This report is prepared in the Statistical Indicators Division of the Bureau of Economic Analysis. Technidal staff and their responsibilities for the publication are-

Barry A. Beckman--Technical supervision and review
Brian D. Kajutti-Composite indexes
Betty F. Tunstall-Data collection and compilation (Phone: 202-523-0541)
The cooperation of government and private agencies that provide data is gratefully acknowledged. Agencies furnishing data are indicated in the list of series titles and sources at the back of this report.

This publication is prepared under the general guidance of a technical committee consisting of the following persoris:

Ronald E. Kutscher, Acting Chairman, Bureau of Labor Statistics, U.S. Department of Labor
Ahmad Al-Samarrie, Office of Management and Budget
John H. Auten, U.S. Department of the Treasury
Charles A. Waite, Bureau of the Census, U.S. Department of Commerce
Helmut F. Wendel, Board of Governors of the Federal Reserve System

## ABOUT THIS REPORT

BUSINESS CONDITIQNS DIGEST (BCD) provides a monthly look at many of the economic time series found most $\psi$ seful by business analysts and forecasters.

The original BCD, which began publication in 1961 under the title Business Cycle Developments, emphasized the cyclical indicators approach to the analysis of business conditions and prospects. The report's contents were based largely on the list of leading, roughly coincident, and lagging indicators maintained by the National Bureau of iconomic Research, Inc.

In 1968, BCD whs expanded to increase its usefuiness to analystb using other approaches to business conditions analysis. Principal additions to the report were series from the national income and product ackounts and series based on surveys of businessmen's and consumers' anticipations and intertions. The composite indexes were added at that time, and the report's present title was adopted.

- The dominant feature of the current BCD is the cyclical indicatots section, in which each business cycle indicator is assigned a three-way timing classification according to its behavior at peaks; at troughs, and at all turns. This section is supplemented by a section containing other important economic measures. The method of presentation is explained in the introductory text which begins on page 1 .

Most of the data contained in this report also are published by their source agencies. A series finding guide and a complete list of series titles and sources can be found at the back of the report.
Cyclical Indicators are economic time series which have been singled out as leaders, coin ciders, or laggers based on their general conformity to cyclical movements in aggregate economic activity. In this report, cyclical indicators are classified both by economic process and by their average timing at business cycle peaks, at business cycle troughs, and at peaks and troughs combined. These indicators have been selected primarily on the basis of their cyclical behavior, but they also have proven useful in forecasting, measuring, and interpreting short-term fluctuations in aggregate economic activity.
Other Economic Measures provide additional information for the evaluation of current business conditions and prospects. They include selected components of the national income and product accounts; measures of prices, wages, and productivity; measures of the labor force, employment, and unemployment; economic data on Federal, State, and local government activities: measures of U.S. international transactions; and selected economic comparisons with major foreign countries.

## Changes in this issue are as follows:

1. New seasonal adjustment factors for the 24 series listed below have been computed using the $X-11$ variant of the Census Method II seasonal adjustment program. New factors are shown in appendix B for all of these series except series 9, 10, 12, 112, 732c, 733c, and 735c-738c.

| Series <br> number | Beginning date for <br> new factors | Series <br> number | Beginning date for <br> new factors |
| :---: | :---: | :---: | :---: |
| 5 | October 1983 | 570 | January 1984 |
| 9 | December 1983 | 580 | November 1983 |
| 10 | December 1983 | 604 | January 1984 |
| 12 | October 1983 | 606 | January 1984 |
| 13 | October 1983 | 614 | January 1984 |
| 15 | II Q 1983 | 616 | January 1984 |
| 33 | March 1983 | 732c | December 1983 |
| 72 | January 1984 | 733c | December 1983 |
| 112 | January 1984 | 735c | December 1983. |
| 517 | November 1983 | 736c | December 1983 |
| 525 | October 1983 | 737c | December 1983. |
| 543 | November 1983 | 738c | December 1983 |

2. The series on new private housing units started (series 28) has been revised for the period 1981 to date to reflect a new seasonal adjustment by the source agency.

Further information concerning this revision may be obtained from the U.S. Department of Commerce, Bureau of the Census, Construction Statistics Division.
3. The average weekly insured unemployment rate (series 45) has been revised for the period 1979 to date to reflect a new seasonal adjustment by the source agency.

Further information concerning this revision may be obtained from the U.S. Department of Labor, Employment and Training Administration, Office of Administration Management.
(Continued on page iv.)
The March issue of BUSINESS CONDITIONS DIGEST is scheduled for release on April 3.

