$\square$ A limited number of changes are made from time to time to reflect the change from one stage of the business cycle to another, to show new findings of business cycle research and newly available economic series, or to emphasize the activity of a particular series or series group. Such changes may involve additions or deletions of series used, changes in placement in relation to other series, changes in components of indexes, etc.

Changes for this issue are as follows:

1. The table showing directions of change for components of selected diffusion indexes (table 5) now includes the signs and, where possible, the figures on which the signs are based. Figures cannot be shown when held confidential by the source agency or considered to be below standards for publications. However, in such cases, the signs continue to be shown. Consequently, this table now shows the maximum amount of information that can be provided each month for these component series.
2. The series on private nonfarm housing starts (series 7) has been revised for the period beginning May 1959 to reflect a new seasonal adjustment.
3. The series on new private housing units authorized by local building permits (series 29) has been revised for the period beginning January 1964 to reflect a new seasonal adjustment. Data for 1948 to 1953 are now plotted in chart 1 ; the figures and an explanation of these data are shown in appendix $F$.
4. The series on newly approved capital appropriations (series 11 and D1I) and backlog of capital appropriations (series 97) have been revised by the source agency for the period 1961 to date.
5. The index of net business formation (series 38) has been converted to a new base with 1957-59=100.
6. Appendix $F$ includes historical data for series 7, 29, and 38.

The July issue of BUSINESS CYCLE DEVELOPMENTS is scheduled for release on July 23.

## Tanc Bmul of Rosimess Cycle Sevies

A punch card file containing data for the business cycle series included in table 2 , the diffusion indexes in table 4 , and the component series (listed in table 5) used to compute 14 of the diffusion indexes in table 4 , is maintained at the Bureau of the Census. Duplicate cards for 85 of the 87 series, the 30 diffusion indexes, and 145 of the component series are available at cost. (The other series can be obtained only from the sponsoring agencies.) The cost for these cards ranges from $\$ 58$ for 500 cards to $\$ 137$ for 5,000 cards. One card is required per series year. Thus, for the 85 principal series, from 1948 to date, the cost would be about $\$ 70$. For these principal series plus the 30 diffusion indexes and 145 component series, the cost would be about $\$ 135$ for the same period.

At present, the Bureau of the Census cannot keep customers' files current. However, the figures for the principal series and diffusion indexes required for this purpose are published in BUSINESS CYCLE DEVELOPMENTS each month.

## BCD Pechnicol Popers

To aid users of BUSINESS CYCLE DEVELOPMENTS, technical papers dealing with the statistical adjustments and series used in BCD will be included in this report from time to time. A limited number of copies of these articles are available, free of charge. The following papers have been included as part of this program:

No. 1.-Summary Description of the $X-9$ and $X-10$ Versions of the Census Method II Seasonal Adjustment Program (published as appendix E in the September 1963 issue). A new version of this program is scheduled to be released later this year. Announcement will be made at that time.

No. 2.-Business Cycle Indicators-The Known and the Unknown by Julius Shiskin (published as appendix H in the September 1963 issue).

No. 3.-Census Trading-Day Adjustment Method by Allan H. Young (published in May 1964 issue).

No. 4.-Eight Series on Manufacturers' Orders and Inventories: Descriptions and Procedures by John Musgrave and John Kuntz (published in July 1964 issue).

No. 5.-Series 54, Sales of Retail Stores: Descriptions and Procedures by Max Shor and Allan Young (published in September 1964 issue).

No. 6.—The Current Expansion in Historical Perspective by Julius Shiskin (published in January 1965 issue).

Please send requests for the material described above to Julius Shiskin, Chief Economic Statistician, Bureau of the Census, Washington, D.C. 20233.

Reports in the BUREAU OF THE CENSUS TECHNICAL PAPER SERIES are also useful to BCD readers. Two reports of particular interest are-

Tests and Revisions of Bureau of the Census Methods of Seasonal Adjustments, Bureau of the Census Technical Paper No. 5, by Julius Shiskin (1961), available from the Bureau of the Census at $\$ 1$ per copy;
Estimating Trading-Day Variation in Monthly Economic Time Series, Bureau of the Census Technical Paper No. 12, by Allan Young (1965), available from Superintendent of Documents, Government Printing Office, Washington D.C., 20402, at 30 cents per copy.

## GNTRODUCTHON

Students of economic conditions describe the business cycle as consisting of alternating periods of expansion and contraction in production, employment, income, money flows, prices, and other economic processes. The fluctuations take place in a concerted manner, but not simultaneously. Once an expansion gets underway, it spreads from firm to firm, from industry to industry, from area to area, and from process to process, cumulating until a cyclical peak in aggregate activity is reached. Even while expansion is widespread during the upward phase of the business cycle, some activities continue to move in the opposite direction. Declines begin to spread as the expansion nears its peak and continue to spread even faster after the peak has been passed. But some activities continue to expand during the general contraction. Before long these expansions become stronger and more widespread. When they begin to dominate the situation, the upturn in aggregate activity has arrived and a new expansion is underway. This sequence is recurrent, but not periodic.

