. Adam Smith; and is stated by him to have a tendency which is very ruinous to the party resorting to it. This practice, however, is often carried on at much less expense to those engaged in it than Dr. Smith
imagines. A, for instance, of London, draws a bill at two months on B, of Amsterdam, and receives immediate money for the bill. B enables himself to pay the bill by drawing, when it is nearly due, a bill at two months on A for the same sum, which bill he sells or discounts; and A again finds the means of payment by again drawing a bill, at two months, on B. The transaction is, in substance, obviously the same as if A and B had borrowed on their joint security, the sum in question for six months. The ground on which transactions of this sort have been stated by Dr. Adam Smith to be ruinous is, that of the heavy expense of a commission on every bill drawn, which is paid by him who raises money in this manner. If, for instance, one half per cent. is the commission, and the bills are drawn at two months, and a discount of five per cent. per annum is paid, the money is raised at an interest of eight per cent. Such transactions, however, are often carried on alternately for the benefit of each of the two parties; that is to say, at one time the transaction is on the account of A, who pays a commission to B; at another it is on the account of B, who pays a commission to A. Thus each party, on the whole, gains about as much as he pays in the shape of such commissions; and the discount in turning the bill into money, which is the same as that on any other bill, may, therefore, be considered as the whole expense incurred. Money may be raised in this manner at an interest of only five per cent. In the case recently proposed, the drawing and re-drawing were imagined to be only between A, of London, and B, of Amsterdam. This practice, however, is often carried on between three or more parties drawing from three or more places. In such case,
the draft is drawn on the place on which the existing course of exchange shews that it will best answer to draw it. An operation of this sort may obviously be carried on partly for the purpose of raising money, and partly for that of profiting by a small turn in the exchange. Transactions which are the converse to this, are, on the other hand, entered into by those who happen to possess ready money. They remit, if the exchange seems to favour their remittance, and draw in consequence of having remitted. To determine what bills are fictitious, or bills of accommodation, and what are real, is often a point of difficulty. Even the drawers and remitters themselves frequently either do not know, or do not take the trouble to reflect, whether the bills ought more properly to be considered as of the one class or of the other; and the private discounter, or banker, to whom they are offered, still more frequently finds the credit of the bills to be the only rule which it is possible to follow in judging whether he ought to discount them.
CHAPTER III.

We proceed next to speak of circulating paper, and first of Notes payable to Bearer on Demand, whether issued by a public bank or by a private banker.

When confidence rises to a certain height in a country, it occurs to some persons, that profit may be obtained by issuing notes, which purport to be
exchangeable for money; and which, through the
known facility of thus exchanging them, may circulate
in its stead; a part only of the money, of which the
notes supply the place, being kept in store as a pro-
vision for the current payments. On the remainder
interest is gained, and this interest constitutes the
profit of the issuer. Some powerful and well accred-
ted company will probably be the first issuers of
paper of this sort, the numerous proprietors of the
company exerting their influence, for the sake of the
dividends which they expect, in giving currency to
the new paper credit. The establishment of a great
public bank has a tendency to promote the institution
of private banks. The public bank, obliged to pro-
vide itself largely with money for its own payments,
becomes a reservoir of gold to which private banks
may resort with little difficulty, expense, or delay, for
the supply of their several necessities.

Dr. A. Smith, in his chapter on Paper Credit, con-
siders the national stock of money in the same light
with those machines and instruments of trade which
require a certain expense, first, to erect, and after-
wards to support them. And he proceeds to observe,
that the substitution of paper, in the room of gold
and silver coin, serves to replace a very expensive
instrument of commerce with one much less costly,
and sometimes equally convenient. “Thus,” he
says, “a banker, by issuing 100,000l. in notes, keep-
ing 20,000l. in hand for his current payments, causes
20,000l. in gold and silver to perform all the func-
tions which 100,000l. would otherwise have per-
formed; in consequence of which, 80,000l. of gold
and silver can be spared, which will not fail to be
exchanged for foreign goods, and become a new
"fund for a new trade, producing profit to the country."

Dr. Smith, although he discusses at some length the subject of Paper Circulation, does not at all advert to the tendency of bills of exchange to spare the use of bank paper, or to their faculty of supplying its place in many cases.

In the former chapter it was shewn that bills, though professedly drawn for the purpose of exchanging a debt due to one person for a debt due to another, are, in fact, created rather for the sake of serving as a discountable article, and of forming a provision against contingencies; and that, by being at any time convertible into cash (that is, into either money or bank notes) they render that supply of cash which is necessary to be kept in store much less considerable.

But they not only spare the use of ready money; they also occupy its place in many cases. Let us imagine a farmer in the country to discharge a debt

* Dr. Smith, in confirmation of this, remarks how greatly Scotland had been enriched in the twenty-five or thirty years preceding the time at which he wrote, by the erection of new banks in almost every considerable town, and even in some country villages, the effects having been, as he affirms, precisely those which he had described. The trade of Glasgow he states to have been doubled in about fifteen years after the erection of its first bank, and the trade of Scotland to be thought to have been more than quadrupled since the first erection of its two first public banking companies. This effect, indeed, he conceives to be too great to be accounted for by that cause alone; though he deems it indisputable, that the banks have essentially contributed to the augmentation of the trade and industry of Scotland. The gold and silver of Scotland, circulating before the union, is estimated by him at full a million; the quantity since the union at less than half a million; and the paper circulating in Scotland since the union at about one million and a half.
of 10l. to his neighbouring grocer, by giving to him a bill for that sum, drawn on his corn factor in London for grain sold in the metropolis; and the grocer to transmit the bill, he having previously endorsed it, to a neighbouring sugar-baker, in discharge of a like debt; and the sugar-baker to send it, when again endorsed, to a West India merchant in an out port, and the West India merchant to deliver it to his country banker, who also endorses it, and sends it into further circulation. The bill in this case will have effected five payments exactly as if it were a 10l. note payable to bearer on demand. It will, however, have circulated in consequence chiefly of the confidence placed by each receiver of it in the last endorser, his own correspondent in trade; whereas, the circulation of a bank note is owing rather to the circumstance of the name of the issuer being so well known as to give it an universal credit. A multitude of bills pass between trader and trader in the country in the manner which has been described; and they evidently form, in the strictest sense, a part of the circulating medium of the kingdom.*

*Mr. Boyd, in his publication addressed to Mr. Pitt on the Subject of the Bank of England Issues, propagates the same error into which many others have fallen, of considering bills as no part of the circulating medium of the country. He says, "by the words means of circulation," "circulating medium," and "currency," "(which are used as synonymous terms in this letter) I understand always ready money, whether consisting of bank notes or specie, in contradiction to bills of exchange, naval bills, exchequer bills, or any negotiable paper which form no part of the circulating medium, as I have always understood that term. The latter is the circulator; the former are merely objects of circulation." See note to the first page of Mr. Boyd's letter to Mr. Pitt.

It will be seen, in the progress of this work, that it was necessary to clear away much confusion which has arisen from the want of a suffici-
Bills, however, and especially those which are drawn for large sums, may be considered as in general circulating more slowly than either gold or bank notes, and for a reason which it is material to explain. Bank notes, though they yield an interest to the issuer, afford none to the man who detains them in his possession; they are to him as unproductive as guineas. The possessor of a bank note, therefore, makes haste to part with it. The possessor of a bill of exchange possesses, on the contrary, that which is always growing more valuable. The bill, when it is first drawn, is worth something less than a bank note, on account of its not being due until a distant day; and the first receiver of it may be supposed to obtain a compensation for the inferiority of its value in the price of the article with which the bill is purchased. When he parts with it, he may be considered as granting to the next receiver a like compensation, which is proportionate to the time which the bill has still to run. Each holder of a bill has, therefore, an interest in detaining it.

Bills, it is true, generally pass among traders in the country without there being any calculation or regular allowance of discount; the reason of which circumstance is, that there is a generally understood period of time for which those bills may have to run, which, according to the custom of traders, are accepted as current payment. If any bill given in payment has a longer time than usual to run, he who receives it is considered as so far favouring the person from whom he takes it; and the favoured person has to compensate full acquaintance with the several kinds of paper credit; and, in particular, to remove, by a considerable detail, the prevailing errors respecting the nature of bills, before it could be possible to reason properly upon the effects of paper credit.
sate for this advantage, not, perhaps, by a recompence of the same kind accurately calculated, but in the general adjustment of the pecuniary affairs of the two parties.

This quality in bills of exchange (and it might be added of interest notes, &c.) of occupying the place of bank paper, and of also throwing the interest accruing during their detention into the pocket of the holder, contributes greatly to the use of them. The whole trading world may be considered as having an interest in encouraging them. To possess some article which, so long as it is detained, shall produce a regular interest, which shall be subject to no fluctuations in price, which, by the custom of commerce, shall pass in certain cases as a payment, and shall likewise be convertible into ready money by the sacrifice of a small discount, is the true policy of the merchant. Goods will not serve this purpose, because they do not grow more valuable by detention; nor stocks, because, though they yield an interest, they fluctuate much in value; and, also, because the expense of brokerage is incurred in selling them, not to mention the inconveniences arising from the circumstance of their being transferable only in the books of the Bank of England. Stocks, however, by being at all times a saleable and ready money article, are, to a certain degree, held by persons in London on the same principle as bills, and serve, therefore, in some measure, like bills, if we consider these as a discountable article, to spare the use of bank notes. Exchequer bills will not fully answer the purpose, because there is a commission on the sale of these, as on the sale of stocks; and because, not to speak of some other inferior objections to them, they fluctuate, in some small degree, in price.
Bills, since they circulate chiefly among the trading world, come little under the observation of the public. The amount of bills in existence may yet, perhaps, be at all times greater than the amount of all the bank notes of every kind, and of all the circulating guineas.*

The amount of what is called the circulating medium of a country has been supposed by some to bear a regular proportion to the quantity of trade and of payments. It has, however, been shewn, that such part of the circulating medium as yields an interest to the holder will effect much fewer payments, in proportion to its amount, than the part which yields to the holder no interest. A number of country bank notes, amounting to 100l. may, for instance, effect on an average one payment in three days; while a bill of 100l. may, through the disposition of each holder to detain it, effect only one payment in nine days.

There is a passage in the work of Dr. Adam Smith which serves to inculcate the error of which I have been speaking; a passage on which it may be useful to comment with some particularity.

He says, "The whole paper money of every kind which can easily circulate in any country, never can exceed the value of the gold and silver of which it supplies the place, or which (the commerce being supposed the same) would circulate there, if there was no paper money."

* Liverpool and Manchester effect the whole of their larger mercantile payments not by country bank notes, of which none are issued by the banks of those places, but by bills at one or two months date, drawn on London. The bills annually drawn by the banks of each of those towns amount to many millions. The banks obtain a small commission on these bills.
Does Dr. Smith mean to include, in his idea of "the whole paper money of every kind which can easily circulate," all the bills of exchange of a country, or does he not? And does he also include interest notes, exchequer bills, and India bonds, and those other articles which very much resemble bills of exchange? In an earlier part of his chapter, he has this observation: "There are different sorts of paper money; but the circulating notes of banks and bankers are the species which is best known, and which seems best adapted for this purpose." We are led to judge by this passage, and also by the term "paper money of every kind" in the passage before quoted, that it was his purpose to include bills of exchange; on the other hand, if all the bills of exchange of a country are to be added to the bank notes which circulate, it becomes then so manifest, that the whole of the paper must be more than equal to the amount of the money which would circulate if there were no paper, that we feel surprised that the erroneousness of the position did not strike Dr. Smith himself. He introduces, indeed, the qualifying word "easily;" he speaks of "the whole paper money of every kind which can easily circulate." But this term, as I apprehend, is meant only to refer to an easy, in contradistinction to a forced, paper circulation; for it is on the subject of a forced circulation that a great part of his observations turn. He seems, on the other hand, to have paid no regard to the distinction on which I have dwelt, of a more slow and a more rapid circulation; a thing which is quite different from an easy and a difficult circulation. He appears, in short, not at all to have reflected how false his maxim is rendered (if laid down in the terms which he has used)
both by the different degrees of rapidity of circulation which generally belong to the two different classes of paper of which I have spoken, and also by the different degrees of rapidity which may likewise belong to the circulation of the same kinds of paper, and even of the same guineas, at different times.

The error of Dr. Smith, then, is this:—he represents the whole paper, which can easily circulate when there are no guineas, to be the same in quantity with the guineas which would circulate if there were no paper; whereas, it is the quantity not of "the thing which circulates," that is, of the thing which is capable of circulation, but of the actual circulation which should rather be spoken of as the same in both cases. The quantity of circulating paper, that is, of paper capable of circulation, may be great, and yet the quantity of actual circulation may be small, or vice versa. The same note may either effect ten payments in one day, or one payment in ten days; and one note, therefore, will effect the same payments in the one case, which it would require a hundred notes to effect in the other.

I have spoken of the different degrees of rapidity in the circulation of different kinds of paper, and of the consequent difference of the quantity of each which is wanted in order to effect the same payments. I shall speak next of the different degrees of rapidity in the circulation of the same medium at different times: and, first, of bank notes.

The causes which lead to a variation in the rapidity of the circulation of bank notes may be several. In general, it may be observed, that a high state of confidence serves to quicken their circulation; and this happens upon a principal which shall be fully ex-
plained. It must be premised, that by the phrase a more or less quick circulation of notes, will be meant a more or less quick circulation of the whole of them on an average. Whatever increases that reserve, for instance, of Bank of England notes which remains in the drawer of the London banker as his provision against contingencies, contributes to what will here be termed the less quick circulation of the whole. Now a high state of confidence contributes to make men provide less amply against contingencies. At such a time, they trust, that if the demand upon them for a payment, which is now doubtful and contingent, should actually be made, they shall be able to provide for it at the moment; and they are loth to be at the expense of selling an article, or of getting a bill discounted, in order to make the provision much before the period at which it shall be wanted. When, on the contrary, a season of distrust arises, prudence suggests, that the loss of interest arising from a detention of notes for a few additional days should not be regarded.

It is well known that guineas are hoarded, in times of alarm, on this principle. Notes, it is true, are not hoarded to the same extent; partly because notes are not supposed equally likely, in the event of any general confusion, to find their value, and partly because the class of persons who are the holders of notes is less subject to weak and extravagant alarms. In difficult times, however, the disposition to hoard, or rather to be largely provided with Bank of England notes, will perhaps, prevail in no inconsiderable degree.

This remark has been applied to Bank of England notes, because these are always in high credit; and it ought, perhaps, to be chiefly confined to these. They
constitute the coin in which the great mercantile payments in London, which are payments on account of the whole country, are effected. If, therefore, a difficulty in converting bills of exchange into notes is apprehended, the effect both on bankers, merchants, and tradesmen, is somewhat the same as the effect of an apprehension entertained by the lower class of a difficulty in converting Bank of England notes or bankers’ notes into guineas. The apprehension of the approaching difficulty makes men eager to do that to-day, which otherwise they would do to-morrow.

The truth of this observation, as applied to Bank of England notes, as well as the importance of attending to it, may be made manifest by adverting to the events of the year 1793, when, through the failure of many country banks, much general distrust took place. The alarm, the first material one of the kind which had for a long time happened, was extremely great. It does not appear that the Bank of England notes, at that time in circulation, were fewer than usual. It is certain, however, that the existing number became, at the period of apprehension, insufficient for giving punctuality to the payments of the metropolis; and it is not to be doubted, that the insufficiency must have arisen, in some measure, from that slowness in the circulation of notes, naturally attending an alarm, which has been just described. Every one fearing lest he should not have his notes ready when the day of payment should come, would endeavour to provide himself with them somewhat beforehand. A few merchants, from a natural though hurtful timidity, would keep in their own hands some of those notes, which, in other times, they would have lodged with their bankers; and the effect would be, to cause
the same quantity of bank paper to transact fewer payments, or, in other words, to lessen the rapidity of the circulation of notes on the whole, and thus to increase the number of notes wanted. Probably, also, some Bank of England paper would be used as a substitute for country bank notes suppressed.

The success of the remedy which the parliament administered, denotes what was the nature of the evil. A loan of exchequer bills was directed to be made to as many mercantile persons, giving proper security, as should apply. It is a fact, worthy of serious attention, that the failures abated greatly, and mercantile credit began to be restored, not at the period when the exchequer bills were actually delivered, but at a time antecedent to that era. It also deserves notice, that though the failures had originated in an extraordinary demand for guineas, it was not any supply of gold which effected the cure. That fear of not being able to obtain guineas, which arose in the country, led, in its consequences, to an extraordinary demand for bank notes in London; and the want of bank notes in London became, after a time, the chief evil. The very expectation of a supply of exchequer bills, that is, of a supply of an article which almost any trader might obtain, and which it was known that he might then sell, and thus turn into bank notes, and after turning into bank notes might also convert into guineas, created an idea of general solvency. This expectation cured, in the first instance, the distress of London, and it then lessened the demand for guineas in the country, through that punctuality in effecting the London payments which it produced, and the universal confidence which it thus inspired. The sum permitted by parliament to be advanced in exchequer
bills was five millions, of which not one half was taken. Of the sum taken, no part was lost. On the contrary, the small compensation, or extra interest, which was paid to government for lending its credit (for it was mere credit, and not either money or bank notes that the government advanced), amounted to something more than was necessary to defray the charges, and a small balance of profit accrued to the public. For this seasonable interference, a measure at first not well understood and opposed at the time, chiefly on the ground of constitutional jealousy, the mercantile as well as the manufacturing interests of the country were certainly much indebted to the parliament, and to the government.*

That a state of distrust causes a slowness in the circulation of guineas, and that at such a time a greater

* The commissioners named in the act state in their report, "that the knowledge that loans might have been obtained, sufficed, in several instances, to render them unnecessary; that the whole number of applications was three hundred and thirty-two, for sums amounting to £3,855,684; of which two hundred and thirty-eight were granted, amounting to £2,202,000; forty-five for sums to the amount of £1,215,100 were withdrawn; and forty-nine were rejected for various reasons. That the whole sum advanced on loans was paid, a considerable part before it was due, and the remainder regularly at the stated periods, without apparent difficulty or distress."

They observe that, "the advantages of this measure were evinced by a speedy restoration of confidence in mercantile transactions, which produced a facility in raising money that was presently felt, not only in the metropolis, but through the whole extent of Great Britain. Nor was the operation of the act less beneficial with respect to a variety of eminent manufacturers, who, having in a great degree suspended their works, were enabled to resume them, and to afford employment to a number of workmen who must otherwise have been thrown on the public."
quantity of money will be wanted in order to effect only the same money payments, is a position which scarcely needs to be proved. Some observations, however, on this subject may not be useless. When a season of extraordinary alarm arises, and the money of the country in some measure disappears, the guineas, it is commonly said, are hoarded. In a certain degree this assertion may be literally true. But the scarcity of gold probably results chiefly from the circumstance of a considerable variety of persons, country bankers, shopkeepers, and others, augmenting, some in a smaller and some in a more ample measure, that supply which it had been customary to keep by them. The stock thus enlarged is not a fund which its possessor purposes, in no case, to diminish, but a fund which, if he has occasion to lessen it, he endeavours, as he has opportunity, to replace. It is thus that a more slow circulation of guineas is occasioned: and the slower the circulation, the greater the quantity wanted, in order to effect the same number of money payments.

Thus, then, it appears, that the sentiment which Dr. Smith leads his readers to entertain, namely, that there is in every country a certain fixed quantity of paper, supplying the place of gold, which is all that "can easily circulate" (or circulate without being forced into circulation), and which is all (for such, likewise, seems to be the intended inference) that should ever be allowed to be sent into circulation, is, in a variety of respects, incorrect. The existence of various hoards of gold in the coffers of bankers, and of the Bank of England, while there are no corresponding hoards of paper, would of itself forbid any thing like accurate comparison between them. Many
additional, though smaller, circumstances might be mentioned as contributing to prevent the quantity of notes which will circulate from being the same as the quantity of gold which would circulate if there were no notes; such as their superior convenience in a variety of respects, the facility of sending them by post, the faculty which they have of being either used as guineas, or of supplying the place of bills of exchange, and furnishing a remittance to distant places.

There is a further objection to the same remark of Dr. Smith. It would lead an uninformed person to conceive, that the trade of a country, and of this country in particular, circumstanced as it now is, might be carried on altogether by guineas, if bank notes of all kinds were by any means annihilated. It may already have occurred, that if bank paper were abolished, a substitute for it would be likely to be found, to a certain degree, in bills of exchange; and that these, on account of their slower circulation, must, in that case, be much larger in amount than the notes of which they would take the place. But further; if bills and bank notes were extinguished, other substitutes than gold would unquestionably be found. Recourse would be had to devices of various kinds by which men would save themselves the trouble of counting, weighing, and transporting guineas, in all the larger operations of commerce, so that the amount of guineas brought into use would not at all correspond with the amount of the bills and notes suppressed. Banks would be instituted, not of the description which now exist, but of that kind and number which should serve best to spare both the trouble of gold, and the expense incurred by the loss of interest upon the quantity of it in possession. Merely by
the transfer of the debts of one merchant to another, in the books of the banker, a large portion of what are termed cash payments is effected at this time without the use of any bank paper,* and a much larger sum would be thus transferred, if guineas were the only circulating medium of the country. Credit would still exist; credit in books, credit depending on the testimony of witnesses, or on the mere verbal promise of parties. It might not be paper credit; but still it might be such credit as would spare more or less, the use of guineas. It might be credit of a worse kind, less accurately dealt out in proportion to the desert of different persons, and therefore, in some instances, at least, still more extended; it might be credit less contributing to punctuality of payments, and to the due fulfilment of engagements; less con-

* The following custom, now prevailing among the bankers within the city of London, may serve to illustrate this observation, and also to shew the strength of the disposition which exists in those who are not the issuers of bank notes to spare the use both of paper and guineas. It is the practice of each of these bankers to send a clerk, at an agreed hour in the afternoon, to a room provided for their use. Each clerk there exchanges the drafts on other bankers received at his own house, for the drafts on his own house received at the house of other bankers. The balances of the several bankers are transferred in the same room from one to another, in a manner which it is unnecessary to explain in detail, and the several balances are finally wound up by each clerk into one balance. The difference between the whole sum which each banker has to pay to all other city bankers, and the whole sum which he has to receive of all other city bankers, is, therefore, all that is discharged in bank notes or money; a difference much less in its amount than the several differences would be equal to. This device, which serves to spare the use of bank notes, may suggest the practicability of a great variety of contrivances for sparing the use of gold, to which men having confidence in each other would naturally resort, if we could suppose bank paper to be abolished.
ducive to the interests of trade, and to the cheapen-
ing of articles; and it would, perhaps, also be credit
quite as liable to interruption on the occasion of any
sudden alarm or material change in the commercial
prospects and circumstances of the country.
CHAPTER IV.

DR. Adam Smith, after laying down the principle which has been lately animadverted on, "that the quantity of paper which can easily circulate in a country never can exceed the gold and silver which would circulate if there were no paper," proceeds to observe, that: the Bank of England, "by issuing too great a quantity of paper, of which the excess was continually returning, in order to be exchanged for gold and silver, was, for many years together, obliged to coin gold to the extent of between
eight hundred thousand pounds and a million a year.

"For this great coinage the bank was frequently obliged to purchase gold bullion at 4l. an ounce, which it soon after issued in coin at 3l. 17s. 10½d. an ounce, losing two and a half and three per cent. on the coinage." Dr Smith probably could not be acquainted with the secret of the actual quantity of those bank notes, of the number of which he complains; he must, therefore, have taken it for granted, that they were what he terms excessive, on the ground of the price of gold being high, and the coinage great. He does not proceed, in any respect, to guard or to limit the observation in question; an observation which, when thus unqualified, may lead the reader to suppose, that whenever the bank finds itself subjected to any great demand for gold in consequence of a high price of bullion, the cause of this evil is an excess of circulating paper, and the remedy a reduction of bank notes. There is also danger, lest it should be conceived, that if the remedy should appear to fail, it can fail only because the reduction is not sufficiently great.

The point of which we are speaking is of great importance, and will be the subject of much future discussion. One object of the present and succeeding Chapter will be to shew, that, however just may be the principle of Dr. Smith when properly limited and explained, the reduction of the quantity of Bank of England paper is by no means a measure which ought to be resorted to on the occasion of every demand upon the bank for guineas arising from the high price of bullion, and that such reduction may even aggravate that sort of rise which is caused by an alarm in the country.
It will be proper, first, to describe the nature of the institution of the Bank of England, and the relation in which it stands to the public; in this detail, the event of the late stoppage of its cash payments will be particularly noticed.

Bills are drawn on London from every quarter of the kingdom, and remittances are sent to the metropolis to provide for them, while London draws no bills, or next to none, upon the country. London is, in this respect, to the whole island, in some degree, what the centre of a city is to the suburbs. The traders may dwell in the suburbs, and lodge many goods there, and they may carry on at home a variety of smaller payments, while their chief cash account is with the banker, who fixes his residence among the other bankers, in the heart of the city. London also is become, especially of late, the trading metropolis of Europe, and, indeed of the whole world; the foreign drafts, on account of merchants living in our out-ports and other trading towns, and carrying on business there, being made, with scarcely any exceptions, payable in London. The metropolis, moreover, through the extent of its own commerce, and the greatness of its wealth and population, has immense receipts and payments on its own account; and the circumstance of its being the seat of government, and the place where the public dividends are paid, serves to increase its pecuniary transactions. The practice, indeed, of transferring the payments of the country to London being once begun, was likely to extend itself. For, in proportion as the amount and number of payments and receipts is augmented in any one particular place, the business of paying and receiving is more easily and cheaply transacted, the necessary guineas
becoming fewer in proportion to the sums to be received and paid, and the bank notes wanted, though increasing on the whole, becoming fewer in proportion also. On the punctuality with which the accustomed payments of London are effected, depends, therefore, most essentially the whole commercial credit of Great Britain. The larger London payments are effected exclusively through the paper of the Bank of England; for the superiority of its credit is such, that, by common agreement among the bankers, whose practice, in this respect, almost invariably guides that of other persons, no note of a private house will pass in payment as a paper circulation in London.

The bank has a capital of near twelve millions, to which it has added near four millions of undivided profits or savings: all this capital and savings must be lost before the creditors can sustain any loss.

The bank of England is quite independent of the executive government. It has an interest, undoubtedly (of the same kind with that of many private individuals), in the maintenance of our financial as well as commercial credit. It is also in the habit of lending out a large portion of its ample funds on government securities of various kinds, a comparatively small part only, though a sum not small in itself, being lent to the merchants in the way of discount. The ground on which the bank lends so much to government is clearly that of mutual convenience, as well as long habit. It is the only lender in the country on a large scale; the government is the only borrower on a scale equally extended; and the two parties, like two wholesale traders in a town, the one the only great buyer, and the other the only great seller of the same article.
naturally deal much with each other, and have comparatively small transactions with those who carry on only a more contracted business. The bank, moreover, in time of peace, is much benefited by lending to government. It naturally, therefore, continues those loans, during war, which it had been used to grant at all antecedent periods. It occasionally furnishes a considerable sum to the East India company. If, indeed, it lent more to the merchants during war, and less to the government, the difference would not be so great as might, perhaps, at first view be supposed. If, for instance, it furnished a smaller sum on the security of exchequer bills, that article might then be supposed to fall in price, or, in other words, to yield a higher and more tempting interest; and the bankers, in that case, would buy more exchequer bills, and would grant less aid to the merchants; they would, at least, in some degree, take up whichever trade the Bank of England should relinquish. The preference given by the bank to the government securities, is, therefore, no symptom of a want of independence in its directors: they are subject, in a much greater degree, to their own proprietors than to any administration. The strong manner in which the directors of the bank * at the time antecedent to the suspension of their cash payments, insisted on having four millions and a half paid up to them by the government—a payment which, though demanded at a very inconvenient time, was accordingly made—may be mentioned as one sufficiently striking mark of the

* See the correspondence of the bank on this subject, in the Appendix to the Report of the House of Commons respecting the order of council for authorising the suspension of the cash payments of the bank.
independence of that company. There is, however, another much more important circumstance to be noticed, which is conclusive on this subject. The government of Great Britain is under little or no temptation either to dictate to the Bank of England, or to lean upon it in any way which is inconvenient or dangerous to the bank itself. The minister has been able to raise annually, without the smallest difficulty, by means of our funding system, the sum of no less than between twenty and thirty millions. The government, therefore, is always able to lessen, by a loan from the public, if it should be deemed necessary, the amount of its debt running with the bank. To suppose that bank notes are issued to excess, with a view to furnish means of lending money to the minister, is, in a high degree, unreasonable. The utmost sum which he could hope to gain in the way of loan from the bank, by means of an extraordinary issue of bank notes, could hardly be more than four or five millions; and it is not easy to believe, that a government which can raise at once twenty or thirty millions, will be likely, for the sake of only four or five millions (for the loan of which it must pay nearly the same interest as for a loan from the public), to derange the system, distress the credit, or endanger the safety of the Bank of England.* This banking company differs in this most important point from every one of those national banks, which issue paper, on the continent. I understand that the banks of Petersburg, Copenhagen, Stockholm, Vienna, Madrid, and Lisbon, each of which issues circulating notes, which pass as curr-

* The same remark has been made in a short pamphlet lately published by Sir Francis Baring.
rent payment, are all in the most direct and strict sense government banks.* It is also well known, that the governments residing in these several places have not those easy means of raising money, by a loan from the people, which the minister of Great Britain so remarkably possesses. Those governments, therefore, have, in times even of moderate difficulty, no other resource than that of extending the issue of the paper of their own banks; which extension of issue naturally produces a nearly correspondent depreciation of the value of the notes, and a fall in the exchange with other countries, if computed at the paper price. The notes, moreover, being once thus depreciated, the government, even supposing its embarrassments to cease, is seldom disposed to bring them back to their former limits, to do which implies some sacrifice on their part at the time of effecting the reduction; but it contents itself, perhaps, with either a little lessen-

* The bank of Amsterdam did not issue circulating notes, but was a mere bank for deposits, the whole of which it was supposed by some to keep always in specie. It was discovered, however, when the French possessed themselves of Holland, that it had been used privately to lend a certain part of them to the city of Amsterdam, and a part to the old Dutch government. These loans ought certainly rather to have been furnished in that open manner in which those of our bank are made. Neither of the two debts, as I understand, have yet been discharged. The bank of Amsterdam had no capital of its own.

In whatever way we may suppose the property of the bank of Amsterdam, or that of any other public bank or private individual, to be employed, it is not easy to imagine that it can altogether escape the hands of a needy and successful invader. If the property of a public bank is kept in money, a rapacious enemy may seize that money. If lent to the merchants, the enemy, by their requisitions, may draw it from the merchants; and by thus incapacitating the merchants to pay their debts to the bank, may cause the failure of the bank.
ing, or with not further adding to, the evil. The ex-
pectation of the people on the continent, therefore,
generally is, that the paper, which is falling in value,
will, in better times, only cease to fall, or, if it rises,
will experience only an immaterial rise, and this ex-
pectation serves of course to accelerate its fall. Hence
it has happened, that in all the places of Europe, of
which mention has been made, there exists a great
and established, and, generally, an increasing discount
or agio between the current coin and the paper mo-
ney of the kingdom. Nor, indeed, is this all: several
of the governments of Europe have not only extended
their paper in the manner which has been described,
but have, besides this, depreciated, from time to time,
their very coin; and thus there has been a two-fold
cause for a rise in the nominal price of their commo-
dities when exchanged with the current paper. There
is, therefore, a fundamental difference between the
nature of the paper of the Bank of England, and that
of all the national or government banks on the conti-
nent. No one supposes that the English guinea con-
tains less and less gold than heretofore, through frauds
practised by government in the coinage; and as
little is it to be suspected that the Bank of England
paper is about to be depreciated by an excessive issue
either ordered or needed by the government. There is,
moreover, at present, this further ground for assuming
that the issue of Bank of England notes is not likely
to be excessive,—that it has lately become a practice
to make the number of them public. Their quan-
tity, as it now appears, has never, in any short time,
varied very greatly; has seldom, in late years, been
below ten or eleven millions, even when no one pound
and two pound notes were issued; and has at no mo-
ment exceeded the sum of about fifteen millions and a half, including two millions and a half of one pound and two pound notes. It is not impossible that the discredit into which the paper of the government banks of the continent of Europe has fallen, into which also the paper of the American banks sunk at the time of the American war, through the same extension of its issues by the then American government; and also that the total annihilation of the paper issued by the successive French revolutionary governments, may have, in some degree, contributed, though most unjustly, to that fall in the exchange which Great Britain has experienced. Foreigners not adverting to that independence of the Bank of England, the grounds of which have been stated, and misled possibly by the abundant misrepresentations which have taken place in this country, may have thought that it was the government which, by its loans, involved the bank in difficulties, (a point which shall be discussed presently), and that the bank is merely an instrument in the hands of the government; an instrument which may be turned, as the government banks on the continent have been, to the purpose of issuing notes to an extravagant extent. If such should, in any degree, be their sentiment, it would be just in them to infer from thence, that the Bank of England notes are not unlikely to fall in their value in the same manner as the notes of the continental banks. An unwillingness to leave in this country whatever sums they may have a right to draw from us (sums probably small in the whole) may have been the consequence of this fear, and a great unwillingness to trust with us even a small quantity of property, may happen to cause, under
certain circumstances, a considerable fall in the exchange.

It may be mentioned as an additional ground of confidence in the Bank of England, and as a circumstance of importance in many respects, that the numerous proprietors who choose the directors, and have the power of controlling them (a power of which they have prudently forborne to make any frequent use), are men whose general stake in the country far exceeds that particular one which they have in the stock of the company. They are men, therefore, who feel themselves to be most deeply interested not merely in the increase of the dividends or in the maintenance of the credit of the Bank of England, but in the support of commercial as well as of public credit in general. There is, indeed, both among them and among the whole commercial world, who make so large a portion of this country, a remarkable determination to sustain credit, and especially the credit of the bank; and this general agreement to support the bank is one of the pillars of its strength, and one pledge of its safety. The proprietors of it themselves are not likely to approve of any dangerous extension even of their own paper; both they and the directors know the importance of confining the bank paper, generally speaking, within its accustomed limits, and must necessarily be supposed to prefer its credit, and the paper credit of the nation, to the comparatively trifling consideration of a small increase in their own dividends; an increase which would prove delusory, if it should arise from that extravagant issue of bank notes which would have the effect of depreciating all the circulating medium of the country, since it would thus raise upon the proprietors of bank stock, as well
as on others, the price of all the articles of life.* While
the proprietors and directors of the bank have thus an
interest on the one hand, in limiting the quantity of
paper issued, they are also naturally anxious, on the
other, in common with the whole commercial world,
to give the utmost possible credit to it; and although
an opinion should prevail, even to some extent among
persons out of business, that the appearance of gold
is the only test of wealth, and that the absence of it,
however temporary, implies great danger to the
country, the mercantile interest, and in particular the
bank proprietors, the bankers, and the traders of
London, by whose transactions the value of the Lon­
don paper is upheld, may be considered as combined
in the support of a juster sentiment. The bank itself
is known to have experienced, at former times (as ap­
ppears from the evidence of the directors given to par­
liament), very great fluctuations in its cash; and, in one
period of returning peace and prosperity, a reduction
of it below that which took place at the time of the
late suspension of its cash payments: the amount of
gold in the bank, at any one particular æra, is, per­
haps, therefore; on the ground of this experience, not
now considered by the commercial world as having all
that importance which was given to it when the bank

* If the bank notes were increased even five millions, the additional pro-
fit which would accrue to the proprietors would not be more than two per­
cent. A proprietor qualified to vote in the bank court (that is, having
500l. stock) would, therefore, gain by this extravagant issue, supposing
it to be maintained for a year, the sum of 10l. A large proportion of the
bank proprietors do not hold more than 100l. stock. The gain of each
of these would not be more than 20l; a sum perfectly insignificant, com­
pared with the interest which they have in the maintenance of the general
commercial credit of the country.
affairs were involved in greater mystery. It is per-
fectly well understood among all commercial men,
that gold coin is not an article in which all payments
(though it is so promised) are at any time intended
really to be made; that no fund ever was or can be
provided by the bank which shall be sufficient for such
a purpose; and that gold coin is to be viewed chiefly
as a standard by which all bills and paper money should
have their value regulated as exactly as possible; and
that the main, and, indeed, the only, point is to take
all reasonable care that money shall in fact serve as
that standard.

This is the great maxim to be laid down on the sub-
ject of paper credit. Let it, then, be next considered
what is necessary, in order sufficiently to secure that,
whatever the circulating paper may be, gold shall be
the standard to which the value of that paper shall
conform itself. It is no doubt important, that there
should be usually in the country a certain degree of
interchange of gold for paper, for this is one of the
means which will serve to fix the value of the latter.
Whether the interchange wanted to produce this effect
must be more or less large and frequent, depends
much on the habits and dispositions of the country,
and, in particular, on the degree of knowledge of the
nature of paper credit generally prevailing, and on the
degree of confidence in it.

In order to secure that this interchange shall at all
times take place, it is important that, generally speak-
ing, a considerable fund of gold should be kept in the
country, and there is in this kingdom no other depo-
sitory for it but the Bank of England. This fund
should be a provision not only against the common and
more trifling fluctuations in the demand for coin, but
also against the two following contingencies. First, it should serve to counteract the effects of an unfavourable balance of trade, for this infallibly will sometimes occur, and it is what one or more bad harvests cannot fail to cause. It is also desirable, secondly, that the reserve of gold should be sufficient to meet any extraordinary demand at home, though a demand in this quarter, if it should arise from great and sudden fright, may undoubtedly be so unreasonable and indefinite as to defy all calculation. If, moreover, alarm should ever happen at a period in which the stock of gold should have been reduced by the other great cause of its reduction, namely, that of a call having been recently made for gold to discharge an unfavourable balance of trade, the powers of any bank, however ample its general provision should have been, may easily be supposed to prove insufficient for this double purpose.

