This report was prepared in the Statistical Indicators Division, Bureau of Economic Analysis. Technical staff and their responsibilities for the publication are-

Barry A. Eeckman-Technical supervision and review,
Morton Somer-Selection of seasonal adjustment methods,
Betty F. Tunstall-Collection and compilation of basic data. (Telephone 301-763-5448)
The cooperation of various government and private agencies which provide data is gratefully acknowledged. The agericies furnishing data are indicated in the list of series and sources at the back of this report.

This publication is prepared under the general guidance of a technical committee established by the Office of Management and Budget. The committee consists of the following persons:
Edgar R. Fiedler, Chairman
Department of the Treasury
Murray F. Foss, Council of Economic Advisers, Executive Office of the President
George Jaszi, Bureau of Economic Analysis, Department of Commerce
Julius Shiskin, Bureau of Labor Statistics,
Department of Labor
Kenneth Williams, Federal Reserve Board

U. S. DEPARTMENT OF COMMERCE

Frederick B. Dent, Secretary
Sidney L. Jones, Assistant Secretary for Economic Affairs

## NATIONAL

INCOME AND
PROLIUCT accounts summarize both receipts and final expenditures for the personal, business, foreign, and government sectors of the economy and provide useful measures of total economic activity. The total of the final expenditures, which equals the total of the receip's, is known as gross national product, the most comprohensive single measure of aggregate economic output. GNP is defined as the total market value of the final output of goods and services produced by' the Nation's economy.

CYCLICAL INDICATORS
are economic time series which have been singled out as leaders, coinciders, or laggers in relation to movements in aggregate economic activity. In this report, the series on the NBER's list of cyclical indicators are classified by economic process and by cyclical timing. These indicators were selected primarily on the basis of their cyclical behavior, but they have also proven useful in forecasting. measuring, and interpreting other short-term fluctuations in aggregate economic activity.

## ANTICIPATIONS

## AND

INTENTIONS data
provide information
on the plans of businessmen and consumers regarding their major economic activities in the near future. This information is considered to be a valuable aid to economic forecasting either directly or as an indication of the state of confidence concerning the economic outlook. A number of surveys by various organizations and government agencies have been developed in recent years to ascertain anticipations and intentions. The results of some of these surveys, expressed as time series, are presented in this report.

This monthly report brings together many of the economic time series found most useful by business analysts and forecasters. Its predecessor, Business Cycle Developments, emphasized the cyclical indicators approach to the analysis of business conditions and was based largely on the list of leading, roughly coincident, and lagging indicators maintained by the National Bureau of Economic Research, Inc. Some other approaches commonly used by students of economic conditions include econometric models and anticipations and intentions data. The econometric model concept utilizes historical and mathematical relationships among consumption, private investment, governinent, and various components of the major aggregates to generate forecasts of gross national product and its composition. Anticipations and intentions data express the expectations of businessmen and the intentions of consumers. Most of the content of Business Cycle Developments has been retained in this new report and additional data reflecting the emphasis of other approaches have been added to make it more generally useful to those concerned with an evaluation of current business conditions and prospects.

The use of the National Bureau's list of indicators and business cycle turning dates in the cyclical indicators section of this report, as well as the use of other concepts, is not to be taken as implying endorsement by the Bureau of Economic Analysis or any other government agency of any particular approach to economic analysis. This report is intended only to provide statistical information so arranged as to facilitate the analysis of the course of the Nation's economy.

Almost all of the basic data presented in this report have been published by their source agencies. A series finding guide, as well as a complete list of series titles and data sources, is shown at the back of this report.

Subscription price, inc:luding supplements, is $\$ 45.80$ a year ( $\$ 11.45$ additional for foreign mailing. Single issues are $\$ 3.70$. Airmail delivery is available at an additional charge. NEW FEATURES
AND CHANGES
FOR THIS ISSUE
A limited number of changes are made from time to time to incorporate recent findings of economic research, newly avail. able time series, and revisions made by source agencies in concept, composition, comparability, coverage, seasonal adjustment methods, benchmark data, etc. Changes may result in revisions of data, additions or deletions of series, changes in placement of series in relation to other series, changes in composition of indexes, etc.
3. The series on Net change in mortgage debt held by financial institutions and life insurance companies (series 33) has been revised to reflect (a) revisions, beginning January 1971, in basic data for mortgages held by savings and loan associations and (b) revisions, beginning January 1973, in basic data for mortgages held by weekly reporting member banks of the Federal Reserve System. Further information concerning these revisions may be obtained from the Federal Home Loan Bank Board, Office of Economic Research and from the Board of Governors of the Federal Reserve System, Banking Section.
4. Basic data for the series on Commercial and industrial loans outstanding, weekly reporting large commercial banks (series 72 and 112) have been revised for the period beginning January 1973. These revisions reflect the source agency's annual updating of these statistics. Fixther information concerning these revisions may be obtained from the Board of Governors of the Federal Reserve System, Banking Section.
5. The series on Manufacturing and trade inventories (serias 3I, 71, and 851) have been revised by the source agency for the period beginning January 1972. These revisions reflect revised estimates of retail inventories and updated seasonal adjustment factors. Further information concerning these revisions may be obtained from the Bureau of Economic Analysis, National Income and Wealth Division.
6. Appendix $C$ contains historical data for series 28, 29, 33, 37, $46,47 \mathrm{~b}, 47 \mathrm{c}, 54, \mathrm{D} 4,59,66,72,85,102,103,112,113,853$, and 860.