NEW FEATURES
AND CHANGES
FOR THIS ISSUE

A limited number of changes are made from time to time to in. corporate recent findings of economic research, newly avail. able time series, and revisions made by
source agencies in concept, composition, comparability, coverage, seasonal adjustment methods, benchmark data, etc. Changes may result in revisions of data, additions or deletions of series, changes in placement of series in relation to other series, changes in composition of indexes, etc.
4. Revised data on U.S. money supply and liquid assets (series 85, 102, and 104108) are shown in this issue for the period October 1982 to date. These data reflect the incorporation of benchmark revisions and updated seasonal adjustment factors. When completed, these revisions will extend back to 1959. Revised data for the period prior to October 1982 will be shown in a subsequent issue.

Further information concerning these revisions may be obtained from the Board of Governors of the Federal Reserve System, Division of Research and Statistics, Banking Section.
5. Series $72,101,111$, and 112 have been revised by the source agency for the period 1975 to date. These revisions reflect changes in the reporting panel and item content for data on commercial and industrial loans. Data on the new basis are shown in this issue for January 1984 only. Revised data for the earlier period will be shown in a subsequent issue.

Further information concerning these revisions may be obtained from the Board of Governors of the Federal Reserve System, Division of Research and Statistics, Banking Section.
6. The producer price indexes (\$eries 98 and 331-334) have been revised for the period 1979 to date to reflect a new seasonal adjustment by the source agency.

Series 99 (change in sensitive materials prices) has been revised for the period 1979 to date to reflect the revision of series 98 , which is one of its components.

Further information concerning these revisions may be obtained from the U.S. Department of Labor, Bureau of Labor Statistics, Office of Prices and Living Conditions, Division of Industrial Prices and Price Indexes.
7. Series 7 and 8 (manufacturer\$' new orders in 1972 dollars for durable goods and for consumer goods and materials) and series 36 (change in inventories on hand and on order in 1972 dollars) have been revised for the period 1979 to date on the basis of revised producer price indexes used as deflators. (See item 6, above.)

Further information concerning these revisions may be obtained from the U.S. Department of Commerce, Bureau of Economic Analysis, Statistical Indicators Division.
8. Seasonally adjusted consumer price index (CPI) data (series 320c and 322) have been revised for the period 1979 to date to reflect a new seasonal adjustment by the source agency.

Further information concerning these revisions may be obtained from the U.S. Department of Labor, Bureau of Labor \$tatistics, Office of Prices and Living Conditions, [livision of Consumer Prices.
9. Series $53,105,106$, and 341 for which seasonally adjusted CPI data are used as deflators, have been revised for the period 1979 to date. (See item 8, above.)

Further information concerning the revision of series 341 may be obtained from the source cited in item 8. Further information concerning the revision of series 53, 105, and 106 may be obtained from the U.S. Department of Commerce, Bureau of Economic Analysis, Statistical Indicators Division.
10. Appendix $C$ contains historical data for series $37,42-44,46,60,90,91$, 441, 442, 444-448, and 451-453.
11. Appendix G contains cyclical comparisons for series $20,40,51,910,920$, and 940 .

## method of presentation

This report is organized into two major parts. Part I, Cyclical Indicators, includes about 150 time series which have been found to conform well to broad fluctuations in comprehensive measures of economic activity. Nearly three-fourths of these are individual indicators, the rest are related analytical measures: Composite indexes, diffusion indexes, and rates of change. Part II, Other Important Economic Measures, covers over 140 series which are valuable to business analysts and forecasters but which do not conform well enough to business cycles to qualify as cyclical indicators. (There are a few exceptions: Four series which are included in part I are also shown in part II to complete the systematic presentation of certain sets of data, such as real GNP and unemployment.) The largest section of part II consists of quarterly series from the national income and product accounts; other sections relate to prices, labor force, government and defense-related activities, and international transactions and comparisons.

The two parts are further divided into sections (see table of contents), and each of these sections is described briefly in this introduction. Data are shown both in charts and in tables. Most charts begin with 1959, but those for the composite indexes and their components (part I, section A) begin with 1948, and a few charts use a two-panel format which covers only the period since 1972. Except for section F in part II, charts contain shading which indicates periods of recession in general business activity. The tables contain data for only the last few years. The historical data for the various time series are contained in the 1977 Handbook of Cyclical Indicators.
In addition to the charts and tables described above, each issue contains a summary table which shows the current behavior of many of the series. Appendixes present seasonal adjustment factors, measures of variability, specific cycle turning dates, cyclical comparison charts, and other information of analytical interest. An index appears at the back of each issue. It should be noted that the series numbers used are for identification purposes only and do not reflect precise relationships or order. However, all series considered as cyclical indicators are numbered in the range 1 to 199.