To revert, then, to the bank of England. A short time before the suspension of its cash payments, the gold in its coffers had been reduced materially through an unfavourable balance of trade. The exchange with Europe had, however, so far improved for some time preceding the suspension, as to have caused gold to begin again to flow into the country. When it was thus only beginning to return, the fear of an invasion took place, and it led to the sudden failure of some country banks in the north of England. Other parts felt the influence of the alarm, those in Scotland, in a great measure, excepted, where, through long use, the confidence of the people, even in paper money of a guinea value, is so great (a circumstance to which the peculiar respectability of the Scotch banks has contributed), that the distress for gold was little felt in
that part of the island. A great demand on the Bank of England for guineas was thus created, a demand which every one who can possess himself of a bank note is entitled to make by the very terms in which the note is expressed. In London, it is observable that much distress was beginning to arise, which was in its nature somewhat different from that in the country. In London, confidence in the Bank of England being high, and its notes maintaining their accustomed credit, its guineas were little called for with a view to the mere object of London payments. The guineas applied for by persons in London, was, generally speaking, on the account of people in the country. The distress arising in London, like that which took place in 1793, was a distress for notes of the Bank of England. So great was the demand for notes, that the interest of money, for a few days before the suspension of the payments of the bank, may be estimated (by calculating the price of exchequer bills, the best test that can be referred to, as well as by comparing the money price of stocks with their time price) to have been about sixteen or seventeen per cent. per ann. The bank, on this occasion, pursued, though only in a small degree, the path which a reader of Dr. Smith would consider him to prescribe, as in all cases the proper and effectual means of detaining or bringing back guineas. They lessened the number of their notes, which, having been for some years before near eleven millions, and having been reduced, for some time, to between nine and ten millions, were at this particular moment brought down to between eight and nine millions.

It has been shewn already, that, in order to effect the vast and accustomed payments daily made in Lon-
don, payments which are most of them promised beforehand, a circulating sum in bank notes, nearly equal to whatever may have been its customary amount, is necessary. But a much more clear idea of this subject will be gained by entering into some detail.

There are in London between sixty and seventy bankers, and it is almost entirely through them that the larger payments of London are effected. It may be estimated (though the conjecture is necessarily a loose one) that the sums paid daily by the bankers of London may not be less than four or five millions. The notes in their hands form, probably, a very large proportion of the whole circulating notes in the metropolis. It is certain, at least, that only a very small proportion of Bank of England notes circulate far from London, and that it is to the metropolis itself that all the larger ones are confined. The amount of the bank notes in the hands of each banker, of course, fluctuates considerably; but the amount in the hands of all probably varies very little; and this amount cannot be much diminished consistently with their ideas of what is necessary to the punctuality of their payments, and to the complete security of their houses. Thus there is little room for reduction as to the whole of that larger part of the notes of the Bank of England which is in the hands of the London bankers: the notes which may chance to circulate among other persons, especially among persons carrying on any commerce, if we suppose the usual punctuality of payments to be maintained, and the ordinary system of effecting them to proceed, can admit also of little diminution.

A deficiency of notes in London is a very different thing from a deficiency either of country bank notes
or of coin in the country. A large proportion of the
London payments are payments of bills accepted by
considerable houses, and a failure in the punctuality
of any one such payment is deemed an act of insolven
cy in the party. The London payments are,
moreover, carried on by a comparatively small quanti
ty of notes; and they, perhaps, cannot easily be ef
fected, with due regularity, by a much smaller num
ber, so complete has been the system of economy in
the use of them which time and experience have in
troduced among the bankers. There is, moreover, no
substitute for them. They have an exclusive, though
limited, circulation. They serve, at the same time,
both to sustain and regulate the whole paper credit of
the country. It is plain, from the circumstances
which have just been stated, that any very great and
sudden diminution of Bank of England notes would
be attended with the most serious effects both on the
metropolis and on the whole kingdom. A reduction
of them which may seem moderate to men who have
not reflected on this subject—a diminution, for in
stance, of one-third or two-fifths, might, perhaps, be
sufficient to produce a very general insolvency in
London, of which the effect would be the suspension
of confidence, the derangement of commerce, and the
stagnation of manufactures throughout the country.
Gold, in such case, would unquestionably be hoarded
through the great consternation which would be ex
cited; and it would, probably, not again appear until
confidence should be restored by the previous intro
duction of some additional or some new paper circu
lation.

The case which has been put, is, however, mere
ly hypothetical; for there is too strong and evident an
interest in every quarter to maintain, in some way or other, the regular course of London payments, to make it probable that this scene of confusion should occur; or, even if it should arise, that it should continue. Whether there might chance to be much or little gold in the country, steps would be taken to induce the bank to issue its usual quantity of paper, or measures would be resorted to for providing, by some other means, a substitute for it. The credit, however, of even the best substitute, would be far inferior to that of the old and known Bank of England notes; for the new paper would be guaranteed by a capital probably far less ample than that of the Bank of England: it would also be just as impossible for the issuers of it to procure, at the time in question, a supply of guineas to be given in payment of it, as it would for the Bank of England to provide a supply of guineas for payment of their notes. The new paper, then, though it should be the same in its general nature, would be inferior to that of the bank. It would yield, indeed, a profit to the issuers, a profit which the bank would lose the opportunity of gaining; and the desire of this profit might co-operate in producing a disposition in new bodies of men to proceed to the creation of it. If we suppose it to be created, and to form one part of the current circulating medium of the metropolis; and if we suppose, also, as we necessarily must, a reduced quantity of Bank of England notes to continue current at the same time, the new paper would then be easily exchangeable for the Bank of England paper; and every holder of the new paper would, therefore, be able, by first exchanging it for the bank paper, to draw gold out of the bank. The directors of the bank, therefore, by proceeding to such
a reduction of their notes, as should create a necessity for the bankers and merchants to create a new paper among themselves, would only increase the general paper circulation in London. They have now, by their exclusive power of furnishing a circulating medium to the metropolis, the means of, in some degree, limiting and regulating its quantity; a power of which they would be totally divested, if, by exercising it too severely, they should once cause other paper to become current in the same manner as their own. Projects for the introduction of a new circulating medium into the metropolis have, at different times, been formed; all such schemes, however, must necessarily fail, as long as there continues to be an unwillingness among the bankers to unite in giving currency to the new paper. This unwillingness would, of course, diminish in proportion as the pressure should become general and severe.

The idea which some persons have entertained of its being at all times a paramount duty of the Bank of England to diminish its notes, in some sort of regular proportion to that diminution which it experiences in its gold, is, then, an idea which is merely theoretic. It must be admitted, however, to be very natural.

It has been supposed by some, that the pressure on the mercantile world which a great diminution of notes must cause, would, especially if it were a severe one, induce the merchants to send for gold from abroad, in order to supply their own want of money. The supposition, when thus put, is stated in much too vague a manner to be susceptible of that close examination which I wish to give to it. There can be no doubt that we shall find it altogether false, when pushed to the extent of assuming that the extreme severity of the
pressure is to be the remedy. Let us consider this point in as practical a way as possible.

It was supposed that the difficulty of obtaining bank notes would cause the merchants to send abroad for gold, in order to effect their payments. But what merchants? Certainly not those merchants whose goods are unfit for a foreign market, and are in no demand there. They must first exchange these unsuitable goods for goods which are suitable, that is, they must sell them; and if they sell them, they must sell them, in the first instance, for money, or what passes as money, and answers, in their view, all the same purposes. Thus they get possession of the very thing, to supply their want of which they are supposed to send abroad. The trader acts, in this respect, like any one who is not a trader. If distressed for the means of effecting what is called a cash payment, he no more turns his thoughts to a foreign country for a supply of gold, than the farmer or landed gentleman who is equally pressed. He considers only what part of his property he can turn into bank notes. These he sees to be at hand; of the gold which is in foreign countries he knows nothing.

It will be allowed, then, that it is not on our traders in general that the pressure will so operate as to induce them to send for gold from the continent. It will, perhaps, however, be said to operate on our foreign merchants: but we must now distinguish, also, between one foreign merchant and another. The export trade to foreign countries is, generally speaking, one trade; the trade of importing from foreign countries is a second; the trade of sending out and bringing home bullion, in order to pay or receive the difference between the exports and imports, may be
considered as a third. This third trade is carried on upon the same principles with any other branch of commerce, that is, it is entered into just so far as it is lucrative to the speculator in bullion, and no farther. The point, therefore, to be inquired into is clearly this,—whether the pressure arising from a scarcity of bank notes tends to render the importation of bullion a more profitable speculation.

In solving this question, there is not, perhaps, all the difficulty which might be supposed; for it is obvious that, generally speaking, it will answer to import gold into a country just in proportion as the goods sent out of it, in the way of trade (that is, the goods which must be paid for), are greater in value than the goods which are, in the way of trade, brought into it. We may, therefore, now dismiss also the case of the mere dealer in bullion from our consideration. We have only to examine in what way the pressure arising from the suppression of bank notes will affect the quantity of goods which are in the way of trade either exported or imported.

That a certain degree of pressure will urge the British merchants in general who buy of the manufacturers, as well as the manufacturers themselves, to sell their goods in order to raise money; that it will thus have some influence in lowering prices at home; and that the low prices at home may tempt merchants to export their articles in the hope of a better price abroad, is by no means an unreasonable supposition. But, then, it is to be observed on the other hand, first, that this more than ordinary eagerness of all our traders to sell, which seems so desirable, is necessarily coupled with a general reluctance to buy, which is exactly proportionate
to it: it must be obvious, that, when the general body of merchants, being urged by the pecuniary difficulties of the time, are selling their goods in order to raise money, they will naturally also delay making the accustomed purchases of the manufacturer. They require of him, at least, that he shall give them a more than usually extended credit; but the manufacturer, experiencing the same difficulty with the merchants, is quite unable to give this credit. The sales of the manufacturer are, therefore, suspended; but though these are stopped, his daily and weekly payments continue, provided his manufacture proceeds. In other words, his money is going out while no money is coming in; and this happens at an æra when the general state of credit is such, that he is not only not able to borrow, in order to supply his extraordinary need, but when he is also pressed for a prompter payment than before of all the raw materials of his manufacture. Thus the manufacturer, on account of the unusual scarcity of money, may even, though the selling price of his article should be profitable, be absolutely compelled by necessity to slacken, if not suspend, his operations. To inflict such a pressure on the mercantile world as necessarily causes an intermission of manufacturing labour, is obviously not the way to increase that exportable produce, by the excess of which, above the imported articles, gold is to be brought into the country.

But, secondly, that very diminution in the price of manufactures which is supposed to cause them to be exported, may also, if carried very far, produce a suspension of the labour of those who fabricate them. The masters naturally turn off their hands when they find their article selling exceedingly ill. It is true,
that if we could suppose the diminution of bank paper to produce permanently a diminution in the value of all articles whatsoever, and a diminution, as it would then be fair that it should do, in the rate of wages also, the encouragement to future manufactures would be the same, though there would be a loss on the stock in hand. The tendency, however, of a very great and sudden reduction of the accustomed number of bank notes, is to create an unusual and temporary distress, and a fall of price arising from that distress. But a fall arising from temporary distress, will be attended probably with no correspondent fall in the rate of wages; for the fall of price, and the distress, will be understood to be temporary, and the rate of wages, we know, is not so variable as the price of goods. There is reason, therefore, to fear that the unnatural and extraordinary low price* arising from

* It may, perhaps be supposed, that a diminution of the quantity of Bank of England notes, if permanent, would produce that permanent diminution of the price of articles which is so much desired, and the observation made above may be thought to give some countenance to this supposition. Such permanent reduction in the price of commodities could not, however, as I apprehend, be by any such means effected. The general and permanent value of bank notes must be the same as the general and permanent value of that gold for which they are exchangeable, and the value of gold in England is regulated by the general and permanent value of it all over the world; and, therefore, although it is admitted that a great and sudden reduction of bank notes may produce a great local and temporary fall in the price of articles (a fall, that is to say, even in their gold price, for we are here supposing gold and paper to be interchanged), the gold price must, in a short time, find its level with the gold price over the rest of the world. The continuance of the great limitation of the number of bank notes would, therefore, lead either, as has already been observed, to the creation of some new London paper, or possibly to some new modes of economy in the use of the existing notes; the effect of which economy on prices would be the same, in all respects, as that
the sort of distress of which we now speak, would occasion much discouragement of the fabrication of manufactures.

Thirdly, a great diminution of notes prevents much of that industry of the country which had been exerted from being so productive as it would otherwise be. When a time either of multiplied failures, or even of much disappointment in the expected means of effecting payments arises, plans of commerce and manufacture, as well as of general improvement of every kind, which had been entered upon, are changed or suspended, and part of the labour which had been bestowed proves, therefore, to have been thrown away. If, for instance, expensive machinery had been erected, under an expectation of regular employment for it, a pressing want of the means of effecting payments may cause that machinery to stand idle. The goods which ought to form part of the assortment of the factor or the shopkeeper, and to be occupying their premises, are loading the warehouse of the manufacturer,* and, perhaps, are suffering da-

of the restoration of the usual quantity of bank notes. What seems most probable, is, that the continuance of any great limitation of the number of bank notes would lead to the transfer of the present cash payments of London to some other place or places in which the means of effecting payments should not be obstructed through the too limited exercise of that exclusive power of furnishing a paper circulation with which the Bank of England has, by its charter, been invested. This subject of the influence of paper credit on prices will be more fully entered into in a future chapter.

* When an interruption of the usual credit arises, it naturally happens that the individuals having the least property, and the fewest resources, are the most pressed; and it is sometimes assumed by the public, rather too readily, that those who suffer are justly punished for the too great extent of their speculations. It is true, undoubtedly, that those who
mage by too long detention. On the other hand, some sales are forced; and thus the goods prepared for one market, and best suited to it, are sold at another. There cease, at such a time, to be that regularity and exactness in proportioning and adapting the supply to the consumption, and that despatch in bringing every article from the hands of the fabricator into actual use, which are some of the great means of rendering industry productive, and of adding to the general substance of a country. Every great and sudden check given to paper credit not only operates as a check to

prove to be the first to fail, have probably been men of too eager and adventurous a spirit. Let the spirit of adventure among traders, however, have been either more or less, the interruption of the usual credit cannot fail to cause distress; and that distress will fall upon those who have merely been, comparatively, the more adventurous part of the trading world. It is often also assumed by the public (and without the least foundation) that the want not of gold merely but of bona fide mercantile capital in the country is betrayed by a failure of paper credit. The error of this supposition is not only plain, from the general principles laid down in the first chapter of this work, but it is also distinctly proved by the circumstance stated above, that while the premises of the factor and of the shopkeeper are becoming empty of goods, the warehouse of the manufacturer is growing proportionably full. The time soon comes, indeed, when that suspension of labour (which, it should be remembered, is the consequence of the suspension of credit) causes the general stock of goods (or the mercantile capital of the country) to be diminished. The evil, therefore, consists not in the want of bona fide capital, but in the want of such a quantity of the circulating medium as shall be sufficient, at the time, to furnish the means of transferring the goods of the manufacturer from his own warehouse to that of the factor and the shopkeeper. The quantity wanted to be employed in the circulation, and especially the quantity of gold, becomes more, as was observed in the third chapter, when confidence is less, because the rapidity of the circulation is less. The substitution of gold for paper, and of better paper for that which is worse, and some temporary increase of the gold and good paper actually circulating, are obviously the remedy.
industry, but leads also to much of this misapplication of it. Some diminution of the general property of the country must follow from this cause; and, of course, a deduction also from that part of it which forms the stock for exportation. It can hardly be necessary to repeat, that on the quantity of exported stock depends the quantity of gold imported from foreign countries.

It will be supposed, perhaps, that the limitation of bank notes, by lessening the means of payment of the importing merchant, may induce him to suspend his imports; and that, since it is the excess of exports above the imports which causes gold to enter the country, the limitation of paper may, with a view to the diminution of imports, be very desirable. There is, probably, some justice in this supposition. It should, however, be observed on this subject, that Great Britain, at that period of an unfavourable balance which we are now supposing, may be considered as importing chiefly either, first, corn, of which no one would wish to check the import by a limitation of paper; or, secondly, that class of articles which are brought from one country in order to be transported to another; articles which come chiefly from very distant parts, and of which the payment cannot be declined, it having been promised long before hand; articles, also, which soon serve to swell the exports in a somewhat greater degree than they had increased the imports; or, thirdly, that rude produce of other countries which forms the raw materials of our own manufacture, and serves, after a short time, to supply exportable articles to a very increased amount.

The limitation of credit at home will chiefly be of use by urging the exporting merchant to press the sale of the goods which he has abroad, and to direct
them to be sold, if he can, at a short credit; and also by its urging, in like manner, the importing merchant to delay buying abroad, as long as he can, and to buy at a long credit. In other words, it may be of use in leading English merchants, in their dealings with foreigners, to anticipate their receipts, and to delay their payments; on the other hand, it is carefully to be remembered, that an anticipation of receipts, and a delay of payments, are only a temporary benefit; while a suspension of manufactures operates, as far as it goes, as so much permanent and entire loss to the country. It is, moreover, to be borne in mind, that a very severe pressure is sure to produce a suspension of manufactures, while it is not sure to cause British merchants to obtain an extension of credit from foreigners. Any very extraordinary suppression of bank notes must produce distrust abroad through the failures at home, to which it is known abroad to give rise. It, therefore, indisposes foreign merchants to lend money to England, and it induces those foreigners, who have debts due to them from Englishmen, to urge the payment of those debts. England, during the prevalence of any great distrust, is obliged to send abroad manufactures not for the payment of goods imported, or for the purchase of gold, but for the extinction of debt.

Although, therefore, it may possibly admit of a doubt whether some moderate restriction of the paper of the bank may not be expedient with a view to mend for the time an unfavourable balance, it seems sufficiently clear that any very sudden and violent reduction of bank notes must tend, by the convulsion to which it will lead, to prevent gold from coming into the country rather than to invite it, and thus to in-
crease the danger of the bank itself. The observation which was before made may, therefore, be repeated, that it is not the severity of the pressure which is to be the remedy. It is, indeed, in every respect plain that it must be important to maintain, and to obtain carefully, the credit of the country, at that time in particular, when its guineas are few, and are also leaving it; that is the time when our own funds are necessarily low, when the most regular industry should by every means be promoted, and when there is the most need of the aid both of our domestic and foreign credit; and it belongs to the Bank of England, in particular, to guard and to superintend the interests of the country in this respect. The very policy of the bank differs, in this particular, from that of the individual country banker, whose own share of the evil resulting to the country, from the sudden suppression of his own notes, is small; who may trust, moreover, that there will be a substitution either of guineas or of other paper in the place of his own paper which is suppressed; and who, it may be remarked, supplies himself with the means of discharging his own notes by obtaining guineas from the Bank of England.

But the Bank of England has no bank to which it can resort for a supply of guineas proportioned to its wants in the same manner in which it is resorted to by the country banks; nor have the bankers and traders in London, to whom at present is transferred the business of effecting the great cash payments of the whole country, the same resource in case Bank of England notes are suppressed which traders in the country have, supposing country bank notes to be withdrawn. The country payments being not strictly promised before hand, may, many of them, bear to be
postponed. Bills of exchange on London may also form some substitute for country bank notes, and may pass as such in the manner which was some time ago described; but if Bank of England notes are suppressed, and are suppressed, as we have been supposing them to be, in consequence of guineas being scarce, there then remain no means whatever of effecting the London payments. There can be no doubt that the extinction or very great diminution of bank notes would be a far greater evil, in the present circumstances of the metropolis, than the disappearing of guineas. If guineas disappear, notes may be substituted in their place; and through that general confidence which may be inspired by the agreement of bankers and other leading persons to take them, they will not fail, provided the issues are moderate, and the balance of trade is not very unfavourable to the country, to maintain exactly the gold price. The punctuality thus introduced into all the larger operations of commerce, will facilitate contrivances for effecting the smaller payments.

Differences of opinion, undoubtedly, may exist as to the exact degree in which the notes of the Bank of England ought, under any given circumstances, to be diminished. It may be hoped, however, that at least one point has now been fully and completely established, namely, that there may be an error on the side of too much diminishing bank notes, as well as on the side of too much increasing them. There is an excessive limitation of them, as every one must admit, which will produce failures; failures must cause consternation, and consternation must lead to a run upon the bank for guineas. There must, in short, then, be some point at which the bank must stop in respect
to the reduction of its notes, however progressive may be the drain upon it for guineas.

But if its notes are not lessened, or if even they are lessened, but are not entirely extinguished, it is then in the power of any one who can possess himself of a bank note to possess himself also of guineas, as long as the bank pays in guineas; and it will be found to follow, moreover, that the bank is thus rendered liable to be totally exhausted of guineas. I mean, that it is liable to be totally exhausted of them, however great their number may have been, if it determines to maintain even the smallest number of notes. By maintaining, that is to say, five millions, or two millions, or even one million, of notes, the bank cannot avoid being exhausted (supposing the alarm to rise high enough to do it) of even five millions, or ten millions, or, if it had them, of twenty or fifty millions of guineas. It will depend, in such case, on the degree of alarm, and not on the maintenance of the greater or of the less quantity of notes, whether the guineas shall be more or less rapidly called for from the bank; or, in other words, the bank may be as much exhausted of guineas if it maintains five millions of notes as if it maintains ten millions, provided the alarm is only the same in the one case as in the other. If, therefore, the maintenance of the five millions of notes is sure to produce more alarm than the maintenance of ten, then the maintenance of the larger quantity of notes will serve to diminish the demand for guineas, and the maintenance of the smaller number to increase it.

The following is the manner in which that operation, which is finally to exhaust all the guineas of the bank, may be supposed to proceed. A, for instance,
the holder of a note of 1000l. (and it is what any man may obtain by selling goods) carries it to the bank and demands 1000l. in gold. The bank gives the gold; which gold, let it be remarked, either goes abroad to pay for an unfavourable balance of trade, or, as we are now rather supposing, fills a void in the circulation of the country, occasioned by the withdrawing of country bank notes in consequence of alarm, or serves as an addition to the fund of country banks, or forms a hoard in the hands of individuals. The 1000l. in gold, thus furnished by the bank, does not supply, in any degree, the place of the 1000l. note for which it was given; for the 1000l. note had been employed in London in making the larger payments. It is hardly ever, in almost any degree, as a substitute for Bank of England notes, that the gold taken from the bank is wanted. The bank, therefore, having paid away this 1000l. in gold, and having received for it their own note for 1000l. must now re-issue this note, if they are resolved to maintain the amount of their paper circulation. How, then, is the bank to issue it? The only means which the bank, on its part, is able to take for the extension of its paper circulation, is to enlarge its loans. It must, therefore, re-issue the 1000l. note, in the shape of a loan, to some person who offers a bill to discount. It receives, therefore, a bill of 1000l. and gives a note of 1000l. in return for it. For the same note, thus re-issued, we may suppose 1000l. in money to be again demanded, and to be again paid. The paper circulation of the bank is now again diminished 1000l. and, therefore, there arises a necessity for issuing the same 1000l. note, or some other note or notes to like amount, a third time, in order to maintain the amount of notes in circulation.
The like transaction, or rather a number of such transactions, may be supposed to be repeated either five, or fifty, or a hundred, or a thousand times. Even if we should suppose the bank to bring down its paper circulation to one hundred thousand pounds, and to maintain it at that sum, it is obvious that this same operation might be so reiterated, from day to day, as to extract at length from the bank even the greatest imaginable number of guineas. Thus, then, the bank is rendered liable to be exhausted of its guineas, by its determination to maintain the number of its notes, whether that number be greater or smaller; and here, also, let it be remarked by the way (a point on which more shall be said presently), that the bank, in consequence of its determination to maintain a given number of notes, is placed under an absolute necessity of increasing its loans to the very same extent to which it is deprived of its guineas. The bank, let it be remembered, was stated to lend an additional 1000l. on the occasion of each reiterated demand upon it for 1000l. in guineas. It thus clearly appears that the Bank of England is placed, by the very nature of its institution, in a situation in which it may not be possible to avoid a temporary failure in the regularity of its cash payments.

An idea has, indeed, prevailed, than which nothing can be more natural, that because an individual merchant is presumed to be blameable if he is not able to make good his payments, therefore, also, a national bank, in case of failure, may be presumed to be censurable in like manner; and, on account of the greater importance of its transactions, to be censurable even in a still higher degree. But the total disparity in the circumstances of the two cases should be taken into
consideration. Private houses may, in general, be fairly presumed to be in fault if they fail in the punctuality of their cash payments, supposing the Bank of England to pay in money, because, if they have made on their part a tolerably prudent provision, they may be in general considered as having in the bank a sure resource. Take away from them that resource, and they will then be not only as liable as the Bank of England to the like accident, but they will be much more so, their means of supplying themselves with guineas becoming then exceedingly precarious. It may be apprehended, also, that, if instead one national bank two or more should be instituted, each having a small capital; each would then exercise a separate judgment; each would trust in some measure to the chance of getting a supply of guineas from the other, and each would allow itself to pursue its own particular interest, instead of taking upon itself the superintendence of general credit, and seeking its own safety through the medium of the safety of the public; unless, indeed, we should suppose such a good understanding to subsist between them as to make them act as if they were one body, and resemble, in many respects, one single institution.

The accident of a failure in the means of making the cash payments of a country, though it is one against which there can be no security which is complete, seems, therefore, to be best provided against by the establishment of one principal bank. It, however, becomes the public not to judge the bank, which is thus rendered its servant, and is completely subjected to its interests, by the same rules by which it judges of smaller banking and commercial establishments, but to advert to the peculiarity of its case.
If there has been any fault in the conduct of the Bank of England, the fault, as I conceive, has rather been, as has just been stated, on the side of too much restricting its notes in the late seasons of alarm, than on that of too much enlarging them. In doing this, it has happened to act (though but in part) according to what seems likely to have been the advice of Dr. A. Smith in the case. It has also taken that course which is the natural one for smaller banks, and which might, perhaps, have been the proper one for the Bank of England itself, in the infancy of its establishment, when the country was less dependent upon it for the means of effecting its payments. It has, probably, pursued a principle which had been acted upon, by its own directors, in all former times. It has also followed what was, at the very period in question, the common opinion of the public on the subject. It has, moreover, only diminished those notes, perhaps, in too great a degree, which there might possibly be found to be some argument for restraining with a more gentle hand. I venture, however, with deference, to express a suspicion that the bank may have, in some measure, aggravated, perhaps, rather than lessened, the demand upon itself for guineas through the suppression of too many notes at the time preceding the suspension of its cash payments; and I will hazard an opinion, that it might also, with propriety, have somewhat extended the temporary issue of its paper in the year 1793, when that alarm, arising from the failure of country banks, which has been already spoken of, took place. It is clear, at least, that it did not, in the more recent instance, succeed by the diminution of its notes in curing the evil which it thus aimed to remedy.
A suspicion prevailed, at the time of which we have been chiefly speaking, that the loans afforded by the bank to the government had caused the distress of the bank. But the government, it should be remembered, has no supply of guineas with which it can discharge any debt. It is circumstances, in this respect, like any other debtor of the bank. It must, if forced to pay its debt, pay it in bank notes, an article which the bank cannot refuse to take. And the government must collect these notes wherever they are to be obtained; that is, from the bankers and traders, and other persons in possession of them, to whom it must, in return, give new stock or exchequer bills, which it may, at all times, easily create; though, at a period of mercantile distress, this would be done at a somewhat unfavourable price. We learn, from the evidence given to parliament, that the government was urged by the bank to pay up four and a half millions of existing debt a short time before the period in question, and that it complied with the demand; that is, the government collected some of the bank notes which were in circulation, and paid them into the bank; and then a part, but only a part, of the notes so paid in were re-issued to the merchants. If the whole of the notes paid into the bank by the government had been immediately re-issued in loans to private traders, then the sum of notes in circulation would have been the same. The government is only one large borrower from the bank; the merchants are a number of similar, though smaller, borrowers. Whether, therefore, the bank lent more to individuals and less to government, or less to government and more to individuals, the effect as to the number of notes allowed to be in circulation, must have been equal.
The Exchequer, after receiving notes from the bank, almost as quickly pays them away, and thus sends them into the common circulation as the merchant does; and it is the total quantity of circulating notes, and not the manner in which they come into circulation, that is the material point.

It may be thought, indeed, that commerce would be encouraged, and commercial credit, as well as general paper credit, would be supported in a much greater degree by the bank sending their notes into circulation, through the medium of a loan to the merchants, than through that of a loan to government. But the difference would not, as I apprehend, be so great as many commercial men themselves at that time imagined. Those merchants who obtained an increase of the accustomed advances from the bank, would, some of them, probably invest, in the new exchequer bills which were created, a part of that very sum with which the bank favoured them. The merchants in higher credit, of course, would have the preference at the bank; and they were certainly under a very strong temptation to borrow of the bank at five per cent. interest for the sake of investing the sum so borrowed in exchequer bills, yielding five and a half or six, or, for a time, even seven or eight per cent. or more. As far as this was the case, it is obvious that the bank, instead of lending to the government, would only lend to those who lent to the government, the government paying an additional interest, and the merchants receiving it. Where this did not take place, that might happen which would be exactly equivalent. The bankers finding that the merchants were, many of them, allowed to become larger borrowers at the bank than before, would think it less
necessary to lend to them, and would, therefore, add
to the sum which they themselves kept in exchequer
bills, the great profit on that article tempting them,
at the same time, to do this. The bank, on this sup­
position, would lend to the merchants, who would
forbear to borrow of the banker (which is the same
thing for the present purpose as lending to the bank­
er), who would lend to the government. But let us
put a third case. Let us imagine it to be a gentle­
man in the country who invested the property in the
new exchequer bills. That property would probably,
since we must suppose it easily applicable to such in­
vestment, have been lying in some private hand at
interest. Let us imagine it to consist of 100l. which
had been in the hands of a country banker; the coun­
try banker, in this case, would draw upon his London
banker; the country banker’s account with the Lon­
don banker would then be worse by 100l.; and the
London banker having 100l. less deposits, would be
able to lend 100l. less to the London merchants. In
other words, the Bank of England, in this case, in­
stead of lending to the government, would lend to
the London merchant, who would forbear to borrow
of the London banker, who would lend to, or per­
haps, forbear to borrow of the country banker, who
would forbear to borrow of the country gentleman,
who would lend to government; which also seems to
be much the same as if the Bank of England them­selves lent to the government. This detailed case has
been put partly for the sake of observing upon it, that
the necessity which would be created for the transfer
of this 100l. through so many hands, would produce
a want of some degree of additional circulating me­
dium in order to effect these several payments. It
would, however, be chiefly by the means of a bill on London that the transaction just now supposed would be conducted; but the bill must finally be paid by a Bank of England note.—Let us imagine a fourth case. Let us suppose a sum to be invested in the new exchequer bills by a person obtaining money for the purpose of the investment, not by calling in a sum lying at interest, as was last assumed, but by selling goods, land, or any other article. We must, then, necessarily suppose a buyer of those goods, of that land, or of that other article to be created by such sale. We shall find, also, that it is necessary to suppose either that buyer to become a borrower, or to become the seller to one who would become a borrower; or, at least, we must come to a borrower at last. We are supposing one man to sell goods for 100l. and not to restore this 100l. to trade, but to lend it out. We must, then, necessarily suppose some other man to borrow 100l. and by thus borrowing to add that 100l. capital to trade which the other had taken from it; for since the trade goods in the country remain the same, the capital invested in trade must be the same also. The body of lenders, therefore, whoever they might be, who lent the four and a half millions to government, necessarily created a body of borrowers to exactly the same amount in what may be called the general money market of the country. Thus a pressure was, on the whole, created, which was just equal to that which was relieved; a pressure, in the first instance, falling in some degree (though by no means entirely, or even principally) in a different quarter than before; a pressure, however, very soon extending itself to the same persons; for there is a competition among the several classes both
of borrowers and of lenders in the money market, which, notwithstanding some inequality occasioned by the usury laws, causes the increased distress brought upon any one class of the accustomed borrowers very soon to distribute itself among all. The bank, it is true, would, by lending the four and a half millions in bills at two months, possess more means of at any time diminishing its loans, and of thus lessening also its notes, than if the same sum had been invested in exchequer bills, since the latter are at a longer date; and it was natural for the bank to call in its loan to government for this reason. If, however, the calling in of the loan to government was only to furnish the means of limiting the notes, then that question returns which has already been discussed, namely, whether the diminution of the notes was not carried possibly somewhat farther than was desirable, even for the sake of the bank itself. During the existence of this loan to government, that reduction of notes, which has been supposed to have been too great, may have been perhaps, to a certain degree obstructed, though by no means necessarily precluded; since an opportunity of diminishing the discounts to the merchants, and of thus lessening the notes, at all times existed. On the whole, there appears to be no reason to infer, from the circumstance of the demand for the four and a half millions having been made upon government, that the government was either the more remote or the more immediate cause of the suspension of the cash payments of the bank, except, undoubtedly, so far as the war in general, or the particular circumstance of a remittance of a subsidy to the Emperor a short time before the event in question, might be considered as
affecting the balance of trade, and thus contributing to draw gold out of the country.

It is, on public grounds, so important to shew that the more than usual largeness of the bank loans to government (for it can hardly fail to be true that they were more than commonly extended) was not the cause of the suspension of the cash payments of the bank, that I shall dwell for some time longer on this subject. This was continually charged as the cause, and it was not unnatural to suppose it to be so. The paper circulation of the bank, however, it has been observed, was at this time not increased. It was, on the contrary, much reduced. It was by no means higher than was necessary for securing the regularity of the payments of the metropolis. Now, if it be allowed that there was this necessity for maintaining the existing quantity of notes, it then was not the notes which must be considered as issued for the purpose of making the loans, but the loans must be considered as made in consequence of the issue of notes. When the notes of the bank are increased, the loans must be increased also; when the notes are maintained, the loans must be maintained in as great proportion; when the notes are decreased, the loans can be decreased only in that proportion. There can, then, be no matter of blame on account of the magnitude of the loans, unless there be matter of blame on account of the magnitude of the notes. But the notes I have stated to have been probably rather too few than too many. If the reader has agreed with me in this, he must then agree with me that the loans were too scanty rather than too large. In other words, then, the bank, at the time of the failure of its cash payments, had lent too little rather than too much. If
the bank would have somewhat diminished its danger by issuing more notes, the granting of more loans would have also diminished its danger. Thus the very converse to the common opinion on this subject seems to be the truth.

There is, however, another point of importance here to be remarked. The loans which the bank had made on the whole, that is, the loans to government and to individuals taken together, at the time of the suspension of its cash payments, were not only maintained in that proportion in which the notes were maintained, but they were increased beyond that proportion. This increase beyond that proportion was also a matter of necessity.

The loans of the bank do not simply keep pace with the notes. The loans necessarily increase or diminish through another cause; they diminish as gold flows in to the bank, and increase as gold goes out, supposing, as we generally may, the article of deposits to remain the same; that is, they necessarily increase and diminish in a ratio directly contrary to that which a theorist would prescribe, and which the public naturally would suppose.

To those who are but slightly acquainted with these subjects, this truth will probably be made much clearer by a statement of the whole disposable effects of the Bank of England, and of the manner in which those effects are employed. The statement is important, because it will serve to prove, beyond the possibility of contradiction, that the extraordinary largeness of the loans of the bank, at the critical period in question, ought to be considered not as a consequence of any disposition in the bank to be great and adventurous lenders at a time when their guineas grew low, but
as arising out of the necessity under which they were placed. I mean that they could not avoid lending to the whole extent to which they did, provided even that small number of notes which they kept in circulation was maintained.

The effects of the bank on the 25th February, 1797, I mean those effects which were their own, as well as those placed in their hands belonging to other persons, may, in conformity to the account rendered by themselves to parliament, be stated, in round numbers, to have been as follows.

(It may be premised, that they had a capital of their own of about 11,626,000£. which shall be excluded from our present consideration, it being lent to government at three per cent. per annum interest).

1. They had a sum of undivided profits which formed an additional and disposeable capital of nearly £ 3,800,000

2. They had of deposits lodged with them by customers of various classes about 5,100,000

These deposits include, as may be presumed, the dividends belonging to many proprietors of stock, which may be viewed in the same light with the cash kept by an individual in the hands of his banker.

3. They had what may be considered as disposeable effects, or deposits placed in their hands in return for bank notes issued* 8,600,000

Thus the bank had, at that time, disposeable effects amounting in all to £ 17,500,000

* The reader, perhaps, may not understand upon what principle it is that the amount of the notes of the Bank of England is classed among the deposits. The amount of them was placed on this side of the account in
It will much illustrate what is about to be added, if the following observations respecting these three several heads of disposable effects are here made.

First. Let it be remarked, that the first sum of 3,800,000/.

Secondly. The second sum of 5,100,000/.

Thirdly. The third, then, is the only one of the

the statement given to parliament by the bank, and very properly, or rather very necessarily. It is not, however, the notes which themselves form deposits. They are given in return for deposits; and they are, therefore, the measure of those deposits. It is in substance the same thing whether a person deposits 100/.

The manner of transacting the discounting business at the bank is this:—the discounter opens a banking account with the bank, and usually keeps a small balance upon it; when he sends bills to be discounted, those bills, if the bank consents to discount them, are placed to the credit of his banking account; and when he draws for them, or for any part of them, the bearer of his draft receives the amount of it in bank notes. The numerous balances, therefore, (in general small ones), which the discounters keep with the bank, are included, no doubt, in the bank account, under the head of deposits, and form a part of the second item in the statement above. The sum which I have considered as deposited in the bank, by those who take away the notes, they opening no account, is not termed deposits in the bank statement. I have, however, thought it necessary to term it, in order to make the subject the more clear to the reader.
three component parts of the disposeable effects of the bank which it is in the power of the bank to increase or diminish at its own option. The bank exercised their power of diminishing this article, at the time in question, so far as to bring it down to about 8,600,000/. To reduce it thus far was, as has been repeatedly stated, to reduce it, perhaps, somewhat too much; but let us assume only, that the reduction was sufficient, or nearly sufficient. The bank, then, it must be admitted, had 17,500,000/ of disposeable effects, and it was not to be ascribed to them as a matter of blame that these effects then stood at about the sum at which they did.