# METHOD OF PRESENTATION 

THIS REPORT is organized into six major subject sections, as follows:
A. National Income and Product
B. Cyclical Indicators
C. Anticipations and Intentions
D. Other Key Indicators
E. Analytical Measures
F. International Comparisons

Each of these sections is described briefly in this introduction. Data for each of the above sections are shown both in Part 1 (charts) and in Part II (tables) of the report. Most charts begin with 1952 (except in section C where they begin with 1957); the tables contain data for only the last few years. Except for section F, the charts contain shading which indicates periods of recession in general business activity.

In addition to the charts and tables described above, each issue contains a summary table which shows the current behavior of many of the series, and several appendixes which present historical data, series descriptions, seasonal adjustment factors, and measures of variability. An index appears at the back of each issue. It should be noted that the series numbers used are for identification purposes only and do not reflect relationships or order.

## Seasonal Adjustments

Adjustments for average seasonal fluctuations are often necessary to bring out the underlying trends of time series. Such adjustments allow for the effects of repetitive intrayear variations resuling primarily from normal differences in weather conditions and from various institutional arrangements. Variations attributable to holidays are usually accounted for by the seasonal adjustment process; however, a separate holiday adjustment is occasionally required for holidays with variable dates, such as Easter. An additional adjustment is sometimes necessary for series which contain considerable variation due to the number of working or trading days in each month. As used in this report, the term "seasonal adjustment" includes trading-day and holiday adjustments where they have been made.
Most of the series in this report are presented in seasonally adjusted form and, in most cases, these are the official figures released by the source agencies. However, for the special purposes of this report, a number of series not ordinarily published in seasonally adjusted form are shown here on a seasonally adjusted basis.

## MCD Moving Averages

Month-to-month changes in a series are often riominated by erratic movements. MCD (months for cyclical dominance) is an estimate of the appropriate span over which to observe cyclical movements in a monthly series. (See appendix A.) It is the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. The more erratic a series is, the larger the MCD will be; thus, MCD is 1 for the smoothest series and 6 for the most erratic. MCD Digitized for FRASER
moving averages (that is, moving averages of the period equal to MCD) tend to have about the same degree of smoothness for all series. Thus, a 5 -term moving average of a series with an MCD of 5 will show its cyclical movements about as clearly as the seasonally adjusted data for a series with an MCD of 1 .

The charts for sections $B$ and $D$ include centered MCD moving averages for all series with an MCD greater than 4. The seasonally adjusted data are also plotted to indicate their variation about the moving averages and to provide observations for the most recent months.

## Reference Turning Dates

The historical business cycle turning dates used in this report are those designated by the National Bureau of Economic Research, inc. (NBER). They mark the approximate dates when, according to the NBER, aggregate economic activity reached its cyclical high or low levels. As a matter of general practice, neither new reference turning dates nor the shading for recessions will be entered on the charts until after both the new reference peak and the new reference trough bounding the shaded area have been designated. This policy is followed because of the conceptual and empirical difficulties of designating a current recession and the practical difficulties of terminating the shading' of a current recession without including part of a new expansion.

The national income and product accounts, compiled by the Bureau of Economic Anat ysis (BEA) summarize both receipts and final expenditures for the personal, business, foreign, and government sectors of the economy and provide useful measures of total economic activity. The total of the final expenditures (including additions to business inventories), which equals the total of the receipts (mainly incomes), is ksown as gross national product (GNP). GNP is defined as the total market value of the final output of goods and services produced by the Na tion's economy. It is the most comprehensive single measure of aggregate economic output.

Gross national product consists of four major components: (1) Personal consumption expenditures, (2) gross private domestic investment, (3) net exports of goods and services, and (4) government purchases of goods and services.