## Seasonal Adjustments

Adjustments for average seasonal fluctuations are often necessary to bring out the underlying trends of time series. Such adjustments allow for the effects of repetitive intrayear variations resulting primarily from normal differences in weather conditions and from various institutional arrangements. Variations attributable to holidays are usually accounted for by the seasonal adjustment process; however, a separate holiday
adjustment is occasionally required for holidays with variable dates, such as Easter. An additional adjustment is sometimes necessary for series which contain considerable variation due to the number of working or trading days in each month. As used in this report, the term "seasonal adjustment" includes trading-day and holiday adjustments where they have been made.

Most of the series in this report are presented in seasonally adjusted form and, in most cases, these are the official figures released by the source agencies. However, for the special purposes of this report, a number of series not ordinarily published in seasonally adjusted form are shown here on a seasonally adjusted basis.

## MCD Moving Averages

Month-to-month changes in a series are often dominated by erratic movements. MCD (months for cyclical dominance) is an estimate of the appropriate span over which to observe cyclical movements in a monthly series. (See appendix A.) It is the smallest span of months for which the average change in the cyclical factor is greater than that in the irregular factor. The more erratic a series is, the larger the MCD will be; thus, MCD is 1 for the smoothest series and 6 for the most erratic. MCD moving averages (that is, moving averages of the period equal to MCD) tend to have about the same degree of smoothness for all series. Thus, a 5 -term moving average of a series with an MCD of 5 will show its cyclical movements about as clearly as the seasonally adjusted data for a series with an MCD of 1 .

The charts in this report generally include centered MCD moving averages for those series with an MCD greater than 4 . The seasonally adjusted data are also plotted to indicate their variation about the moving averages and to provide observations for the most recent months.

## Reference Turning Dates

The historical business cycle turning dates used in this report are those designated by the National Bureau of Economic Research, Inc. (NBER). They mark the approximate dates when, according to NBER, aggregate economic activity reached its cyclical high or low levels. As a matter of general practice, neither new reference turning dates nor the shading for recessions will be entered on the charts until after both the new reference peak and the new reference trough bounding the shaded area have been designated.

The historical reference turning dates are subject to occasional reviews by NBER and may be changed as a result of revisions in important economic time series. The dates shown in this publication for the 1948-70 time period are those determined by a 1974 review. Since then, NBER has designated turning points for recessions in 1973-75, 1980. and 1981-82.

## Part I. CYCLICAL INDICATORS

Business cycles have been defined as sequences of expansion and contraction in various economic processes that show up as major fluctuations in ag. gregate economic activity-that is, in comprehensive measures of production, employment, income, and trade. While recurrent and pervasive, business cycles of historical experience have been definitely nonperiodic and have varied greatly in duration and intensity, reflecting changes in economic systems, conditions, policies, and outside disturbances.
One of the techniques developed in business cycle research and widely used as a tool for analyzing current economic conditions and prospects is the cyclical indicators approach. This approach identifies certain economic time series as tending to lead, coincide with or lag behind the broad movements in aggregate economic activity. Such indicators have been selected and analyzed by NBER in a series of studies published between 1938 and 1967. During the 1972-75 period, a new comprehensive review of cyclical indicators was carried out by the Bureau of Economic Analysis (BEA) with the cooperation of the NBER research staff. The present format and content of part I of $B C D$ are based on the results of that study.

## Section A. Composite Indexes and Their Components

All cyclical indicators have been evaluated according to six major characteristics: Economic significance, statistical adequacy, consistency of timing at business cycle peaks and troughs, conformity to business expansions and contractions, smoothness, and prompt availability (currency). A formal, detailed weighting scheme was developed and used to assess each series by all of the above criteria. (See articles in the May and November 1975 issues of $\boldsymbol{B C D}$.) The resulting scores relate to cyclical behavior of the series during the period 1947-70. This analysis produced a new list of indicators classified by economic process and typical timing at business cycle peaks and troughs. (See tables on page 2 and text below relating to section $B$.)
This information, particularly the scores relating to consistency of timing, served as a basis for the selection of series to be included in the composite indexes. The indexes incorporate the best-scoring series from many different economic-process groups and combine those with similar timing behavior, using their overall performance scores as weights. Because they use series of historically tested usefulness and given timing characteristics (for example, leading at both peaks and troughs), with diversified economic coverage and a minimum of duplication, composite indexes give more reliable signals over time than do any of the individual indicators. Furthermore, much of the

independent measurement error and other "noise" in the included series are smoothed out in the index as a whole. The indexes include only monthly series that are acceptable in terms of relatively prompt availability and reasonable accuracy.

The main composite indexes are distinguished by their cyclical timing. Thus, there is an index of leading indicators, series which historically reached their cyclical peaks and troughs earlier than the corresponding business cycle turns. There is an index of roughly coincident indicators, consisting of series which historically reached their turning points at about the same time as the general economy, and an index of lagging indicators, which includes series that typically reached their peaks and troughs later than the corresponding business cycle turns.