Having, then, these effects, and being under a necessity of disposing of them in some way or other, let us state next how they did in fact employ them.

In proceeding to make this statement, it will be necessary, with a view to the object for which it is made, to name some specific sum (it matters not whether more or less than the real one) for the amount of that part of the effects of the bank which was, on the 25th February, 1797, invested in bullion. In the account rendered to parliament, the value of the bullion and of the bills discounted, &c. are put together, and are stated at nearly seven millions. Let it be supposed that the bullion was either one, two, or three millions; and that the bills discounted, &c. were, therefore, either four, five, or six millions. The mode of disposing of the 17,500,000/ will then be as follows.

The bank invested in government securities, that is, in exchequer bills, in loans to government made on the security of the land and malt tax which was com-
ing in, and in treasury bills of exchange growing due, about £ 10,500,000

They invested, as shall for the present be assumed in conformity to the estimate which it was before proposed to make, in bills discounted to the merchants, in what is termed in their account, "money lent," and in some other (probably small) "articles," 4,000,000

And they had property invested in bullion, as shall for the present be assumed, amounting to 3,000,000

Making together, as the investment necessarily must, the same sum exactly which the disposable effects were before stated to amount to, namely £ 17,500,000

This same account of the investment may be given more briefly and conveniently for our present purpose, in the following manner, viz. the total sum lent both to government and to individuals, or, in other words, the total loans were £ 14,500,000

The total of the bullion was 3,000,000

Making together £ 17,500,000

It will now be obvious to the reader, that if the bullion, instead of three millions, is supposed to have been only two millions, then the total of the loans must be supposed to be increased one million; and that if the bullion, instead of three millions, is supposed to be only one million, then the loans must be supposed to be increased two millions.

In other words, the account of the investment may
either be stated as has been just done, or it may be stated as follows:

<table>
<thead>
<tr>
<th>Description</th>
<th>Amount</th>

</table>

Making together, as before, £17,500,000

It thus appears that the loans necessarily must increase in proportion as the gold decreases, provided the disposable effects remain the same.

It follows, on the principle which has just been explained, that if we suppose, as we necessarily must, the bullion to have been, twelve months before the time of the suspension of the cash payments of the bank, much higher than at the period of the suspension, the loans would, during the course of those twelve months, necessarily increase. Let us (for the sake of illustration) suppose the gold to have been a year before the suspension eight millions, and to have fallen on the 26th February, 1797, to the sum of two millions. In that case, if we were to suppose the disposable effects of the bank to have been at both periods the same, there must necessarily have been, in the course of the year, an increase of the bank loans of no less than six millions. But the effects of the bank were not quite the same at the two periods. They probably were higher by about two millions at the former period; for the notes were higher by nearly that sum. The notes, then, fell in the year two mil-
lions, but the bullion fell six. The loans, therefore, would be decreased two millions, through the decrease of notes, but would be increased six millions through the decrease of bullion; that is, they would necessarily be increased, in the course of the year, four millions. I have dwelt thus particularly on this circumstance, because the whole of the suspicion, that the magnitude of the bank loans were the cause of the failure of its cash, seems to me to rest upon it. The largeness of those loans was not the cause of the guineas going from them, as has been ordinarily supposed; it was the effect. Nothing could be more natural than for the public to call that the cause, in this instance, which was the effect, and that the effect which was the cause. In the case of private persons it is often very justly said, that a man fails in his payments because he has lent so largely; and it would seem very strange to reply that this was not the case, for that the man in question had found it necessary to lend largely, because his cash failed him; and that the failure of the cash was the cause, and the lending merely an effect. That, however, which could not be affirmed of an individual, is true in the case of the bank, and the circumstances which give occasion for this peculiarity in our reasonings respecting that institution, are these two; first, the difficulty in obtaining a supply of guineas which the bank experiences, a difficulty totally unknown to individuals who draw their guineas from the bank itself; and, secondly, the singular necessity under which the bank is placed of maintaining at all times its notes.

It was thought by some, that the interference on the part of the government and parliament was improper, inasmuch as the bank ought not to have been
prevented from continuing to pay in cash as long as it had any remaining ability to do so. Every bank note, it was urged, is a contract to pay money entered into between the bank and the possessor of it, in consequence of what has been deemed a valuable consideration; and no authority of parliament ought, except in a case of the last necessity, to interpose itself to prevent the fulfilment of such a contract. To this it seems to be a fair answer to say, that the question is not whether any one holder of a note shall have his claim to receive money for it interfered with, but that it is a question respecting all the holders of notes, as well as all other persons having a right to demand any cash payments in any quarter whatever. Now, there are few or no creditors who are not also debtors; and a very large proportion of debtors owe as much to others, as others owe to them. Bankers and traders are greater debtors than other men; but they are also greater creditors. The bank itself is a great creditor, its credits, indeed, being far greater than its debts, and it is entitled to receive a part of its debts almost immediately. The case, then, is this: a comparatively very small portion of the persons having a right to demand cash, are led, by sudden alarm, to urge their claim for guineas to such an extent as to invest even a large portion of their capital in that article of which a quantity has been provided which is sufficient only for the purpose of the ordinary kind of payments. All the cash in the world would not satisfy claims of this sort, if all men, having a right to urge them, were disposed equally to do so. The very persons who press for these payments do not reflect, that they themselves, perhaps, have creditors who might, with equal justice, exact the immediate money payment of a still larger
debt against them. The law authorising the suspension of the cash payments of the bank, seems, therefore, to have only given effect to what must have been the general wish of the nation in the new and extraordinary circumstances in which it found itself. If every bill and engagement is a contract to pay money, the two parties to the contract may be understood as agreeing, for the sake of a common and almost universal interest, to relax as to the literal interpretation of it, and as consenting that "money should mean money's worth," and not the very pieces of metal; and the parliament may be considered as interposing in order to execute this common wish of the public.

By authorising the suspension of the cash payments of the bank, while a certain quantity of guineas still remained in its coffers, the parliament, moreover, much diminished the shock which this extraordinary event might naturally be expected to occasion; and also provided the means of furnishing the guineas actually necessary after that era for some smaller current payments, as well as the means of securing the credit of bank notes, thus rendering them a more valuable medium of exchange for goods, and a fairer substitute for guineas than they might otherwise have been. The parliament, then, were led by the practical view which they took of the subject, to disregard theory, as well as some popular prejudice, for the sake of more effectually guarding the public safety, and promoting real justice.

The danger chiefly to be apprehended in London, was, that the common class of people, not receiving their pay in the usual article of coin, and not knowing at the first that one and two pound notes would purchase every thing in the same manner as gold, might
be excited to some tumultuous proceedings. It was also feared that, through the discredit cast on small notes by the common people, this new paper might fall, at the first issue of it, to a discount. It was important, therefore, to continue for a time to pay the labouring people in money; and to circulate the new one and two pound notes, in the first instance, by the medium of the higher classes. Of the sum remaining in the bank, a small part was issued to each of the bankers, after the suspension took place, for the convenience of common workmen. It was obviously desirable, that a farther sum should be reserved in the bank as a provision for any subsequent and important uses.

Immediately after this event, the bank extended the quantity of its notes nearly to the amount of the sum usually in circulation: and not only was credit revived, but in no long time guineas became remarkably abundant. The bank, as is commonly supposed, was replenished with them. And there is this infallible proof, that gold flowed into the country; and that the course of exchange became much in favour of it.
CHAPTER V.

The law which authorised the suspension of the cash payments of the bank having been re-enacted; the high price of provisions having given occasion to much speculation on the subject of paper credit; the course of exchange having again turned greatly against the country; and gold having to a material degree disappeared, its place being occupied by small paper notes; it is not surprising that suspicions of the necessity of an alteration in the system of our paper credit should have become prevalent. Some consideration shall here be given to that unfavourable state of the exchange between this country and Europe,
which operated during the last two years of the war, in again drawing away our guineas.

It may be laid down as a general truth, that the commercial exports and imports of a state (that is to say, the exported and imported commodities, for which one country receives an equivalent from another) naturally proportion themselves in some degree to each other, and that the balance of trade, therefore, (by which is meant the difference between these commercial exports and imports), cannot continue for a very long time to be either highly favourable or highly unfavourable to a country. For that balance must be paid in bullion, or else must constitute a debt. To suppose a very great balance to be paid, year after year, in bullion, is to assume such a diminution of bullion in one country, and such an accumulation of it in another, as are not easy to be imagined: it may even be questioned whether the commercial prosperity of a state does not tend, on the whole, to reduce, rather than augment, the quantity of gold in use, through that extension of paper credit to which it leads. To suppose large and successive balances to be formed into a debt, is to assume an accumulation of debt, which is almost equally incredible. A prosperous nation commonly employs its growing wealth, not so much in augmenting the debts due to it from abroad, as in the enlargement of its capital at home; I mean, in the cultivation of its lands, in the increase of its buildings, the extension of its machinery, the multiplication of its docks and its canals, and in a variety of other improvements, which become the sure sources of an increasing income. The state may be progressive in these respects, even in years in which the balance of trade is unfavourable. There is a customary
length of credit in foreign parts which the British ex-
porter, however overflowing his capital may be, is not
very willing to enlarge. And events fail not occasion-
ally to arise, which remind him of the danger of com-
mitting too great a portion of his property into the
hands of those who are not subject to the same laws
with himself; and whose country may suddenly be in-
volved, at any moment, in a war with Great Britain.

The equalization of the commercial exports and im-
ports is promoted not only by the unwillingness of the
richer state to lend to an unlimited extent, but also
by a disinclination to borrow in the poorer. There is
in the mass of the people, of all countries, a disposi-
tion to adapt their individual expenditure to their in-
come. Importations conducted with a view to the
consumption of the country into which the articles are
imported, (and such, perhaps, are the chief importa-
tions of a poor country), are limited by the ability of
the individuals of that country to pay for them out of
their income. Importations, with a view to subse-
quent exportation, are in like manner limited by the
ability to pay which subsists among the individuals of
the several countries to which the imported goods are
afterwards exported. The income of individuals is
the general limit in all cases. If, therefore, through
any unfortunate circumstance, if through war, scarci-
ty, or any other extensive calamity, the value of the
annual income of the inhabitants of a country is dimi-
nished, either new economy on the one hand, or new
exertions of individual industry on the other, fail not,
after a certain time, in some measure, to restore the
balance. And this equality between private expen-
ditures and private incomes tends ultimately to pro-
duce equality between the commercial exports and imports.

But though the value of the commercial exports and imports of a country will have this general tendency to proportion themselves, to each other, there will not fail occasionally to arise a very great inequality between them. A good or a bad harvest, in particular, will have a considerable influence in producing this temporary difference. The extra quantity of corn and other articles imported into Great Britain in this and the last year, with a view to supply the deficiency of our own crops, must have amounted in value to so many millions, that it may justly excite surprise that we should have been able, during an expensive war, to provide the means of cancelling our foreign debt so far even as we have done; especially when the peculiar interruptions to our commerce are also considered. In this country, however, as in all others, the two principles of economy and exertion are always operating in proportion to the occasion for them. But the economy and exertion follow rather than accompany the evil which they have to cure. If the harvest fails, and imports are necessary, in order to supply the deficiency, payment for those imports is almost immediately required: but the means of payment are to be supplied more gradually through the limitation of private expenditure, or the increase of individual industry. Hence a temporary pressure arises at the time of any very unfavourable balance. To understand how to provide against this pressure, and how to encounter it, is a great part of the wisdom of a commercial state.

By the commercial exports and imports which have been spoken of, those articles have been intended for
which an equivalent is given; not those which form a remittance, for which nothing is obtained in exchange. Many of our exported and some of our imported commodities are of that class which furnish no return.

For example, numerous stores were shipped, during the war, for the support of our navy and army in foreign parts. Remittances were made, in the way of loan and subsidy, to our allies. Some dividends may be supposed to have been transmitted to the foreign proprietors of British stock. Much property is also sent out of the kingdom, which constitutes a capital employed in the cultivation of lands in the West Indies. On the other hand, capital is transmitted to Great Britain from the East Indies, both by the India Company and by individuals.

Although exports and imports of this class form no part of the commercial exports and imports which have been spoken of, they affect the quantity of those commercial exports and imports, and they contribute, exactly like the circumstance of a bad harvest, to render the balance of trade unfavourable;* they tend,

* This point may be illustrated in the following manner:—

Let us suppose a subsidy, for example, of two millions to be remitted to the Emperor of Germany, through the medium of bills to that amount, directed to be drawn by Vienna on London. By these bills, Great Britain is laid under a necessity of exporting two millions, either of goods or of bullion, or of both, for which no foreign commodities will be given in return. These two millions of exports diminish our fund of exportable goods; and they also satisfy a part of the foreign demand for British articles. They tend, in both these respects, to reduce the quantity of goods which can be exported by us in the way of ordinary commerce, and to turn the balance of trade against us. Capital transferred to our colonies, dividends transmitted to foreigners, and articles shipped for the use of our
that is to say, in the same manner, to bring Great Britain into debt to foreign countries, and to promote the exportation of our bullion. Our mercantile exports and imports, nevertheless, by whatever means they may be rendered disproportionate, necessarily become in the long run, tolerably equal; for it is evident that there is a limit, both to the debt which foreigners will permit British merchants to incur, and also to the quantity of British bullion which is exportable.

Gold has been spoken of in this chapter as that article by which a balance of trade is discharged, and not as itself constituting a commodity. Gold, however, when exported and imported, may be considered in the same light with all other commodities; for it is an article of intrinsic value: its price, like that of other commodities, rises and falls according to the proportion between the supply and the demand; it naturally seeks, like them, that country in which it is the

fleets and armies, contribute in the same manner as foreign subsidies to render the balance of trade unfavourable. It may be added, that articles consumed at home, in the support of similar fleets and armies, as well as all other expenditure in Great Britain, must have the same general tendency.

It may be worthy of remark, that since an additional internal expenditure, in the same manner as the remittance of a subsidy to foreign parts, contributes to an unfavourable balance of trade, and therefore, also, to the exportation of our gold, it follows; that, if the remittance of a small subsidy tends to produce at home a large saving; if, for instance, it spares the expense of maintaining a great naval and military force for the defence of our own island, through the continental diversion to which it leads, the subsidy may conduce to render our balance of trade more favourable; and may, on the whole, prevent rather than promote the exportation of our coin—A circumstance which, in considering the policy of furnishing an aid to foreign allies, is not always taken into contemplation.
dearest; and it is, in point of fact, like them, exported by our merchants accordingly as the export or import is likely to yield a profit. Some description of the circumstances which cause the export of gold to become a profitable speculation to the merchant may serve to illustrate this subject.

When a bill is drawn by one country on another—by Hamburgh, for instance, on London—it is sold (or discounted) in the place in which it is drawn, to some person in the same place; and the buyer or discounter gives for the bill that article, whatever it may be, which forms the current payment of the spot. This article may consist either of gold or silver coin, or of bank paper, or, which is much the same thing as bank paper, of a credit in the books of some public bank.

Let us now suppose that the exporter of corn from Hamburgh to London draws a bill for 100l. on London, and offers it for sale on the Hamburgh Exchange at the season when great exportations of corn to London are taking place. The persons in Hamburgh having occasion to buy bills are fewer, in such a case, than those who want to sell them; and the price of the bill, like that of any other article, fluctuates according to the proportion subsisting between the supply and the demand. The disproportion, then, between the number of those persons at Hamburgh who want to sell London bills for Hamburgh coin, and the number of those who want to sell Hamburgh coin for London bills, causes the price of London bills to fall, and of Hamburgh coin to rise. Thus gold is said to rise at Hamburgh; and the exchange between London and Hamburgh becomes unfavourable to London. This fluctuation in the exchange will, in the first instance, be small. It will be limited to that
trifling sum which it costs to transport bullion from
the one place to the other, so long as there is bullion to
be transported. But let us now suppose the number
of Hamburgh bills on London, drawn for the payment
of the goods imported into the latter place, to be so
numerous, that the exportation of all the bullion which
is purchaseable in Great Britain, has not sufficed for
their payment. Gold coin, in this case, will be ex-
ported, being first melted down for the purpose. Coin
indeed, is not allowed to be exported from Great Bri-
tain, nor gold which has been melted down from coin,
an oath being required of every exporter of gold, that
the gold which he exports does not consist of guineas
which have been melted. There are, however, many
ways of escaping the law which imposes this oath.
The law is dishonestly evaded either by the clandes-
tine exportation of guineas, no oath at all being taken;
or by taking a false oath; or by contriving that the
persons taking the oath shall be, in some degree, igno-
rant of the melting which has been practised. The
operation of the law is avoided without this dishones-
ty, through the exportation of gold which had been
turned, or had been about to be turned, to the pur-
poses of gilded and golden ornaments, the place of this
gold being supplied by gold melted down from coin.
The state of the British law unquestionably serves to
discourage and limit, though not effectually to hinder,
that exportation of guineas which is encouraged by an
unfavourable balance of trade; and, perhaps, scarcely
lessens it, when the profit on exportation becomes
very great. The law tends, indeed, to produce a
greater interchange of gold for paper at home. But it
increases whatever evil arises from an unfavourable
state of the exchange with foreign countries.
Let it now be considered how this high price of gold in London must operate in respect to the Bank of England. Great demands for guineas will be made on the bank; and, in general, probably by persons not intending to melt or export guineas themselves, but wishing only to supply that want which all have begun to experience in consequence of the large illicit exportations carried on by a few unknown persons. It is assumed, for the present, that the bank is paying in guineas. What, then, is the course which the bank will naturally pursue? Finding the guineas in their coffers to lessen every day, they must naturally be supposed to be desirous of replacing them by all effectual and not extravagantly expensive means. They will be disposed, to a certain degree, to buy gold, though at a losing price, and to coin it into new guineas; but they will have to do this at the very moment when many are privately melting what is coined. The one party will be melting and selling, while the other is buying and coining. And each of these two contending businesses will now be carried on not on account of an actual exportation of each melted guinea to Hamburgh, but the operation (or, at least, a great part of it) will be confined to London; the coiners and the melters living on the same spot, and giving constant employment to each other.

The bank, if we suppose it, as we now do, to carry on this sort of contest with the melters, is obviously waging a very unequal war; and even though it should not be tired early, it will be likely to be tired sooner than its adversaries.

The dilemma in which the bank is thus placed, is evidently one which implies no deficiency in its wealth, in its credit, or in the strength of its resources. The
public, during all this time, may have the highest confidence in it. The notes of the bank may be of the same number as usual, possibly somewhat lower in number; its capital and savings may be immensely great, and perfectly well known; its stock may be selling at much above par; its clear annual profits may be considerable. Its gold, nevertheless, through the operation of that one cause which has just been named, may be growing less and less. And it is not at all impossible, if an alarm at home should draw away the gold at the same time, that, however ample its general fund may have been, it may be reduced to its last guinea; and may actually be brought under the necessity of making a temporary suspension of its payments.

An important subject of inquiry here suggests itself. Dr. Smith, as was remarked in the beginning of the former chapter, in some degree leads his reader to assume the Bank of England to be in fault (that is to have issued too many notes) whenever an excess of the market price above the mint price of gold takes place, an excess which produces, as shall immediately be shewn, that difficulty in replenishing the coffers of the bank which has been recently described. If the observation of Dr. Smith be, without exception or qualification, true, then the quantity of paper issued by the Bank of England has undoubtedly been excessive throughout the last two years; for the excess of the market price above the mint price of gold has been, during that time, considerable. Then, also, it is the bank which has placed in its own way that obstacle to the purchase of gold which has been spoken of. Any inquiry tending to indicate the causes which place the
bank under this singular difficulty, seems to be important.

I shall here endeavour clearly to explain what is meant by the high and the low price of gold; and also by that difference between the mint price and the market price, which has such material consequences.

Gold must be considered as dear, in proportion as goods for which it is exchangeable are cheap; and as cheap, in proportion as goods are dear. Any circumstance, therefore, which serves to make goods generally dear, must serve to make gold generally cheap, and vice versa; and any circumstance which serves to make goods dear at any particular time or place, must serve to make gold cheap at that time or place, and vice versa.

The reason of the difference between the mint price and the market price of gold, does not easily occur. If the bank, from time to time, buys gold at a high price, that is, if it gives for gold a large quantity of goods (or something convertible into a large quantity, which is the same thing); it is natural, on the first view, to suppose that the high price given by the bank, which is the principal and almost the only English purchaser, must form the current English price; and that this high current price of gold in England will prove the means both of bringing it hither, and of detaining it here; causing goods, which are cheap, to go abroad; and gold, which is dear, to come hither, and also to remain in the country. Undoubtedly gold would remain in England, when tempted hither by the high price given for it by the bank, if it were not for the following circumstance. Gold is bought by the bank, in order to be converted into coin, and, when turned into coin, it forms a part
of the circulating medium of the country, paper constituting another part. If, then, this paper is by any means rendered cheap, and if the paper so rendered cheap is currently interchanged for one sort of gold, namely, for gold which has been coined, then the coined gold will partake in the cheapness of the paper; that is, it will buy, when in the shape of coin, a smaller quantity of goods than it will purchase when in the form of bullion. In other words an ounce of gold coming from the mint in the shape of guineas, and making 3l. 17s. 10½d. (for that is the sum into which an ounce always is coined at the mint), will be worth less than the same ounce of gold was worth before it went to the mint, and less than it would again be worth if converted back into bullion. There arises, therefore, a temptation to convert back into bullion, and then to export; or, which is the same thing, to export, and then convert back into bullion; or, which is also the same thing, to convert back into bullion, and then sell to the bank, at the price which would be obtained by exportation, that gold which the bank had turned from bullion into coin. In proportion as the difficulty of collecting, melting, and sending abroad the gold coin is augmented (and it increases as the quantity of coin diminishes), the difference between the mint and market price of bullion will become more considerable, supposing the demand for gold in foreign countries to continue. Thus it is through the interchangeableness of gold coin with paper, that gold coin is made cheap in England, or, in other words, that goods, in comparison with gold coin, are made dear. The goods which are dear remain, therefore, in England; and the gold coin, which is cheap (for the bank is indisposed to buy it, on account of the loss sustained on each coinage), goes abroad.
There is, undoubtedly, much ground for the supposition of Dr. Smith, that a diminution of the quantity of paper has a tendency to cure this evil.* It tends to render the paper more valuable, and, therefore, to make that gold coin more valuable for which the paper is interchangeable, and thus to destroy that excess of the market price above the mint price of gold, which forms the obstacle to the introduction of a supply of gold into the coffer of the bank. There seems, nevertheless, to be much of inaccuracy and error in the doctrine of Dr. Smith on this subject. He begins by representing the quantity of paper which may properly circulate, as to be measured by that of the gold which would circulate if there were no paper. The reader is, therefore, led to believe, that a difference between the mint price and the market price of gold arises from an issue of a greater quantity. Dr. Smith also too much countenances an idea, that the excess consists

* That the diminution of the circulating paper has a tendency to bring down the price of goods at home, and to cause those goods to go abroad for the sake of a better market, was observed in the preceding chapter, and will again be insisted on when we proceed to treat of the importance of properly limiting the quantity of Bank of England notes. Many remarks, however, were added, in the former chapter, respecting those detrimental effects of a reduction of paper, which are to be set against the good consequences of it. In the present chapter the same arguments, on each side, are about to recur, and they will, therefore, be but slightly touched upon.

In the former chapter, the difficulties which the bank experiences in consequence of a run occasioned by an alarm, were chiefly considered; in the present, the difficulties arising from that sort of drain which proceeds from an unfavourable balance of trade are investigated. In some future Chapters, the difficulties to which the bank is exposed by a similar drain, resulting from a too great emission of paper, will be the subject of examination.
of paper forced into circulation; for he terms the proper quantity that paper which will "easily circulate." He, moreover, induces his reader to suppose, that the excessive issue is an issue to a more than usual amount. At the time of a very unfavourable balance of trade (an event which Dr. Smith leaves totally out of his consideration), it is very possible, as I apprehend, that the excess of paper, if such it is to be called, is merely an excess above that very low and reduced quantity to which it is necessary that it should be brought down, in order to prevent the existence of an excess of the market price above the mint price of gold. I conceive, therefore, that this excess, if it arises on the occasion of an unfavourable balance of trade, and at a time when there has been no extraordinary emission of notes, may fairly be considered as an excess created by that unfavourable balance, though it is one which a reduction of notes tends to cure.

The fair statement of the case seems to be this. At the time of a very unfavourable balance (produced, for example, through a failure of the harvest), a country has occasion for large supplies of corn from abroad: but either it has not the means of supplying at the instant a sufficient quantity of goods in return, or, which is much the more probable case, and the case which I suppose more applicable to England, the goods which the country having the unfavourable balance is able to furnish as means of cancelling its debt, are not in such demand abroad as to afford the prospect of a tempting or even of a tolerable price; and this want of a demand may happen possibly through some political circumstance which has produced, in a particular quarter, the temporary interruption of an established branch of commerce. The country, therefore, which
has the favourable balance, being, to a certain degree, eager for payment, but not in immediate want of all that supply of goods which would be necessary to pay the balance, prefers gold as part, at least, of the payment; for gold can always be turned to a more beneficial use than a very great overplus of any other commodity. In order, then, to induce the country having the favourable balance to take all its payment in goods, and no part of it in gold, it would be requisite not only to prevent goods from being very dear, but even to render them excessively cheap. It would be necessary, therefore, that the bank should, not only not increase its paper, but that it should, perhaps, very greatly diminish it, if it would endeavour to prevent gold from going out in part of payment of the unfavourable balance. And if the bank do this, then there will arise those other questions, which Dr. Smith leaves totally out of his consideration; namely, whether the bank, in the attempt to produce this very low price, may not, in a country circumstanced as Great Britain is, so exceedingly distress trade and discourage manufactures as to impair, in the manner already specified, those sources of our returning wealth to which we must chiefly trust for the restoration of our balance of trade, and for bringing back the tide of gold into Great Britain. It is also necessary to notice in this place, that the favourable effect which a limitation of bank paper produces on the exchange is certainly not instantaneous, and may, probably, only be experienced after some considerable interval of time; it may, therefore, in many cases, be expected that the exchange will rectify itself before the reduction of bank paper can have any operation. It is also to be recollected (a point, indeed, which Dr. Smith himself
states), that gold is retained or drawn away, not by the limitation or the increase of the Bank of England paper alone, but by that of their paper, conjointly with that of the other paper of the country. The bank paper serves, it is true, to regulate, in a great degree, that other paper; but not with exactness. The bank, by proceeding to that reduction of its own paper which is necessary to bring gold into the country, may possibly annihilate, before it is aware, a part or even almost the whole of the circulating country bank notes, and much other paper also; and it may, in that case, have to supply gold sufficient to fill the whole void, perhaps more than the whole void, which it has created; for it may be called upon to furnish large additional sums which may forthwith be hoarded in consequence of the alarm thus occasioned. Hence, even though it should increase the supply of gold from abroad; it may augment, in a far greater degree, the demand for it at home. For this reason, it may be the true policy and duty of the bank to permit, for a time, and to a certain extent, the continuance of that unfavourable exchange, which causes gold to leave the country, and to be drawn out of its own coffers: and it must, in that case, necessarily increase its loans to the same extent to which its gold is diminished. The bank, however, ought generally to be provided with a fund of gold so ample, as to enable it to pursue this line of conduct, with safety to itself, through the period of an unfavourable balance; a period, the duration of which may, to a certain degree, be estimated, though disappointment in a second harvest may cause much error in the calculation.

The more particular examination of this subject of an unfavourable exchange, brings us, therefore, to the
same conclusion to which we were led in the former Chapter; namely, that the bank ought to avoid too contracted an issue of bank notes. The absence of gold, though itself an evil, may prevent other evils of greater moment; and may thus conduce, under certain circumstances, to the good of the country. Our gold has lately furnished the prompt payment for a part of that corn, which has been necessary for our consumption. The common manufacturer, if he understood his own interest, would approve rather than complain of the temporary substitution of paper for gold, which has been thus occasioned: for the export of gold has served to ease him in the first instance: his labour, indeed, must hereafter purchase back again the gold which has been exported, but he will have to buy it back by exertions less severe than would otherwise have been needful. The price of the goods which he manufactures, and, consequently, the price also of his own labour, is rendered somewhat higher by not glutting the foreign market with a quantity of articles altogether disproportionate to the demand. It should farther be remembered, that gold is an unproductive part of our capital: that the interest upon the sum exported is so much saved to the country: and that the export of gold serves, as far as it goes, to improve the exchange, by discharging the debt due on account of an unfavourable balance of trade; and to prevent the depreciation of our own paper currency, as compared with the current money payments of other countries.

It may probably be thought that the exported gold will not return. This subject may deserve a careful inquiry. It should be observed, in the first place, that in order to produce an improvement in the exchange,
we have only to suppose the present degree of the pressure for payment of goods imported to abate. It may happen, for instance, that in consequence of Hamburg having become richer through the favourable harvest enjoyed in the surrounding countries, and through the high price obtained for its exported corn, while Britain has become poorer; the antecedent custom of Hamburg merchants being in debt to London merchants may change, and a contrary custom may become prevalent. If this new debt of London to Hamburg should be permitted to exist in the same manner as the Hamburg debt may be supposed to have existed before, the exchange will not be affected by it. The debt which affects the exchange is only that sort of debt, the payment of which is more or less eagerly demanded. A country, therefore, seems likely soon to arrive at a limit in this respect. It has only to diminish not the debt itself, but the pressure of the demand for payment, and the exchange begins to mend. Let the two countries become equally satisfied to allow the debt to continue as it is, and the exchange finds its level. Again; let the country in debt prove itself to be somewhat more desirous to pay its debt, a debt of course running at interest, than the creditor country is to receive payment; and the exchange will be even in favour of the debtor country.

It may naturally be inquired what becomes of the gold which has been supposed to go from this country to Hamburg; and how it comes to pass that it is there demanded in such large quantities. When Britain has already spared out of its circulation, and out of the coffers of its principal bank, many millions, perhaps, of gold; whence happens it that Europe, having only the same trade as before, uses all that is sent, and
continues to call, by means of the exchange, for a still increasing supply?

I understand that, at the period of every very favourable exchange to Hamburgh, most of the gold poured in thither is melted down into the several sorts of coin which are current on the continent; and that it then becomes an article of remittance to various places. It is, of course, remitted to those parts in which the balance of trade with Hamburgh is unfavourable to that city. Still, however, the difficulty of accounting for the new and general demand for gold seems to remain. The following considerations may afford some solution of it. When the trade of the world, or of many separate and considerable places, is more than usually fluctuating, as in times of political uncertainty or convulsion, it can hardly fail to be, a larger quantity of gold is wanted than when confidence is high, and when the several exports and imports of different countries more nearly balance each other. Gold, during any extraordinary irregularity in trade between independent states, is the most commodious of all articles of remittance. It is a species of return which Hamburgh, for instance, can send to every place from which its spirit of speculation may have called for articles of commerce. It is indeed, only the balance of the accounts which is paid in money; but, at different times, there may be balances of different sizes to be thus discharged. Whatever event, therefore, so disturbs the course of trade over the continent as to cause an increase in the balances of the trade of independent countries, seems likely to cause an augmentation of the general demand for gold. But the general demand for gold is also affected by the degree of confidence at the same time subsisting. It has
been already shewn, that the quantity of gold requisite for the circulation of any single country may be very different at different periods, and that the difference is proportioned to the degree of confidence between man and man existing at the several seasons. The quantity of gold wanted for the general trade of the world may also fluctuate, in some degree, from the same cause. It is however, likely also to vary from a variation in the confidence subsisting between independent countries. For the sake of illustration, let us suppose that Hamburgh owes some town in Prussia, one hundred miles distant, 100,000l. sterling, in consequence of an unfavourable balance of trade occasioned by corn purchased there, and exported by Hamburgh merchants to London; a balance which, if the creditors in the Prussian town were willing to wait six months, would probably by that time be repaid, and even more than repaid, through the importation into the same town of West India articles which Hamburgh would have received within that period from Great Britain. If confidence is high, the merchants of this town will be content, for the sake, perhaps, of an addition of one per cent. to the stipulated interest, to permit the debt to remain unextinguished for the six months; and in this case the course of exchange between the Prussian town and Hamburgh will alter to the extent of one per cent. But if, through the want of confidence subsisting between the Prussian town and Hamburgh, an addition not of one, but of two per cent. to the current interest should be considered to be the adequate compensation for the risk incurred, the exchange will fluctuate two per cent.; and a variation of two per cent. in the exchange will produce, let it be supposed, to the
Hamburgh debtors a greater loss than would be incurred by the expense of transporting 100,000l. in gold to the Prussian town in question. Gold, is therefore, in that case, transported. On the two circumstances, taken together, of the largeness of the balance between the independent places, and the degree of confidence subsisting between them, appears to depend the quantity of bullion required. It seems, therefore, by no means difficult to account for the manner in which large quantities of gold exported from this country may be employed on the continent in seasons of general distrust, even though we should not suppose any great portion to be hoarded.

Bullion to a very large amount was retained in the Spanish settlements, during the latter period of the war, through the fear of capture; and perhaps, therefore, we might trace in part the want of gold, of which we have complained, to those successful exertions in watching the ports of the enemy which have been made by the British navy.

The immediate cause, however, of the exportation of our coin has been an unfavourable exchange, produced partly by our heavy expenditure, though chiefly by the superadded circumstance of two successively bad harvests. When the recurrence of a favourable balance of trade is long delayed, the fluctuation of the exchange may be expected to be not an immaterial one. The exchange is, in some degree, sustained for a time, which is thought likely to be short, through the readiness of foreigners to speculate in it; but protracted speculations of this sort do not equally answer, unless the fluctuation in the exchange is very considerable. If, for example, a foreigner remits money to London, at a period when the exchange has be-
come unfavourable to England to the extent of three per cent. places it at interest in the hands of a British merchant, and draws for it in six months afterwards, the exchange having by that time returned to its usual level, he gains two and a half per cent. for half a year's interest on his money, and also three per cent. by the course of exchange, which is five and a half per cent. in a half year, or eleven per cent. per annum. But if the same foreigner remits money to England when the exchange has, in like manner, varied three per cent. and draws for it not in six months but in two years, the exchange having returned to its usual level only at the end of that long period, the foreigner then gains ten per cent. interest on his money, and three per cent. by the exchange, or thirteen per cent. in two years: that is to say, he gains in this case six and a half per cent. per annum, but in the other eleven per cent. per annum. If a variation of three per cent. is supposed necessary to induce foreigners to speculate for a period which is expected to end in six months, a variation of no less than twelve per cent. would be necessary to induce them to speculate for a period which is expected to end in two years. The improvement of our exchange with Europe having been delayed through a second bad harvest, it is not surprising that the expectation of its recovery within a short time should have been weakened in the minds of foreigners. Indeed, many circumstances, some of which have been already touched upon, * con-

---

* A mistaken idea of the bank payments having been suspended through the improper largeness of its loans to government, and of its resembling the continental banks which have issued excessive quantities of paper for the service of their several governments, was before stated to be not un-
curred, towards the conclusion of the war, in rendering our exchange unfavourable. Some gold, it may be presumed, was retained in the bank coffers, which, if the cash payments of that company had not been suspended, would have found its way to foreign countries, and have contributed to remedy the existing evil.

We depended chiefly, as will be shewn hereafter, on the proper limitation of the quantity of our circulating paper, though partly, also, on the degree of expectation which was kept up abroad of the future improvement of our exchange; an expectation which might be rendered greater or less by a variety of circumstances. Great Britain has had this great advantage over those countries which are in the habit either of depreciating their coin or of allowing a discount on their paper, that they, in anticipating the return of a more favourable state of their trade, look forward only to a time when their uncertain and unstable rate of exchange may be meliorated in a degree not easy to be calculated; whereas we have anticipated a period when an intrinsically valuable and specific standard would be restored, when our banks would be obliged to pay fully in guineas containing the same

likely to have prevailed abroad, too much countenance having been given in this country to such a sentiment. Foreigners, if such was their opinion, would conceive that our exchange was a permanently declining one, and that it would, therefore, answer better for them to draw than to remit, and to draw immediately than to delay drawing. The idea that foreign property might be seized in England, as an act of retaliation for the British property seized in the north of Europe, may also have had some influence. The expectation of seizures on each side would prejudice the exchange of whichever country was in debt, and the country in debt happened to be Great Britain.
weight of gold as before, and when our exchange, therefore, might be expected completely to return to its former level.

Undoubtedly, circumstances of so great and extraordinary a nature may arise as to prevent the return of gold at an early or assignable period. It may, however, be safely affirmed, that when the main sources of a country's wealth are unimpaired; when its population, its industry, its manufacturing and trading capital, its general commerce, its credit, its colonial possessions, its political strength and independence, its laws and constitution remain; and when, moreover, its paper is confined within its accustomed bounds; the absence of its gold, more especially if it be the obvious consequence of one or more unfavourable seasons, is an evil which is likely neither to be durable, nor in any respect very important.

Under such circumstances, to alter materially the old and accustomed system of paper credit, and, in particular, to restrain in any very extraordinary degree the issues of paper of more responsible banks, is to deprive a country of those means of recovering itself which it naturally possesses. This seems to be the fair inference from the observations which have been stated in the present and preceding chapters. The return of gold is to be promoted not so much by any legislative measure directed to that immediate object, as by cherishing the general industry, and attending to the higher and more leading interests of the community.