Personal consumption expenditures is the market value of goods (durable and nondurable) and services purchased by individuals and nonprofit institutions and the value of food, clothing, housing, and finan-
cial services received by them as income in kind. The total purchase cost is covered, including sales taxes. Home purchases are excluded, but the estimated rental value of owner-occupied homes is included.
Gross private domestic investment combines gross fixed investment and net changes in business inventories. Fixed investment consists of producers' durable equipment and private (as opposed to government) structures, including owneroccupied residential units. The estimates are gross in the sense that there is no deduction for capital consumption. The inventory component measures the change in the physical volume of inventories valued at current replacement cost.
Net exports of goods and services measures the excess of exports over imports. Exports include receipts from domestic output sold abroad, transportation, travel, other services, fees and royalties and income on investments in foreign areas. Imports include purchases of foreign goods, payments for transportation, travel and other services, military inditures as well as payments of income on foreign investments in the United States. More detail on U.S. balance of payments is provided in Section D.
Government purchases of goods and senv. ices includes general government expenditures for compensation of employees, net purchases from business and from abroad, payments to private nonprofit institutions for research and development, and the gross fixed investment of government enterprises. Not included are current outlays of government enterprises, acquisitions of land, transfer payments, subsidies, loans, and interest payments to domestic creditors.
A breakdown of the goods portion of GNP, covering durable and nondurable goods and both final sales and changes in business inventories, is also included in section A. Other major aggregates taken from the national income and product accounts are described below.
National income is the total earnings arising from the current production of goods and services and accruing to the labor and property employed in production. The components of national income are compensation of employees, proprietors' income, rental income of persons, corporate profits and the inventory valuation adjustment, and net interest.

Personal income measures the current income of individuals, owners of unincorporated businesses, nonprofit institutions, private trust funds, and private health and welfare funds. It consists of wage and salary disbursements, other labor income, proprietors' income, rental income of persons, dividends, personal interest income, and transfer payments to persons, less personal contributions for social insurance.
Disposable personal income is the personal income available for spending or saving. It consists of personal income less personal taxes and other nontax payments to general government.

Gross saving represents the difference between income and spending during an
accounting period. It is the total of personal saving, undistributed corporate profits, corporate inventory valuation adjustment, the excess of wage accruals over disbursements (usually negligible), government surplus or deficit, and capital consumption allowances.

Most of the series in this section are on a current-dollar basis, but some are shown on a constant: (1958) dollar basis so that the effects of price changes are eliminated. The implicit price deflator (computed by dividing the current-dollar data by the con-stant-dollar data) for total GNP is also shown.

The business cycle is generally described as consisting of alternating periods of expansion and contraction in aggregate economic activity; that is, the complex of activities represented by such concepts as total production, employment, income, consumption, trade, and the flow of funds. Although a recurrent pattern has been characteristic of American economic history, many economists do not consider it inevitable.
One of the techniques developed in business cycle research is widely used as a
tool for analyzing current economic conditions and prospects. This is the cyclical indicators concept, which singles out certain economic time series as being leaders, coinciders, or laggers in relation to movements in aggregate economic activity. The NBER has, since 1938, maintained a list of such indicators and has periodically subjected the list to extensive review. Their most recent (1966) list of 73 cyclical indicators is the basis for this section of BCD. These indicators were selected primarily for their cyclical behavior, but they have also proven useful in forecasting, measuring, and interpreting other short-term fluctuations in aggregate economic activity.

The NBER employs a dual classification scheme which groups the indicators by cyclical timing and by economic process, and this report uses tha same classification groupings. The diagram below summarizes the cross-classification system used in this section. The 80 cyclical indicators are presented with economic process as the principal basis of classification and cyclical timing as the secondary basis. The major processes are divided into minor processes which exhibit rather distinct differences in cyclical timing. The timing classification takes into account a series' historical record of timing at business cycle peaks and troughs. Leading indicators are those which usually reach peaks or troughs before the corresponding turns in aggregate economic activity; roughly coincident indicators are direct measures of aggregate economic activity or move roughly together with it; lagging indicators usually reach their turning points after the turns in aggregate econornic activity.

The NBER has also specified a "short list" of indicators. This more selective and substantially unduplicated group of principal indicators is drawn from the full list and provides a convenient summary of the current situation. The short list consists of 26 series: 12 leading, eight roughly coincident, and six lagging. Only five of these are quarterly series; the rest are monthiy. The short list is classified only by timing and is shown separately in chart B8.