The leading index contains series with long as well as short leads, but each series leads on the average over time and shows a frequency of leads at the individual turns exceeding that attributable to chance, given the historical distribution of cyclical timing. (An analogous statement applies to the components of the lagging index.) Since 1948, leads were generally more frequent and longer at peaks than at troughs of business cycles, while lags were generally more frequent and longer at troughs than at peaks. The adopted system of scoring and classifying the indicators takes into account these well-established differences in timing. Consequently, rough coincidences include short leads (.) and lags ( + ) as well as exact coincidences ( 0 ). (For monthly series, the range is from -3 through +1 at peaks and from -1 through +3 at troughs, where minus denotes leads and plus denotes lags in months.)

For purposes of constructing a composite index, each component series is standardized: The month-to-month percent changes in a given series are divided by the long-run average (without regard to sign) of those changes. Thus, the more volatile series are prevented from dominating the index. The coincident index is calculated so that its longterm trend (since 1948) equals the average of the trends of its four components. This trend, which is similar to that of GNP in constant dollars, can be viewed as a linear approximation to the secular movement (at an average growth rate) in aggregate economic activity. The indexes of leading and lagging indicators have been adjusted so that both their trends and their average month-to-month percent changes (without regard to sign) are approximately equal to those of the coincident index. (For a more detailed description of the method of constructing the composite indexes, see the 1977 Handbook of Cyclical Indicators.)

In addition to these principal composite indexes, differentiated according to cyclical timing, there are five indexes based on leading indicators which have been grouped by economic process. Taken together, these additional indexes include all 12 component series of the overall leading index, plus a few related series. Also shown in this section is the ratio of the index of roughly coincident
indicators to the index of lagging indicators, a series known to have a useful pattern of early cyclical timing. Numbers entered on the charts of the composite indexes show the length, in months, of leads $(\cdot)$ and lags $(+)$ at each of the reference turning dates covered.
The next set of data consists of series included in the principal composite indexes. These are the 12 components of the leading index, the 4 components of the coincident index, and the 6 components of the lagging index. Following the title of each series, its typical timing is identified by three letter symbols in a small box. The first of these letters refers to the timing of the given indicator at business cycle peaks, the second to its timing at business cycle troughs, and the third to its timing at all turns, i.e., at peaks and troughs combined. " L " denotes a tendency to lead, " C " a tendency to roughly coincide with the business cycle turns (as represented by the NBERdesignated reference dates), and " $L g$ " a tendency to lag. Since these series have been selected for the consistency of their timing at both peaks and troughs, all components of the leading index are denoted " $\mathrm{L}, \mathrm{L}, \mathrm{L}$," all components of the coincident index "C,C,C," and all components of the lagging index " $\mathrm{Lg}, \mathrm{Lg}, \mathrm{Lg}$." It should be remembered that these classifications are based on limited evidence, namely the performance of the indicators during the business cycles of the $1948-70$ period, which included five peaks and five troughs. While the timing classifications are expected to agree with the patterns prevailing in the near future, they will not necessarily hold invariably in every instance. The timing of the series in the period since 1970 can be determined by inspection of the charts, where the recessions of 1973-75, 1980, and 1981-82 are shaded according to the dates of the NBER reference cycle chronology.

## Section B. Cyclical Indicators by Economic Process

This section covers 111 individual time series, including the 22 indicators used in the construction of the composite indexes. The peak and trough timing classifications are shown on the charts in the same manner as described above, but this section includes series with different timing at peaks and at troughs, as well as series where the timing is not sufficiently consistent to be classified as either $\mathrm{L}, \mathrm{C}$, or Lg according to the probabilistic measures and scoring criteria adopted. Such series are labeled U, i.e., unclassified as to timing at turning points of the given type. Eight series are unclassified at peaks, one series at troughs, and 19 series at all turns (of the 19, 15 have definite but different timing at peaks and at troughs). No series that is classified as $U$ both at peaks and at troughs is included in the list of cyclical indicators.

The classification scheme which groups the indicators of this section by economic process and cyclical timing is summarized in the two tabulations on page 2. Cross-classification $A$ is based on the observed behavior of the series at five business cycle peaks (November '48, July '53,

August '57, April '60, and December '69); crossclassification B , on their behavior at five business cycle troughs (October '49, May '54, April '58, February '61, and November '70). Each tabulation distinguishes seven major economic processes and four types of cyclical timing. The titles in the cells identify subgroups of the given economic process with the given timing characteristic. The number of series in each such group is given in parentheses following the title. Complete information on how individual indicators are classified by timing at peaks, troughs, and all turns, along with selected measures and scores, is provided in the 1977 Handbook of Cyclical Indicators.