It may be proper here to add, that the experience of past times, both of war and peace, leads us to suppose, that the exchange between Great Britain and foreign countries is not likely to remain for any long
period unfavourable to Great Britain. Experience has likewise proved, that the return of gold has not been precluded by the law which authorised the continuance of the suspension of the cash payments of the bank; for, while that law was in force, there occurred one season during which gold flowed with a remarkably strong tide into the country.

It seems scarcely necessary now to dwell on the reasons which evince that the repeal of the law in question, in the last period of the war, would have been inexpedient. It would have been to repeal it at a time not a little resembling that in which the parliament first thought proper to enact it; for it would have been to repeal it when gold had been recently drawn out of the country by an unfavourable exchange; and when we were subjected, as before, to alarms of invasion. To have opened the bank would have been, moreover, to have subjected it not only to a demand for gold on these two accounts, but also to such extra calls as might have arisen from the anxiety of the country banks to provide for the event of the first opening more amply than might have been permanently necessary. The renewal, therefore, of the law for suspending the cash payments of the bank stood on the ground of the particular circumstances of the times, and not on any principle which necessarily implied the permanence or even the long continuance of the suspension.
CHAPTER VI.

Error of imagining that Gold can be provided at the Time of actual Distress. Reasons for not admitting the Presumption that the Directors of the Bank must have been to blame for not making beforehand a more adequate Provision.

The impracticability of increasing the fund of gold in the Bank of England, when an alarm at home has already taken place, or even during the period of a very unfavourable balance of trade, has been manifested in the preceding pages.

There is a peculiar inconsistency in the supposition that a country ought, at such a season, to take its measures for increasing the quantity of its gold. The argument for such an attempt would run thus: “The stock of gold has been in past time too low, as appears by the experience of the present period; for it is not now sufficient to supply what is necessary
for our own circulation, and to enable us also to pay our unfavourable balance. We ought, therefore, to take due care that, in time to come, there shall be a larger provision of gold in the country.” So far, undoubtedly, there may be some general justice in the reasoning. But if the further inference is added, that we must, therefore, now begin to make the provision, this is to propose to take measures to provide against a want, which is future and contingent, at a time when that very want which we would prevent is actually pressing upon us. With as fair an appearance of justice it might have been argued in respect to the stock of corn in hand in the country—

The stock of corn has been, as now appears, for some time too low; for it is, at the present season, insufficient for the due supply of the country. We ought, therefore, to take care that, in time to come, there shall be a better provision for such contingencies as the present.” So far, undoubtedly, there might be justice in the observation. But to proceed in our reasoning as to corn, in the same manner as is sometimes done in respect to guineas, would be to add—“Therefore, now, while the scarcity is pressing upon us, let us begin to make this provision; let us instantly stock our granaries with a surplus quantity of corn; let us divert the little grain which we possess from those most necessary uses to which it is now destined. Let us increase our present difficulty, in order that the country may be put, for the future, out of the reach of the danger which it is experiencing at the present hour.” The two cases are not, indeed, precisely parallel; but there seems to be sufficient resemblance to justify the elucidation.

There is, however, another ground on which the
directors of the bank may possibly be thought censurable: that of having failed to supply themselves with a sufficient quantity of gold at an antecedent period. Let us, therefore, inquire whether the public has sufficient reasons for entertaining this suspicion.

Let it be premised, that, since the directors of the Bank of England can have no particular temptation to improvidence; and since our national bank is, from its very nature, liable to that accident which has lately, for the first time, befallen it, a liability which, for obvious reasons, it may have been the custom too studiously to conceal, there is not all that previous presumption of blame which might be supposed. There can be no doubt that the credit of the Bank of England has been, at all periods, most anxiously consulted by its directors; and that present profit has uniformly been only the second consideration.

There are, however, certain limits which, even when gold is most easily purchased, the bank naturally prescribes to itself in respect to its stock of that article. The amount of the disposable effects of the bank, on the 26th of February, 1797, was stated under three heads in a former place; and it was then observed, that the only part of them which the bank itself could enlarge was the deposits lodged in return for bank notes issued. But even the bank notes cannot safely be increased in a degree which is very considerable. Indeed, experience has proved, that there may be some sort of limit to the demand for them; for the applications for loans have often amounted, during peace, to less than the bank has been disposed to afford on the credit of good bills at the existing rate of discount.

Let us, then, proceed to illustrate our subject by
supposing the disposeable effects of the bank to have usually stood, for some years antecedent to the suspension of its cash payments, at the sum of about nineteen millions, that is to say, let us allow them to have been about a million and a half more than they amounted to at that period.

It must not be imagined that these nineteen millions could, at any time, be with propriety invested in gold. For the Bank of England, like every other mercantile establishment, carries on its business on such principles as will produce a profit. And the very lowest profit which can serve as a sufficient inducement to pursue the trade of banking, must be somewhat higher than the mere current interest of money. Let us reckon this necessary profit of the bank to be six per cent. The bank makes no more than three per cent. interest on the capital subscribed by its members, which is permanently lent to government. It must, then, so manage its disposeable effects as to gain an annual sum equal to an additional three per cent. upon its own capital, that is, about 350,000l. This it must do by lending out at interest a part of the nineteen millions; and it must lend out, at interest, a still farther part of it, both in order to defray the annual charges of its establishment, and in order also to furnish the means of paying those occasional sums to government which are required as the price of the renewal of its charter. It will be found, perhaps, that not less than ten or twelve of the nineteen millions must be always at interest in order to provide for these objects; and, consequently, that eight or nine millions will have formed the highest average sum which the bank can have kept in gold, consistently with the acquisition of merely the necessary profit on
ts capital. But neither is it fair to suppose, that these eight or nine millions ought to have been the general or average sum kept in gold. The cash of the bank fluctuates very greatly; and in order to secure the keeping of cash and bullion to the average amount of eight or nine millions, it will occasionally have been necessary to keep twelve or fourteen millions, or possibly even more. This sum would be most unreasonably large; for, during the time when twelve or fourteen millions are invested in gold, the bank, instead of gaining six per cent. on its capital, will not gain above three or four; and, moreover, it cannot exactly know how long this extraordinary quantity of gold may continue in its coffers. It certainly can never count beforehand on those great reductions of cash which may serve, by increasing the sum at interest, to compensate for what is lost by a large detention of bullion: for the reduction of cash happens not through any measures taken by the bank, but in consequence of events difficult to be foreseen, and, as has been already shewn, by no means easy to be controlled. The bank, therefore, without impeachment of the character of its directors, may be reasonably presumed to have been at least somewhat indisposed to make investments in bullion, which, while they lasted, should reduce its income very far below the necessary annual profit.

Thus the bank, in endeavouring to secure what has been termed the necessary annual profit, would naturally be led to make, on the whole, something more than that profit; and, indeed, a variety of circumstances have lately occurred which have had a tendency to increase its gains to a degree which must have been unexpected by the bank itself. Let us,
then, suppose that the profits which the bank, consider-
ing all circumstances, may fairly and properly have
derived from its business for some years past, may
have been not six per cent. (which was spoken of as
the lowest sum necessary for carrying on the trade of
banking), but seven or eight per cent. Now seven
or eight per cent. or a little more, seems likely to be
that profit which the bank has, in point of fact, been
gaining. The dividends which it has paid to the prop-
rietors have been, for some time, seven per cent.;
and it has also added 3,800,000l. to its capital. This
addition has been accruing, no doubt, during a long
course of years. If we assume that it has accumu-
lated at the rate of about 116,000l. per annum, the
bank will have gained annually one per cent. on its
capital, besides the seven per cent. which has been
divided; if at 232,000l.* per annum, the bank will
have gained annually two per cent. on its capital, be-
sides the seven per cent. which has been divided.

The bank, then, let it be supposed, has been gain-
ing eight or nine per cent. when seven or eight per-
cent. is as much as it is reasonable that it should have
acquired. I have entered into this detail, which, in
various parts, may be somewhat erroneous, merely for
the sake of shewing that any proposed inquiry whe-
ther the quantity of gold kept by the bank may or
may not have been too small, must necessarily be
much narrower than many persons may imagine. Ac-
cording to the supposition just made, it can relate only

*This is to suppose that the savings of the bank have been between
sixteen and seventeen years in accumulating, a period certainly much too
short; but the accumulation must have been more rapid during the last
years.
to the propriety of a past annual gain of about one per cent. or at most of two per cent. on the bank capital. A gain of one per cent. would have been about 116,000l. per annum; and consequently the bank, by taking this gain, have, on an average, kept a stock of gold which has been smaller than it would otherwise have possessed by about 2,300,000l. Whether this sum of 2,300,000l. or whether any sum somewhat greater than this, or somewhat short of it, ought or ought not, in time past, to have been invested in gold in addition to the sum which was invested, is a point on which all that it seems safe to affirm with confidence, is, that no person unacquainted with the affairs of the bank can be capable of pronouncing any clear judgement. There must have existed many arguments, and some standing even on the ground of safety and credit, against maintaining the additional fund which has been mentioned.

If the whole profits of the bank had been lately restricted to seven per cent. they would have been limited to that sum which the bank proprietors had been for some time in the habit of receiving. They would have been confined to a sum which would not easily have admitted of accumulations. By obtaining a higher profit the directors have secured to the proprietors the continuation of the same regular dividend, and have thus prevented that uncertainty which would have encouraged gambling in bank stock. They have also made, in the course of years, an important addition to their capital; an addition which has caused it to maintain nearly an uniform proportion to the growing extent of the transactions of the bank, and to the advancing commerce of the country; an addition also, by the help of which they have lately lent to govern-
ment three millions without interest, for a short term of years, as the price of the renewal of their charter. They have thus strengthened that security which the creditors of the bank possess, so far as additional capital can strengthen it; and they will be able hereafter, if it shall seem necessary, to invest in gold, in addition to what they could otherwise have invested, a much larger sum than they could with any propriety have so invested in time past.

It must farther be borne in mind, that the necessity under which the bank has been placed of providing gold which is to fill the void occasioned by the disappearing of country bank notes, has been, in part, a new necessity, country bank notes not having circulated, at remoter periods, in so great a degree as they have lately; and that the additional sum of two or even of three or four millions would have been no security against the effects of a general alarm in the country. The fluctuation in the balance of trade with foreign countries, which we experience, is also become, in consequence of the greater extent of our population and commerce, larger than heretofore. The scale of all things having increased, the scale of this balance may have increased also to a degree unexpected by the bank. A war, moreover, unprecedented as that in which we have lately been engaged was not to be anticipated; and the case of a succession of two bad harvests, and of an importation of corn, amounting in two years to the value of fifteen or twenty millions, is felt by all to have been an extraordinary event. We need not wonder, then, if events unforeseen by others, were not foreseen by the Bank of England; nor if for unforeseen events an adequate provision was not at hand.
On the whole, it may be suggested to those who cast blame on the bank for its improvidence in time past, that they should consider well the several points which have here been briefly pointed out; and that if, afterwards, they continue to think the bank censurable, they should ask themselves, before they become the censurers, whether they are sure that, in taking upon themselves the office, they exercise that candour with which they would expect to be judged if they had been themselves, during the late difficult and trying period, directors of that institution.

It has already been observed, that, in that crisis during which the conduct of the directors has been more particularly known, they proceed, perhaps, with too great fear and caution rather than with too little. There seems, therefore, to be a presumption, that a character, if not for caution, at least for tolerable prudence, must have generally been their due. To say the least, there appears to be no ground for charging them with having acted in antecedent times on a directly opposite principle.
CHAPTER VII.

Of Country Banks. Their Advantages and Disadvantages.

The country banks in Great Britain appear to have amounted, in the year 1797, to three hundred and fifty-three. By a numeration taken in 1799, they appear to have been three hundred and sixty-six. By a third numeration taken in 1800, they were three hundred and eighty-six.* It seems, therefore, that no material addition to their number has arisen in these three years.

A great increase of country banks took place during the time which intervened between the American and

* This statement of the number of country banks is taken from three printed accounts of them, the first of which may not have been very accurate, but may be presumed to state them at too low rather than too high a number. The two later enumerations were made in a more careful manner.
the present war, and chiefly in the latter part of it; a
period during which the trade, the agriculture, and the
population of the country must have advanced very
considerably. The circumstance of so many of our
country banks having originated at such a time, affords
a presumption that they are consequences and tokens
of the prosperity, rather than indications of the decli­
ning state of the country. No banks have arisen in
France during the period of its troubles, though seve­
ral attempts to erect them have been made. It was
with difficulty that any banks supported themselves in
America during the war; but after the establishment
of peace, banks were instituted in most of the Ameri­
can states. They seem naturally to belong to all com­
mercial countries; but are more particularly likely to
be multiplied in a state like ours, in which the mer­
cantile transactions are extended, the population is
great, and the expenditure of individuals considerable;
and where also a principal bank exists, which, through
the necessity imposed on it by its situation, undertakes
the task of providing a constant reservoir of gold ac­
cessible to every smaller banking establishment. The
creation of the large bank operates as a premium on
the institution of the smaller.

A description of the origin of one of our smaller
country banks may elucidate the subject before us.
In every town, and in many villages, there existed, an­
tecedently to the creation of what were afterwards
termed banks, some trader, manufacturer, or shop­
keeper, who acted, in many respects, as a banker to
the neighbourhood. The shopkeeper, for example,
being in the habit of drawing bills on London, and of
remitting bills thither, for the purposes of his own
trade, and receiving also much money at his shop,
would occasionally give gold to his customers, taking in return their bills on the metropolis, which were mixed with his other bills, and sent to his London correspondent.

Persons who were not customers being also found to want either money for bills, or bills for money, the shopkeeper was led to charge something for his trouble on accommodating them: and the trade of taking and drawing bills being thus rendered profitable, it became an object to increase it. For the sake of drawing custom to his house, the shopkeeper, having as yet possibly little or no view to the issuing of bank notes, printed “The Bank” over his door, and engraved these words on the checks on which he drew his bills.

It may be assumed, also, to have been not uncommon, before country banks were established, for the principal shopkeeper in a town to take at interest some of the money of his neighbours, on the condition, however, that he should not be required to pay it back without some notice. The money thus deposited with him, or borrowed by him (it is difficult to say which term is the more proper), might either be thrown into his trade, or employed in discounting bills soon to become due; but the latter would evidently be the more safe and prudent way of investing it.

All these parts of the banking business arose out of the situation and circumstances of the country; and existed in many places before the name of banker was assumed.

The practice of issuing country bank notes, that is to say, notes payable to the bearer on demand, may, undoubtedly, be considered as a separate branch of business. These notes, however, have been shown to.
be not so very different in their nature from other paper as is commonly imagined.

For the sake of more particularly proving this point let us advert to the nature of interest notes, a species of paper which some country banks have issued to a great extent. Even the shopkeeper, it was lately observed, would take sums at interest. For each of these sums, especially if he became a banker, he would give out his note, in which would be expressed the sum lent or deposited, the rate of interest upon it, and the time which was to intervene before payment could be demanded. This note would be transferable to any third person. There would, however, be some impediments to its circulation. The interest must be calculated as often as it should change hands. Some of the persons to whom it was offered might not be disposed to accept it as a payment, especially if it had a long time to run. Although these notes might circulate, they would circulate heavily. In order to promote their circulation, and thus increase the whole number of issuable notes, the banker would be inclined to lessen the time within which they should be payable; and he would find that, in proportion as he adopted this practice, a lower rate of interest on the notes would suffice to induce persons to take them. Notes carrying no interest would circulate, if due within a short time, better than notes bearing interest which should be due at a very distant period. But the only notes which would circulate freely would be those which should be payable, or at least paid, without any notice. Some banks wishing, on the one hand, to encourage the circulation of their paper, and, on the other, to avoid the inconvenience of a strict obligation to pay without notice have issued notes pay-
able after a certain time, and yet have been in the regular practice of giving money for them whenever payment was demanded, and have taken no discount for the accommodation.

Thus, then, the shorter the notice is, the greater is the currency of the note; and in proportion, therefore, as the circumstances of a country render it more safe for the banks to shorten their notice, in the same proportion it may be expected that notes to the bearer on demand will be issued, and gold displaced.

Some speculative persons have imagined, that the practice pursued by bankers of emitting notes payable on demand is founded on an altogether vicious and unwarrantable principle, inasmuch as such paper is issued with a view to a profit which is to be obtained only by lending out part of the sum necessary for the payment. A number of promises, it is said, are thus made, which the banker has evidently placed it out of his power to perform, supposing the fulfilment of them all to be required at the same time, an event by no means impossible. This objection implies, that the banker ought not, after receiving the deposits left with him by his customers, to lend out part of the sum necessary for the payment of those deposits; for he is as much bound to discharge demands for deposits without notice, as to pay without notice all his notes. The Bank of England, the London banker, the country banker, the merchant, and also the individual of every class, proceed, in respect to all their promises to pay money, not on any principle of moral certainty, but on that of reasonable and sufficient probability. The objection to bank notes, as such, if pushed to that extent to which, if it is at all just, it might be carried, would apply to all verbal promises.
to pay money, and, indeed, to almost all promises whatever; for there is scarcely any class of these for the performance of which a perfectly sure provision is always made at the time of giving the promise. The objection, implies, therefore, that men ought to be prohibited from acting in their commercial concerns according to that rule of sufficient probability by which all the other affairs of human life are conducted.*

It is completely understood by the holders of notes, as well as by the customers of banks, that instant payment is provided for only a part of that sum which may, by possibility, be demanded; and the banker, therefore, seems fully justified if he makes such provision as the general and known usage of others in the same profession (for he is supposed, by those who trust him, to follow this usage), and a prudent regard to all the circumstances of his own case teach him to consider as sufficient.

The practice of issuing notes payable to bearer on demand became very common a few years antecedent to the present war, when various circumstances united to encourage this part of the country banker's employment. Confidence was then high, the number of traders in the country had been greatly multi-

* In some of the democratic pamphlets of the present day; bank notes of every kind are spoken of not merely as liable to be carried to excess, or to be issued by irresponsible persons, or as producing particular evils, but as radically and incurably vicious; they are considered in the light of a complete fraud upon the public, which is practised by the rich, and connived at by the government; and the very issue of them has been stigmatised as equivalent to the crime of forgery. The resemblance of bank notes to other paper, and the resemblance of a promise on paper to any other promise, have been here touched upon with a view of exposing the absurdity of those doctrines.
plied, the income and expenditure of individuals were much increased, and every branch, therefore, of the banking business had naturally enlarged itself. Some addition had been made to the number of London bankers; and a few of these took forward and active measures to encourage the formation even of very small banks in the country, with a view to the benefit expected from a connexion with them. In many of our great towns, a fair opening was afforded for the erection of additional banks. These new establishments having taken place, various country traders, who had before made use of their own correspondents in London, fell into the practice of transacting their business with the metropolis through the medium of the country banker with whom they kept their cash. The country banker drew largely on a London banker on the account of the country traders, and the London banker was willing to execute the extensive country business which he thus acquired, in consideration of a much lower commission than had before been paid by the several country traders to their separate correspondents in London, who had been, for the most part, London merchants. The reduction of the rate of commission arose from two causes: first, from the new security which was afforded to the transactions between the town and the country, by the interposition of the credit of rich and responsible country banks; and, secondly, from the transfer to one house of that labour of keeping accounts, writing letters, and receiving and paying bills, which had, before, been divided among many. The risk and trouble being diminished, a proportionate abatement in the rate of commission could be afforded.
The multiplication even of country banks, purposing to deal chiefly in bills, would tend, in many ways, to produce an increased issue of notes on demand. Some deposit of gold would be kept by banks of every class, with the view of satisfying the demands of their customers; and the stock, maintained for this purpose, would form a part of the necessary provision for the payment of notes payable on demand, and it would, therefore, become an encouragement to the issue of them. The multiplication of deposits of gold through the country would, moreover, furnish, in many cases, more prompt means of obtaining gold on any sudden emergency; since one country bank might often procure a supply from a neighbouring one, especially if a good understanding on this subject should subsist between them. The establishment of mail coaches afforded, at the same time, a more cheap and ready method than before of bringing gold from London, as well as of transmitting thither any superfluity of it which might arise in the country. In proportion to the facility of obtaining gold, the unproductive stock of it kept in hand might be reduced; or, if the same stock should be maintained, the issue of notes payable on demand would be less hazardous. Indeed, a few old and respectable country banks had long been in the habit of emitting much paper of this sort, and had seldom experienced any inconvenience from doing it. The new ones, therefore, many of which were not at all inferior in property to the old, were led into the practice partly by example.

The circumstance which chiefly operated in procuring currency to the new circulating paper, was that participation of the benefit resulting from it which was enjoyed by the customers of the country bankers.
for he lent among them the capital which was acquired by the issue of his paper, and they became his instruments in sending it into circulation, by accepting it as a ready-money payment in return for bills discounted. In consideration of their obligations to the banker, and of the interest which they had in his stability, they were also forward, on most occasions, in the support of his credit. Such appear to have been the chief circumstances which led to that great increase of our country banks, and to that substitution of paper in the place of gold, which have been, for some years past, so much the subject of complaint.

In order to assist the reader in judging whether a preponderance of good or of evil results from our numerous country banks, an endeavour shall now be made to enumerate the principal benefits as well as inconveniences of them.

That country banks have, in a variety of respects, been highly advantageous, can scarcely admit of a doubt. They have afforded an accommodation to many descriptions of persons; but more especially to those who are engaged in commerce. They may be regarded as an effect of that division of labour which naturally takes place in every opulent country. The receipts and the payments of money are now no longer conducted at home, even by the middling trader, but are become a separate branch of business in the hands of bankers. It was to be expected that they to whom this employment has been transferred would find means of abridging labour, and of sparing the use of coin, the most expensive circulating medium. By their skill in attaining these objects, they transact an important portion of the business of the trader at an expense far inferior to that which he must incur were
he to conduct it by his own clerks; and they derive a profit to themselves, which, no less than the saving to the customer, may be regarded as clear gain to the kingdom.

Country banks are also useful by furnishing to many persons the means of laying out at interest, and in a safe manner, such money as they may have to spare. Those banks, in particular, which give interest notes for very small sums, afford to the middling and to the lower class of people an encouragement to begin to lay up property, and thus to make provision for the time of sickness or old age. Country banks also furnish a very convenient method of distributing to one class of men the superfluity of another. All who have money to spare know where they can place it, without expense or loss of time, not only in security, but often with pecuniary advantage: and all commercial persons of credit understand in what quarter they can obtain such sums, in the way of loan, as their circumstances will fairly warrant them in borrowing. While country banks thus render a benefit of the first magnitude to fair and prudent commerce, they are important barriers against rash speculation, though not unfrequently they are loudly accused of favouring it. However some few banks may have subjected themselves to this charge, banks in general, and particularly those which have been long established, take care to lend the sums which have been deposited in their hands, not to the imprudent speculator, or to the spendthrift, by whom they are in danger of suffering loss, but to those who, being known to possess some wealth and to manage their concerns with prudence, give proof that they are likely to repay the loan. Borrowers of this class are not apt to enter into very
large and perilous undertakings; for they are unwilling to risk the loss of their own capital. Bankers, especially men of eminence, feel a special motive to circumspection, in addition to that which operates with other lenders. The banker always lends under an impression that, if he places in any one a boundless or immoderate confidence, the imprudence will necessarily be known, in case the borrower should fail, as the affairs of every bankrupt are laid open to the body of creditors; and that his rashness is, therefore, liable to become the subject of conversation among his customers. Indiscretion of this kind, even if the particular instance be of no prominent magnitude, may thus prove an occasion of injuring the character and credit of the banking house, and of lessening the general profits of the business.

The banker also enjoys, from the nature of his situation, very superior means of distinguishing the careful trader from him who is improvident. The bill transactions of the neighbourhood pass under his view; the knowledge, thus obtained, aids his judgment; and confidence may, therefore, be measured out by him more nearly than by another person, in the proportion in which ground for it exists. Through the creation of banks, the appreciation of the credit of numberless persons engaged in commerce has become a science; and to the height to which this science is now carried in Great Britain we are in no small degree indebted for the flourishing state of our internal commerce, for the general reputation of our merchants abroad, and for the preference which in that respect they enjoy over the traders of all other nations. It is certainly the interest, and, I believe, it is also the general practice, of banks to limit not only the loan
which any one trader shall obtain from themselves, but the total amount also, as far as they are able, of the sum which the same person shall borrow in different places; at the same time, reciprocally to communicate intelligence for their mutual assistance; and, above all, to discourage bills of accommodation. While the transactions of the surrounding traders are thus subject to the view of the country banks, those of the country banks themselves come under the eye of their respective correspondents, the London bankers; and in some measure, likewise, of the Bank of England. The Bank of England restricts, according to its discretion, the credit given to the London banker. Thus a system of checks is established, which, though certainly very imperfect, answers many important purposes, and, in particular, opposes many impediments to wild speculation.

Country banks, also, as well as the Bank of England, have been highly beneficial, by adding, through the issue of their paper, to the productive capital of the country.* By this accession our manufactures,

*Dr. Smith remarks, that it is not by augmenting the capital of the country, but by rendering a greater part of that capital active and productive than would otherwise be so, that the most judicious operations of banking can increase the industry of the country. "Dead stock," he observes, "is converted into active and productive stock." Whether the introduction of the use of paper is spoken of as turning dead and unproductive stock into stock which is active and productive, or as adding to the stock of the country, is much the same thing. The less the stock of gold is, the greater will be the stock of other kinds; and if a less stock of gold will, through the aid of paper, equally well perform the work of a larger stock, it may be fairly said that the use of paper furnishes even additional stock to the country. Thus, for example, the use of a new sort of machinery which costs less in the erection than that which was em-
unquestionably, have been very much extended, our foreign trade has enlarged itself, and the landed interest of the country has had a share of the benefit. The common charge which is brought against country banks, of having raised up a fictitious capital in the country, admits of the following answer. They have substituted, it is true, much paper in the place of gold: but the gold which has gone abroad has brought back, as Dr. Smith observes, valuable commodities in return. The guinea spared from circulation has contributed to bring home the timber which has been used in building, the iron or the steel which has been instrumental to the purposes of machinery, and the cotton and the wool which the hand of the manufacturer has worked up. The paper has thus given to the country a bona fide capital which has been exactly equal to the gold which it has caused to go abroad; and this additional capital has contributed, just like any other part of the national stock, to give life to industry.

It has lately been objected to paper credit, that, by supplying the farmers with large loans, it has enabled them to keep back their corn from the market and enhance the price. It is true, that farmers, both in the last and many preceding years, may have obtained larger loans than they would have procured if no country bank notes had existed. The capital so furnished to the farmers may possibly have induced some of them, at certain times, to keep in hand a larger quan-
tity of grain than they would otherwise have found it convenient to hold. We know, however, that the general stock of grain in the autumn of 1800 was particularly low. Since, therefore, but a small part of the capital of the farmers, whether borrowed or their own, was then vested in grain, the principal share would probably be laid out on their land, and would increase its produce; for, unquestionably, the value of a crop obtained from a farm depends chiefly on the sum employed in cultivation and improvement. Country bank notes have thus added to the general supply of grain; and, by doing so, have contributed to prevent a rise in its price: they have, probably, in this manner, afforded much more than a compensation for any temporary advance in price to which they may have given occasion by enabling farmers to keep a larger quantity in hand. The very possession of a large quantity in hand is to be considered as, in general, a benefit rather than a disadvantage; for it is our chief security against scarcity, and, consequently, also against dearness. To the want of a larger surplus stock at the end of the years 1799 and 1800 is to be ascribed, in a great degree, the subsequent high price of provisions. The tendency, therefore, of country bank paper to increase generally the stock of grain in the hands of the farmer is to be ranked among the advantages of country banks. The tendency to increase it at the particular time of actual scarcity, is to be classed among the evils which they produce; and it is an inconsiderable evil, which is inseparable from a great and extensive good. To those who are disposed to magnify this occasional evil, it may be further observed, that the farmer is enabled to enlarge his stock by the increase of his own as well as of the general
wealth, much more, no doubt, than by the share which he obtains of that particular part of the new capital of the kingdom which is created through the substitution of country bank notes for gold; only a portion, therefore, of the mischief complained of is to be referred to country bank notes. It is principally to be ascribed to the growing riches and prosperity both of the farmers and other inhabitants of the country.

It is no small additional recommendation of the use of our paper, that the public draws a large yearly revenue from the tax imposed on bills and notes. If paper credit did not exist, a sum equal to that which is thus raised must be supplied by taxes either burdening the industry, or paid out of the property of the people. The public has, since the late additional tax, become a very considerable sharer in the profits of the country bankers' business.

Since, therefore, a paper medium has served the purposes which have been described, and has been, generally speaking, quite as convenient an instrument in settling accounts as the gold which it has displaced, the presumption in favour of its utility seems to be very great; and, if it could be added, that no other effects than those which have as yet been stated have arisen or are likely to arise from it, the advantage of it would be beyond dispute. To reproach it with being a merely fictitious thing, because it possesses not the intrinsic value of gold, is to quarrel with it on account of that quality which is the very ground of its merit. Its merit consists in the circumstance of its costing almost nothing. By means of a very cheap article the country has been, for some years, transacting its money concerns, in which a very expensive material had previously been employed. If this were
the whole question, the substitution of paper for gold would be as much to be approved as the introduction of any other efficacious and very cheap instrument in the place of a dear one. It would stand on the same footing with the substitution, for example, of cast iron for wrought iron or steel; of water carriage for land carriage; of a steam engine for the labour of men and horses; and might claim a high rank among that multitude of ingenious and economical contrivances to be found among us, by the aid of which we have attained to the present unrivalled state of our manufactures and commerce.

Some very solid objections, however, may be urged against the system of banking in the country.

The first which I shall mention, is, the tendency of country banks to produce, occasionally, that general failure of paper credit, and with it that derangement and suspension of commerce, as well as intermission of manufacturing labour, which have been already spoken of.

Country bank notes, and especially the smaller ones, circulate, in a great measure, among people out of trade, and pass occasionally into the hands of persons of the lower class; a great proportion, therefore, of the holders of them, have few means of judging of the comparative credit of the several issuers, and are commonly almost as ready to take the paper of any one house calling itself a bank, as that of another. A certain degree of currency being thus given to inferior paper, even the man who doubts the ultimate solvency of the issuer is disposed to take it, for the time during which he intends to detain it is very short, and his responsibility will cease almost as soon as he shall
have parted with it.* Moreover, the amount of each note is so small, that the risk seems, also, on that account, insignificant. The notes of the greater and of the smaller country banks, thus obtaining, in ordinary times, a nearly similar currency, they naturally fall at a season of alarm into almost equal discredit. If any one bank fails, a general run upon the neighbouring ones is apt to take place, which, if not checked in the beginning by pouring into the circulation a large quantity of gold, leads to very extensive mischief. Many country bankers, during a period of danger, prescribe to themselves a principle of more than ordinary reserve in the issue of their notes, because they consider these as the more vulnerable part of their credit. They know that if the character of their house should be brought into question, through the fears or even the caprice of any of those strangers into whose hands their circulating paper passes, some distrust may be excited among their customers, the effect of which may be a sudden demand for the payment of large deposits. The amount, therefore, of the country bank notes circulating in the kingdom is liable to great fluctuation. The country banker, in case of an alarm, turns a part of the government securities, bills of exchange, or other property which he has in London,

* I apprehend that, supposing a country bank to fail, the holder of one of its notes, who should have parted with it in sufficient time to afford to the next holder an opportunity of applying for the discharge of it before the day of failure, could not be called upon for the payment of the value of it. The responsibility, therefore, of him who has been the holder of a country bank note commonly ceases in about one or two days after it has been parted with. That of the holder of a bill continues till after the bill is due, namely, for a period, perhaps, of one or two months.
into Bank of England notes, and those notes into money; and thus discharges many of his own circulating notes, as well as enlarges the fund of gold in his coffers. The Bank of England has, therefore, to supply these occasional wants of the country banker; and, in order to be fully prepared to do this, it has, ordinarily, to keep a quantity of gold equal to that of the notes liable to be extinguished, as well as a quantity which shall satisfy the other extraordinary demands which may be made at the same season of consternation either by banking houses, or by individuals. Thus the country banker by no means bears his own burden, while the Bank of England sustains a burden which is not its own, and which we may naturally suppose that it does not very cheerfully endure. *

The national bank, indeed, may fairly be called upon, in consideration of the benefits enjoyed through its monopoly, to submit to a considerable expense in supplying gold for the country; but there must be some bounds to the claims which can equitably be made upon it: and, in estimating the benefit arising to the kingdom from the use of country bank notes, we have either to deduct the loss which the Bank of

*At the time of the distress of 1793 some great and opulent country banks applied to the Bank of England for aid, in the shape of discount, which was refused on account of their not offering approved London securities: some immediate and important failures were the consequence. The Bank of England was indisposed to extend its aid to houses in the country. The event, however, shewed that the relief of the country was necessary to the solvency of the metropolis. A sense of the unfairness of the burden cast on the bank by the large and sudden demands of the banking establishments in the country, probably contributed to produce an unwillingness to grant them relief.
England incurs by maintaining an additional supply of gold sufficient to answer the demands which they occasion, or else we have to take into consideration the risk which the bank incurs by only keeping a fund of gold which is somewhat inadequate. The country banks may, perhaps, cause the bank in some measure to increase its general fund of gold, though not to hold so much of this unproductive article as to afford a security to that which the bank would enjoy if no country bank notes existed.

It is obvious, that the additional capital given to the kingdom through the use of country bank notes must not be measured by the amount of those notes, but that a deduction must be made of the sum kept in gold in the coffers of the issuers, as their provision for the occasional payments to which their bank paper subjects them. The other deduction, which has been spoken of, is of the same nature. It is a second deduction, which must be made on account of a similar, and, perhaps, no less considerable provision for the payment of country bank notes, which is rendered necessary to be kept in the coffers of the Bank of England. In other words, the capital given to the country, through the use of country bank notes, is only equal (and it was so stated in speaking of that subject) to the amount of the gold which they cause to be exported.

I shall endeavour here to explain more particularly than has yet been done, some of those circumstances which cause a great diminution of country bank notes to bring distress on London, and to end in a general failure of commercial credit.

In a former chapter it was observed, that when that alarm among the common people, which produces an
unwillingness to take country bank paper, and an eagerness for gold has risen to a considerable height, some distrust is apt to be excited among the higher class of traders; and that any great want of confidence in this quarter produces an increased demand for that article, which is, among London bankers and merchants, in much the same credit as gold; I mean Bank of England notes, and which forms, at all times, the only circulating medium of the metropolis in all the larger transactions of its commerce. This more than usual demand for Bank of England notes the bank is at such a time particularly unwilling to satisfy, for reasons which I shall endeavour fully to detail. The reader will have been prepared to enter into them by the observations on the subject of the bank, introduced towards the close of the chapter which treated of that institution.

First, the bank may be supposed to be unwilling to satisfy that somewhat increased demand for its notes which a season of consternation is apt to produce, because it is not unlikely to partake, in some degree, in the general alarm, especially since it must necessarily be supposed to have already suffered, and to be still experiencing a formidable reduction of the quantity of its gold. The natural operation of even this general sort of fear must be to incline it to contract its affairs, and to diminish rather than enlarge its notes.

But it must also be recollected, that the bank has necessarily been led already to increase its loans in the same degree in which its gold has been reduced, provided it has maintained in circulation the accustomed quantity of notes. This point was explained in the chapter on the subject of the bank. The directors, therefore, must seem to themselves to act with ex-
traordinary liberality towards those who apply to them for discounts, if they only go so far as to maintain the usual, or nearly the usual, quantity of notes. The liberality in lending which they must exercise, if, when the gold is low, they even augment their paper, must be very extended indeed.

In order to render this subject more clear, let us suppose an extra demand on the Bank of England for three millions of gold has been made through the extinction of the paper of country banks, and through the slower circulation and hoarding of gold which have attended the general alarm. Let us assume, also, that the bank, during the time of its supplying this gold, has thought proper to reduce its notes one million. It will, in that case, have necessarily increased its loans two millions. Let us further assume, as we not very unreasonably may, that the two millions of additional loans have been afforded, not to the government, who owe a large and standing sum to the bank (suppose eight or ten millions besides the bank capital), but exclusively to the merchants; and let the total amount of loans antecedently afforded to the merchants be reckoned at four millions. The bank, in this case, will have raised its discounts to the merchants from four millions to six; that is, it will have increased them one half, even though it has diminished its notes one million. This extension of the accustomed accommodation to the mercantile world must appear to call for the thanks of that body, rather than to leave any room for complaint; and yet it is plain from reasoning, and, I believe, it might be also proved from experience, that it will not ease the pressure. The difficulties in London, notwithstanding this additional loan of two millions to the merchants,
will be somewhat increased; for a sum in gold, amounting to three millions, has been drawn from the bank by the London agents of the country bankers and traders, and has been sent by those agents into the country. London, therefore, has furnished for the country circulation three millions of gold; and it has done this by getting discounted at the bank two additional millions of bills, for which it has received two of the millions of gold, and by sparing one million of its circulating notes as a means of obtaining the other million. This reduction of the usual quantity of notes is borne by the metropolis with peculiar difficulty at a time of general alarm. However liberally, therefore, the bankers and merchants may acknowledge themselves to have been already relieved by the bank, they will repeat, and will even urge more than ever, their application for discounts.