Included in this section are a number of composite indexes which provide simple summary measures of the average behavior of selected greups of indicators. Each component of an index is weighted accordiag to its value in forecasting or identifying short-term movements $n$ aggregate eccnomic activity. The cornponents are standardized so that each has, aside from its weight, an equal opportunity to influence the index. Each index is standardized so that its average month to-month percent change is 1 (without regard to sign).

The composite indexes presented in this report are based onl groups of indicators selected by timing. Thus, there is an index of leading indicators, another of coincident indicators, and a third of lagging indicators. In addition, there are five indexes based on leading indicators which have been grouped by economic process. These indexes indicate the underlying cyclical trends of each group of indicators and the relative magnitude of their short-tern changes. The index of 12 leading indicators has been "reverse trend adjusted" so that its long-run trend paralleis that of the coincident index. This facilitates

## Cross-Classification of Cyclical Indicators by

 Economic Process and Cyclical Timing
comparisons among the leading, coincident, and lagging indexes and tends to shorten the leads of the leading index at business cycle peaks while lengthening them at troughs; it also reduces the variability of the leads and lags.

## SECTION C

ANTICIPATIONS AND INTENTIONS

Most businessmen and many individual consumers have some type of plans as to their major economic activities in the near future. Information on these plans is regarded as a valuable aid to economic forecasting either directly or as an indication of the state of confidence concerning the economic outlook. In recent years, much progress has been made in compiling such information, and a number of surveys by various organizations and government agencies ascertain anticipations and intentions of businessmen and consumers. The results of some of these surveys, expressed as time series, are presented in this section of the report.

The business analyst who uses these series should be aware of their limitations. These data reflect only the respondents' anticipations (what they expect others to do) or intentions (what they plan to do), not firm commitments. Among both businessmen and consumers, some responses may not be very reliable; that is, the plans may be conjectural or the respondent may make little effort to reply accurately to the survey questions. Also, many plans are subject to modification or even complete abandonment due to unforeseen and uncontrollable developments. In some cases, the anticipations (or intentions) may have a systematic bias; for example, the anticipations (or intentions) data may tend to be lower than the subsequent actual data under certain economic conditions and higher under other conditions. Sometimes they merely project what has already occurred and hence appear to lag behind actual changes. Actual data are included in this section to indicate their historical relationship to the anticipations and intentions. Some of the series are diffusion indexes, a concept explained in the description for section $E$.

Many economic series are available which, although not included in the three main sections of the report, are nevertheless important for an overall view of the economy. This section presents a number of such series, though by no means a com-
prehensive selection. In general, these series reflect processes which are not direct measures of economic activity but which do have a significant bearing on business conditions.
The foreign trade and payments series include data on imports and exports and their balance, export orders, and the balance of payments. Many of the components of the balance-of-payments accounts are shown. Some are charted in a manner which emphasizes the balance between receipts and expenditures for each component; for example, comparisons of exports of goods and services with imports of goods and services, and income on U.S. investments abroad with payments on foreign investments in the United States. In addition, balances are shown for U.S. Government grants and capital transactions and for capital transactions of the private sector (banks and U.S. residents other than banks). i Finally, cumulative changes are shown for other components; for example, U.S. liquid liabilities to all foreigners and U.S. official reserve assets.
The Federal Government activities series include Federal receipts and expenditures, and their balance, and selected defense activities. The receipts and expenditures data are from the national income and product accounts. The defense series are only a few of the many available. For a more comprehensive picture of defense activities, see Defense Indicators, a monthly Bureau of Economic Analysis publication.
Three other groups of series are included in this section. The price movements series consist of consumer and wholesale price indexes and their major components. The series on wages and productivity include measures of hourly earnings and output per man-hour and also rates of change for most of these measures. The final group of series measures the civilian labor force and its major components, including unemployment rates for selected segments of the labor force.

This section begins by comparing gross national product in constant dollars with a measure of potential GNP. In effect, these two series reflect the relationship between the economy's productive capacity and total demand, the excess of potential over actual GNP indicating the degree to which potentially productive resources are not fully utilized. The measure of potential GNP, developed by the Council of Economic Advisers in the early 1960's, takes into account increases in both available man-hours and output per man-hour.

The NBER list of cyclical indicators includes some series which measure the relationship between different economic variables (for example, the series on labor cost
per unit of output). There are, however, additional analytical ratios which have proven useful in evaluating business conditions and prospects. A number of such ratios are shown in the second part of this section.