## Section C. Diffusion Indexes and Rates of Change

Many series in this report are aggregates compiled from numerous components. How the individual components of an aggregate move over a given timespan is summarized by a diffusion index which indicates the percentage of components that are rising (with half of the unchanged components considered rising). Cyclical changes in these diffusion indexes tend to lead those of the corresponding aggregates. Since diffusion indexes are highly erratic, they are computed from changes measured over 6 - or 9 -month (or 3 - or 4 -quarter) spans, as well as 1 -month (or 1 -quarter) spans. Longer spans help to highlight the trends underlying the shorter-term fluctuations. Diffusion indexes are shown for the component series included in each of the three composite indexes and for the components of some of the aggregate series shown in section B.

Diffusion measures can be derived not only from actual data but also from surveys of anticipations or intentions. Indexes based on responses of business executives about their plans and expectations for several operating variables are presented, along with the corresponding indexes based on actual data, as the last set of diffusion series.

This section also records rates of change for the three composite indexes (leading, coincident, and lagging) and for four indicators of aggregate economic activity: GNP in constant dollars (quarterly), industrial production, employee hours in nonagricultural establishments, and personal income less transfers in constant dollars. Rates of change are shown for 1-and 3 -month spans or for 1-quarter spans.

Although movements in diffusion indexes and in rates of change for the same aggregates are generally positively correlated, these two measures present information about two related but distinct aspects of economic change. Diffusion indexes measure the prevailing direction or scope of change, while rates of change measure the degree as well as the overall direction. As is the case for diffusion indexes, cyclical movements in the rates of change tend to lead those of the corresponding indexes or aggregates, and thus, they tend to lead at the business cycle turns as well.

## Part II. OTHER IMPORTANT ECONOMIC N|EASURES

This part is divided into six sections which cover a wide range of quarterly and monthly time series measuring various aspects of economic activity. Some of these series are very comprehensive, pertaining to the U.S. economy as a whole, others have to do with particular sectors or markets, and still others relate to U.S. international transactions or to selected foreign countries. The represented variables include incomes, outputs, and expenditures; prices, earnings, and productivity; labor resources; government receipts, expenditures, and defense-related activities; exports and imports; and selected indicators for a few key foreign countries.

## Section A. National Income and Product

The national income and product accounts, compiled by BEA, summarize both receipts and final expenditures for the personal, business, foreign, and government sectors of the economy.
Section Al shows the gross national product, final sales, and persional and disposable personal income. The four major components of the gross national product-personal consumption expenditures, gross private domestic investment, government purchases of goods and services, and net exports of goods and services-are presented in sections A2 through A5. Most of the series in section $A$ are presented in current as well as constant dollars. There are also a few per capita series. The national income and product accounts, briefly defined below, are described more fully in the Survey of Current Business, Part I, January 1976.
Gross national product (GNP) is the market value of final goods and services produced by the labor and property supplied by residents of the United States, before deduction of allowances for the consumption of fixed capital goods. It is the most comprehensive measure of aggregate economic output. Final sales is GNP less change in business inventories.
Personal income is the income received by persons (individuals, owners of unincorporated businesses, nonprofit institutions, private trust funds, and private noninsured welfare funds) from all sources. It is the sum of wage and salary disbursements, other labor income, proprietors' income, rental income of persons, dividends, personal interest income, and transfer payments, less personal contributions for social insurance.

Disposable personal income is the personal income available for spending or saving. It consists of personal income less personal taxes and nontax payments to government.

Personal consumption expenditures (A2) is goods and services purchased by individuals, operating expenses of nonprofit institutions, and the value of food, fuel, clothing, rent of dwellings, and financial services received in kind by individuals. Net purchases of used goods are also included.

Gross private Homestic investment (A3) is fixed capital goods purchased by private business and nonprofit institutions and the value of the change in the physical volume of inventories held by private business. The former include all private purchases of dweilings, whether purchased for tenant or owner occupancy. Net purchases of used goods are also included.
Government purchases of goods and services (A4) is the compensation of government employees and purchases from business and from abroad. It excludes transfer payments, interest paid by government, and. subsidies. It includes gross investment by government enterprises but excludes their current outlays. It includes net purchases of used goods arid excludes sales and purchases of land and finaricial assets.
Net exports of goods and services (A5) is exports less imports of goods and services. Exports are part of the national ploduction; imports are not, but are included in the components of GNP and are therefore deducted. More detail on U.S. international transactions is provided in section $E$.
National income (A6) is the incomes that originate in the production of goods and services attributable to labor and property supplied by residents of the United States. Thus, it measures the factor costs of the goods and services produced. It confists of the compensation of employees, proprietors' income, rental income of persons, corporate profits, and net interest.
Saving (A7) is the difference between income and expenditures during an accounting period. Total gross saling includes personal saving, business saving (mainly undistributed corporate profits and capital consumption allowances), and government surdlus or deficit.