It may be observed, with a view to the further elucidation of this part of our subject, that both the bank, and they who borrow of it, are naturally led to fix their attention rather on the amount of the loans furnished than on that of the notes in circulation. The bank is used to allow to each borrower a sum bearing some proportion to his supposed credit; but seldom or never exceeding a certain amount. It is true, the various borrowers do not always in an equal degree avail themselves of their power of raising money at the bank; and, therefore, a material enlargement of the sum total of the bank loans may take place at a moment of difficulty, through the increased use which some of the richer merchants then make of their credit, as well as through the creation of a few new borrowers at the bank. The directors also, in particular cases, may suffer their rule to be relaxed.
The circumstance, however, of the general principle on which the bank ordinarily, and, indeed, naturally proceeds, being that of a limitation of the amount of each of its loans to individuals, must tend, as I conceive, to place something like a general limit to the total sum lent. It must conduce to prevent the fluctuation in the bank loans from keeping pace with the variation in the necessities of the public, and must contribute to produce a reduction of notes at that season of extraordinary distrust, when the state of the metropolis, as was more fully remarked in a former part of this Work, calls rather for their increase.

That the borrowers at the bank are likely to pay no attention to the subject of the total quantity of notes in circulation, is easily shewn. They have, indeed, no means of knowing their amount. They can only judge of the liberality of the bank by the extent of its loans; and of this they form an imperfect estimate by the sum which they or their connexions have been able to obtain. Scarcely any one reflects, that there may be a large increase of the general loans of the bank, as well as possibly an extension of each loan to individuals, while there is a diminution of the number of bank notes; and that the amount of the notes, not that of the loans, is the object on which the eye should be fixed, in order to judge of the facility of effecting the payments of the metropolis.

It was remarked, in a former chapter, that the bank, at the time antecedent to the suspension of its cash payments, having diminished the sum lent by it to government, and enlarged, though not in an equal degree, that furnished to the merchants, the pressure on the merchants was not relieved, as was expected, by the increased loan afforded them, but even grew
more severe. It was also shewn, that this could not fail to be the case, since the bank notes necessary for effecting the current payments of the metropolis were then diminished, and since the additional loans afforded to the merchants only in part compensated for the new pressure which was created in the general money market of the kingdom, by the circumstance of the government being obliged to become a great borrower in that market. Whenever the bank materially lessens its paper, a similar pressure is likely to be felt. Neither the transfer of the bank loans from the government to the merchants, nor even a large increase of its loans, when that increase is not carried so far as is necessary to the maintenance of the accustomed, or nearly the accustomed, quantity of bank paper, can prevent, as I apprehend, distress in the metropolis; and this distress soon communicates itself to all parts of the kingdom. The short explanation of the subject is this. Many country bank notes having disappeared, a quantity of gold is called for, which is so much new capital suddenly needed in the country. The only place in which any supply of gold exists is the Bank of England. Moreover, the only quarter from whence the loan of the new capital, under all the circumstances of the case, can come, is also the Bank of England; for the gold in the bank is the only dead or sleeping stock in the kingdom which is convertible into the new active capital which is wanted. The bank, therefore, must lend the gold which it furnishes; it must lend, that is to say, to some individuals a sum equal to the gold which other individuals have taken from it: otherwise it does not relieve the country.

If it should be asked, Why does not the bank in such case demand something intrinsically valuable, in-
stead of contenting itself with mere paper in return?—
the answer is, first, that if the bank were to receive
goods in exchange for its gold, or, in other words,
were to purchase goods, it would have afterwards to
sell them; and it would then become a trading com­
pany, which it is forbid to be by its charter: it is al­
lowed to traffic only in bullion. The answer is, se­
condly, that if it were to take goods as a mere secu­
rity, and to detain them as such, it would then pre­
vent their passing into consumption with the desira­
ble expedition. By proceeding on either of these
plans, it would also involve itself in a degree of trou­
ble which would not be very consistent with the ma­
agement of the business of a banking company.* It
may be answered, thirdly, that the bills which the bank
discourts, are, generally speaking, so safe, that the se­
curity either of goods, or stocks, or land, none of
which are received in pledge by the directors, may be
considered as nearly superfluous. A very small pro­
portion of the five per cent. discount, gained upon the
bills turned into ready money at the bank, has com­
pensated, as I believe, for the whole of the loss upon
them, even in the years of the greatest commercial
failures which have yet been known.

The observations which have now been made suf­
ficiently shew what is the nature of that evil of which

* Of the parliamentary loan of eschequer bills in 1793, which was di­
rected to be granted on the security either of sufficient bonds men, or of a
deposit of goods, only a small proportion was taken on the latter principle,
on account of the great obstruction to the sale of goods, which was thought
to arise from warehousing them on the account of the commissioners ap­
pointed by parliament. It has been already remarked, that no part of the
sum lent was lost.
we are speaking. It is an evil which ought to be charged not to any fault in the mercantile body, but to the defects of the banking system. It is a privation which the merchants occasionally experience of a considerable part of that circulating medium which custom has rendered essential to the punctual fulfilment of their engagements. In good times, the country banks furnish this necessary article, which they are enabled to do through the confidence of the people in general; but when an alarm arises, the country banks cease to give it out, the people refusing what they had before received; and the Bank of England, the only body by whose interposition the distress can be relieved, is somewhat unwilling to exercise all the necessary liberality, for the reasons which have been so fully mentioned. The merchants are some of the chief sufferers, and they are generally, also, loaded with no inconsiderable share of censure: but the public, the country banks, and the Bank of England, may more properly divide the blame.

The mischief produced by a general failure of paper credit is very considerable. How much such a failure interrupts trade and manufacturing industry, and, therefore, ultimately also tends to carry gold out of the country, has been already stated at large. It also causes a great, though merely temporary, fall in the market price of many sorts of property; and thus inflicts a partial and very heavy loss on some traders, and throws extraordinary gain into the hands of others; into the hands, I mean, of those who happen to have superior powers of purchasing at the moment of difficulty. By giving to all banking, as well as mercantile, transactions the appearance of perilous undertakings, it deters men of large property, and of a cau-
tious temper, from following the profession of bankers
and merchants. It creates no small uneasiness of mind,
even among traders who surmount the difficulties of
the moment. Above all, it reduces many respectable,
prudent, and, ultimately, very solvent persons to the
mortifying necessity of stopping payment; thus
obliging them to share in that discredit, in which, it is
much to be desired, that traders of an opposite charac­
ter only should be involved. If, indeed, we suppose,
as we necessarily must, that, on account of the multi­
tude of failures which happen at the same time, the
discredit of them is much diminished, then another
evil is produced, which in a commercial country, is
very great. Acts of insolvency, leaving less stigma
on the character, become not so much dreaded as
might be wished. The case of some, who bring dif­
ficulties on themselves, being almost unavoidably con­
founded with that of persons whose affairs have been
involved through the entanglement of paper credit, to
stop payment is considered too much as a misfortune
or accident, and too little as a fault; and thus a prin­
cipal incentive to punctuality in mercantile payments
is weakened, and an important check to adventurous
speculation is in some measure lost.

The observations which have been made, will, how­
ever, shew that the tendency of country bank paper
to produce a general failure of paper credit, is an evil
which may be expected to diminish; for, first, if the
Bank of England, in future seasons of alarm, should
be disposed to extend its discounts in a greater degree
than heretofore, then the threatened calamity may be
averted through the generosity of that institution.*

* It is by no means intended to imply, that it would become the Bank
of England to relieve every distress which the rashness of country banks
If, secondly, the country bankers should be taught (as, in some degree, unquestionably they must), by the difficulties which they have experienced, to provide themselves with a larger quantity of that sort of property which is quickly convertible into Bank of England notes, and, therefore, also, into gold, then the country bankers will have in their own hands a greater power of checking the progress of an alarm. Still, indeed, their resource will be the gold which is in the bank. The increased promptitude, however, with which the greater convertibility of their funds will enable them to possess themselves of a part of the bank treasure, will render a smaller supply of it sufficient; and this smaller supply may be expected to be furnished, without difficulty, either by means of such a trifling addition to the bank loans as the bank will not refuse, or by sparing the necessary sum from the paper circulation of the metropolis, which, if commercial confidence is not impaired, will always admit of some slight and temporary reduction. The Bank of England will itself profit by the circumstance of its gold becoming more accessible to the country banks; for the untoward event of a general failure of paper credit will thus be rendered less probable, and, may bring upon them: the bank, by doing this, might encourage their improvidence. There seems to be a medium at which a public bank should aim in granting aid to inferior establishments, and which it must often find very difficult to be observed. The relief should neither be so prompt and liberal as to exempt those who misconduct their business from all the natural consequences of their fault, nor so scanty and slow as deeply to involve the general interests. These interests, nevertheless, are sure to be pleaded by every distressed person whose affairs are large, however indifferent or even ruinous may be their state.
therefore, a smaller stock of gold will be an equally sufficient provision for the extraordinary demands at home to which the bank will be subject. Or if, thirdly, those among whom country bank notes circulate should learn to be less variable as to the confidence placed by them in country paper, or even to appreciate more justly the several degrees of credit due to the notes of different houses, then the evil which was before supposed to be obviated by the liberality of the Bank of England, or by the prudence of the country banker will abate through the growth of confidence and the diffusion of commercial knowledge among the public. It seems likely that by each of these means, though especially in the second mode which was mentioned, the tendency of country bank notes to produce an occasional failure of commercial credit will be diminished. In time past, the mischief has been suffered to grow till it appeared too formidable to be encountered; and this has happened partly in consequence of our wanting that knowledge and experience which we now possess.

Another evil attending the present banking system in the country is the following.

The multiplication of country banks issuing small notes to bearer on demand, by occasioning a great and permanent diminution in our circulating coin, serves to increase the danger, lest the standard by which the value of our paper is intended to be at all times regulated should occasionally not be maintained.

The evils of a great depreciation of paper currency are considerable. In proportion as the article which forms the current payment for goods drops in value, the current price of goods rises. If the la-
bourer receives only the same nominal wages as before the depreciation took place, he is underpaid. Antecedent pecuniary contracts, though nominally, and, perhaps, legally fulfilled, are not performed with due equity. It is true, that the general stock of wealth in the country may remain nearly the same; and it is possible that the circulating paper may be restored to its full value when the period of the particular difficulty shall have passed by. Some degree, however, of unfairness and inequality will, in the mean time, have been produced, and much pressure may have been felt by the lower classes of people, whose wages are seldom raised until some time after the occasion for a rise has begun to exist.

In those countries in which the government is the chief banker or issuer of notes, a temptation arises, on the occasion of every public pressure, either to lessen the quantity of precious metal contained in the chief current coin, as one of the means of detaining it in the country, or to allow paper to pass at a considerable and professed discount, which is another mode of preventing the coin from being exported. These are evils from which we consider ourselves as happily secured by the established principles of good faith which prevail in Great Britain. Those principles, however, should, perhaps, lead us even to place ourselves at a distance from that temptation to depreciate coin, or to permit a discount on paper, to which so many other countries have yielded. The possession, in ordinary times, of a very considerable quantity of gold, either in the bank or in general circulation, or both, seems necessary for our complete security in this respect. The substitution of country bank notes for gold tends to lessen that security. The evil of
them is not that they create any false and merely ideal riches, or that they do any constant prejudice to the country. They enable the trader to vest a capital in merchandise, which, without them, he would not possess, and thereby add to the annual income of the nation. In their immediate effect, therefore, they are beneficial; but they leave us more exposed to an occasional evil, against which it is prudent to guard, provided we can accomplish that purpose without too great a sacrifice of present advantages. It seems, on this account, as well as on some others, very undesirable to render permanent the temporary law passed some years since, and subsequently renewed, for the purpose of permitting the issue of English notes under five pounds. When it shall have expired, the power of re-enacting it, which we shall possess, will be a valuable resource. If, moreover, any measure can be devised, which, by increasing the public confidence in good paper, will lessen the danger of a general failure of paper credit, and of a run upon the bank for gold, and which, also, by obstructing the issue of five and ten pound notes by smaller and less respectable banks, will somewhat extend the use of coin, on the whole, it will have a twofold argument to recommend it.*

* Various objections, however, occur against almost every parliamentary measure for the regulation of country banks. Dr. Smith is of opinion, that a law prohibiting the issue of small notes is alone a sufficient remedy for the evils attending these institutions, and that the danger arising from banks is lessened by the multiplication of them. It is the object of this work not so much to canvass any question respecting the particular means of regulating paper credit, as to lay down some general principles concerning it.
The reader will observe, that even our circulating gold coin has here been considered in the light of a provision against an unfavourable balance of trade with foreign countries, and, therefore, as exportable. Part of our coin will, in fact, always be exported when the balance is very unfavourable, and the exportation, under such circumstances, is beneficial to the country. We are apt to think that it is the interchange of the usual gold coin for paper at home which alone maintains the value of our paper; and we are partly, on this account, much more anxious to detain our gold at home, than we are to discharge by means of it an unfavourable balance of trade, and thereby to improve our exchange with foreign countries. I apprehend, however, that an unfavourable course of exchange, which the export of our gold would cure, will, in many cases, tend much more to depreciate our paper, and to produce a rise in the nominal price of articles, than the want of the usual interchange of gold for paper at home. Our coin itself, as has been already remarked, when paper is depreciated, passes not for what the gold in it is worth, but at the paper price; though this is not generally observed to be the case. It is the maintenance of our general exchanges, or, in other words, it is the agreement of the mint price with the bullion price of gold which seems to be the true proof that the circulating paper is not depreciated.
CHAPTER VIII.

Of the Tendency of a too great Issue of Bank Paper to produce an Excess of the Market Price above the Mint Price of Gold. Of the Means by which it creates this Excess, namely, by its operation on the Price of Goods and on the Course of Exchange. Errors of Dr. A. Smith on the Subject of excessive Paper. Of the Manner in which the Limitation of the Quantity of the Bank of England Paper serves to limit the Quantity and sustain the Value of all the Paper of the Kingdom.

A THIRD objection commonly made to country banks, is, the influence which their notes are supposed to have in raising the price of articles.

By the principles which shall be laid down in this Chapter, I propose to prove, that, though a general increase of paper has this tendency, the objection, when applied to the paper of country banks, is particularly ill founded.
It will be necessary, in the discussion which is now about to take place, to join the consideration of two subjects, that of the influence which an enlarged emission of paper has in lifting up the price of commodities, and that of its influence, also, in producing an excess of the market price above the mint price of gold, and in thus exposing the bank to failure, and the country to considerable inconvenience. It is through the medium of the enhanced price of commodities that I conceive the ill effect on the mint price of gold to be brought about.

The discussion of these topics will best be introduced by a statement of the principle which regulates the value of all the articles of life.

The price of commodities in the market is formed by means of a certain struggle which takes place between the buyers and the sellers. It is commonly said, that the price of a thing is regulated by the proportion between the supply and the demand. This is, undoubtedly, true; and for the following reason. If the supply of an article or the demand for it is great, it is also known to be great; and if small, it is understood to be small. When, therefore, the supply, for example, is known to be less than the demand, the sellers judge that the buyers are in some degree at their mercy, and they insist on as favourable a price as their power over the buyers is likely to enable them to obtain. The price paid is not at all governed by the equity of the case, but entirely by the degree of command which the one party has over the other. When the demand is less than the supply, the buyers, in their turn, in some degree, command the market, giving not that sum which is calculated to indemnify the seller against loss, but so much only as they think
that the seller will accept rather than not sell his article. The question of price is, therefore, in all cases, a question of power, and of power only. It is obvious, that a rise in the price of a scarce commodity will be more or less considerable in proportion as the article is felt to be one of more or less strict necessity.

The principle which has been laid down as governing the price of goods must be considered as also regulating that of the paper for which they are sold; for it may as properly be said, on the occasion of a sale of goods, that paper is sold for goods, as that goods are sold for paper: thus the sale of a single commodity, as it is called, is a two-fold transaction, though not commonly understood to be so: I mean, that the price at which the exchange (or sale) takes place depends on two facts; on the proportion between the supply of the particular commodity and the demand for it, which is one question; and on the proportion, also, between the state of the general supply of the circulating medium and that of the demand for it, which is another.

Paper, moreover (of which I shall here speak as if it were the only circulating medium, it being the only one used in the larger payments), is, to some persons, somewhat in the same manner as bread is to all, an article of necessity. It is necessary to traders, partly because they have come under engagements to make payments which are only to be effected by means of their own previous receipts: and partly because they hold goods which must, within no long time, be sold for money, that is to say, for paper, since a continually growing loss accrues from the detention of them. Paper, therefore, must be bought by the trader: and if there is a difficulty in obtaining
it, the buyer of it is brought under the power of the seller, and, in that case, more goods must be given for it.

Let us, now, trace carefully the steps by which an increase of paper serves to lift up the price of articles. Let us suppose, for example, an increased number of Bank of England notes to be issued. In such case the traders in the metropolis discover that there is a more than usual facility of obtaining notes at the bank by giving bills for them, and that they may, therefore, rely on finding easy means of performing any pecuniary engagements into which they may enter. Every trader is encouraged by the knowledge of this facility of borrowing, a little to enlarge his speculations; he is rendered by the plenty of money, somewhat more ready to buy, and rather less eager to sell; he either trusts that there will be a particular profit on the article which is the object of his speculation, or else he judges, that, by extending his general purchases, he shall at least have his share of the ordinary profit of commercial business, a profit which he considers to be proportioned to the quantity of it. The opinion of an increased facility of effecting payments causes other traders to become greater buyers for the same reason, and at the same time. Thus an inclination to buy is created in all quarters, and an indisposition to sell. Now, since the cost of articles depends on the issue of that general conflict between the buyers and sellers, which was spoken of, it follows, that any circumstance which serves to communicate a greater degree of eagerness to the mind of the one party than to that of the other, will have an influence on price. It is not necessary to suppose either a monopoly, or a combination, or the least un-
fairness, to exist, or even large and improper speculations. The increase in the eagerness of each buyer may be trifling. The zeal to buy, being generally diffused, may, nevertheless, have a sensible operation on price.

That, on the other hand, a reduction of the quantity of paper causes a fall in the price of goods, is scarcely necessary to be proved. It may be useful, however, in some degree, to illustrate this point by facts. I understand, that at the time of the great failure of paper credit in 1795, the price of corn fell, in a few places, no less than twenty or thirty per cent. The fall arose from the necessity of selling corn under which some farmers were placed, in order to carry on their payments. Much of the circulating medium being withdrawn, the demand for it was in those places far greater than the supply; and the few persons, therefore, who were in possession of cash, or of what would pass as cash, having command of the market, obliged the farmers to sell at a price thus greatly reduced. It was a new and sudden scarcity of cash, not any new plenty of corn, which caused the price of corn to drop.

It has been already observed, that some few days antecedently to the suspension of the cash payments of the bank, exchequer bills, as well as stocks, when sold for ready money, that is to say, for bank notes, fell in price. Not many days afterwards, although no material event had occurred except that of the stoppage of the bank, they rose. This fall and rise in the price of government securities evidently did not result from any corresponding fluctuation in the national confidence in them; for the fall took place when the national credit would naturally be the highest, name-
ly, when the bank was as yet paying in cash, and the approaching stoppage was not known; and the rise happened when the national credit would be the lowest, namely, within a few days after that discouraging event. The reason of each of the fluctuations unquestionably was the fluctuation in the quantity of the Bank of England notes, which, as it has since appeared, were, during the day or two which preceded the suspension, about a million less than they were either a short time before or a short time afterwards. The notes being fewer during those few days, the price of them was, at the same time, higher. It was, in fact, therefore, the price of notes which rose, rather than that of stocks which fell, on the days immediately preceding the suspension; and it was the price of notes which a few days afterwards fell, rather than that of stocks which rose.*

* In the event of any great public alarm, such, for instance, as that which might be occasioned by the landing in this country of any considerable body of enemies, it is likely that the price of Bank of England notes compared with that of stocks, or other articles for which there is a ready money market, would in like manner rise, even though the quantity of paper should continue the same; this would happen in consequence of that increased demand for bank notes, to which it has been repeatedly observed that a state of consternation always gives occasion. Many bankers, at such a time, would feel a doubt whether they might not be drawn upon more largely than usual by some of their more timid customers; and whether, also, they might not be subjected to more than common difficulty in selling government securities, an article which, in ordinary times, they are used to turn into cash on the shortest notice, and which, while a prompt sale of them is to be depended on, they prefer to bank notes, because an interest is gained by holding the one, and not by detaining the other.

During the short crisis of an invasion, the advantage of accruing interest would be little regarded, and each banker, therefore, would make an effort to exchange his exchequer bills, or, perhaps, his stocks, for
I shall, for the present, consider the doctrine which has been laid down, as being sufficiently established, namely, that paper fluctuates in price on the same principles as any other article, its value rising as its quantity sinks, and *vice versa*; or, in other words, that an augmentation of it has a general tendency to raise, and a diminished issue to lower, the nominal cost of commodities, although, partly for reasons which have been already touched upon, and partly for some which shall be hereafter given, an exact correspondence between the quantity of paper and the price of commodities can by no means be expected always to subsist.

The reader possibly may think that, in treating of this subject, I have been mistaking the effect for the cause, an increased issue of paper being, in his estimation, merely a consequence which follows a rise in the price of goods, and not the circumstance which produces it. That an enlarged emission of paper may often fairly be considered as only, or chiefly, an effect of high prices, is not meant to be denied. It is, how-

*Bank of England notes, an effort which must prove generally ineffectual, supposing the quantity issued to be the same; but which, however, would have the effect of bringing down the comparative price of the article so eagerly offered in exchange for notes. Thus the price of government securities would appear to fall, when, in part at least, it would rather be the price of bank notes which should be said to rise. Some increase of the bank issues seems very justifiable at such a time; such an increase, I mean, as should be sufficient only to prevent what may be termed an unnatural rise in the value of bank notes. This issue would be the means of preventing a misconception among the public respecting the degree of distrust in government securities entertained by the dealers in them, a circumstance which might be of some political importance in a moment of general consternation.*
ever, intended to insist, that, unquestionably, in some cases at least, the greater quantity of paper is, more properly speaking, the cause. A fuller explanation of this apparently difficult and disputable position will be given in the further progress of this work.

I proceed in the next place to shew in what manner a general rise in the cost of commodities, whether proceeding from an extravagant issue of paper, or from any other circumstance, contributes to produce an excess of the market price above the mint price of gold.

It is obvious, that, in proportion as goods are rendered dear in Great Britain, the foreigner becomes unwilling to buy them, the commodities of other countries which come into competition with our's obtaining a preference in the foreign market; and, therefore, that in consequence of a diminution of orders from abroad, our exports will be diminished; unless we assume, as we shall find it necessary to do, that some compensation in the exchange is given to the foreigner for the disadvantage attending the purchase of our articles. But not only will our exports lessen in the case supposed; our imports also will increase: for the high British price of goods will tempt foreign commodities to come in nearly in the same degree in which it will discourage British articles from going out. I mean only, that these two effects (that of a diminished export, and that of an increased import) will follow, provided that we suppose, what is not supposeable, namely, that, at the time when the price of goods is greatly raised in Great Britain, the course of exchange suffers no alteration. For the following reason, I have said that this is not supposeable. Under the circumstances which have been described of a diminished export, and an increased import, the balance
of trade must unavoidably turn against us; the consequence of which must be, that the drawers of bills on Great Britain in foreign countries will become more in number than the persons having occasion to remit bills. This disparity between the number of individuals wanting to draw, and of those wanting to remit, as was remarked in a former chapter, must produce a fall in the price at which the overabundant bills on England sell in the foreign market. The fall in the selling price abroad of bills payable here, will operate as an advantage to the foreign buyer of our commodities in the computation of the exchangeable value of that circulating medium of his own country with which he discharges the debt in Britain contracted by his purchase. It will thus obviate the dearness of our articles: it will serve as a compensation to the foreigner for the loss which he would otherwise sustain by buying in our market. The fall of our exchange will, therefore, promote exportation and encourage importation. It will, in a great degree, prevent the high price of goods in Great Britain from producing that unfavourable balance of trade, which, for the sake of illustrating the subject, was supposed to exist.

The compensation thus made to the foreigner for the high British price of all articles is necessary as an inducement to him to take them, somewhat in the same manner as a drawback or bounty on exportation is the necessary inducement to take those particular goods which have been rendered too dear for the foreign market by taxes laid on them in this country. In each case the British consumer pays the high price, and the foreigner is spared, because otherwise he will not accept our commodities.
The fall in our exchange was just now defined to be an advantage gained in the computation of the exchangeable value of that foreign circulating medium with which the foreigner discharges his debt in Great Britain, a debt paid in the circulating medium of this country. It implies, therefore, a high valuation of his circulating medium, and a low valuation of ours; a low valuation, that is to say, both of our paper and of the coin which is interchanged with it.

Now, when coin is thus rendered cheap, it by no means follows that bullion is rendered cheap also. Coin is rendered cheap through its constituting a part of our circulating medium; but bullion does not constitute a part of it. Bullion is a commodity, and nothing but a commodity; and it rises and falls in value on the same principle as all other commodities. It becomes, like them, dear in proportion as the circulating medium for which it is exchanged is rendered cheap, and cheap in proportion as the circulating medium is rendered dear.

In the case, therefore, which has now been supposed, we are to consider coin as sinking below its proper and intrinsic worth, while bullion maintains its natural and accustomed price. Hence there arises that temptation, which was formerly noticed, either to convert back into bullion and then to export; or, which is the same thing, to export and then convert back into bullion; or, which is also the same thing, to convert back into bullion, and then sell to the bank, at the price which would be gained by exportation, that gold which the bank has purchased, and has converted from bullion into coin.

In this manner an increase of paper, supposing it to be such as to raise the price of commodities in Britain above the price at which, unless there is some al-
lowance afforded in the course of exchange, they will be received in foreign countries, contributes to produce an excess of the market price above the mint price of gold, and to prevent, therefore, the introduction of a proper supply of it into the Bank of England, as well as to draw out of its coffers, that coin which the directors of the bank would wish to keep in them.

Dr. Smith appears to me to have treated the important subject of the tendency of an excessive paper circulation to send gold out of a country, and thus to embarrass its banking establishments, in a manner which is particularly defective and unsatisfactory. It is true, that he blames the Bank of England for having contributed to bring on itself, during several successive years, a great expence in buying gold through a too great circulation of its paper; and that he also charges the Scotch banks with having had, through their excessive issues, a share in producing this evil. Thus, therefore, he seems to give to his reader some intimation of the tendency of an excessive issue of paper to create an excess of the market price above the mint price of gold.*

* "By issuing too great a quantity of paper, of which the excess was continually returning in order to be exchanged for gold and silver, the Bank of England was, for many years together, obliged to coin gold to the extent of between eight hundred thousand pounds and a million a year. For this great coinage the bank (in consequence of the worn and degraded state into which the gold coin had fallen a few years ago) was frequently obliged to purchase gold bullion at the high price of 4l. an ounce, which it soon after issued in coin at 3l. 17s. 10d. an ounce, losing, in this manner, between two and a half and three per cent. Though the bank, therefore, paid no seignorage, though the government was properly at the expense of the coinage, this liberality of government did not prevent altogether the expence of the bank."—Enquiry into the Nature and Causes of the Wealth of Nations, by Dr. A. Smith, Vol. I. page 451; 4th edit. Oct.
It appears, however, in some degree, from the passage in question, though much more clearly from other parts of his work, that he considers every permanent excess, whether of the market price above the mint price, or of the mint price above the market price of gold, as entirely referable to "something in the state of the coin.*

In one place he remarks, that a high price of bullion arises from the difference between the weight of our more light and that of our more heavy guineas, the value of the gold in the heavier guineas, as he represents the case, determining the general current value of both the lighter and the heavier pieces of coin; and the superior quantity of gold in the heavier guineas constituting, therefore, so much profit on the melting of those heavier pieces:† a supposition ma-

* "When the market price either of gold or silver bullion continues for several years together steadily and constantly either more or less above, or more or less below, the mint price, we may be assured that this steady and constant either superiority or inferiority of price is the effect of something in the state of the coin, which, at that time, renders a certain quantity of coin either of more value or of less value than the precise quantity of bullion which it ought to contain."—Smith on the Wealth of Nations, Vol. I. page 69, 4th edit. Oct.

† "In every country the greater part of the current coin is almost always more or less worn or otherwise degenerated from its standard. In Great Britain, it was, before the late reformation, a good deal so, the gold being more than two per cent. and the silver more than eight per cent. below its standard weight. But if forty-four guineas and a half containing their full standard weight, a pound weight of gold, could purchase very little more than a pound weight of uncoined gold, forty-four guineas and a half wanting a part of their weight, could not purchase a pound weight, and something was to be added, in order to make up the deficiency. The current price of gold bullion at market, therefore, instead of being the same with the mint price, or 46l. 14s. 6d.
nifestly erroneous, and contradicted by experience; for it implies that the excess of the market price above the mint price of gold both never is and never can be greater than the excess of the weight of the heavier above the lighter guineas; and, also, that the price of bullion cannot fluctuate while the state of our coinage remains in all respects the same. We have lately experienced fluctuations in our exchange, and correspondent variations in the market price, compared with the mint price of gold, amounting to no less than eight or ten per cent; the state of our coinage continuing, in all respects, the same.

Dr. Smith recommends a seignorage, as tending to raise the value both of the lighter and heavier coin; and thus, also, to diminish, if not destroy, the excess of the market price above the mint price of gold.*

"was then about 47l. 14s. and sometimes about 48l. When the greater part of the coin, however, was in this degenerate condition, forty-four guineas and a half, fresh from the mint, would purchase no more goods in the market than any other ordinary guineas; because, when they come into the coffers of the merchant, being confounded with other money, they could not afterwards be distinguished, without more trouble than the difference was worth. Like other guineas, they were worth no more than 46l. 14s. 6d. If thrown into the melting pot, however, they produced, without any sensible loss, a pound wt. of standard gold, which could be sold at any time for between 47l. 14s. and 48l. either in gold or silver. There was an evident profit, therefore, in melting down new coined money; and it was done so instantaneously, that no precaution of government could prevent it. The operations of the mint were, upon this account, somewhat like the web of Penelope; the work that was done in the day was undone in the night. The mint was employed not so much in making daily additions to the coin, as in replacing the very best part of it which was daily melted down."

"Were the private people to carry their gold and silver to the mint to pay themselves for the coinage, it would add to the value of
It is remarkable, that this writer does not, in any degree, advert either to that more immediate cause (a fall of our exchanges), from which I have, in this

those metals in the same manner as the fashion does to that of plate.

Coined gold and silver would be more valuable than uncoined. The

seignorage, if it was not exorbitant, would add to the bullion the whole

value of the duty, because the government having every where the ex-

clusive privilege of coining, no coin can come to market cheaper than

they think proper to afford it.

A seignorage will, in many cases, take away altogether, and will in

all cases diminish the profit of melting down the new coin. This pro-

fit always arises from the difference between the quantity of bullion

which the common currency ought to contain, and that which it actual-

ly does contain. If this difference is less than the seignorage, there

will be loss instead of profit. If it is equal to the seignorage, there

will neither be profit nor loss. If it is greater than the seignorage,

there will, indeed, be some profit; but less than if there were no

pages 333, 334, and 335.

These observations of Dr. Smith, on the subject of a seignorage, seem

erroneous in the following respects. Plate, when bought, is purchased

in order not to be sold again, but to be retained by the possessor; and

the price paid by the original buyer may, therefore, be not unfairly con-

sidered, as it is by Dr. Smith, to be the current price of the article.

Gold, on the contrary, is no sooner bought and coined, than it is sent

into circulation; it is sold, that is to say (or exchanged for commodities),

again and again. What we mean, therefore, by the current price of gold

coin, is that price at which it passes, not in the original bargain for bul-

lion between the seller of it and the bank, but in the general course of

this subsequent circulation. Guineas, moreover, not only circulate at

home, but are liable to be sent abroad in the event of any unfavourable

balance of trade. They are worth in that case, just as much as the for-

eign country will give for them; and the foreign country, in estimating

their value, since it means to melt them, does not at all take into its cal-

culation the expense of the coinage of the piece of metal. It acts like a

buyer not of new but of old plate, who destines it to the melting pot,

and, therefore, refuses to allow anything for “the fashion.”

This foreign price of our coin principally determines the current value
as well as in a former chapter, described the excess in question, as, in all cases, arising; or to that more remote one on which I have lately dwelt, namely, a too high price of goods, which produces a fall of our exchanges.

of the price of coin in England. It appears to me to do this in the following manner.

When the price which our coin will fetch in foreign countries is such as to tempt it out of the kingdom, the directors of the bank naturally diminish, in some degree, the quantity of their paper, through an anxiety for the safety of their establishment. By diminishing their paper, they raise its value; and in raising its value, they raise also the value in England of the current coin which is exchanged for it. Thus the value of our gold coin conforms itself to the value of our current paper, and the current paper is rendered by the bank directors of that value which it is necessary that it should bear in order to prevent large exportations; a value sometimes rising a little above, and sometimes falling a little below, the price which our coin bears abroad; a price, in the formation of which no regard is had to the fashion.

A seignorage, nevertheless, might add to the current value of the coin of the kingdom for the following reason. It might incline the directors of the bank to improve the value of their paper by a stricter limitation of it, for the sake of more effectually exempting themselves from an occasional burthen, which is now borne for them by the government. The point below which they would wish to prevent their paper from falling would still be the same as it is now, namely, the selling price of our coin when melted and carried to foreign countries: the care, however, which they would take to prevent its falling below that price would, perhaps, be greater, and would be such as to raise its average price, if, in the event of each depression, they should be subject not only, as they are now, to loss in the purchase of gold, but to a further loss in coining it. There seems no reason, however, to suppose the the degree of fluctuation which is now apt to subsist between the market price and mint price of gold could, by any efforts of the bank, be materially lessened. It results from the fluctuations in the exchange; and those fluctuations, in general, proceed from variations in the markets of Europe, which affect the balance of trade, and cannot, by any management of bank paper, be exactly counteracted.
Dr. Smith does not, in any of his observations on this subject, proceed sufficiently, as I conceive, on the practical principle of shewing how it is through the medium of prices (of the prices of goods in general, and of bullion in particular, compared with the price of the current circulating medium), that the operations of importing and exporting gold are brought about. He considers our coin as going abroad simply in consequence of our circulation at home being over full. Payment in coin, according to his doctrine, is demanded of every bank for as much of its paper as is excessive, because the excessive paper can neither be sent abroad nor turned to any use at home; whereas, when it is changed into coin, the coin may be transmitted to a foreign part, and may there be advantageously employed.*

The reader will perceive that, according to the prin-

* "The coffers of a banking company which issues more paper than can be employed in the circulation of the country, and of which the excess is continually returning upon them for payment, though they ought to be filled much fuller, yet must empty themselves much faster than if their business was confined within more reasonable bounds, and must require not only a more violent but a more constant and uninterrupted exertion of expense in order to replenish them. The coin, too, which is thus continually drawn in such large quantities from their coffers cannot be employed in the circulation of the country. It comes in place of a paper which is over and above what can be employed in that circulation, and is, therefore, over and above what can be employed in it too. But as that coin will not be allowed to lie idle, it must, in one shape or another, be sent abroad, in order to find that profitable employment which it cannot find at home; and this continual exportation of gold and silver, by enhancing the difficulty, must necessarily enhance still further the expense of the bank in finding more gold and silver in order to replenish those coffers which empty themselves so very rapidly."—Vol. I. page 450.
ciple which I have endeavoured to establish, coin does not merely leave the country because, the circulation being full, no use can be found at home for additional circulating medium; but that every increase of paper has been represented as enhancing the price of goods, which advanced price of goods affords employment to a larger quantity of circulating medium, so that the circulation can never be said to be over full. This advanced price of goods is the same thing as a reduced price of coin; the coin, therefore, in consequence of its reduced price, is carried out of the country for the sake of obtaining for it a better market. The heavier pieces, undoubtedly, will be preferred, if there is a facility of obtaining and transporting them; but the lighter guineas will also be exported, when the state of the exchange shall be sufficiently low to afford a profit on such a transaction. One of the consequences of Dr. Smith's mode of treating the subject, is, that the reader is led into the error of thinking, that when, through an excessive issue of paper, gold has been made to flow away from us, the expense of restoring it consists merely in the charge of collecting it and transporting it from the place to which it is gone. It follows, on the contrary, from the principles which I have laid down, that, in order to bring back gold, the expense not only of importing it may be to be incurred, but that also of purchasing it at a loss, and at a loss which may be either more or less considerable: a circumstance of great importance in the question. If this loss should ever become extremely great, the difficulties of restoring the value of our paper might not easily be surmounted, and a current discount or difference between the coin and paper of the country would scarcely be avoidable.
Dr. Smith indeed, represents the expense of bringing back gold as considerable; but he seems to impute the greatness of it to the circumstance of its recurring again and again: and he describes it as continuing to recur in the case of each individual bank, whether in town or country, which persists in the false policy of issuing more paper than is sufficient to fill the circulation of the neighbouring district. I shall here take occasion to notice some great inaccuracies in one part of his reasoning upon this point.

He says—"A banking company which issues more paper than can be employed in the circulation of the country, and of which the excess is continually returning upon them for payment, ought to increase the quantity of gold and silver which they keep at all times in their coffers, not only in proportion to this excess, but to a much greater proportion. Suppose, for instance, all the paper of a particular bank, which the circulation of the country can easily absorb, amounts to forty thousand pounds, and the bank keeps usually ten thousand pounds in gold and silver for its occasional demands. If this bank should attempt to circulate forty-four thousand pounds, the excess of four thousand pounds will return as fast as it is issued. Fourteen thousand pounds must then be kept instead of ten thousand pounds, and the bank will gain nothing by the excessive circulation. On the contrary, it will lose the whole expense of continually collecting four thousand pounds in gold and silver, which will be continually going out of its coffers as fast as they are brought in."

He then adds—"Had every particular bank always understood and attended to its own interest, the cir-
calculation would never have been overstocked with paper money.

There is, no doubt, some sort of ground for saying that an excess of paper will come back upon the banks which issue it, and that, in coming back, it will involve the issuing banks in expense. Much exception, however, might be taken against Dr. Smith's mode of estimating the expense which the quantity which would come back would bring upon the issuing banks. But the objection which I shall, in the first place, urge against the remark of Dr. Smith, is, that, even granting it to be just, it can be just only in a case which can scarcely ever occur among the country banks of this kingdom. I mean, that it can apply solely to the case of a single bank of which the paper circulates exclusively through a surrounding district: it obviously cannot hold in the case of many banks, the paper of all of which circulates in the same district.