The third part presents a selection of diffusion indexes. Many series in this report are aggregates compiled from a num. ber of components. A diffusion index is a summary measure expressing, for a particular aggregate, the percentage of components rising over a given timespan (half of the unchanged components are considered rising). Cyclical changes in diffusion indexes tend to lead those of the corresponding aggregates. Since diffusion indexes are highly erratic, long-term (6- or 9 -month span) indexes are used to indicate underlying trends and short-term (1month span) indexes are used to show recent developments. Most of the indexes are constructed from components of series shown in section $B$, and these indexes have the same identification numbers as the corresponding aggregates. The diffusion indexes are classified by the cyclical timing of the aggregates to which they relate. Recent data and directions of change for many of the components are shown in table E4.

The final part (E5) presents, in chart form, rates of change for a selected group of economic series. Percent changes are shown for 1- and 3 -month spans or for 1-quarter spans.

Because this report is designed as an aid to the analysis of U.S. business conditions, all previous sections are based on data which relate directly to that purpose. But many business analysts examine economic developments in other important countries with a view to their impact on the United States. This section is provided to facilitate a quick review of basic economic conditions in six of the nations with which we have important trade relationships.

Data on consumer prices, industrial production, and stock prices are shown for Canada, the United Kingdom, France, West Germany, Japan, and Italy and are compared with the corresponding U.S. series, Also included is an industrial production index for the European countries in the Organization for Economic Cooperation and Development. The industrial production series provide a comprehensive measure of output and the consumer price indexes measure an important sector of prices, while stock prices tend to be important as leading indicators. In this section, the U.S. business cycle shading has been omitted from the charts.

Peak ( $P$ ) of cycle indicates end of expansion and beginning of Recession (shaded areas) as designated by NBER.

Series numbers are for identification only and do not reflect series relationships or order.

Solid line indicates monthly data. (Data may be actual monthly figures or MCD moving averages.*)

Broken line indicates actual monthly data for series where an MCD Inoving average* is plotted.

Paralled lines indicate a break in continuity (data not available, changes in series definitions, extreme values, etc.).

Solid line with plotting points indicates quarterly data.

Trough (T) of cycle indicates er of recession and beginnings Expansion as designated I NBER.

Arabic number indicates late: month for which data are ploite (" 6 " $==$ June)

Roman number indicates late: quarter for which data al piotted. ("IV" :at fourth quartei

Dotted line indicates anticipate data.

Various scales are used to higt light the patterns of the individue series. "Scale A" is an arithmet scale, "scale $L-1$ " is a logaritl mic scale with 1 cycie in a give distance, "scale $L-2$ " is a log arithmic scale with 2 cycles i that distance, etc. The scale should be carefully noted becaus they show whether the ploltelines for various series are di rectly comparable.

Scale shows percent of compo nents rising.

Arabic number indicates lates month for which data are usel in computing the indexes. (" 6 " $=$ June)

Roman number indicates lates quarter for which data are usel in computing the indexes. ("I" $=$ first quarter)

Broken line with plotting point indicates quarterly data over vari ous spans.

NOTE: Some of the charts o anticipations and intentions date (section C) and balance of pay ments data (section D) do no conform to the above method 0 presentation. Deviations are adc: quately explained as they occun

## HOW TO LOCATE A SERIES

1. See ALPHABETICAL INDEX-SERIES FINDING GUIDE in the back of the report where series are arranged alphabetically according to subject matter and key words and phrases of the series titles, or
2. See TITLES AND SOURCES OF SERIES where series are listed it numerical order according to series numbers within each of "hi Digest's six sections.

Table 1. Summary of Recent Data and Current Changes for Principal Indicators

NOTE: Serlas are seasonally adjusted except for thosa indicated by (4) , which appear to contain no seasonal movement. "Serios included in the 19 fr 5 NBER "short list" of indicaters. NA : not available. a = anticipated.
$E O P=$ end of period. S/Arseasonally adjusted (used for special emphasis). For complete series titles (including composition of composite indexes) and saurces, see "Titles and Scurces of Series" in the tack ol BCD.
${ }^{1}$ For a fow series, data shown here have been rounded to fewer digits than those shown in the tables in part II. Where available, annual it fureb are those published by the source agencies; otherwise, they (and the quarterly figures for monthly series) are averages of the data as ahom in fiat fl.
${ }^{2}$ Differences rather than percent changes are shown for this aeries.
${ }^{3}$ Index for the latest month excludes series $12,16,31$, and 113 , for which data are not yet available.
4nvertod series, Since this series tends to move counter to movements in general bueiness activity, signs of the changea are reversea.
${ }^{5}$ End-of-period aeriee. The annual figurse (and quarterly figures for monthly series) are the last figures for the period.

\section*{Special Note on Potential GNP}

The following note has been provided by the Council of Economic Advisers regarding potential GNP.