Shares of GNP and national income (A8).-The major expenditure components of GNP (consumption, investment, etc.) are expressed as percentages of GNP, and the major income components of national income (compensation of employees, corpdrate profits, etc.) are expressed as percentages of rational income.

## Section B. Prices, Wages, and Productivity

The important|data on price movements include the monthly consumer and producer price indexes and their major components. Based largely on these series are the quarterly price indexes from the national income and product accounts, notably the GNP implidit price deflator (with weights reflecting the changing proportions of different expenditure categories in GNP) and the fixedweighted price index for the gross business product. Data on both levels and percent changes are presented for the period since 1972.

The group of series on wages and productivity consists of data on average hourly earnings and average hourly compensation (including earnings and other benefi s) in current and constant dollars, output per hour ff work in the business sector, and rates of change for most of these measures.

Section C. Labor Force, Employment, and Unemployment

This section contains measures of the civilian labor force and its major components: Total numbers of employed and unemployed persons. The number of unemployed is subdivided into selected categories defined by sex, age, and class of worker. Also included are data on participation rates for a few principal segments of the labor force.

## Section D. Government Activities

Receipts, expenditures, and their balance (surplus or deficit) are shown quarterly on two levels: (1) Federal Government and (2) State and local government. Also shown is a selection of series from the discontinued $\bar{D}$ efense Indicators. These series measure defense activities which influence short-term changes in the national economy. Included are series relating to obligations, contracts, orders, production, shipments, inventories, outlays, and employment. These series are grouped according to the time at which the activities they measure occur in the defense order-production-delivery process. Series measuring activities which usually precede production, such as contract awards and new orders, are classified as "advance measures of defense activity." Series measuring activities which tend to coincide with production, such as employment, and activities which usually follow production, such as shipments, are classified as "intermediate and final measures of defense activity."

## Section E. U.S. International Transactions

This group includes monthly series on exports (excluding military aid) and general imports, plus a few selected components of these aggregates. Also shown are the balances between receipts and expenditures for goods and services, merchandise, and investment income.

## Section F. International Comparisons

This section is designed to facilitate a quick review of basic economic conditions in six of the nations with which we have important trade relationships. The U.S. business cycle shading has been omitted from these charts. Data on industrial production, consumer prices, and stock prices for Canada, the United Kingdom, France, West Germany, Japan, and Italy are compared with the corresponding U.S. series. Also included is an industrial production index for the European countries in the Organization for Economic Cooperation and Development (OECD). The industrial production series provide cyclically sensitive output measures for large parts of the economies covered. Changes in consumer price indexes (plotted for the period since 1972) provide important measures of the rates of inflation in the major industrialized countries. Stock prices (also shown beginning in 1972) tend to be significant as leading indicators.

Peak (P) of cycle indicates end of expansion and beginning of recession (shaded area) as designated by NBER.

Solid line indicates monthly data. (Data may be actual monthly figures or moving averages.)

Broken line indicates actual monthly data for series where a moving average is plotted.

Solid line with plotting points indicates quarterly data.

Parallel lines indicates a break in continuity (data not available, extreme value, etc.).

Solid line indicates monthly data over 6- or 9-month spans.

Broken line indicates monthly data over 1 -month spans.

Broken line with plotting points indicates quarterly data over 1-quarter spans.

Solid line with plotting points indicates quarterly data over various spans.

Diffusion indexes and rates of change are centered within the spans they cover.

Solid line indicates percent changes over 3 - or 6 -month spans.

Broken line indicates percent changes over 1 -month spans.

Solid line with plotting points indicates percent changes over 3 - or 4-quarter spans.

Basic Data

Diffusion Indexes

## Rates of Change

Trough ( T ) of cycle indicates end of recession and beginning of expansion as designated by NBER.

Arabic number indicates latest month for which data are plotted. ("9" = September)

Dotted line indicates anticipated data.
Roman number indicates latest quarter for which data are plotted. ("IV" = fourth quarter)

Various scales are used to highlight the patterns of the individual series. "Scale A" is an arithmetic scale, "scale L-1" is a logarithmic scale with 1 cycle in a given distance, "scale L-2" is a logarithmic scale with two cycles in that distance, etc.

Arabic number indicates latest month for which data are used in computing the indexes.

Roman number indicates latest quarter for which data are used in computing the indexes.

Dotted line indicates anticipated quarterly data over various spans.

Arabic number indicates latest month used in computing the changes.

Broken line with plotting points indicates percent changes over 1-quarter spans.

Roman number indicates latest quarter used in computing the changes.

## HOW TO LOCATE A SERIES

1. See ALPHABETICAL INDEX-SERIES FINDING GUIDE at the back of the report where series are arranged alphabetically according to subject matter and key words and phrases of the series titles, or-
2. See TITLES AND SOURCES OF SERIES at the back of the report where series are listed numerically according to series numbers within each of the report's sections.