In order to explain this clearly, let us make the following supposition. Let us imagine the circulation of country bank paper which a certain district will bear to be one hundred thousand pounds, and ten banks to be in that district, each usually circulating and able to keep in circulation ten thousand pounds. Let us also suppose an excessive issue of four thousand pounds, and let us allow the effect of this on the ten banks to be that which Dr. Smith describes, a point which might certainly be disputed, namely, that a necessity will arise for always keeping (for this is what Dr. Smith's language implies) an additional stock of gold amounting to exactly four thousand pounds, and also that a reiterated expense will be incurred (Dr. Smith does not say how frequently reiterated) in col-
lecting and transporting these four thousand pounds of gold. Still it must be observed, that we may suppose the issue of the four thousand pounds excessive paper to be made by some one only of the ten banks, while the charge incurred by such issue may be divided among them all. It may, therefore, on Dr. Smith’s own principles, answer to one of several banks emitting paper which circulates in the same place, to issue the paper which is considered by him as excessive; and the practice of doing so may be owing to the country bankers too well knowing his own interest, and not, as Dr. Smith supposes, to his too ill understanding it.

But the case which I have supposed has been put merely by way of illustration. When many banks issue notes circulating over the same district, it is impossible to say whose paper constitutes the excess. Whatever temptation to excess exists, must be a general one. It is, however, counteracted not only by the charge of transporting gold, on which alone Dr. Smith dwells, but likewise by all the other charges, as well as by all the risks to which country bank notes subject the issuers; not to mention the difficulty of finding a channel through which a quantity of paper much larger than common can be sent by the country bank into circulation.

Dr. Smith supposes, in the passage which has just been quoted, that, when there is an excessive circulation of country bank paper, the excess returns upon the banks to be exchanged for gold and silver. The fact is, that it returns to be exchanged not for gold and silver only, but either for gold and silver, or for bills on London. A bill on London is an order to receive in London, after a certain interval, either gold or Bank of
England notes. This order imposes on the country banker the task of providing a fund in London sufficient to answer his draft: it serves, however, to spare that expense of transporting gold, as well as to lessen that necessity of maintaining a stock of guineas, which Dr. Smith assumes to be the consequence of every excessive emission of notes, and to be the certain means, if bankers do but understand their interest, of limiting their issue.

The remark which has just been made derives particular importance from the circumstances of the period through which we have passed. For, if the usual means of preventing an excess of country bank notes were nothing else than the liability of the issuers to be called upon for a money payment of them, it might fairly be assumed, that, at a time when the money payment of them has been suspended, we must necessarily have been exposed to the greatest inundation of country paper, and to a proportionate depreciation of it. The unbounded issue of country bank notes has been restrained by the obligation under which country bankers have considered themselves to be of granting bills on London; that is to say, orders to receive in London Bank of England paper in exchange for their notes, if required to do so: and it is certain that they would be required to do so whenever the quantity of their notes should be much greater in proportion to the occasion for them, than the quantity of the notes of the Bank of England in proportion to the occasion for those notes.

For the sake of explaining this, let it be admitted, for a moment, that a country bank has issued a very extraordinary quantity of notes. We must assume these to be employed by the holders of them in ma-
king purchases in the place in which alone the country bank paper passes, namely, in the surrounding district. The effect of such purchases, according to the principles established in this Chapter, must be a great local rise in the price of articles. But to suppose a great and merely local rise, is to suppose that which can never happen or which, at least, cannot long continue to exist; for every purchaser will discover that he can buy commodities elsewhere at a cheaper rate; and he will not fail to procure them in the quarter in which they are cheap, and to transport them to the spot in which they are dear, for the sake of the profit on the transaction. In order that he may be enabled to do this, he will demand to have the notes which pass current in the place in which we have supposed goods to have been rendered dear by the extraordinary emission of paper, converted into the circulating medium of the place in which goods are cheap: he will, therefore, require to have his country bank note turned into a Bank of England note, or into a bill on London, which is nearly the same thing, provided Bank of England notes are fewer in proportion to the occasion for them than the country bank notes; that is to say, provided Bank of England notes have less lifted up the price of goods in London than country bank notes have lifted up the price of goods in the country.

This point may be still more fully illustrated in the following manner. Let us imagine a mercantile house to consist of two branches, the one placed in the metropolis, the other in the country, and each branch to be accustomed to make certain payments in the spot in which it is situated, each, however, to be in the habit of borrowing as largely as it is able, the one of a
neighbouring country bank, the other of the Bank of England, and of applying these loans to the joint use of the trading concern. Let us next suppose an extraordinary facility of borrowing at the country bank to arise, while the opportunities of obtaining loans at the Bank of England remain the same.* In such case the mercantile house, provided its London payments continue to bear the same proportion as before to its country payments, which will hardly fail to be the case, will exchange some part of its increased loans in the country, consisting in country bank notes, for bills on London, or, in other words, for Bank of England notes. It will thus adjust, with the greatest nicety, the quantity of London and of country paper to the amount of the pecuniary demands upon it in each quarter; and, in doing so, it will contribute to prevent the supply of notes in either place from becoming greater in proportion to the demand than in the other. What has been supposed of one house, may be supposed of many similar ones; and not only of houses of the particular description which has been spoken of, but also of the several independent establishments in the two distant places which have pecuniary transactions together, and have an interest in accommodating

* The case here put is assumed to exist only by way of argument. The point intended to be shewn, is, that the case cannot happen: or, at least, that such cannot be the case, at the same time, of all the country banks in the kingdom. A single individual, it is true, may find his means of borrowing at a particular country bank to increase in the manner which is here supposed; for he may obtain a preference over other borrowers. A single bank, also, may find its means of lending to increase; for its notes may usurp the place of those of other banks. There can, however, be no material enlargement on the whole of the paper of the country, while the facility of borrowing in London remains the same.
each other. Their general operations of a pecuniary kind, must be such as always to check a local rise in the price of commodities in either place, while it is as yet so small as to be scarcely perceptible. In this manner, therefore, the exchangeableness of country paper for London paper will never fail very nearly to equalize the value of them both. It is, moreover, important clearly to point out that their value will be equalized, or nearly equalized, not by a tendency in the London paper to partake in a low value which the country paper has acquired in consequence of its not being limited by any voluntary act of the issuers; nor by a tendency in each to approximate in value to the other; but by a tendency in the country paper to take exactly the high value which the London paper bears in consequence of its being restricted by the issuers. That this must be the case is plain, from the remark which has just been made; for it has been shewn, that the country paper, however it may fail to be limited in quantity by any moderation or prudence of the issuers, becomes no less effectually limited through the circumstance of their being compelled by the holders to exchange as much of it as is excessive for the London paper which is limited; which is limited, I mean, in consequence of a principle of limitation which the directors of the Bank of England have prescribed to themselves.

The country paper, let it then be observed, does not add any thing to the quantity of the London paper; for the effectual limitation of the London paper is the great point, which it must be borne in mind, that we have assumed. The country paper, therefore, does not in any degree diminish the price of the London paper; for its price must remain fixed so long
as its quantity continues fixed, supposing, as we do in our present argument, that the demand for it is the same. It has been proved, however, that the country paper is rendered, by its exchangeableness with the London paper, almost exactly equal to it in value. It is, then, rendered almost exactly equal in value to a paper of which the value is completely sustained. Thus, therefore, the limitation of the supply of the single article of London paper, of which, however, we are taking for granted that the demand continues the same, is the means both of sustaining the value of London paper, and also of sustaining the value as well as limiting the quantity of the whole paper of the country.

It is, however, necessary here to point out to the reader, that, in the immediately preceding observations, we have assumed certain facts to exist, for the sake of stating clearly a general principle. It will be the object of a succeeding chapter to shew in what respects the case which has been supposed differs from the actual one.
CHAPTER IX.

Of the Circumstances which cause the Paper of the Bank of England, as well as all the other Paper of the Country, to fail of having their Value regulated according to any exact Proportion to the Quantity of Bank of England Notes.

Several points may be considered as having been assumed, for the sake of describing clearly the principle which was laid down in the close of the former Chapter. They may be stated to have been the following.

First, the notes of the Bank of England were spoken of as forming exclusively the whole circulating medium of the district which surrounds the metropolis, and as having no circulation beyond the boundaries of that district. The object was, then, to evince, that supposing, secondly, the quantity of Bank of England
paper to continue the same; and supposing, thirdly, the payments within the district to be the same; and supposing also, fourthly, the general circumstances to be such as to render the same quantity of circulating medium just as sufficient as before to effect the same payments; the Bank of England paper could not fail both to maintain its own value, and also to maintain the value as well to restrict the quantity of the general paper of the country.

In attempting to shew in what respects the case thus put may have differed from the actual one, I shall advert to each of the four points which have just been mentioned.

First, the notes of the Bank of England have a circulation, which is not perfectly exclusive, over any definable district. In the metropolis itself, and in its neighbourhood, they are the only current paper, some coin circulating also. In many distant parts of the country a very small quantity of Bank of England notes circulate, and also much other paper, as well as a certain quantity of coin. This London and country coin, as well as country paper, may happen through various causes to supplant the Bank of England paper, or to be supplanted by it, either in a greater or in a less degree; and every such variation will have an effect which it is necessary to consider. If, for example, a larger quantity than usual of Bank of England notes should circulate in the country; then the quantity of them which remains applicable to the uses of the London district will be smaller, supposing the total amount issued to be the same. In the case, therefore, of more Bank of England notes circulating in the country, and in the case also of some Bank of England notes occupying the place of guineas antecedently
current in London, an issue of a larger total quantity of Bank of England paper will be necessary in order to give the same means as before of effecting London payments, and in order to produce the same limitation as before of the total quantity of circulating paper in the country.

All the one and two pound notes of the Bank of England (a species of paper which has been issued only since the suspension of its cash payments) have clearly formed that sort of addition to the bank paper of which I have been speaking. These have circulated, some in London, and many of them in the country, in the place of guineas, which have disappeared; and the amount of them has lately been two millions. In order, therefore, to produce the same effect on the country paper as before the suspension, the total amount of Bank of England notes lately circulating ought to have exceeded the quantity issued before the suspension by about two millions, supposing all other things the same. There are other causes which occasionally produce variations in that part of the Bank of England paper, which assists in supplying the distant country circulation: and these variations may sometimes be considerable, and may not easily be estimated. They probably, however, have not lately been material. For though, while the practice of paying in gold has been suspended, country banks, on the one hand, may have been encouraged somewhat more than before to push their notes into circulation, and may thus have supplanted some of the paper of the Bank of England usually passing in their neighbourhood; they certainly, on the other hand, have many of them kept lately in their drawer a fund of Bank of England notes, which was not heretofore deemed ne-
cessary, for the sake of being able to offer these in payment of their own paper.*

I have to consider, secondly, how far, allowing for that difference of two millions of which mention has been made, the circulating quantity of Bank of England paper has lately corresponded with that of antecedent periods.

The average amount of Bank of England notes in circulation during three years ending in December 1795, appears to have been 11,975,573l. The amount in circulation on the 26th of February, 1797, the day antecedent to the suspension of the cash payments of the bank, has been already stated to have been about 8,600,000l. this being that very low sum to which they were then reduced. By a statement of their amount on the 6th December, 1800, laid before the House of Commons, they appear to have been then 15,450,970l. This last mentioned sum includes the two millions of one and two pound notes. If these two millions are deducted, the amount on the 6th December, 1800, will exceed the average amount in three years antecedent to the suspension of the cash payments of the bank by 1,475,397l. It remains, however, to be observed, that the notes of the Bank of England were stated to the House of Commons by the governor of that company, in the spring of 1801, to have been then reduced to a sum less by about a million and a half than their amount on the 6th December, 1800. The total quantity, therefore, of the Bank of England notes in circulation in one part of

* Some Bank of England notes have also been recently employed in the place of small bills on London, the use of which has lately been discouraged by the late additional duty on bills and notes.
the spring of 1801, if the two millions be deducted, almost exactly agrees with their average amount during the three years ending December 1795.*

We have to consider, thirdly, whether the payments of the metropolis may be likely to have been the same in the last year as in some preceding years.

* This account of the comparative quantities of the Bank of England notes circulating before, and of those circulating after the suspension of the cash payments of the bank, differs greatly from that of Mr. Boyd, who has, in his pamphlet, minutely investigated the same subject. The causes of this disagreement are the following.

He mentions, as I have done, the amount of Bank of England notes to have been, on the 6th December, 1800, 15,450,970l. He then compares this their highest amount (for such, or nearly such, I consider it to be) first with their lowest amount, namely, with their amount on the 26th February, 1797, which was 8,640,250l. and then with their average amount for three years antecedent to the suspension of the cash payments of the bank, viz. 11,975,573l. the same average amount at which I have reckoned them, for I have adopted Mr. Boyd's own statement. He then infers, that, on the first of his principles of comparison, an addition of nearly four-fifths, and, on the second, of three-tenths, had been made to the sum in circulation.

To this representation the answer is, as will appear from the text, first that of the 15,450,970l. stated to the House of Commons to be the amount of Bank of England notes in circulation on the 6th December, 1800, the sum of about two millions, consisting in one and two pound notes, ought to have been deducted by Mr. Boyd in forming his comparison. These notes evidently filled the place which was before occupied by guineas. They were, for that reason, not added to the 15,450,970l. in the return made by the bank to parliament, as they have been in the pamphlet of Mr. Boyd, but were set down as a separate article. Bankers have commonly given out these one and two pound notes as a substitute for guineas; and every individual, whether in London or in the country, who has had a note of this description in his pocket, has obviously kept it in the place of gold.

It is to be replied, secondly, that the sum of 8,640,250l. with which one of the comparisons of Mr. Boyd is made, is that remarkably low sum
A subject, in the examination of which there may seem to be some difficulty, shall here, in the first place, be discussed. It has been already observed, that the quantity of Bank of England notes is limited by the bank directors who issue them; and that the quantity of country bank paper, though restricted in an equal degree, is limited not by the act of the issuers, but through the circumstance of its exchange-

to which the Bank improperly, as I have ventured to suspect, and certainly to the no small distress of the metropolis, had suffered their notes to fall on the day antecedent to the suspension of their cash payments, a sum of the smallness of which Mr. Boyd himself has complained. Their notes on the 18th February, that is, exactly one week before, were

<table>

</tbody>
</table>

Their notes, also, immediately after they were at that lowest sum of 8,640,250l. with which Mr. Boyd forms the first of his comparisons, were increased considerably: they were, on the 4th March, that is, one week after, 10,416,520l. and they gradually raised still higher.

There can, therefore, be no doubt that the comparison ought to have been made with the number which were in circulation, not at the remarkable era of the 26th February 1797, but only during an average of years preceding the suspension.

The fact of the Bank of England notes having been reduced near a million and a half in the spring of 1801, a circumstance which renders the amount of them almost exactly equal at the two periods at which both I and Mr. Boyd have made our comparison, could not be known to Mr. Boyd at the time of writing his pamphlet.

Mr. Boyd founds, on the supposed fact of the vast increase of Bank of England notes, the opinion which he states in the beginning of his Work, that "to the augmentation of bank paper not convertible into specie, more than to any other cause, is to be ascribed the high price of provisions."
ableness for London paper. By saying that the country paper is limited in an equal degree, I always mean not that one uniform proportion is maintained between the quantity of the London paper and that of the country paper, but only that the quantity of the one, in comparison with the demand for that one, is the same, or nearly the same, as the quantity of the other in proportion to the call for the other.

The reader, in reasoning on this state of the case, may, perhaps, be inclined to infer, and it is a question which seems to deserve consideration, that when the Bank of England paper is more than usually restricted, the pressure in London which in such case takes place (for it is there that the general pressure originates), may be likely to relieve itself either by drawing to London a large part of the Bank of England paper usually circulating in the country, the place which it occupied being supplied by country paper, or by causing many of the payments of London to transfer themselves to the country. If either of these two consequences should result from every pressure in London, then, even though the total amount of Bank of England paper should be diminished, that part of it which circulates in London may possibly continue to be just as sufficient as before to perform the task assigned to it of effecting the London payments; and in that case the country paper also, since it always takes the price of the London paper, will so far increase itself as to become in the same manner as before commensurate with the country payments. If any considerable effect of this kind should follow from every limitation of the London paper; then the principle which was laid down in the close of the former Chapter in a great measure fails; and the bank
has not that power which was ascribed to it of re-
stricting the quantity and regulating the value of the
paper of the country.

That a pressure in London is not likely to produce
the first of the two effects which have been mention-
ed, that of drawing to London the Bank of England
notes circulating in the country, is a point on which I
shall not separately dwell, except so far as to observe,
that a pressure in London, if it be very sudden and
severe, may be suspected of having a tendency di-
rectly contrary to that of bringing Bank of England
notes from the country to London; for it is apt,
through the alarm which it excites, to produce, as
was formerly explained, an extraordinary diminution
of country bank notes; a diminution, I mean, which
is even greater in proportion to the country payments
to be effected than that of the notes of the Bank of
England in proportion to the London payments. In
such case, a necessity is created for the substitution
of other circulating medium in the place of the coun-
try paper which has been suppressed. The substitute
principally demanded will be gold; but some Bank of
England paper is not unlikely to be also employed in
filling the void.

In proceeding to inquire whether a pressure in
London, arising from the restriction of Bank of Eng-
land paper, is likely to cause the transfer to the coun-
try of many of the payments usually made in London,
I shall advert to past experience.

It was mentioned in an early Chapter of this Work,
that there seems to have existed, for some time, an
increasing disposition to transfer to London the pecu-
niary part of even those commercial transactions which
belong properly to the country. It here naturally oc-
curs to us to inquire for what reason the restriction of the notes of the Bank of England by the issuers in time past, has not served to remove this disposition, and even to cause the quantity of London payments, compared with those of the country, continually to lessen, rather than to increase. The Bank of England paper, let it here be observed, operated before the suspension of the cash payments of the bank in restricting the country paper, exactly in the same manner as it has done since that event. It is commonly and very naturally supposed, that it was the exchangeableness of the country paper for guineas which used to sustain its value. This, however, was not the case: its value was sustained by its exchangeableness for Bank of England notes. The country paper bore always and necessarily the same value as the notes of the Bank of England; and not always or necessarily the same value as the gold contained in the coin, for which the country paper was exchangeable. It is true, indeed, that the quantity of gold in our coin had an influence on the value of country paper. It had, however, only an influence which was imperfect and indirect. It served to dictate to the directors of the Bank of England what was that quantity of paper which they might properly emit. For, if at any time the exchanges of the country became so unfavourable as to produce a material excess of the market price above the mint price of gold; the directors of the bank, as appears by the evidence of some of their body given to parliament, were disposed to resort to a reduction of their paper as a means of diminishing or removing the excess, and of thus providing for the security of their establishment. They, moreover, have at all times been accustomed to observe some
limit as to the quantity of their notes, for the same prudential reasons.

This interest in the prevention of any great excess of the market price above the mint price of gold was in no degree felt by the country banker; for the loss sustained by every new conversion of bullion into coin was borne not by him, but by the Bank of England, out of whose coffers all the guineas called for in every part of the kingdom were supplied. The Bank of England, if coin was demanded of it, had to purchase bullion at a losing price. The country banker, if coin was in like manner required of him, had only to possess himself of a Bank of England note, which was exchangeable at the bank for guineas without any discount. If, therefore, the directors of the Bank of England suffered their paper to be worth less than the gold contained in the coin for which their paper was exchangeable, the country paper was worth less also; or, in other words, the degree of expense and difficulty which the country banker incurred in obtaining guineas, was to be measured by the degree of expense and difficulty incurred in obtaining Bank of England notes, and not by the degree of expense and difficulty incurred in buying and then coining gold. The necessity which the Bank of England felt of curing any great excess of the market price above the mint price of gold, caused the limitation of Bank of England paper; and then this limitation, in proportion as it took place, produced the limitation of the paper of the country. It was in this manner that an excessive issue of the paper of the kingdom was restrained before the suspension of the cash payments of the Bank of England. If, then, the direc-
tors of the bank were used before the suspension of their cash payments to limit their issues through a necessity which sometimes urged them, and if thus they limited the paper of the country in the manner which has been described, it follows that, supposing them after that event to have restrained their issues in like manner, though through a somewhat less urgent motive, the general effect must have been the same. There can, therefore, be no more reason to suppose a transfer to have lately taken place of London payments to the country, or of Bank of England notes circulating in the country to London, than there is to suppose the same transfer to have taken place in the time when the bank paid in gold. Both the nature of the pressure, and the principle on which our paper credit stood, were the same at both periods.

It remains for us to inquire, how far the payments of London are likely to have varied through any other cause. It is probable that, under ordinary circumstances, they do not fluctuate in any very considerable degree within a short distance of time. War seems likely, on the whole, to increase them, both by the additional business in the stocks, and also by the other pecuniary transactions on the account of government (transactions generally carried on entirely in London), to which it gives occasion. It also increases the payments of London, in common with those of the country, by contributing to a general rise in the price of articles. It is, however, necessary to guard this observation. In respect to the total quantity of consumable articles produced and sold in the kingdom, war, perhaps, may be considered as usually making little difference; for, while it gives a
spur to some, it operates as a check to other branches of industry; and, while it increases national consumption, it may possibly diminish, in an almost equal degree, that of individual. It raises, however, the price of commodities, and thus enlarges the general amount of payments, though it more particularly augments those payments which are made in the metropolis. This general augmentation, however, of the price of our articles, unattended by a similar rise in the price of the commodities of other countries, obstructs, as has been already shown, the exportation of our goods; since it renders them less able to stand the competition to which they are subject in foreign markets, unless a compensation for the rise is afforded to the foreigner in the computation of the exchange between the two countries. The reader may, perhaps, be led here to imagine, that the bank ought to prevent this rise, according to the principles which it is the object of this Chapter to establish, a sufficiently considerable reduction of its paper being all that is necessary for the purpose. No doubt the fact is, that the tendency of goods to rise is continually restrained by the limitation of the paper of the Bank of England. And I apprehend that it is restrained just as much as it is proper, or, perhaps, practicable, to restrain it, if the paper of the bank is so far confined as to prevent an excess of the market price above the mint price of gold: for, in that case, it is restrained so far as still to afford to our goods the opportunity of sale in a foreign market, without giving to the foreigner that compensation in the exchange which leads to the exportation of the current coin of the country. To suppose the bank paper to be restrained
much farther, is to suppose a profit on the importation of bullion; a profit, to which the continuance of the importations of that article must soon put a period. In saying, therefore, that war enhances the price of goods, and thus causes an increase of payments, we ought here to bear in mind that it ought only to be allowed to lift them up to that point to which they can be raised consistently with the general maintenance of our exchanges; and that, so far as they permanently stand above that point, it is the enlarged and too great quantity of notes of the Bank of England which is to be considered as the cause of the high price of goods, rather than the high price of goods which is to be taken to be the cause of the enlarged quantity of notes of the Bank of England.*

There is considerable danger, lest in this respect, we should, in some degree, at least, mistake the effect

* It was observed in a former place, that this difficult and disputable point would be again adverted to in the progress of the present Work. The fairest mode, as it appears to me, of determining which ought to be deemed the cause and which the effect, is that which has been adopted in the text; namely, to charge too much paper with being the cause when the price of bullion is rendered permanently higher than that of coin, and, when, otherwise, to consider it rather as an effect. By the term "permanently," I, however, mean such a degree of permanence as may serve to shew that the fall of our exchanges, and the rise in the price of bullion, are not referable to any extraordinary and passing event, such as that of one or even of two particularly bad harvests; for these may not unfairly be termed temporary circumstances, though their influence may extend over a period of one or two years. In general it may, perhaps, also be assumed, that an excessive issue of paper has not been the leading cause of a fall in the exchange, if it afterwards turns out that the exchange is able to recover itself without any material reduction of the quantity of paper.
for the cause; and should too much incline to consider an advanced price of commodities to be both the cause of an increased issue of paper and the justification of it.

War, on the contrary, may be supposed to lessen the amount of general payments, or, at least, to check their growth, so far as it obstructs the accumulation of wealth and the natural progress of commerce. We know, however, that, during the late war, the amount of our exported and imported articles continued greatly to increase. This happened partly, no doubt, through the general tendency of our trade to enlarge itself, partly through the advantages resulting from some new colonial acquisitions, and partly from the circumstance of the commerce of our competitors having been still more interrupted than our own. Our exports and imports, it is true, form no just measure of the total quantity either of our commercial transactions or of our general payments; they afford, however, some presumption of the enlargement of both. If we take into consideration all the points which have been touched upon, there will appear sufficient reason to believe, that, during the late war, a very considerable and progressive augmentation of the payments of the metropolis must have taken place.

It now remains only to consider, fourthly, how far circumstances may have been such as to have rendered the same quantity of Bank of England notes either more or less sufficient for effecting the same quantity of London payments.

Several causes may have contributed to spare the use of notes. First, it is to be remembered, that a small extension of their quantity may be sufficient to effect a comparatively large number of additional pay-
ments; for the private bankers in London, who are the chief holders of Bank of England paper, by no means find it necessary to enlarge their stock of it in full proportion to the increased number of their pecuniary transactions. The talent of economizing bank notes is also a continually improving one; and the very circumstance of the suspension of the cash payments of the bank, by serving to strengthen mercantile credit, has favoured the exercise of economy in the use of the paper of the Bank of England. When payments were currently made in gold, the country banks were subject to sudden demands for cash through temporary alarms among the holders of their notes. From these they have lately been more exempt, in consequence of no other option having been given to those who demanded payment of country bank paper than that of receiving Bank of England notes in return. Since the suspension of the cash payments of the bank, credit has been less subject to interruption, and the quantity both of country paper and of Bank of England notes has probably been less variable; or, if the fluctuations of the latter have been as considerable as before, they may have more nearly corresponded with the variations in the wants of the public.*

* Immediately after the payment of the quarterly dividends on the public funds, the amount of Bank of England paper in circulation is considerably increased; but the expectation that the plenty of it will soon cease, disposes bankers and others to hold for a time a superfluous quantity. In consequence of the additions to the public debt made during the war, the occasional enlargements of the quantity of bank paper, arising from this cause, have become much more considerable. A diminution of notes, if known to be temporary, and if also moderate, produces, on the other hand, little pressure; for the expectation of returning abundance
To sum up the observations which have now been made: it thus appears, that, since the suspension of the cash payments of the bank, the number of its notes has been the same, or nearly the same, as before that event, if those two millions of one and two pound notes, which have been a mere substitute for gold, are deducted; that the payments, however, of the metropolis have been much increased; but that, on the other hand, the same number of notes has probably sufficed of late for more than the same number of payments.

It has not been the object of these remarks to found upon them any exact estimate of the effect which the quantity of Bank of England paper lately issued is likely to have had on the cost of commodities, or on the market price of bullion; but rather, on the contrary, to shew that no such estimate can with confidence be formed, on account of the number of circumstances, some of them very difficult to be appre-
ated, which affect the question. I believe the fact to be, that very little correspondence has subsisted between the fluctuation in the amount of Bank of England notes in circulation at different times, and the variations in the general price of articles at the same periods; and this want of a very discernible connexion between the cause and the effect, seems not unlikely to have led some persons too hastily to conclude, that the enlargement and diminution of Bank of England paper have not that influence on the exchanges or on the price of commodities which has been spoken of.*

Let it, therefore, be carefully remembered, that I by no means suppose a limitation of London paper to operate simply by causing an equal reduction of country paper, and then such a fall in the price of goods over the kingdom as is exactly commensurate with the general diminution of paper; and, finally, also such a variation in the exchange as is precisely proportionate to the reduction of paper, and to the fall in the price of goods. Counteracting circumstances of

* It is not long since the Bank of England first adopted the custom of issuing notes for five pounds. These have circulated for some years in the place partly of gold, partly of country bank notes, and partly also, though it is impossible to say in what degree, in the place of ten pound Bank of England notes. There is, therefore, an unknown number of notes for five pounds which has formed that sort of addition to the Bank of England paper, which has no influence in raising the price of articles. This is only one of many circumstances, some operating in one direction, and some in the contrary, which render it difficult to draw a correct inference from those accounts of the quantity of Bank of England notes circulating at a variety of periods, which have been lately laid before parliament.
various kinds may prevent these proportions from being maintained: and the full effects may not follow their cause until after the lapse of some period of time.

It must, in particular, be borne in mind, that a limitation of Bank of England paper affects prices in a great measure by its operation on the state of commercial confidence; and this influence on the minds of men will be far from uniform. A small limitation of Bank of England paper may give a great shock to confidence, when the state of credit is delicate; and may, therefore, at such a time, much discourage speculation. The very same limitation, under other circumstances of the country, may be almost without effect.

But although there is so great difficulty in estimating the precise influence on the cost of articles, or on the market price of bullion, which each alteration in the quantity of Bank of England notes may produce, there is no reason, on that account, to doubt the general truth of the proposition which was laid down in the close of the former chapter, namely, that the restriction of the paper of the Bank of England is the mean both of maintaining its own value, and of maintaining the value, as well as of limiting the quantity, of all the paper in the country. Although it should be difficult or even impossible, to determine to what point the limitation must be carried in order to produce a given effect, it may be sufficiently clear that the tendency of the limitation is to secure the benefit in question.

The perplexities of this subject being such as I have now described, it naturally occurs to us to reason
from the effect to the cause, and to infer a too great issue of paper when we perceive that there is an excess of the market price above the mint price of gold. But this inference is one which, for reasons formerly given, should always be very cautiously made; for it is to be borne in mind, that the excess may arise from other causes besides that of a too great emission of paper. Let the manner in which an extravagant issue of notes operates in producing the excess be recollected. It raises, and probably by slow degrees, the cost of British goods. It thus obstructs the export of them, unless a compensation for the high price is afforded to the foreign buyer in the rate of exchange; and the variation in our exchange produces a low valuation of our coin, compared with that of bullion.

The state of the exchange, then, is the immediate cause of the evil in question. Now, a suspension of the foreign demand for British manufactures, or an increase of the British demand for foreign articles, circumstances which may arise when there is no increase of bank paper, are the much more frequent as well as the more obvious causes of a fall in our exchange, and, therefore, also of a high price of bullion.

We are thus led back to the point which was dwelt upon some time since. Our two defective harvests, and the interruptions experienced in our export trade, very sufficiently account for the late fluctuation of our exchanges. In these respects there has evidently been much more in our situation which has been remarkable; while, as has been proved in the present chapter, there has been nothing which ought to be deemed extraordinary in the quantity of paper issued by the Bank of England.
It must, however, be admitted, that if an excessive issue of Bank of England notes produces, as it has been shewn to do, an unfavourable exchange; a reduction of them below the accustomed number must have a tendency to improve our exchange, by whatever means it may have been made to turn against us. But, after this admission, it may be remarked, that it may be necessary to encounter much evil in effecting the reduction. We have been lately placed between two dangers; between that of a depreciated paper currency on the one hand, and that of an interruption to our paper credit, and a consequent stagnation of our commerce and manufactures, on the other. And, on the whole, we have, perhaps, owed much to that liberal policy of the directors of the Bank of England, which has led them to maintain a quantity of notes in appearance increased, and in reality not diminished, in spite of some political as well as popular prejudices on this subject: at a time, also, when their conduct was observed with particular jealousy, on account of the suspension of their cash payments, and even when the course of exchange was much against us. Whether the bank may have erred a little on the one side or on the other, is a point which it would be invidious very critically to examine, and difficult to determine with certainty. It seems sufficiently clear, that if, at the period of the late northern confederacy, when our exchanges were the least favourable, the bank had materially diminished its paper, the embarrassment of our manufacturers and merchants, which the state of the continent had begun to render great, would have immediately become far greater; and that manufacturing labour, which was
then in some degree interrupted by a suspension of
the demand for British goods on the continent, would
have been likewise obstructed at the same season (a
season of peculiar pressure on the common people,
from the circumstance of the scarcity) by a more than
ordinary difficulty which our manufacturers would have
experienced in effecting their payments. The stock
of goods in our warehouses, made ready for subse-
quent exportation, would, in this case, have been
smaller; and we might, therefore, on the whole, have
had to look forward to a less early rectification of our
exchanges. The difficulties of 1793 might have been
added to those of the spring of 1801; and if commer-
cial confidence had failed, political credit might in
consequence have been shaken at one of the most
critical periods of our history.

From the principles recently laid down, some addi-
tional inferences may be deduced.

It was the object of several former Chapters to
point out the evil of a too contracted issue of paper.
The general tendency of the present, as well as of
the preceding one, has been to shew the danger of a
too extended emission. Two kinds of error on the
subject of the affairs of the Bank of England have
been prevalent. Some political persons have assumed
it to be a principle, that in proportion as the gold of
the bank lessens, its paper, or, as is sometimes said,
its loans (for the amount of the one has been confound-
ed with that of the other), ought to be reduced. It
has been already shewn, that a maxim of this sort, if
strictly followed up, would lead to universal failure.
A sentiment has prevailed among other persons, which
has bordered on a very different extreme. They have
complained of nothing, except the too scanty liberality of the bank, and have seen no danger in almost any extension of its discounts, or profusion in the issue of its paper, provided only the bills discounted (that is, the bills received by the bank in return for its notes) were real bills, and were those also of sufficiently safe and responsible houses.

But it will appear from the principles laid down in this and the preceding Chapter, that there may be a disposition among very rich and punctual men to borrow a sum far exceeding that which it may be prudent in the bank to lend. Every additional loan obtained from the bank, if we suppose its gold to remain the same, implies an increased issue of paper; but the measure of such issue has been shewn to be regulated by a principle which is not even connected with the question of the opulence of the borrowers at the bank, or of the nature of the bills discounted. The borrowers make a promise (and we will suppose that there is no reason to doubt the fulfilment of it) that the loan shall be repaid with punctuality. But in what manner is the payment to be effected? It will be made either in notes furnished by the Bank of England itself, or else in gold supplied by the same company, which notes and gold the bank must take care to render interchangeable for each other; and this is only to be done by keeping down their quantity, and thus maintaining their value.

Objections have been made by some to the monopoly of the bank. And its indisposition to lend to safe houses, on the security of real bills, to an extent which is deemed sufficient, has probably been the circumstance which has induced some mercantile persons
to favour the idea of the establishment of a rival establish­ment. Competition, it is thought, would lead to greater liberalality; and, in a variety of respects, would operate beneficially in this case, as it is known to do in many others.

It has been evinced, however, in the present Chapter, that we derive a material advantage from the power enjoyed by the Bank of England of exclusively furnishing the paper circulation of the metropolis. To this very circumstance the bank stands indebted for its faculty of regulating all the paper of the kingdom. On the bank is devolved the task of providing guineas for the whole country: with the bank is lodged the power of so restricting the general paper, as to render bullion purchasable, except in some extraordinary cases of alarm or difficulty. If these excepted cases should arise, and the cash payments of the bank should be suspended, an event of the possible recurrence of which we must not altogether exclude the idea; then the same circumstance of the monopoly of the bank affords to it the means of still sustaining the value both of its own paper and of that of the whole island. It serves also to impose upon the directors of this powerful company a complete responsibility. If a rival institution to the Bank of England were established, both the power and the responsibility would be divided; and, through the additional temptation to exercise that liberalality in lending, which it is the object of competition to promote, the London notes, and also the country bills and notes, would be more liable to become excessive. Our paper credit would, therefore, stand in every respect on a less safe foundation.
CHAPTER X.

Objections to the Doctrine of the two preceding Chapters answered. Of the Circumstances which render it necessary that the Bank should impose its own Limit on the Quantity of its Paper. Effect of the Law against Usury. Proof of the Necessity of restricting the Bank Loans, drawn from the Case of the Transfer of Capital to Foreign Countries.

SINCE it is not improbable that the reasoning of the preceding Chapters may have failed to produce full conviction in the mind of those who have been in the habit of deeming all limitation of the bank paper by the bank itself to be unnecessary; some few pages may be usefully employed in answering popular objections to the doctrine which has been laid down, and in more fully elucidating the subject.
"The increase of Bank of England paper," we will suppose it to be still said by an objector, "is the effect and not the cause of an advanced price of commodities. To enlarge the bank of England notes merely in proportion as safe and real bills are offered in return for them, is only to exchange one species of paper for another, namely, Bank of England notes for bills, which, though not so current or so safe as bank notes, are sufficiently worthy of credit. It is, therefore, simply to afford a guarantee to the transactions of the merchant, and thus to render that accommodation to commerce which it belongs to the bank to give."

"The depreciation of paper," it may be added, is apt to arise not so much from an extension of its quantity, as from a want of sufficient confidence in it. The great object of the bank should, therefore, be to maintain the public confidence; to which it contributes by furnishing, in return for bills confessedly good, a species of paper still better. The evil of an unfavourable exchange, and of a consequent high price of gold, arises from an unfavourable balance of trade, and from that cause only. The true mode of preventing this evil, or of remediying it, if unfortunately it exists, is to increase the national industry. The way to encourage industry is to give full scope to trade and manufactures by a liberal emission of paper. The balance of trade will not fail to be rendered favourable by that abundance of exportable articles which the labour thus excited must necessarily create. The course of exchange will, consequently, be supported; all excess of the market price above the mint price of
"gold will be prevented; and thus the value of our "paper will be sustained by the very means of its "increase."

Suppose a reasoner, on the same side, to add, that when the credit of the assignats of France was overthrown, the fall, especially at the first, was owing rather to the prevalence of distrust than to the excessive quantity of the article, and that the depreciation of assignats rarely bore a regular proportion to the extension of their amount."