The idea of potential GNP has had a long history, Its measurement by the Council of Economic Advisers was started in the Economic Report of the Council in 1962. Since that time, it has been used as a standard with which to evaluate the past and future behavior of the economy.

Potential GNP purports to measure what the economy would produce if all of its resources were fully utilized given the technology and institutional arrangements that have existed at the time. "Fully utilized" has never meant the kind of utilization that would prevail, say, under wartime conditions but rather the utilization that could be expected under conditions of reasonable price stability. This has always been less than complete utilization. Under ordinary circumstances, some unemployment is present because some workers are in the process of changing jobs; similarly, some old plants are idle because market conditions do not permit them to operate profitably. In the past, this degree of utilization has been reflected in an overall unemployment rate of 4 percent. The rate of inflation associated with that degree of unemployment has typically not been specified. Furthermore, notions of what constitutes reasonable price stability can vary over time.

Potential GNP is not something ordinarily observable. In practice, the

Council in 1962 made the judgment that the economy was operating at 100 percent of potential in mid-1955. Since that time potential GNP has been estimated to grow at differing annual rates, as follows: 3.5 percent from the first quarter of 1952 to the fourth quarter of 1962, 3.75 percent from the fourth quarter of 1962 to the fourth quarter of 1965,4 percent from the fourth quarter of 1965 to the fourth quarter of 1969. At the beginning of 1970, the Council estimated that after the fourth quarter of 1969 potential was growing at an annual rate of 4.3 percent, reflecting a rise of 1.8 percent in the potential labor force, a 0.2 percent decline in annual hours of work, and a 2.7 percent rise in output per manhour at potential. Drawing on a new study by the Bureau of Labor Statistics ("The United States Economy in 1985". Monthly Labor Review, December 1973), the Council has lowered its estimate of potential growth after 1969 to 4 percent per annum, reflecting the following component changes: labor force, 1.8 percent; annual hours, -0.3 percent; output per manhour, 2.5 percent.

Although potential is presented in the chart on page 61 and the table above as a point estimate each quarter, it is clearly subject to a margin of error and consequently, as with any measure of capacity, should be used with considerable caution. There are uncertainties regarding both the growth and the level of potential. It cannot be reasonably assumed that potential grows in each year or quarter at the same annual rate. Some qualifications about the measure of potential appear on pages 64.65 of the 1974 Economic Report.

NOTE: Serias are seasonally adjusted except those series that appear to contain no seasonal movement. Unadjusted series are indicated by (1). Series numbers are for identificatitun o dy and do not reflect series relationships or prder. Complete titles and sources are shown at the back of the book. The " \(r\) " indicates revised; " \(p\) ", preliminary; " 0 ", estimated; " 1 i ", anticipated; and " NA ", not available.

Graphs of these series are shown on page 6\%.
\({ }^{2}\) See "New Foatures and Ohanges for This Issue," page iii.

NOTE: Figures are the percent of series components rising (half of the unchanged components are considered rising). Data are centered within spans: 1 -month indexes are placed on 2 d month and 9 -month indexes are placed on the 6th month of span; 1 -quarter indexes are placed on the 1st month of the 2 d quarter and 3 -quarter indexes are placed on the 1st month of the 3 d quarter. Seasonally adjusted cumponents are used except in index D19 which requires no adjustment and index D34 which is adjusted only for the index. Table E4 identifies the components for most of the indexes shown. The " \(r\) " indicates revised; " \(p\) ", preliminary; and " \(N A\) ", not available. Unadjusted series are indicated by (U).

Graphs of these series are shown on page 63.

"Series included in the 1966 NBER "short list" of 26 indicators.
(1) Measures are based on unadustee gave.