"See "New Features and Changes for This Issue," page iii.
${ }^{2}$ Average for weeks ended February 3, 10, and 17.
${ }^{3}$ Average for weeks ended February 2, 9, and 16.
${ }^{4}$ Average for February 1 through 24.

NOTE: Figures are tie percent of series components rising. (Half of the unchanged components are counted as rising.) Data are centered within the spans: 1 -month indexes are placed on the 2 d month, 6 . month indexes on the 4 th month, and 9 -month indexes on the 6 th month of the span; 1 -quarter indexes are placed on the 1 st month of the $2 d$ quarter and 4 -quarter indexes on the $2 d$ month of the $3 d$ quarter. Series are seasonaity adjusted except for those, indicated by (a). that appear to contain no seasonal movement. Series numbers are for identification only and do not reflect series relationships or order. Compiete litles and sources are listed at the back of this issue. The " $r$ " indicates revised; " $p$ ", preliminary: "e". estimated: " $a$ ", anticipated; and "NA", not available.

Graphs of these series are shown on plage 36.
${ }^{1}$ Figures are the percent of components declining.
${ }^{2}$ Excludes series 36 and 111, for which data are not available
${ }^{9}$ Excludes series 57, for which data are not available.
${ }^{\text {E Excludes series }} 77$ ' and 95 , for which data are not available.

NOTE: To facilitate interpretation, the month-to-month directions of change are shown atong with the numbers: 1, rising. ( 0 ) unchanged. and $(-)=$ falling. The " $r$ " indicates revised: " p ". pretiminary: and "NA". not available.
${ }^{1}$ The index is. the average for February 1 through 21 ; component prices are averages for February 7, 14 , and 21.
${ }^{2}$ Data are not seasonally adjusted. These series are based on copyrighted data used by permission; they may not be reproduced without written permission from Commodity Research Bureau, Inc. Components are converted to metric units by the Bureau of Economic Analysis.

NOTE: Series are seasonally adjusted except for those. indicated by (u). that appear to contain no seasonal movement. Serres numbers are for identification only and do not reflect series relatiouships or order. Complete tittes and sources are listed at the back of this issue. The " $r$ " indicates revised: " $p$ ". preliminary: " $e$ ". estimated: " $a$ ". anticipated; and "NA". not available.
Graphs of these series are shown on pages 40 and 41.

NOTE: These series are seasonally adjusted by the Bureau of Economic Analysis rather than by the source agency. Seasonally adjusted data prepared by the source agency will be used in BUSINESS CONDITIONS DIGEST whenever they are available. For a description of the method used to compute these factors, see Bureau of the Census Technical Paper No. 15, the x-11 VARIANT OF THE CENSUS METHOD II SEASONAL ADJUSTMENT PROGRAM.
${ }^{2}$ Factors are the products of seasonal and trading-day factors.
${ }^{2}$ Quarterly series; factors are placed in the middle month of the quarter.
${ }^{3}$ These quantities, in millions of dollars, are subtracted from-the month-to-month net change in the unadjusted monthly totals to yield the seasonally adjusted net change. These factors are computed by the additive version of the $\mathrm{X}-11$ variant of the Census Method II seasonal adjustment program.
${ }^{4}$ These factors apply to only the loans portion of this series.

NOTE: These series contain revisions beginning with 1979.

## E. Business Cycle Expansions and Contractions in the United States

NOTE: Underscored figures are the wartime expansions (Civil War, World Wars I and II, Korean war, and Vietnam war), the postwar contractions, and the fuill cycles that include the wartime expansions.
129 cycles. $\quad{ }^{2} 15$ cycles.
${ }^{3} 24$ cycles.

- 13 cycles.

| 95. Ratio, consumer installment credit to personal income (percent) . | 13.16 | r13.22 | pl3.35 | NA | 0.23 | 0.50 | N/ |
| 930. Composite index of 6 lagging indicators ${ }^{3}$ (index: 1967:-100) | 109.8 | r110.1 | r110.9 | p109.9 | 0.27 | 0.73 | $-0.90$ |

NOTE: The net contribution of an individual component is that component's share in the composite movement of the group. It is computed by dividing the standardized and weighted change for the component by the sum of the weights for the available components and dividing that resuld by the index standardization factor. See the February 1983 issue of BUSINESS CONDITIONS DIGEST (pp. 108-109) for the weights and standardization factors. NA, not available. p, preliminary. r, revised. e, estimatec.
${ }^{1}$ This series is inverted in computing the composite index; i.e., a decrease in this series is considered an upward movement.
${ }^{2}$ This series is a weighted $4 ;$ term moving average (with weights $1,2,2,1$ ) placed on the terminal month of the span.
${ }^{3}$ Figures in the net contribution columns are percent changes in the index. The percent change is equal (except for rounding differences) to the sum of the individual components' contributions plus the trend adjustment factor. The trend adjustment factor for the leading index is 0.139 ; for the coincident index, -0.175 ; for the lagging index, 0.018 .