It may, with equal truth, be affirmed by the objector, that if a reference be made to the prices of corn in the London corn-market at various æras, and also to the account of the quantity of bank notes stated by the bank to have been in circulation at the same or at immediately preceding periods, the price of grain in London will by no means be found to have been high in proportion as the number of Bank of England notes has been great, and low in proportion as it has been small; but that the very contrary has often been remarkably the case.

To these objections it may be answered, that they

* The following extract from Mr. Arthur Young's Tour through France, seems to establish the abovementioned fact."

"In September 1790, four hundred millions of assignats were in circulation; but the discount at Bourdeaux never exceeded ten, at Paris six per cent. And in May 1791, after many hundred millions more were issued, the discount was from seven to ten per cent. Condorcet, with other theories, expected that the prices of corn, and of other necessaries of life, would enormously advance; but the contrary happened to be the event—the price of corn declined. The assignats amounted, on the dissolution of the first assembly, to eighteen hundred millions."—Vol. I. 4to edition, page 520.
who represent an unlimited issue of Bank of England paper as having no tendency to produce the evils of a rise in the price of commodities in Great Britain, of a fall in our exchange, and of an excess of the market price above the mint price of gold, are bound to prove one of the two following propositions: either, first, that, supposing the directors of the bank to make the most enormous addition to their paper; to raise it, let us suppose, to fifty millions, even this augmentation will not lead to the consequences which have been mentioned; or if they do not affirm this strong position, but admit that there is a certain quantity of notes which will not fail to produce the evils in question, then, secondly, in order to prove that the bank need not place any limit to the issue of its own paper, they are bound to shew that the bank paper has a natural tendency sufficiently to limit itself.

Let us separately investigate each of these two points.

When we assume the fact of the bank paper being raised from its present amount of about fifteen millions, to the sum of fifty millions, we are led, in the first place, to inquire in whose hands the additional sum of thirty-five millions would be placed, and what would be the motive for holding it? I admit, or rather it is a point on which I would insist, that the maintenance of the price of the assignats of France by no means rested entirely, nor, for a time, even principally, on their quantity. It depended much on the opinion entertained by Frenchmen respecting the value of the lands declared to be purchaseable by means of this particular kind of paper, and respecting the fidelity of the French government.
to its engagements. Assignats, it is true, bore no interest; but the prospect of an ultimate profit to be reaped by the possessor of them, would operate, for a time, exactly like an accruing interest, in causing many persons to detain them; and, therefore, although they were used as a circulating medium, it is probable that only a part of them was turned to this purpose, and that even that part circulated but slowly. The reader is here desired to recollect a point which was explained in an early part of this work; namely, that the quantity of circulating medium which can be employed without injury to its value, is to be estimated not merely by its proportion to the quantity of trade or of payments, but also by the relative rapidity of its circulation. A species of circulating medium which changes hands once in ten days, will need to be a hundred times as great in quantity as the paper which passes through ten hands in one day. When that sanguine spirit which had at first inspired the holders of assignats subsided, the article would naturally sink in value with considerable rapidity; and in proportion as its price fell, the French government would be under the necessity of extending its issues. It is, therefore, not at all surprising that French assignats should, for a time, have borne a price which was proportionate not so much to their quantity as to their credit. Their quantity, however, after a certain period, operated on their credit, and became a very powerful cause of their depreciation.

Bank of England notes are exactly the converse to assignats in the points which have been mentioned; and their value, on that account, will be found to depend not so properly on their credit as on their quan-
It is true, that when, in consequence of alarm, a run is made upon the bank for guineas, the same confidence which is placed in gold is not reposed in Bank of England paper. Even in this case, however, it is only a small part of the community which is eager for gold: the holders of a very large proportion of the bank paper remain exactly as well contented as before to use it as the medium of their payments. And since the hoarders of gold prefer it not to paper only, but to land, to goods, and to almost every species of property, the paper of the bank cannot be affirmed to fall into discredit in consequence of applications for coin made with a view to hoard it, so properly as gold may be said to come into peculiar demand. In a season of alarm, our guineas are preferred by some persons both to our bank notes and to goods, on the same principle on which, in a state of extreme political convulsion, diamonds, because they may be still more easily transported or concealed, would probably be preferred to gold.

By saying, therefore, that the value of bank notes depends not on their credit, but on their quantity, I mean to affirm that their credit, so far as it affects their value, is always good, and that the common fluctuations of their price, in exchange both for goods and bullion, are not, in the smallest degree, to be referred to variations in the degree of confidence placed by Englishmen in the good faith or the solidity of the Bank of England. The magnitude of its capital is perfectly well known, and not the slightest doubt subsists respecting the sufficiency of its effects to answer much more than all its engagements. If the rise and fall in the public confidence in bank notes were the
cause of the gradations in their price, the period at which their value would have been the lowest would have been that which followed the suspension of the cash payments of the bank; an event certainly calculated, more than any other which has been experienced, to affect the reputation of that company. But it is a most remarkable fact, and a fact decisive on the present point, that the exchanges of this country improved, or, in other words, that Bank of England paper rose in value when compared with bullion, in the months subsequent to the suspension of its payments in cash.

Bank of England paper, therefore, is not apt to vary in its value in consequence of the fluctuations of the public confidence in it; but essentially differs in this respect from the late assignats of France. It presents to the holder no hope of future profit from the detention of it. Not only does it bear no interest (in this point, indeed, resembling assignats), but it offers no substitute for interest, it holds out no privileges, certain or contingent, real or pretended, tempting the possessor to detain it. There is, on the contrary, a known and continually increasing loss sustained by keeping it. On this account the quantity held by each person is only that which the amount of payments to be effected by it renders, in his opinion necessary.

We are at present assuming, for the sake of illustrating the subject, that thirty-five millions of additional bank paper are retained in the hands of the public. Imagine a London banker to acquire his share of them. The supply of bank notes which he chooses to reserve in his drawer is always estimated
by the scale of his payments; or, to speak more correctly, by the probable amount of the fluctuations in his stock of notes, which fluctuations are proportionate, or nearly proportionate, to the scale of his payments. So long, therefore, as his payments remain the same (and they will not materially alter while the price of goods suffers no variation, supposing his transactions to retain their former proportion to those of the whole kingdom), he will be perfectly indisposed to hold fifty thousand pounds in bank notes, in the place of each fifteen thousand pounds which he has been accustomed to deem necessary. He will make haste to part with the whole superfluous quantity; he will offer to lend it to any safe merchants, and even at a reduced rate of interest, in case he shall find that borrowers cannot otherwise be invited.

If we imagine the merchants to become possessed of the new paper, the same difficulty of accounting for the detention of it remains; unless we admit that the principles laid down in the two former Chapters are just, and that the larger quantity of circulating medium will cause goods to rise in value, and will thus find for itself employment.

There seem to be only two modes in which we can conceive the additional paper to be disposed of. It may be imagined either, first, to be used in transferring an increased quantity of articles, which it must, in that case, be assumed that the new paper itself has tended to create; or, secondly, in transferring the same articles at a higher price.

Let us examine the first of these cases.

An increased quantity of articles can only arise from additional commodities either brought from
abroad or produced at home through the exertion of new industry. An extraordinary issue of paper will bring goods from abroad only so far as it enables the country to export either gold, or additional commodities created at home, as the means of paying for the foreign articles. The export of gold has its limit. It is, moreover, desirable, for reasons which have been fully stated, that this limit should be narrow. Whether a very great emission of notes tends to increase the quantity of goods produced at home, is the point which remains to be considered.

In examining this question, an error into which it is very natural to fall must be developed. When the Bank of England enlarges its paper, it augments, in the same degree, as we must here suppose, its loans to individuals. These favoured persons immediately conceive, and not without reason, that they have obtained an additional though borrowed capital, by which they can push their own particular manufacture or branch of commerce; and they are apt, also, though not with equal justice, to infer, that the new capital thus acquired by themselves is wholly an accession to that of the kingdom; for it does not occur to them that the commerce or manufactures of any other individuals can be at all reduced in consequence of this increase of their own.

But, first, it is obvious, that the antecedently idle persons to whom we may suppose the new capital to give employ, are limited in number; and that, therefore, if the increased issue is indefinite, it will set to work labourers, of whom a part will be drawn from other, and, perhaps, no less useful occupations. It may be inferred from this consideration, that there are
some bounds to the benefit which is to be derived
from an augmentation of paper; and, also, that a libe­
ral, or, at most, a large increase of it, will have all
the advantageous effects of the most extravagant emis­

Let us also consider the mode in which the new
paper operates through the medium of these indivi­
dual borrowers, as unquestionably it does, in giving
life to fresh industry. The bank notes convey to them
the power of obtaining for their own use, or of de­
stining to such purposes as they please, a certain por­
tion of purchaseable commodities. The extraordinary
emission of paper causes no immediate difference in
the total quantity of articles belonging to the king­
dom. This is self-evident. But it communicates to
the new borrowers at the bank a power of taking to
themselves a larger share of the existing goods than
they would otherwise have been able to command.
If the holders of the new paper thus acquire the
power over a larger portion of the existing stock of
the kingdom, the possessors of the old paper must
have the power over a smaller part. The same paper,
therefore, will purchase fewer goods, or, in other
words, commodities will rise in their nominal value.
The proprietors of the new paper will become greater
encouragers of industry than before; the owners of
the old paper, being able to command less property,
will have less power of employing labour. For in­
dustry is excited, strictly speaking, not by paper, but
by that stock which the paper affords the means of
purchasing. Money of every kind is an order for
goods. It is so considered by the labourer when he
receives it, and is almost instantly turned into monies
worth. It is merely the instrument by which the purchaseable stock of the country is distributed with convenience and advantage among the several members of the community.

It may be said, however, and not untruly, that an increased issue of paper tends to produce a more brisk demand for the existing goods, and a somewhat more prompt consumption of them; that the more prompt consumption supposes a diminution of the ordinary stock, and the application of that part of it, which is consumed, to the purpose of giving life to fresh industry; that the fresh industry thus excited will be the means of gradually creating additional stock, which will serve to replace the stock by which the industry had been supported; and that the new circulating medium will, in this manner, create for itself much new employment.

The supposition which has now been made is admitted to be just. Let the reader, however, take notice, that it assumes the demand both for goods and labour to become more eager than before. Now the consequence of this increased eagerness in the demand must, unquestionably, be an enhancement of the price of labour and commodities, which is the very point for which I am contending. Indeed, whatever view we take of the subject, we seem obliged to admit, that, although additional industry will be one effect of an extraordinary emission of paper, a rise in the cost of articles will be another.

Probably no small part of that industry which is excited by new paper is produced through the very means of the enhancement of the cost of commodities. While paper is increasing, and articles continue rising,
mercantile speculations appear more than ordinarily profitable. The trader for example, who sells his commodity in three months after he purchased it, obtains an extra gain, which is equal to such advance in the general price of things as the new paper has caused during the three months in question:—he confounds this gain with the other profits of his commerce; and is induced, by the apparent success of his undertakings, to pursue them with more than usual spirit. The manufacturer feels the same kind of encouragement to extend his operations; and the enlarged issue of paper supplies both him and the merchant with the means of carrying their plans into effect. As soon, however, as the circulating medium ceases to increase, the extra profit is at an end; and, if we assume the augmented paper to be brought back to its ordinary quantity, we must suppose industry to languish for a time, through the ill success which will appear to attend mercantile transactions.

Mr. Hume has an observation in his Essay on Money, which, in some degree, confirms the remarks which have been made in the text. Having represented an influx of money as exciting industry (and we may presume an increase of paper to have exactly the same effect), "At first," he says, "no alteration is perceived; by degrees the price rises first of one commodity, then of another, till the whole, at last, reaches a just proportion with the new quantity of specie which is in the kingdom. In my opinion, it is only in this interval or intermediate situation between the acquisition of money and rise of prices" (Mr. Hume must mean, no doubt, the completion of
the rise, and not the commencement of it) "that the increasing quantity of gold and silver is favourable to industry."*

It must be also admitted, that, provided we assume an excessive issue of paper to lift up, as it may for a time, the cost of goods though not the price of labour, some augmentation of stock will be the consequence; for the labourer, according to this supposition, may be forced by his necessity to consume fewer articles,

* Mr. Hume, in observing that, when money increases, "the price rises first of one commodity, then of another, till the whole, at last, reaches a just proportion with the new quantity of specie which is in the kingdom," appears to me not sufficiently to advert to the tendency of money to go abroad as soon as it shall have raised the gold price of articles above their level in other countries, allowing for the charges of transportation; a subject which will be more fully treated of in the next Chapter. He also describes the operation of an increase of coin in raising prices as proceeding somewhat more slowly than, perhaps, it would be found to do. An augmentation of Bank of England notes operates, no doubt, in this respect, more quickly than an increase of money; for the London bankers, who are the great holders of bank paper, are likely to be much less disposed to detain, for example, a double quantity of it, than all the individuals of the kingdom are to detain in their several drawers, or in their pockets, a double quantity of guineas. The banking system, by committing the business of payments to few hands, has made much difference in respect to the time within which an increased quantity of circulating medium may be supposed to raise the price of articles. It has given to many great holders of Bank of England paper a very strong interest on the side of not keeping a superfluous quantity of it.

That an increase of the circulating medium tends to afford temporary encouragement to industry, seems also to be proved by the effects of the Mississippi scheme in France; for it is affirmed by French writers, that the notes of Mr. Law's bank appeared for a time to have a very powerful influence in extending the demand for labour, and in augmenting the visible and bona fide property of the kingdom.
though he may exercise the same industry. But this saving, as well as any additional one which may arise from a similar defalcation of the revenue of the unproductive members of the society, will be attended with a proportionate hardship and injustice. This supposition also implies the acknowledgment of the point for which we are contending, that an increased issue of paper tends to raise the price of commodities.

It has thus been admitted that paper possesses the faculty of enlarging the quantity of commodities by giving life to some new industry. It has, however, been affirmed, that the increase of industry will by no means keep pace with the augmentation of paper. The question now to be considered, is, whether, if we suppose thirty-five millions of new paper to be suddenly issued, the fresh industry which would, consequently, be excited, would create a quantity of goods, the sale of which would give employment to all the new paper. Let it be admitted, for the sake of illustrating this point, that the thirty-five millions of additional bank notes will have the extraordinary power of calling at once into being thirty-five millions of new goods; still it may be remarked, that even all this additional property would by no means find employment for that equal quantity of paper which is here assumed to have given existence to it.

We shall be able to explain this circumstance, as well as to throw some new light on the general subject, by supposing an individual, A, to become, in consequence of an extraordinary issue of paper, a new borrower at the bank to the extent of twenty thousand pounds. The twenty thousand pounds, while it is held in the shape of paper, affording him no inter-
he will make haste to part with it, by purchasing goods, stocks, land, or some other article, to the extent of the sum in question. Suppose him to make the purchase from B, in three days after he received the notes. B is now in possession of twenty thousand pounds in new bank paper, created by the extraordinary emission; and is, in like manner, in haste to part with it. Imagine him, also, to pay away the same paper in return for goods at the end of three days. Thus the same notes will in six days have effected two purchases amounting together to forty thousand pounds. If we imagine the like transaction to be repeated again and again; the same notes will in twelve days have effected the purchase of goods amounting to eighty thousand pounds; in about a month to two hundred thousand pounds; and in a year to about two millions. Thirty-five millions of new paper will thus effect in a year the sale of goods to the extent of two or three thousand millions. In order, therefore, to account for the employment of the thirty-five millions, we must assume, if we allow no rise in prices to take place, such a new quantity of goods to be called into existence by the magic influence of the new paper, as to become a subject for purchases, amounting, in a year, to no less than these two or three thousand millions. We must assume the creation not of thirty-five millions of property, but of five, ten, or, perhaps, twenty times that sum; or else we must suppose, what is not supposeable, that the newly created capital of thirty-five millions changes hands as frequently as the thirty-five millions of bank notes which created it; that is to say, that the new property undergoes a fresh sale on every third day.
The case which has been put is inaccurate, inasmuch as the payments effected by bank notes are on the account not merely of goods and other articles sold, but likewise of numberless sums borrowed and repaid. It is probable, however, that payments of this latter kind will always bear a nearly uniform proportion to those of the other class. The general inference which was intended to be drawn from the case, will, therefore, be just.

In speaking formerly of the reduction of bank paper, much pains were taken to point out the important difference between that limitation of loans which leads to a diminution of paper, and that which produces no such diminution; and it was then observed, that it was by the quantity of Bank of England paper, and not by the amount of loans, or by the amount of loans so far only as they influence the quantity of paper, that a judgment was to be formed of the pressure on the metropolis, and of the reduction of prices. Many of the remarks then made respecting the limitation of bank paper, apply with nearly equal force to the subject of its increase.

It has now been fully shewn, first, that Bank of England paper is an article of such a nature, that a very superfluous quantity of it will never be for a long time retained in any quarter; and, secondly, that the vast increase of it, which, for the sake of more convenient discussion, was assumed to take place, cannot possibly create such a new capital as shall furnish the new paper with employment. There remains, therefore, no other mode of accounting for the uses to which the additional supply of it can be turned, than that of supposing it to be occupied in carrying on the
sales of the same, or nearly the same, quantity of articles as before, at an advanced price, the cost of goods being made to bear the same, or nearly the same, proportion to their former cost, which the total quantity of paper at the one period bears to the total quantity at the other.

We are thus brought, though by a different course, to the point at which we arrived in an early part of a former Chapter. An enlarged issue of paper, it was then observed, produces an increased facility of borrowing, as well as an opinion of increased facility; and thus adds to the eagerness of purchasers. It communicates an additional power of purchasing, not only to the original borrower at the bank, but successively, also, as has now been shewn, to all the other individuals into whose hands the new bank notes pass in the course of their circulation.

Very strong confirmation of the present doctrine may be furnished by a reference to the case of gold. No one doubts, that, in the event of an augmented supply of this article from the mines, the value of it would fall nearly in proportion to the extension of its quantity; especially if it were used for the sole purpose of a circulating medium, and were also the only kind of circulating medium. The metropolis of Great Britain is so circumstanced, that the issue of an extraordinary quantity of bank paper for the purpose of effecting the payments of London, in a considerable degree resembles the creation of an extraordinary supply of gold for the general uses of the world.

It was stated in the beginning of this Chapter, as
one objection to the doctrine which I have been en-
deaouring to establish, that "to enlarge the quantity
of Bank of England notes merely in proportion as
sufficient and real bills are offered in return for them,
is only to exchange one species of paper for ano-
ther, namely, Bank of England notes for bills, which,
though not so current or so safe as bank notes, are
sufficiently worthy of credit. That it was, there-
fore, simply to afford a guarantee to the transactions
of the merchant, and thus to render that accommo-
dation to commerce which it belongs to the bank to
give." This objection will be sufficiently answered
by repeating an observation which has been already
frequently made, namely, that the effect produced by
paper credit on the price of articles depends not
merely on the quantity of paper in existence, but also
on its currency, or, in other words, on the rapidity of
its circulation. It was admitted in the objection, that
bills are not current like bank notes, and that it is the
greater currency of the latter which causes the ex-
change to be desired.

It was mentioned, as another argument against the
doctrine which has been laid down, that corn has not
usually borne any sort of proportion to the quantity
of Bank of England paper in circulation at the same
time. The answer is, that the directors of the bank
have never augmented their notes in such a degree as
to be likely to produce any material alteration in the
general price of goods; that one or more of those cir-
cumstances which were dwelt upon in the preceding
Chapter, may have counteracted the tendency of the
fluctuations of the quantity of paper to produce cor-
respondent variations in the price of commodities;
and, above all, that even a small reduction of the supply of grain can hardly fail to lead to a rise in its value when exchanged for paper, so great as to forbid all comparison between the effects of an alteration of the quantity of the one article and of an alteration of the quantity of the other. Paper has been spoken of as raising the cost of commodities, at the most, only in proportion to its increased quantity. But in the case of a diminished supply of corn, the price rises according to a very different ratio; and for this obvious reason, that we cannot accustom ourselves to the use of a reduced allowance of grain, in the same manner in which we are able, by degrees, to accommodate ourselves to a smaller quantity of circulating medium.*

* The following extract from the work of Sir W. Davenant, who wrote from 1695 to 1712, may give some idea of the vast effect which a small failure of the supply of corn has on the price of this necessary of life.

"It is observed, that but one-tenth defect in the harvest may raise the price three-tenths; and when we have but half our crop, which now and then happens, the remainder is spun out by thrift and good management, and eeked out by the use of other grain; but this will not do for above one year, and would be a small help in the succession of two or three unseasonable harvests.

"We take it, that a defect in the harvest may raise the price of corn in the following proportions:

<table>
<thead>
<tr>
<th>Defect of</th>
<th>Above the common rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 tenth</td>
<td>3 tenths</td>
</tr>
<tr>
<td>2 tenths</td>
<td>8 tenths</td>
</tr>
<tr>
<td>3 tenths</td>
<td>7 six-tenths</td>
</tr>
<tr>
<td>4 tenths</td>
<td>2 eight-tenths</td>
</tr>
<tr>
<td>5 tenths</td>
<td>4 five tenths</td>
</tr>
</tbody>
</table>

"So that, when corn rises to treble the common rate, it may be presumed that we want above one-third of the common produce; and if
Let the principle which was laid down as regulating
the cost of all articles be recollected. The question
of prices is a question of power, and of power only;
and, in the event of the scarcity of any commodity, the
buyers are more or less under the power of the sellers, in proportion as the article in question is of more
or less urgent necessity.

That the quantity of circulating paper must be
limited, in order to the due maintenance of its value,
is a principle on which it is of especial consequence
to insist, as it has been overlooked by some writers on
paper credit. In the work of Sir James Stewart on
Political Economy, banks are discussed at considerable
length; but little intimation is given of the necessity
of confining the total quantity of circulating paper, or
of the tendency of an excessive emission to render the
exchange unfavourable, and thus to cause gold to be
drawn away. On the other hand, the duty of not
giving out bank paper, except for sufficient value re-
ceived (a point on which, at the present time, there is
less occasion to enlarge) is strongly urged by this
writer, and the security of bills of exchange is implied

"we should want five-tenths, or half the common produce, the price
would rise to near five times the common rate."

This scale is not likely to be very accurate. It is, indeed, by no means
clear, whether it proceeds on the supposition of a deficiency of the antecedent crop only; or of a deficiency of the total stock, that is to say, of the antecedent crop and of the stock remaining over from a former year taken together; which are two very different questions. And many circumstances may render such calculations, however just, by no means equally applicable to every period. The passage, therefore, is quoted merely for the purpose of giving some general ideas on the subject.
by him to be inadequate, that of land alone being fully approved. Bank notes emitted without obtaining value in return, are termed by him paper issued for "value consumed;" and are represented as the great source both of loss and danger to a banking company. His mode of expressing himself on this point is such as to make him appear to lend much countenance to the error which it is the object of the present Chapter to expose; namely, that of imagining that a proper limitation of bank notes may be sufficiently secured by attending merely to the nature of the security for which they are given.*

Dr. A. Smith, who is a more late writer, has asserted the necessity of a limitation of paper, in the passage which was quoted in an early part of this

* "When paper is issued for no value received, the security of such paper stands alone upon the original capital of the bank; whereas, when it is issued for value received, that value is the security on which it immediately stands, and the bank stock is, properly speaking, only subsidiary.

"I have dwelt the longer on this circumstance (namely, that of taking sufficient property in pledge for the notes issued), because many who are unacquainted with the nature of banks have a difficulty to comprehend how they should ever be at a loss for money, as they have a mint of their own, which requires nothing but paper and ink to create millions. But if they consider the principles of banking, they will find that every note issued for value consumed, in place of value received and preserved, is neither more nor less than a partial spending either of their capital or profits on the bank."—Stewart's Political Economy, Book IV. Part II. Chap. IV.

Chapter V. is a short chapter, of which the object is to shew that banks issuing circulating paper "ought to issue their notes on private not mercantile credit." By private credit, that of "lands and personal estates" appears to be meant.
work; but he has done this in terms which are inaccurate, and he has given an erroneous and inadequate idea of the evil which may result from a very extended emission.

Mr. Locke has lent some countenance to the error which I am endeavouring to expose, by his way of considering the subject of the balance of trade, which is the same mode in which I supposed, in the beginning of this Chapter, an objector to conceive of it. "The evil of an unfavourable exchange," I imagined my opponent to say, "and of a consequent high price of gold, arises from an unfavourable balance of trade, and from that only. The true way of preventing this evil, or of remedying it, if it unfortunately exists, is to increase the national industry; and the way to encourage industry, is to give full scope to trade and manufactures by a liberal emission of paper. The balance of trade will not fail to be rendered favourable by that abundance of exportable articles which the labour thus excited must necessarily be supposed to create."

Mr. Locke's language respecting an unfavourable balance of trade, and its influence in causing gold to be melted down and exported, is as follows. "Profit," he says, "can be made by melting down our money, but only in two cases. First, when the current prices of the same denomination are unequal and of different weights, some heavier some lighter; for then the traders in money cull out the heavier, and melt them down with profit. The other case wherein our money comes to be melted down, is a losing trade, or, which is the same thing in other words, an over great consumption of foreign com-
modities. Whenever the over-balance of foreign trade makes it difficult for our merchants to get bills of exchange, the exchange presently rises. If the law makes the exportation of our coin penal, it will be melted down; if it leaves the exportation of our coin free, it will be carried out in specie—one way or other, go it must. But this melting down carries not away one grain of our treasure out of England. The coming and going of that depends wholly upon the balance of trade."

The error which I consider as encouraged and supported by this passage of Mr. Locke (and much similar language is to be found in other writers), is this:—the passage implies, that it is the comparative state of our exports and imports which regulates the exchange, and not at all the state of the exchange which regulates the comparative state of our exports and imports. It leads us to suppose, that an unfavourable balance of trade (that is, the excess of the goods imported above those exported) is exclusively the cause, and that the bad state of the exchange is altogether the effect. The passage inclines us not at all to suspect a circumstance which Mr. Hume admits in a note in his Essay on Money, namely, "that an unfavourable exchange becomes a new encouragement to export."

The point which I wish here to establish may be still more clearly explained in the following manner. It has been shewn in a former Chapter, and, indeed, it is stated by Mr. Locke, that the selling price of bills determines the rate of exchange. When, therefore,
for example, persons abroad wishing to sell bills on England are more numerous than those who are disposed to buy them, the price of bills must drop; and it must continue to fall until it becomes so low as to tempt some individuals to become purchasers of them. They who buy the bills on England, are the buyers of so many orders to receive in England either money or bank notes. The money or bank notes thus received, unless left in some English hand (and they will be so left in some few cases only), must be invested in British articles, and exported. The profit afforded by the fall in the selling price of the bills must, therefore, be sufficient to cause the speculation of the buyers of the bills to answer—the speculation I mean of either bringing over British gold, which would not otherwise have been transferred, or of purchasing and exporting British commodities which would not otherwise have been at that time transported. Thus, therefore, an unfavourable exchange may be considered not only as becoming, according, to Mr. Hume’s expression, “a new encouragement to export,” but as affording all that degree of encouragement to export which is necessary to secure as much actual exportation either of gold or of goods, or of both, as shall serve to equalize the exports and imports; unless, indeed, the same cause, namely, the unfavourableness of the exchange, should tempt foreigners to remit money to England, and lodge it for a time in our hands, with a view to the profit to be obtained by this species of speculation.

The principle which I would lay down on the subject now under consideration, is, I think, simple and intelligible, and it applies itself to all periods of time,
and to every kind of circulating medium which may happen to be in use. I would be understood to say, that in a country in which coin alone circulates, if, through any accident the quantity should become greater in proportion to the goods which it has to transfer than it is in other countries, the coin becomes cheap as compared with goods, or, in other words, that goods become dear as compared with coin, and that a profit on the exportation of coin arises. This profit, indeed, soon ceases through the actual exportation of the article which is excessive.

I would say again, that in a country in which coin and paper circulate at the same time, if the two taken together should, in like manner, become, in the same sense of the term, excessive, a similar effect will follow. There will, I mean, be a profit on sending away the coin, and a consequent exportation of it.

I would say, thirdly, that in a country in which paper alone circulates, if the quantity be in the same sense excessive, supposing the credit of the banks which issued it to be perfect, the paper will fall in value in proportion to the excess, on an exactly similar principle; or, in other words, that goods will rise; and that a necessity will exist for granting, in the shape of exchange, a bounty on the exportation of them equal to that which would have been afforded in the two former suppositions, assuming the quantity of circulating medium to be excessive in an equal degree in all the three cases.

It thus appears, that "the coming and going of gold" does not (as Mr. Locke expresses it, and as was supposed in the objection at the beginning of this Chapter) "depend wholly on the balance of trade."
It depends on the quantity of circulating medium issued; or it depends, as I will allow, on the balance of trade, if that balance is admitted to depend on the quantity of circulating medium issued. Mr. Locke, however, is very far from leading his reader to conceive that the balance of trade depends on the quantity of circulating medium issued; for he describes an unfavourable balance as resulting from a "losing trade," and from an "over great consumption of foreign commodities," terms which seem to imply an unprosperous state of commerce, and a too expensive disposition in the people, and which naturally lead to the conclusion, that the prosperity of the country will effectually secure us against the danger of the exportation of our coin, whatever may be the quantity of our paper.

It has now, I trust, been made sufficiently to appear, that banks, if they pay in gold, or if, while not paying in gold, they maintain the value of their notes, must observe some limit in respect to their emission of them.

If, indeed, we could suppose a country to have no intercourse with any other, we might imagine an unlimited issue of paper to take place without producing any difference in its value when exchanged for gold. In that case it would be necessary to assume the price of goods to rise indefinitely, but the people to be content to use a less and less proportion of gold to paper, and on that account to continue to consider the relative value of gold and paper as the same. This unlimited rise in the price of goods, and equally indefinite fall in the value of gold, are everywhere precluded by the commercial communications which take
place between different parts of the world; gold in exchange for goods, allowing for the expense of transporting them, necessarily bearing that price, or nearly that price, in each country which it bears in all. The variations in the value of bullion, as compared with that of the circulating medium, serve, therefore, to detect and restrain that too great emission of notes to which all countries would otherwise be prone; and those operations of the exchange, which have been described, are the means by which every bank is compelled to make the value of its paper conform itself to the ancient standard.

Let the case of the continental bank notes, already spoken of, be here adverted to. The depreciation of these has been apt to originate, as I conceive, in the state of the exchanges. The unfavourable exchange has produced a difference between the value of bullion, and that both of the current paper of those banks and of the current coin; and, when this difference has become permanent and considerable, a discount on the paper has established itself; in other words, coin has ceased to bear the price of paper, and has taken the price of bullion, and from that time the paper alone has passed at the reduced rate. The difference between the value of the circulating medium of this country and that of bullion has always been sufficiently small to prevent the like discount from arising; and so long as we avoid a discount, persons, in general, do not discover that any depreciation of our paper exists. But even the most insignificant of those depressions in the value of our circulating medium, which are indicated by the exchange, are to be referred to the same immediate cause from which the depreciation
of the bank paper on the continent has originated. I do not mean that our smaller and their greater deprecations are alike to be referred to an excess of paper. I would affirm, however, that they have equally resulted from the circumstance of goods, at the time in question, being too high in value (possibly, in the one case, through an excess of paper, and, in the other, through a fluctuation in the markets) to bear to be exported in sufficient quantity to satisfy the debt for which payment has been demanded, unless an advantage in the exchange was granted to the exporting merchant.

It may be convenient to the reader here to recapitulate the several points which have been lately dwelt upon.

I have shewn, first, that since Bank of England paper affords no profit to the holder, a very superfluous quantity is not likely to be held in any quarter; and that the additional thirty-five millions, which have been spoken of, must, therefore, be supposed to be employed either in transferring an increased quantity of goods, which, in that case, it must be assumed to have itself created, or in transferring the same goods at a higher price. I have, then, insisted, that since the fresh industry which is excited cannot be supposed to be commensurate with the new paper, it is necessary to assume (conformably to the principles of a former Chapter), that a great rise in the price of commodities will take place. This rise in the cost of articles in Great Britain must produce, as has been also shewn, a diminution of the demand for them abroad, unless a compensation for their high price is given to the foreigner in the rate of exchange; so
that the too great emission of paper will be the cause of a disadvantageous balance of trade, and also of an unfavourable exchange; or, in other words, of a low valuation of the circulating medium of Great Britain when compared with that of other countries.

It has, likewise, been observed, that even the smallest of those depressions in the value of our circulating medium, which are indicated by the exchange, arise out of the same circumstance which has produced the greater depreciations of the continental bank paper; goods, it has been said, being rendered too high (in the one instance, probably, by an excess of paper, in the other by a fluctuation in the markets) to bear to be exported in sufficient quantity to satisfy the debts for which payment has been demanded, unless a bounty, in the shape of the exchange, be granted to the exporting merchant.*

* Some proof of the tendency of a too great emission of paper to render the exchange unfavourable by the means which have been described, and to cause the current coin to be exported, is furnished by the following extracts from arretes of the French government, issued a short time after the establishment of Mr. Law's bank. The reader is desired to take notice, that this bank was instituted on the same professed principles with the Bank of England; was, for a time, independent of the government, though sanctioned by it; possessed a capital of one hundred millions of livres, and lent money on good security. Being, however, permitted to issue notes to the vast amount of about thirty-eight millions sterling, the credit (in some degree a well founded one) which this bank obtained, encouraged the formation of the Mississippi scheme, and led to other doubtful undertakings. The bank paper being rendered exchangeable for the actions (or stock) of the Mississippi company, though at a regulated discount, the value of it, like that of the late assignats of France, was made to depend on the public opinion of the pro-
We come next to the second topic of inquiry, namely, whether those bounds within which Bank of

fits of a speculation, and, therefore, on the credit of the circulating article, rather more, perhaps, than on its quantity.

Extract from the King's arret, dated 21st May, 1720.—" The King having caused to be examined in his council the condition to which the kingdom was reduced before the establishment of the bank, that he might compare it with its present condition; it has appeared to the King, that the high rate of the interest of money had done more damage to the kingdom than all the expenses which the late King had been at during his several wars. By the establishment of the bank, the King has restored things to good order. The nobility have found, in the increase of the value of their lands, means to make themselves easy; manufactures, commerce, and navigation, are re-established; the lands are cultivated, and the artificer works."

By the arret of the 5th March, his Majesty ordained "that actions of the India (or Mississippi) company might be converted into bank notes, and those notes into actions, according to the proportion which at that time was reckoned most just with respect to the value of the coin. It remained for his Majesty to find an expedient for re-establishing the value of the coin in such proportion as might suit foreign commerce and the want of the products of the country. His Majesty has provided for these things by his declaration of 11 March, which orders the reduction of the value of coin."

This singular arret then proceeds to observe, that since "this reduction" of the coin "must necessarily produce a diminution of the price of commodities" (a measure calculated to produce its increase, and which would only fail to have this effect so far as the too great issue of paper had already produced it), "his Majesty," therefore, "has judged the general interest of his subjects required that the price or nominal value of actions and of bank notes should be lessened for maintaining them in a just proportion with the coin and other commodities of the kingdom, for binding the too high value of coin from sinking the public credit, and for preventing the losses which his subjects might suffer in commerce with foreigners."

The arret then directs that actions of 10,000 livres should be reduced to 5,000, and bank notes of 1,000 to 500.

The people, after this arret, which doubled the public injury under the
England paper must be confined, in order to guard against a dangerous depreciation of it, are likely to be

pretence of dispensing equal justice, refused to take the notes, and the arrest was revoked. Another arrest, reducing the actions alone, was substituted. Still, however (as is observed by Mr. Postlethwaite, from whom this account is taken), "the people having been frightened, would not meddle with bank notes, except in payment for their goods, which they raised four times above their usual value, or upon a very great discount."

Another ordinance of the King, to the following effect, was then issued. "His Majesty being informed that many of his subjects, who, in these latter times, have got considerable fortunes, forgetting what they owe to their country, have sent the greatest part thereof into foreign countries; and that some others of his said subjects keep in the said countries considerable sums in specie, with a design to place the same there, which has kept up the course of exchange to the advantage of foreigners" (the exportation of the gold would tend so far as it went to improve the course of exchange, and was an effect of the unfavourable exchange and not the cause), "and has occasioned the exporting out of the kingdom a considerable quantity of specie. And his Majesty, considering how much it is important to remedy an abuse so contrary to the laws of government, though without constraining the liberty of commerce; his Majesty, with the advice of Monsieur the Duke of Orleans, regent, ordains, that in general all his subjects shall be obliged to recall their funds, and cause the same to be brought again into the kingdom within two months from the publication of this present ordinance."

It appears from the first of these arrests, that an increased emission of paper tends to raise prices as well as to excite industry; from the second, that it leads, however, to a very unfavourable exchange; and to the exportation of the coin of a country; and that the reduction of the value of the coin is the remedy which is naturally resorted to. The same point is confirmed by the third arrest.

All the three arrests unite in proving the gross ignorance which at this time prevailed on the subject of exchanges and of paper credit, and in shewing, therefore, the unfairness of inferring from the Mississippi project in France the instability of our own paper credit. In the instance of our own South Sea scheme, no new bank was instituted, and the credit of the Bank of England paper was sustained.
observed, in consequence of some natural tendency which it has to limit itself, so that it is unnecessary that the bank should restrain it.

In examining this question, I mean also to inquire whether the adoption merely of such rules as may tend, in a general way, to confine the loans of the bank, may be sufficient; or whether, also, any limitation of the specific sums lent may be necessary.

First, it is obvious that the principle of lending, simply in proportion to the property of those who desire to borrow, cannot be a safe one. If mere capital were to give a title to bank loans, the borrowers might become beyond measure numerous; even all proprietors of the public funds might prefer a claim for assistance.