\section*{BRIEF DEFINITIONS OF MEASURES SHOWN IN PART 1}

The following are brief definitions; more complete explanations appear in Electronic Computers and Business Indicators, by Julius Shiskin, issued as Occasional Paper 57 by the National Eureau of Economic Research, 1957 (reprinted from Jourral of Business, October 1957).
" \(\overline{\mathrm{CI}}\) " is the average quarter-to-quarter percentage change, without regard to sign, in the seasonally adjusted series or, if the series contains no measurable seasonal, in the unadjusted series.
\(" \overline{\mathrm{C}}\) " is the same for the cyclical component, a smooth, flexible moving average of the seasonally adjusted series.
" \(\overline{\mathrm{I}}\) " is the same for the irregular component, obtained by dividing the cyclical component into the seasonally adjusted series.
"QCD" (quarters for cyclical dominance) provides an estimate of the appropriate time span over which to observe cyclical movements in a quarterly series. It is small for smooth series and large for irregular series. In deriving QCD, percentage changes are computed separately for the irregular component and the cyclical component over 1 -quarter spans (1st: quarter-2d quarter, 2d quarter-3d quarter, etc.), 2-quarter spans (1st quarter-3d quarter, 2d quarter-4th quarter, etc.), up to 4 -quarter spans. Averages, without regard to sign, are then computed for the changes over each span. QCD is the shortest span in quarters for which the average percentage change (without regard to sign) in the cyclical component is larger than the average percentage change (vithout regard to sign) in the irregular component,
and remains so. Thus, it indicates the point at which fluetuations in the seasonally adjusted series became dominitred by cyclical rather than irregular novements. All series witt a QCD greater than " 3 " are shown as " 4 "
\(" \overline{\mathrm{I}} / \overline{\mathrm{C}}\) " is a measure of the relative imoothness (small values) or irregularity (large values) of the seasonally adjusited series. It is shown for 1 -quarter spans and for spans of the period of QCD. WhenQCD is " 4 ", no \(I / \bar{C}\) : ratio is shown for the QCD period.
"Average Duration of Run" (ADR) is another measure of smoothness and is equal to the average nurnber of consecutive quarterly changes in the same direction in any series of observations. When there is no change between 2 quartes, a change in the same direction as the preceding chanpe is assumed. The ADR is shown for the seasonally adjusted series CI, irregular component I, cyclical component \(C\), ard the QCD curve. The QCD curve is an unweighted moving average (with the number of terms equal to ()CD) ot the seasonally adjusted series.

A comparison of these measures of AI 1 w whe the expected ADR of a random series gives an indication of whethe the changes approximate those of a random serics. Over 1quarter intervals in a random series, the expected value of the ADR is 1.5. The actual value of \(A D R\) falls between 1.36 and 1.75 about 95 percent of the time. Over 1-quister intervals in a moving average ( 2 CD ) of a random series, tie expected value of ADR is 2.0 . For example, the ADR of Cl is 1.60 for the series on the ratio of personal saving to disposathe personal income (series 854). This indicates that 1-quitter
changes in the seasonally adjusted series, on the average, reverse sign about as often as expected in a random series. The ADR measures shown in the next two columns, 1.28 for 1 and 3.5 C for C , suggest that the seasonally adjusted series has been successfully separated into an essentially random component and a cyclical (nonrandom) component. Finally, ADR is 3.17 for the QCD moving average. This indicates that a 2-quarter moving average of the seasonally adjusted series
(2 quarters being the QCD span) reverses direction, on the average, about every 3 quarters. The increase in the ADR from 1.60 for CI to 3.17 for the QCD moving average indicates that, for this series, quarter-to-quarter changes in the QCD moving average usually reflect the underlying cyclical trend movements of the series, whereas the quarter-to-quarter changes in the seasonally adjusted series usually do not.

\section*{A. QCD and Related Measures of Variability--Continued}

\section*{Part 2. Quarterly Series: Average Actual Changes}

*Series included in the 1966 NBER "short list" of 26 indicators. when QCD is "4."
(1) Measures are based on unadjusted data.
\({ }^{1}\) Not shown

\section*{BRIEF DEFINITIONS OF MEASURES SHOWN IN PART 2}

These measures are computed by an additive method. This method is used for series with zero or negative data and for other series where it seems appropriate, such as series expressed in percent.

Thus, " \(\overline{\mathrm{CI}}\) " is the average quarter-to-quarter change in the seasonally adjusted series. This average is computed without regard to sign and is expressed in the same unit of measure as the series itself.
" \(\overline{\mathrm{C}}\) " is the same for the cyclical component, which is a moving average of the seasonally adjusted series.
" \(\overline{\mathrm{I}}\) " is the same for the irregular component, which is determined by subtracting the cyclical component from the seasonally adjusted series.

All other measures have the same meaning as in part 1.

NOTE: These series are not published in seasonally adjusted form by the source agency (except series 13 and D34). Seasonal adjustments were made by fhe furza. of Berount chalysi: ar the National Bureau of Economic Research, Inc. They are kept current by the Bureau of Economic, Analysis. Seasonally adjusted data prepared by the source aginnsy will be subistitutud whenewe tuey
 Pragram.