## G. Experimental Data and Analyses-Continued

Cyclical Comparisons: Current and Selected Historical Patterns

NOTE: For an explanation of these charts, see "How to Read Charts" on p. 106 of the January 1984 issue.
${ }^{1}$ This series is an MCD moving average placed on the center month of the span. Specific trough dates used, however, are those for the actual monthly series. ${ }^{2}$ Numeral indicates latest month used in computing the series.

- The number shown is the page of the Handbook of Cyclical Indicators (1977) on which the series description appears.

## TITLES AND SOURCES OF SERIES

Series are listed below according to the sections of this report in which they appear. Series numbers are for identification only and do not reflect relationships or order among the series. " $M$ " following a series title indicates monthly data; "Q" indicates quarterly data. Data apply to the whole period except when indicated by "EOM" (end of month) or "EOQ" (end of quarter).

To save space, the commonly used sources listed below are referred to by number:

Source 1-U.S. Department of Comnierce, Bureau of Economic Analysis; Source 2-U.S. Department of Commerce, Bureau of the Census; Source 3-U.S. Department of Labor, Bureau of Labor Statistics; Source 4-Board of Governors of the Federal Reserve System.

Following the source for each series is an indication of the pages on which that series appears. The "Series Finding Guide" also lists chart and table page numbers for each series.

## I-A. Composite Indexes

910. Composite index of twelve leading indicators (includes series $1,5,8,12,19,20,29,32,36,99,106,111$ ) (M).-Source 1
( $10,39,60$ )
911. Composite index of marginal employment adjustments (includes series $1,2,3,5$ ) (M).-Source 1
912. Composite index of capital investment commitments (includes series $12,20,29$ (M).-Source $1(11,60)$
913. Composite index of inventory investment and purchasing (includes series 8, 32, 36, 99) (M).-Source 1
$(11,60)$
914. Composite index of profitability (includes series 19,26 , 80) (M).-Source
$(11,60)$
915. Composite index of money and financial flows (includes series 104, 106, 111) (M).-Source !
$(11,60)$
916. Composite index of four roughly coincident indicators (includes series 41, 47, 51, 57) (M).-Source 1
( $10,39,60$ )
917. Composite index of six lagging indicators (includes series 62, 77, 91, 95, 101, 109) (M).-Source 1
( $10,39,60$ )
918. Ratio, coincident composite index (series 920) to lagging composite index (series 930) (M).-Source 1
$(11,60)$

## 1-B. Cyclical Indicators

1. Average workweek of production workers, manufacturing (M).-Source 3
(12,16,61,77)
2. Accession rate, manufacturing (M).-Source 3
3. Layoff rate, manufacturing (M).-Source 3
4. Quit rate, manufacturing (M),-Source 3
5. Average weekly initial claims for unemployment insurance, State programs (M).-U.S. Department of Labor, Employment and Training Administration; seasonal adjustment by Bureau of Economic Analysis
$(12,16,61)$
6. Value of manufacturers' new orders, durable goods industries, in current dollars (M).-Source 2(21,64,77)
7. Value of manufacturers' new orders, durable goods industries, in 1972 dollars (M).-Sources 1, 2, and 3
$(21,64)$
8. Value of manufacturers' new orders for consumer goods and materials in 1972 dollars (M).-Sources 1, 2, and 3
$(12,21,64)$
9. Construction contracts awarded for commercial and industrial buildings, floor space (M).-McGraw-Hill Information Systems Company; seasonal adjustment by

Bureau of Economic Analysis (Used by permission. This series may not be reproduced without written permission from the source.)
$(23,66)$
10. Contracts and orders for plant and equipment in current dollars (M).-Source 2 and McGraw-Hill Information Systems Company; seasonal adjustment by Bureau of the Census and Bureau of Economic Analysis $(23,66)$
11. Newly approved capital appropriations, 1,000 manufacturing corporations (Q).-The Conference Board
$(24,66)$
12. Index of net business formation (M).-Source 1; seasonal adjustment by Bureau of Economic Analysis and National Bureau of Economic Research, Inc.
$(12,23,65)$
13. Number of new business incorporations ( $M$ ).-Dun \& Bradstreet, Inc.; seasonal adjustment by Bureau of Economic Analysis and National Bureau of Economic Research, Inc.
$(23,65)$
14. Current liabilities of business failures (M).-Dun \& Bradstreet, Inc.
$(33,72)$