If it should be said that the bank loans ought to be afforded only to traders, and on the security of real bills, that is to say, of bills drawn on the occasion of an actual sale of goods, let it be remembered that real bills, as was observed in an early part of this work, may be multiplied to an extremely great extent; and moreover, that it is not only necessary sufficiently to extend the customary length of credit, in order to effect the greatest imaginable multiplication of them. If the bank directors were to measure their discounts by the amount of real bills offered, it may be apprehended, that bankers and other discounters, who now take this better kind of paper, might become much more considerable holders of mere notes of hand, or of fictitious bills; and that an opportunity might thus be afforded of pouring a vast additional quantity of real bills into the Bank of England.

It may be imagined, that if the directors were to
govern their conduct by a regard partly to the capital of the borrowers, partly to the species of bills offered, but partly, also, to the probability of punctual payment, the addition of this third check to the former might suffice. But it is here to be recollected, that the bank itself, if we suppose a progressive enlargement of notes, must be assumed to furnish perpetually increasing means of effecting payments, and thus to render punctuality in fulfilling even the most extravagant engagements convenient and easy to the merchants.

It only remains to inquire, lastly, whether any principle of moderation and forbearance on the part of the borrowers at the bank may be likely to exempt the directors of that institution from the necessity of imposing their own limit.

It may possibly be thought, that a liberal extension of loans would soon satisfy all demands, and that the true point at which the increase of the paper of the bank ought to stop, would be discovered by the unwillingness of the merchants to continue borrowing.

In order to ascertain how far the desire of obtaining loans at the bank may be expected at any time to be carried, we must inquire into the subject of the quantum of profit likely to be derived from borrowing there under the existing circumstances. This is to be judged of by considering two points: the amount, first, of interest to be paid on the sum borrowed; and, secondly, of the mercantile or other gain to be obtained by the employment of the borrowed capital. The gain which can be acquired by the means of commerce is commonly the highest which can be had; and it also regulates, in a great measure, the rate in
all other cases. We may, therefore, consider this
question as turning principally on a comparison of the
rate of interest taken at the bank with the current
rate of mercantile profit.

The bank is prohibited, by the state of the law,
from demanding, even in time of war, an interest of
more than five per cent. which is the same rate at
which it discounts in a period of profound peace. It
might, undoubtedly, at all seasons, sufficiently limit
its paper by means of the price at which it lends, if
the legislature did not interpose an obstacle to the
constant adoption of this principle of restriction.

Any supposition that it would be safe to permit the
bank paper to limit itself, because this would be to
take the more natural course, is, therefore, altoget­
er erroneous. It implies that there is no occasion
to advert to the rate of interest in consideration of
which the bank paper is furnished, or to change that
rate according to the varying circumstances of the
country.

At some seasons an interest, perhaps, of six per
cent. per annum, at others, of five, or even of four
per cent. may afford that degree of advantage to bor­
rowers which shall be about sufficient to limit, in the
due measure, the demand upon the bank for discounts.
Experience, in some measure, proves the justice of
this observation; for in times of peace, the bank has
found it easy to confine its paper by demanding five
per cent. for interest; whereas, in war, and especially
in the progress and towards the conclusion of it, as
well as for some time afterwards, the directors have
been subject, as I apprehend, to very earnest solicita­
tions for discount, their notes, nevertheless, not being
particularly diminished. It is, therefore, unreasonable to presume that there will always be a disposition in the borrowers at the bank to prescribe to themselves exactly those bounds which a regard to the safety of the bank would suggest. The interest of the two parties is not the same in this respect. The borrowers, in consequence of that artificial state of things which is produced by the law against usury, obtain their loans too cheap. That which they obtain too cheap they demand in too great quantity. To trust to their moderation and forbearance under such circumstances, is to commit the safety of the bank to the discretion of those who, though both as merchants and as British subjects they may approve in the general of the proper limitation of bank paper, have, nevertheless, in this respect, an individual interest which is at variance with that of the Bank of England.

The temptation to borrow, in time of war, too largely at the bank, arises, as has been observed, from the high rate of mercantile profit. Capital is then scarce, and the gain accruing from the employment of it is proportionally considerable.

The reader, possibly, may think that an extension of bank loans, by furnishing additional capital, may reduce the profit on the use of it, and may thus lessen the temptation to borrow at five per cent. It has been already remarked in this Chapter, that capital, by which term bona fide property was intended, cannot be suddenly and materially increased by any emission of paper. That the rate of mercantile profit depends on the quantity of this bona fide capital, and not on the amount of the nominal value which an in-
creased emission of paper may give to it, is a circumstance which it will now be easy to point out.

I admit, that a large extension of bank loans may give a temporary check to the eagerness of the general demand for them. It will cause paper to be for a time over abundant, and the price paid for the use of it, consequently, to fall.

It seems clear, however, on the principles already stated, that when the augmented quantity of paper shall have been for some time stationary, and shall have produced its full effect in raising the price of goods, the temptation to borrow at five per cent, will be exactly the same as before; for the existing paper will then bare only the same proportion to the existing quantity of goods, when sold at the existing prices, which the former paper bore to the former quantity of goods, when sold at the former prices: the power of purchasing will, therefore, be the same; the terms of lending and borrowing must be presumed to be the same; the amount of circulating medium alone will have altered, and it will have simply caused the same goods to pass for a larger quantity of paper. To assume under such circumstances the same rate of mercantile profit to subsist, is only to suppose that the trader will be situated neither more nor less advantageously than before; and that the annual gain which he will obtain by trading with the same quantity of goods, will bear the same proportion as before to their current cost. If this observation be just, there can be no reason to believe that even the most liberal extension of bank loans will have the smallest tendency to produce a permanent diminution of the applications to the bank for discount. It is the progressive aug-
mentation of bank paper, and not the magnitude of its existing amount, which gives the relief. It thus appears, that the moderation and forbearance among borrowers, which were supposed likely to restrain the too great emission of paper, are only to be excited by the means of its perpetual increase; by the means, that is to say, of the very evil which it was assumed that they would be sufficient to prevent.

The danger of enlarging the loans of the bank in proportion to the extension of the demand for them, may be more particularly shewn by adverting to the case of the sudden transfer to foreign countries of capital which had been antecedently lodged in this. Let us suppose the foreign owners, either of British stocks, or of property left in the hands of English correspondents, to draw during the space of three months to a very large amount; and let us imagine that, in consequence of such an event, the exchange turns against Great Britain to the extent of five per cent. and moreover that, at the end of the three months, the drafts ceasing, and the mercantile state of the country improving, the exchange returns to its proper level. In this case any Englishman who can send goods abroad on his own account, and draw for them during the three months in question, will gain an extra profit of five per cent. supposing him to buy them in England for the same English money, and to sell them abroad for the same foreign money, for which goods may be bought and sold at the periods preceding, and following the interval of time of which we are speaking. A similar extra profit will be obtainable during the same three months by a variety of other modes of employing capital. It is obvious, for example, that
the public funds may be expected to experience a sudden fall through the great sale or foreign property in the stocks, which we have imagined to take place. He, therefore, who shall buy into the funds at the season of depression, and shall sell out at the expiration of the three months, will be likely to derive a benefit from this species of speculation. It is also plain that the quantity of goods in Great Britain will be reduced through the enlarged exportations, as well as through the suspension of imports, to which the state of the exchange will have given occasion. The profit, therefore, on the use of the remaining stock will be generally augmented. The exportation of bullion will afford a gain of the same sum of five per cent. the expense of transporting it being, indeed, deducted. The demand upon the bank for discounts is, therefore, likely to be particularly earnest during the period of which we are speaking; and it is important here to notice, that the ground on which it will be made will not be that which was spoken of in an early part of this work. It will not be the privation of that quantity of circulating medium which is necessary for carrying on the accustomed payments, for these will be very immaterially increased; the cause of the extraordinary applications to the bank will be the temporary advantage which may be gained, or the loss which may be avoided, by borrowing, during the three months in question, at the rate of five per cent. A pressure, it is true, may be occasioned by the multitude of foreign drafts, and it may resemble that which would arise from a diminution of Bank of England paper. Some of those merchants in whose hands the foreign property had been placed may not be able,
with sufficient readiness, to spare from their commerce the sums necessary to answer the bills drawn upon them. Creditors, not being permitted to demand more than five per cent. interest from their debtors, are apt, at particular junctures, to call in their money, for the sake of taking to themselves the extraordinary benefit to be obtained by the use of capital. The disappointments thus brought on persons trading with borrowed wealth are often productive of much evil. The maintenance of the accustomed quantity of Bank of England notes may, therefore, be insufficient to furnish the means of securing the usual regularity of the payments of the metropolis; and a material diminution of paper may be particularly inconvenient. Possibly an augmentation of it may be necessary to the due maintenance of credit, if we suppose, however, a very great increase of bank notes to take place (and an increase, probably, equal to the total capital transferred on account of foreigners, will immediately be desired), the result must be a very important fall in the exchange, in addition to the fall of five per cent. already mentioned; and a new and proportionate danger to the Bank of England.

The point which it has been the object here to explain, might have been equally illustrated by imagining either the case of a strong disposition in many British subjects to transfer their own property to foreign countries, in order to lodge it there; or the case of a general eagerness to extend foreign commerce; for we must assume the transfer to foreign parts of an additional British capital to take place on either of these suppositions.

The preceding observations explain the reason of a
determination, adopted some time since by the bank directors, to limit the total weekly amount of loans furnished by them to the merchants. The adoption of a regulation for this purpose seems to have been rendered necessary by that impossibility of otherwise sufficiently limiting, at all times, the Bank of England paper, which it has been the design of this Chapter to point out.

The regulation in question I consider as intended to confine within a specific, though in some degree fluctuating, sum, the loans of the bank, for the sake of restricting the paper. The variations in the amount of loans fail of producing exactly correspondent variations in the amount of paper, in proportion as the gold of the bank fluctuates. But the regulation being a weekly one, opportunity is afforded of correcting this attendant imperfection before any material evil can have arisen. The changes which occur in the amount of the loans to government form another ground for taking into weekly consideration the sum which shall, in the succeeding week, be afforded to the merchants.

To limit the total amount of paper issued, and to resort for this purpose, whenever the temptation to borrow is strong, to some effectual principle of restriction; in no case, however, materially to diminish the sum in circulation, but to let it vibrate only within certain limits; to afford a slow and cautious extension of it, as the general trade of the kingdom enlarges itself; to allow of some special, though temporary, increase in the event of any extraordinary alarm or difficulty, as the best means of preventing a great demand at home for guineas; and to lean to the side
of diminution, in the case of gold going abroad, and
of the general exchanges continuing long unfavoura-
ble; this seems to be the true policy of the directors
of an institution circumstanced like that of the Bank
of England. To suffer either the solicitations of mer-
chants, or the wishes of government, to determine
the measure of the bank issues, is unquestionably to
adopt a very false principle of conduct.
CHAPTER XI.

Of the Influence of Paper Credit on the Price of Commodities. Observations on some Passages of Montesquieu and Hume. Conclusion.

This subject has been in so great a degree anticipated by the discussions which have taken place; that it will scarcely be necessary to do more than to remind the reader of the principles which have been laid down, and to point out the manner in which they bear upon the present question.

It was observed in a former Chapter, that a very considerable advance in the price of the commodities bought and sold in one quarter of this kingdom, while there was no such rise in any other, was not supposeable; because the holders of the circulating medium current in the spot in which goods were imagined to have been rendered dear, would exchange it for the
circulating medium of the part in which they were assumed to be cheap, and would then buy the commodities of the latter place, and transport them to the former, for the sake of the profit on the transaction.

The exchangeableness of our country paper for our London paper was represented as always in this manner preventing the quantity of paper circulating in one place from being very disproportionate to the quantity circulating in another; and as also precluding any great local rise in the price of commodities within our own island.

We may justly extend our views, and conceive of Europe, and even of the world, as forming one great kingdom, over the whole of which goods pass and re-pass, as suits the interest of the merchant, nearly in the same manner in which they spread themselves through this single country.

In one particular, indeed, the resemblance between the two cases fails. Country bank paper, as compared with Bank of England notes, cannot be, to a material degree, excessive in any part of England; because, by the custom of our country banks, it is convertible, without any discount, into the London paper. But British paper is not exchangeable for the circulating medium of the continent, unless a discount, or difference, be allowed. Of this fluctuating discount, or difference, the variations in the course of exchange are the measure.

It is true that the continental circulating medium, like our own, varies in value. Both, however, commonly vibrate only within certain limits; and both may be considered as fluctuating exactly so far as their
value differs from that of bullion. To say that bullion varies in its price, is to say that there is an alteration in the general exchangeable value of that article, which constitutes the standard of the world.

We are led, by these observations, to divide our subject into two branches of inquiry: first, into the question how far our paper credit may have raised the price of goods in Great Britain, by causing their current price here (that is to say, their price in British paper, as well as in British coin) to be higher than their bullion price; and, secondly, how far also the bullion price of our commodities here (that is to say, their value in exchange for the article of bullion) may be suspected of having been enhanced by means of the paper credit of Great Britain.

As to the first question; the highest influence which a too extended paper credit can have had in raising the current price of commodities in Great Britain above their bullion price, must be measured by the difference which has subsisted between the market price and mint price of gold; or, which is nearly the same thing, by the fluctuation in the state of our general exchanges. This difference or fluctuation has at no period been more than about ten or twelve per cent. Even this variation, however, has not been fairly referable to a too great issue of paper, but rather to the peculiar circumstances of the country; and, in particular, to our two bad harvests, which sufficiently account for the unfavourable state of our exchanges.

The second question is, how far the bullion price of our commodities may be suspected of having been
raised through the influence of the paper credit of Great Britain.

It was formerly stated, that the bullion price of articles may be considered to be their general price: because bullion necessarily bears that value, or nearly that value, in each country, in exchange for goods, which it bears in all, allowance being made for the expense of their transmission, inclusive of export and import duties, ordinary profit of the merchant, freight, insurance, and other customary charges. The expense of the transportation of commodities from the several places of their growth or manufacture, an expense which is great in some cases, and small in others, is the measure of the difference subsisting between the bullion prices of the same articles, at the same time, in different parts of the world. Each addition to this difference implies an extra profit on the transportation either of bullion or of goods; and must be supposed soon to cause the one or the other to be carried over in such quantity as to restore their due relative price. Every rise, therefore, of the bullion price in Great Britain of those commodities which she is accustomed to export, if we suppose the usual exportation to continue, implies an equal, or nearly equal, enhancement of the bullion price of all articles of the same class in every foreign part in which our commodities are sold.

Great Britain so remarkably takes the lead in manufactures and commerce, that she may not unjustly be deemed to have the power, especially in a time of general war, of prescribing to foreign countries the rate at which they shall buy her commodities.

That monopoly of the supply, however, which I
am here supposing Great Britain to possess, is, probably, but temporary, and, in every respect, imperfect. In most of her sales abroad she meets with strong competition; for, though other countries may not rival her in the quality of her goods, they can, generally, furnish a substitute, which, if British prices are much lifted up, will gain, by comparative cheapness, the preference. Every great enhancement of the cost of our articles must lessen the foreign demand for them. It must reduce our exported and augment our imported goods. By thus turning the balance of trade against us, and rendering our exchanges unfavourable, it must cause the rise at home to be a rise not in the bullion price of our articles, the subject which we are now considering, but in the paper or current price, the point which was noticed before. If the advance is in the paper or current price, the bank is compelled to restrict its issues; and the reduction of the quantity of bank notes has a tendency to limit the cost not only of those particular commodities which are the subjects of exportation, but of every commodity in the kingdom.

That the bullion price of some British articles has lately been much increased, and that the bullion price of all, or of almost all, has in some degree risen, are facts which cannot be doubted. But that this enhancement is to be charged to an increase of paper, is not equally to be admitted; for it is plain that other causes have powerfully operated, namely, a state of war, new taxes, and two bad harvests, which, by raising the price of bread, have in some degree lifted up that of labour, and of all commodities. Our prices may have also been partly augmented by the enhancement
of the cost of raw materials brought from other countries.

Although it should be granted, as it must, either that the amount of our paper has been enlarged in proportion to the extension of pecuniary transactions; or that an increased economy in the use of it has rendered an equal quantity sufficient for more payments (and it seems of little moment which of these two suppositions is adopted): still it may be questioned whether the extended issue of paper ought to be deemed the cause of the high prices; or whether the high prices ought not to be deemed the cause, and the increase of paper the effect.

It was before remarked, that it seems in general more fair to consider the latter to be the case, when the extension of paper is not such as to be the means of reducing its value below that of bullion. To prove the reasonableness of this observation, let us imagine the paper credit of this country to be abolished, and our payments to be conducted by a circulating medium consisting wholly of gold; and let us assume, that we still find ourselves able to procure for our commodities sent abroad a higher bullion price than before. In this case the bullion price of articles at home will also experience a rise; for the high bullion prices abroad will have the effect of enlarging our exported and diminishing our imported goods; of rendering our balance of trade favourable, and of bringing gold into the kingdom; which increase of gold will have precisely the same effect as an augmentation of paper, namely, that of raising British prices. The bullion will continue to flow in until it shall have brought the bullion price of goods in England to a level with the bullion
prices of the same articles in foreign parts, allowing for charges of transportation. On the ability, therefore, of Great Britain to maintain a high bullion price for her goods abroad, would depend the bullion price of her commodities at home, in the event of her employing gold as her only circulating medium.

If we suppose paper to constitute the circulating medium of Great Britain, and an increased bullion price for her commodities abroad to be in like manner obtainable, the case will in the main be similar, though in one particular it will differ. The case will be similar, inasmuch as Great Britain will experience, exactly as if she made use only of gold, an increase in the price of her commodities at home, as well as an enlargement of the quantity of her circulating medium; such an enlargement, I mean, as is necessary for effecting her more extended payments. The case will differ, inasmuch as, instead of importing the additional circulating medium which is wanted, she will create it. The production, therefore, of a rather less quantity of exportable articles will be necessary on the one supposition than on the other; and the state of the exchange itself will be in some degree affected by this variation in the circumstances of the two cases.

It may, perhaps, be thought, that I have considered the bullion price of goods in Great Britain as exclusively depending on the bullion price of the same kind of commodities abroad; and that I ought to have stated the converse to be also in some measure the fact, namely, the bullion price of articles abroad to depend in part on the bullion prices of Great Britain. I have intended thus to represent the case. My position has been this,—that the bullion price of articles
in Great Britain conforms itself to the bullion price abroad; but that, in the formation of this bullion price abroad, the British price has some share of influence: and this influence I have considered to be proportioned to the degree of our monopoly of the supply of the foreign markets.

There is an additional mode of considering the influence of paper credit on the bullion price of articles.

The increased use of paper in each individual country must contribute to lower the price of bullion, by lessening the general demand for it in the world. On every advance in the cost of commodities, it may be suspected that the means of effecting the increased payments are supplied not by bringing more gold into use, but rather by the enlargement of that part of the circulating medium which consists in paper. No inconsiderable portion of British gold coin is employed in effecting the fractional parts of payments; and the total amount of these does not increase in the same proportion in which the sum total of payments is augmented.* Moreover, the art of economizing gold is

* The bank notes in circulation commonly are notes for five, ten, fifteen, twenty, twenty-five, thirty, forty, fifty, and one hundred pounds and upwards. If we suppose the price of all articles to be doubled, then we may assume every payment of one guinea to be a payment of two guineas, and to employ a double quantity of gold; every payment of two guineas to be a payment of four guineas, and also to employ a double quantity of gold; but every payment of three guineas will be a payment of six, and it may employ a five pound note, the fractional part only being paid in money. This particular payment will, therefore, require less gold. A payment of four guineas will be a payment of eight, and will also require less gold. The payments of more than four guineas,
continually advancing. The very vicissitudes of com­merce, probably, tend to improve it. A time of dis­tress, such as was felt in 1793, compels many to re­sort to new expedients, tending to spare the use both of Bank of England notes and of coin. The measures adopted, at first, through necessity, are afterwards persisted in because they are economical. To put the case which we have more recently experienced. An unfavourable balance of trade, arising out of the disadvantageous circumstances of the country, causes our guineas to go abroad. Paper is necessary to sup­ply their place. Experience of the loss incurred by hoarding money, and of the practicability of sustaining both private and public credit during the absence of gold, strengthens the general confidence in a paper currency, and encourages a permanently increased use of it. If we could suppose as large a substitution of paper in the place of coin to take place in other coun­tries as we have lately experienced in our own; the diminution of the demand for bullion might be such as very materially to affect its general value, and to enhance the money price of articles over the world.

There is, however, a limit to this evil. The annual supply of the precious metals is obtained from mines, of which some afford to the proprietors a higher and

when, in like manner, doubled, will some of them employ a greater and some a less quantity of gold than before. They will employ, taking them together, the same quantity. It is evident from this statement, that an increase of the quantity of the circulating medium of a country employing paper in its larger payments, and coin only in the smaller, will consist chiefly of paper; a circumstance which may considerably tend to prevent an increased demand for bullion on the occasion of an augmentation of prices, and which may, therefore, greatly facilitate a rise of the bullion price of articles in the world.
others a lower revenue, and some probably no revenue at all. If we suppose the increased use of paper to lower, in any degree, the value of the precious metals; we must assume those mines which have not yielded any rent, to be no longer worked; and the supply of gold and silver to be, in consequence, somewhat reduced. If we imagine the reduction of the price of the precious metals to be progressive, we must conceive a period to arrive when all mines will be unable to defray the charge of extracting the ore, except those which now yield the very highest rent. At this point the fall will necessarily stop. In other words, gold and silver must continue to bear that price, or nearly that price, at which they are now exchangeable for commodities, a deduction being made of the total present rent derived from the richest mines; a deduction which, if Dr. A. Smith's observations on this subject are just, cannot be very considerable.

Mr. de Montesquieu has represented, in the following manner, the principle which regulates the price of the precious metals. He "compares the mass of gold and silver in the whole world with the quantity of merchandise therein contained," and "every commodity with a certain portion of the entire mass of gold and silver:" and then observes, that, "Since the property of mankind is not all at once in trade, and as the metals or money also are not all in trade at the same time; the price is fixed in the compound ratio of the total of things in trade with the total of signs in trade also." This theory, though not altogether to be rejected, is laid down in a manner which is very loose and fallacious.*

* It is controverted at great length in the work of Sir James Stewart on Political Economy.
Not to mention the misconception of the subject which may arise from the silence of Mr. de Montesquieu respecting the state of the mines, it may be observed, first, that he alludes, in a manner so imperfect as to be scarcely intelligible, to those effects of the different degrees of rapidity in the circulation both of money and goods, which it has been one object of this work to explain. It is on the degree of the rapidity of the circulation of each, combined with the consideration of quantity, and not on the quantity alone, that the value of the circulating medium of any country depends.

Mr. de Montesquieu also leaves out of his consideration the custom of transacting payments by means of entries in books, and of other expedients. In proportion as contrivances of this sort prevail; and they must abound more and more as commercial knowledge advances in the world; the demand for bullion will be diminished.

He also does not advert to that reserve of gold and silver in the coffers of the banks of various countries which merely forms a provision against contingencies. The amount of this reserve will depend on the opinion which the banks entertain respecting the extent of the sum likely to be suddenly drawn from them, in consequence either of fluctuations in the national balances of trade, or of temporary interruptions of credit among individuals. In proportion, therefore, as the variations in the national balances of trade, as well as in the state of commercial confidence, are greater or smaller, the fund of gold which is kept out of circulation will be more or less considerable. On the amount of this fund depends, in no inconsiderable degree, the price of bullion in the world.
Mr. de Montesquieu likewise omits to take into his account that now immense and perpetually increasing influence in sparing the precious metals which arises from the use of paper credit. The false impression which he gives of this subject, may chiefly be referred to his not having contemplated the effects of the introduction of the banking system.

Mr. Hume has spoken strongly of the influence of paper credit in sparing the use of the precious metals, and in proportionably lowering their value, and raising that of labour and of commodities. He inveighs against bank paper on this account, as well as on some others; but, in so doing, he appears to assume, that paper credit causes a merely local rise in the price of articles; a rise, I mean, which extends itself only over the whole of the single independent country in which the paper is issued. That bank is considered by him as most advantageous to a state, which locks up all the gold received in return for its notes [he admits that it will have no profit on its dealings], and thus causes the total quantity of circulating medium to remain the same. The price of labour, he says, will, in this manner, be kept down. The Bank of Amsterdam is approved by him, on account of its being an establishment of this nature.* In thus repre-

* It has been already observed, that, when the French possessed themselves of Holland, it was discovered that the Bank of Amsterdam had been accustomed privately to lend its deposits of specie to the city of Amsterdam, and, also, to the old Dutch government. The specie thus lent, as soon as goods in exchange for it experienced a very small rise in Holland, would naturally find its way to other countries. The following are the passages from Mr. Hume, referred to in the text.

"In general we may observe, that the dearness of every thing, from plenty of money, is a disadvantage which attends an established com-
senting the subject, he appears to forget, that, when the total circulating medium of a country, whether

"merce, and sets bounds to it in every country, by enabling the poorer
states to undersell the richer in all foreign markets.

"This has made me entertain a doubt concerning the benefit of banks
and paper credit, which are so generally esteemed advantageous to every
nation.

"That provisions and labour should become dear by the increase of
trade and money, is, in many respects, an inconvenience; but an in-
convenience that is unavoidable, and the effect of that public wealth
and prosperity which are the end of all our wishes. It is compensated
by the advantages which we reap from the possession of these precious
metals, and the weight which they give the nation in all foreign wars
and negotiations. But there appears no reason for increasing that in-
convenience by a counterfeit money, which foreigners will not accept of
in any payment, and which any great disorder in the state will reduce
to nothing. There are, it is true, many people in every rich state, who,
having large sums of money, would prefer paper, with good security,
as being of more easy transport, and more safe custody. If the public
provide not a bank, private bankers will take advantage of this cir-
cumstance, as the goldsmiths formerly did in London, or as the bank-
ers do, at present, in Dublin: and, therefore, it is better that a public
company should enjoy the benefit of that paper credit, which always
will have place in every opulent kingdom. But to endeavour artifi-
cially to increase such a credit, can never be the interest of any trading
nation, but must lay them under disadvantages, by increasing money
beyond its natural proportion to labour and commodities, and thereby
heightening their price to the merchant and manufacturer. And, in
this view, it must be allowed that no bank could be more advantageous
than such a one which locked up all the money it received [this is the
case with the Bank of Amsterdam]; and never augmented the circu-
lating coin, as is usual, by returning part of its treasure into com-
merce. A public bank, by this expedient, might cut off much of the
dealings of private bankers and money-jobbers; and, though the state
bore the charge of salaries to the directors and tellers of this bank (for,
according to the preceding supposition, it would have no profit from its
dealings), the national advantage resulting from the low price of la-
consisting of gold, or of paper, or of both, is rendered excessive; when it has thus lifted up the gold price of

"bour, and the destruction of paper credit, would be a sufficient com-
penation."—Hume's Essay on Money.

That the increase of the money of an individual state can have no very great and permanent effect in raising the price of labour, or of commodities, on account of the tendency of so much of the coin as is excessive to transport itself to other countries, as soon as it shall have raised the cost of articles above their general level in the world (the principle contended for in the text), is shewn, on the authority of Mr. Hume himself, in the following passage. Mr. Hume, indeed, names money alone; but his observation is equally applicable to the case of money and paper taken together, of which I have spoken.

"Suppose four-fifths of all the money in Great Britain to be annihi-
lated in one night, and the nation reduced to the same condition, with
regard to specie, as in the reigns of the Harrys and Edwards; what
would be the consequence? Must not the price of all labour and com-
mmodities sink in proportion, and every thing be sold as cheap as they
were in those ages? What nation would then dispute with us in any
foreign market; or pretend to navigate or to sell manufactures at the
same price which to us would afford sufficient profit? In how little
time, therefore, must this bring back the money which we had lost, and
raise us to the level of all the neighbouring nations; where, after we
have arrived, we immediately lose the advantage of the cheapness of la-
bour and commodities; and the farther flowing in of money is stopped
by our fullness and repletion?

"Again; suppose that all the money of Great Britain were multiplied
five fold in a night; must not the contrary effect follow? Must not
all labour and commodities rise to such an exorbitant height, that no
neighbouring nations could afford to buy from us; while their commo-
dities, on the other hand, became, comparatively, so cheap, that, in
spite of all laws which could be formed, they would be ran in upon us,
and ours flow out, till we fell to a level with foreigners, and lose that
great superiority of riches which has laid us under such disadvantages?

"Now it is evident that the same causes which would correct these ex-
orbitant inequalities, were they to happen miraculously, must prevent
their happening in the common course of nature; and must for ever, in
all neighbouring nations, preserve money nearly proportionate to the art
and industry of each nation."—Hume's Essay on the Balance of Trade.
articles above the point at which they stand in adjacent countries, the gold is obliged, by the operation of the exchange, to transport itself to those other parts; and that paper credit, therefore enhances the prices not of that single spot in which it passes, but of the adjoining places, and of the world. The state which issues paper only in such quantity as to maintain its general exchanges, may be considered as substituting paper in the place of gold, and as gaining additional stock in return for whatever coin it may cause to be exported. It derives, therefore, from its own issue, the whole advantage of this augmentation of capital. It participates with other countries in that inconvenience of a generally increased price of commodities which its paper has contributed to produce.

That the popular opinion which was lately entertained of the great influence of paper credit in raising the price not only of commodities in general, but of provisions in particular, had no just foundation, is a position which admits of easy proof.

First, that opinion has proceeded on the assumption of the fact of a vast increase of the total circulating medium of the kingdom, within the last two or three years, the period during which the high prices have subsisted. But I have shewn both that the amount of the notes of the Bank of England has lately not been such as to imply a material augmentation of the circulating medium of the metropolis, and, also, that the quantity of circulating medium in the country necessarily conforms itself to that of London, for which it is exchangeable. It has obviously been the use of country bank notes, and especially of the smaller ones, in the place of gold, not in addition to it, which has been the chief occasion of the prevailing suspicion:
for the common complaint has been not only that paper has been multiplied, but, also, that guineas have been hardly to be seen: and it has not been considered, that by this double invective some sort of acknowledgement is made that the one article is only that substitute for the other, by which none of the supposed effect on the price of commodities can be produced.

It is sometimes said, that the additional loans which the paper of the country banks has enabled them to furnish, have encouraged mercantile speculation; and that we may ascribe to the spirit thus excited much of the late rise in the price of articles in general, and of corn in particular.

There is an error in the public sentiment on this subject, which it is important to correct.

It has been already shewn, that it is by the amount not of the loans of the Bank of England, but of its paper; or if of its loans, of these merely as indicating the quantity of its paper, that we are to estimate the influence on the cost of commodities. The same remark may be applied to the subject of the loans and paper of country banks. For the sake of more fully illustrating this point, let us examine into the several ways in which a country banker may be supposed to extend his loans, without augmenting the quantity of circulating medium in the kingdom.

He may be enabled to do this, first, through the enlargement of the deposits lodged with him. In this case some of his customers may be considered as leaving with him, or as lending to him, a sum which is lent by him to other customers. This is the same as if some individuals were to lend to others,
without the intervention of the banker. Loans of this nature will be admitted not to have the supposed influence on prices.

A country banker may also increase his loans, without augmenting the quantity of the circulating medium of the country, in the following manner. He may extend the issue of his own paper, and then that paper may circulate in the place of gold either hoarded or exported. If the gold is hoarded; if a quantity of coin locked up by one man equals the amount of the new paper issued by another; it is plain that there will not be the supposed influence on prices. If the gold is exported, we must consider it in the same light with any other commodity sent abroad. It is true that the paper, according to this supposition, may be said to give existence to an additional exportable article: but so also does every increased exertion of the national industry, as well as every favourable harvest. An augmentation of prices is no more to be inferred from the creation of a new exportable commodity in the one case than in the others.

The following facts furnish a convincing proof that the late high prices of corn have not been owing to the enlargement of Bank of England paper.

By the account which the bank rendered to Parliament, it appears, that the amount of Bank of England notes was, on the 25th of February, 1795, 13,539,160l. In the three months immediately following the 25th of February, 1795, the average price of wheat, in the London corn-market, was about 57s. per quarter.

By the same bank account, it appears, that the amount of Bank of England notes was, on the 25th of February, 1796, 11,030,116l. In the three months
immediately following the 25th of February, 1796, the average price of wheat, in the London corn market, was about 94s. per quarter.

Thus wheat bore a comparatively low price when the amount of bank notes in circulation was greater; and a comparatively high price when their amount was smaller. It bore the moderate price of 57s. per quarter, at a time when the amount of Bank of England notes was full as considerable (allowing for about two millions of 1l. and 2l. notes) as it is known to have been at any period.

Paper credit may be considered as tending, in some respects, to reduce the price of commodities. It was compared, in a former chapter, to a cheap species of machinery, which is substituted in the place of a dear one; and it is obvious, that, in proportion as any instrument of manufactures or commerce is less expensive, the articles which it contributes to produce may be afforded at a lower rate.

Paper credit, also, promotes general cheapness, by sparing much expense and trouble in weighing, counting, and transporting, money; and by thus facilitating more particularly the larger transactions of the merchant. Mr. Hume appears to suppose, that, when a great increase of it takes place, the augmentation is artificially produced. But it has been shewn, that mercantile persons naturally resort more and more to the use of paper, in proportion as wealth accumulates confidence improves, and commerce advances. The consumers of commodities may be considered as having an interest in permitting the merchants to follow their own plans of economy, in this respect, in the same manner as in all others.
But whatever may be the amount of that influence on the price of commodities which ought to be ascribed to paper credit, one point is clear, namely, that, during the period in which our paper has extended itself, our trade has prospered, the state of our agriculture has advanced, and both the capital and the income of the country have been augmented.

The chief mischiefs which, according to Mr. Hume, are to be apprehended from any considerable addition to our paper currency, may be stated to be the following: first, the great enhancement of the price of British labour and commodities, an evil with which we ought unquestionably to connect that of the diminution of the sale of our manufactures in foreign markets; secondly, the inconvenience to which we may be exposed in time of war through the want of sufficient means of making remittances in bullion to other countries; and, thirdly, the confusion which the failure of paper credit may produce at home in the event of any great disorder in the nation.

That the first consequence (the great enhancement of the price of British labour and commodities) cannot follow from the enlargement of our paper currency in the degree which Mr. Hume supposes, has been proved from the circumstance of our paper causing guineas to go abroad, and tending, therefore, to raise the prices of the world rather than those of our own single island. That our prices, however high, have not been such as to lessen the vent abroad of our home made articles, and have, therefore, not been raised above the prices of other countries, is proved by those documents from our custom-house which state the
continually increasing quantity of manufactures exported by Great Britain.*

That the second evil (that of our being reduced to difficulty in making remittances abroad in time of war through the want of bullion) is one which there is less reason to dread than Mr. Hume has imagined, may likewise be inferred from recent experience. We have been able to maintain the credit of our funds, and to carry on all our financial operations, during the whole of the late expensive and protracted contest, although in the commencement of it our stock of circulating gold was probably less than in many former periods; and although, also, in the last years of the struggle, a period in which we lent considerable sums to Ireland, and had to purchase immense quantities of foreign grain, we were in a great measure deprived of current coin, and the cash payments of the Bank of England remained suspended.

Mr. Hume himself has remarked, "That want of money can never injure any state within itself; for that men and commodities are the real strength of any community." He might have added, that Want of money can never injure any state in its transactions with foreign countries, provided it sufficiently abounds

* The British manufactures exported in 1785 amounted to—

with commodities which are in demand abroad, and which it can afford to sell at a bullion price lower than that for which foreign articles of a similar kind can be afforded. The power of manufacturing at a cheap rate is far more valuable than any stock of bullion. Even the greatest quantity of gold which we can be supposed at any time to possess, bears but a small proportion to our extraordinary expenditure in time of war, and affords a security which is extremely slender in comparison of that which we derive from the commercial capital, the manufacturing skill, and the other resources of the country.

That the third evil (the confusion which the failure of paper credit may produce in the event of any disorder at home) is less a subject for apprehension than Mr. Hume and other British writers have conceived, is a point which a great part of the preceding work will have contributed to establish.

During the late scenes of trouble and consternation on the continent, the possession of a stock of the precious metals probably added little to the security of any nation. When the French armies approached, or when an insurrection was projected, a stock of gold and silver possessed by a government bank might contribute to invite attack; or if the fund should at such a juncture be expended in the public service, it would not long continue to perform the office of a circulating medium. It might even disappear after effecting a single payment.

Our own island has been preserved, through the favour of Providence, from those violent convulsions which have been felt on the continent. We have, however, been exposed to many smaller evils, and, in par-
ticular, to the interruption of our mercantile credit. It was probable that the enemy, knowing how much our political strength depended on our commercial prosperity, and our commercial prosperity on the due maintenance of mercantile confidence among us, would direct his endeavours to the very object of exciting alarms over the kingdom, with the view of thus disturbing the course of our trade and manufactures. If therefore became us to protect ourselves by the best means in our power against this species of injury; and the continuance of the law for suspending the cash payments of the Bank of England has been one of the steps which parliament has deemed necessary.

There can be no doubt, that, in the situation in which we have thus found ourselves placed, we have been greatly benefited by the circumstance of our having been previously accustomed to the free use of a paper credit. In a commercial country, subjected to that moderate degree of occasional alarm and danger which we have experienced, gold is by no means that kind of circulating medium which is the most desirable. It is apt to circulate with very different degrees of rapidity, and also to be suddenly withdrawn, in consequence of its being an article intrinsically valuable, and capable of being easily concealed. If, during the war, it had been our only medium of payment, we might sometimes have been almost totally deprived of the means of carrying on our pecuniary transactions; and much confusion in the affairs of our merchants, great interruption of manufacturing labour, and very serious evils to the state, might have been the consequences.

Paper credit has, on this account, been highly im-
portant to us. Our former familiarity with it prepared us for the more extended use of it. And our experience of its power of supplying the want of gold in times of difficulty and peril, is a circumstance which, though it ought not to encourage a general disuse of coin, may justly add to the future confidence of the nation.

THE END.