\footnotetext{
\({ }^{1}\) Facters are products of stasonal and tradiatg-day factors.
\({ }^{2}\) Quarterly series; figures are placed in middle month of quarter.
\({ }^{3}\) These quan;itios, in millions of dollars, are to be subtracted from the month-to-month net change in the unadjusted monthly totals to yield tha seasonally adjusted net thange. They vara computed by tha additive version of the X 11 variant of the Census Method II seasonal adjustment program.
\({ }^{4}\) Bimonthly series. Factors are for even-fumbered months (February, April, June, August, October, and December).
\({ }^{s} 1\)-quarter diffusion index: Figures are placed in the 1 st month of the quarter. The unadjusted diffusion index is computed and the factors, computad by the addi ive versien of the \(X\) - 11 viriant of the Census Mathod II seasonal idjustment program, are subtracted to yiald the seasonally adjusted index.
}

\section*{C. Historical Data for Selected Series}

This appendix provides historical data (back to 1945 if available) for ;elected BCD series. Data are shown for series which (a) have recently jeen added to the report, (b) have recently been revised, or (c) have not Jeen shown here for a long time. By keeping these tables, the user can zequire a complete set of historical data. Each time a series is included in this appendix, it is footnoted to indicate the extent of any revisions ince it was last shown. See the "Alphabetical Index-Series Finding Guide" for the latest issue in which historical data were published for
each series. Current figures are shown in the basic data tables each month and may be used to update these historical tables.

Series shown here are seasonally adjusted except for those, indicated by (1), which appear to contain no seasonal movement. Official source agency annual figures are shown if available. Such figures are often derived from data with more digits or from data which have not been seasonally adjusted; therefore, they may differ slightly from annual figures computed from the monthly or quarterly data shown.

\section*{G. Experimental Data and Analyses}

There has been considerable interest in recent months about the impact of price changes on the leading indicators and, in particular, on the composite index of 12 leading indicators, BCD series 810 . In response to that interest, this appendix presents two experimental leading composite indexes designed to suppiement series 810 . These new indexes divide the 12 leading components into
two subgroups: one group consists of the seven components measured in, or related to, current-dollar units; the other group consists of the five components measured in nonmonetary units. These new indexes should be viewed as experimental tools for research. They are not to be viewed as substitutes for the leading index but rather as supplements to it.

NOTE: The experimental indexes are not shown for the current month because less than two-thirds of the current-dollar components were available by the publication deadine.
\({ }^{1}\) Original trend replaced by trend of undeflated coincident index (series 820).
\({ }^{2}\) Original trend replaced by trend of deflated coincident index (series 825).

AL.PHABETICAL INDEX-SERIES FINDING GUIDE

"Denotes series on the 196G NBEA "short list" of indieators. \#The "number" for this series titia was changed since the publication date shown. NIA means National Income and frothat Mrounts.

*Oenotes series on the 1966 NBER "short list" of indicators. \#The "number" for this series title was changed since the publication date shown. NIA means National fncome and Product Accounts.

\footnotetext{
"Denotas saries on the 1986 NBER "shart list" of indicators. \#Tha "number" for this series tite was changed since the publication date shown. NIA means National Incomia ind Frocinf Aceraunts.
}
each of the report's six sections, series are listed in :al order according to series numbers. The series \(s\) are for identification purposes only and do not series relationships or order. To find chart and table mbers, historical data, and series descriptions, consult phabetical Index-Series Finding Guide."
shabetic-numeric designations following each series d source indicate the charts and tables in which the ay be found. See the table of contents for the chart ile titles and page numbers. " \(M\) " indicates monthly " Q " indicates quarterly series. Data apply to the seriod except for series designated by "EOM" (end of or "EOQ" (end of quarter).
'" following a series number indicates a component same number) as a percent of an aggregate series, such ' or national income. The series in section B preceded sterisk (") are included in the 1966 NBER "short list" ical indicators, chart B8. The "D" preceding a number as a diffusion index.

(F3)
781. United States, index of consumer prices (M). See in section 0 .

\title{
FOR A PERSPECTIVE ON ECONOMIC GROWTH GET THE JUST PUBLISHED LONG TERM ECONOMIC GROWTH 1860-1970
}

"an invaluable body of information that runs the gamut from the money supply to detailed figures on the growth of regions. Virtually all of the data are processed in ways that provide quick answers for busy users . . . a lucid introduction to the problems of measuring economic growth . . . a model of excellence . . ."

That is how the Washington Post described the first edition of Long Term Economic Growth on October 15, 1966.
- Long Term Economic Growth, 1860-1970 provides a convenient and comprehensive statistical
basis for analyzing economic trends. About 1,200 annual time series are included in the major sections on
- Aggregate Output, Input, and Productivity
- Processes Related to Economic Growth
- Regional and Industry Trends
- International Comparisons
- Growth Rate Triangles
- More than 60 of the report's 300 pages are devoted to charts on economic and related processes going back as long as 110 years.