The causal relations among these various economic processes are primarily responsible for the cumulative nature of cyclical forces, and explain why expansion eventually turns into recession and recession into expansion. Cyclical fluctuations in production and employment are preceded by fluctuations in measures which relate to future rather than to current produc-tion-measures such as new orders for durable goods, the formation of new business enterprises, and accessions to payrolls. They are followed by fluctuations in various types of economic costs, such as labor costs, interest rates, fulfillment of long-term commitments, and holdings of inventories and of debts.

Although this pattern has been characteristic of American economic history, today many economists do not consider it inevitable.

Intensive research by the National Bureau of Economic Research (NBER) over many years has provided
a list of those significant series that usually lead, those that usually move with, and those that usually lag behind cyclical movements in aggregate economic activity. The series have been grouped and classified by the NBER as "leading", "roughly coincident", or "lagging" indicators. These indicators are defined as follows:
$\triangle$ NBER Leading Indicators.-Series that usually reach peaks or troughs before those in aggregate economic activity as measured by the roughly coincident series (see below). One group of these series pertains to activities in the labor market, another to orders and contracts, and so on.

D NBER Roughly Coincident Indicators.-Series that are direct measures of aggregate economic activity or move roughly together with it; for example, nonagricultural employment, industrial production, and retail sales.
$\Rightarrow$ NBER Lagging Indicators.-Series, such as new plant and equipment expenditures and manufacturers' inventories, that usually reach turning points after they are reached in aggregate economic activity.

Other U.S. series with business cycle significance are included in this report. Some of these series, such as change in money supply, merchandise trade balance, and cash surplus or deficit, represent important factors in the economy, but they have not qualified as indicators for various reasons, such as irregularity in timing. Finally, industrial production indexes for several countries which have important trade relations with the United States are presented.

## METHOD OF PRESENTATON

Data are shown in this report in three general categories, as follows:

Basic Data (chart 1 and tables 1 and 2).-Data are shown for business cycle indicators, additional
U.S. series with business cycle significance, and industrial production indexes for selected countries. Together, they provide a broad view of current and prospective business cycle fluctuations in the economy as well as the basis for making an economic interpretation of these fluctuations.
A Analytical Measures (chart 2 and tables 3 to 5).These are measures that aid in forming a judgment of the imminence of a turning point in the business cycle, determining the extent of current changes in different parts of the economy, and pointing to developments in particular industries and places.

Cyclical Patterns (chart 3 and tables 6 to 8 ).Current cyclical levels are compared with levels at corresponding stages of earlier cycles. These comparisons are made in different ways depending upon the phase of the business cycle.

In addition to the data shown as part of the regular report, certain appendix materials are presented. These materials include historical data, key information, and adjustment factors.

DESIGNATPON OP
BUSUNESS CYCLE TURNMNG PONNPS
The business cycle turning dates used in this report are those designated by the NBER. They mark the approximate dates when aggregate economic activity reached its cyclical high or low levels. As a matter of general practice, a business cycle turning date will not be designated until at least 6 months after it has occurred.

Monthly business cycle peaks and troughs have been dated by the NBER for the period 1854-1961. Over this span, expansion has prevailed 61 percent of the time and contraction, 39 percent. If war periods are disregarded, expansion has prevailed 56 percent of the time and contraction, 44 percent.

SEASONAL AND RELATE STATMSTICAL ADIUSTAENTS

Official seasonally adjusted data are used in this report, if they are available. However, for the special purposes of business cycle studies, a number of series that are not ordinarily published in seasonally adjusted form are shown on a seasonally adjusted basis in this report. Seasonal adjustments for these series were developed by either the NBER or the Bureau of the Census using Census Method II. The adjustment factors are shown in
appendix D , except for those series which are the sums of seasonally adjusted components, and those series which are based on unpublished source data. Seasonally adjusted data prepared by the source agency will be substituted whenever they are published.

Adjustments for changes in average climatic conditions and institutional arrangements during the year are made by Census Method II. In addition, series such as new building permits are adjusted for variations in the number of trading or working days and series such as retail sales of apparel are adjusted for variable holidays (for example, Easter).

Studies of the effect of unusual weather upon some series have also been started. It is important to note, however, that present methods adjust for average weather conditions and not for the dispersion about this average; that is, present methods are designed to adjust for normal but not abnormal weather at any time of the year. For this reason, many seasonally adjusted series, such as housing starts, will tend to be low in months when the weather is unusually bad and high in months when the weather is unusually good. While it eventually may be possible, Census methods do not at present make any adjustments for such variations.

## MCD MOMNG AVERAES

MCD (months for cyclical dominance) is an estimate of the appropriate span over which to observe the cyclical movements in a monthly series. This span is usually longer than a single month because month-to-month changes are often dominated by erratic movements, but shorter than the frequently used 12 -month span (change from the same month a year ago), and is different for different series (see appendix C for MCD values and method of computation).

MCD is, on average, the first span of months for which the average change for the cyclical factor is greater than that of the irregular factor and remains so. It is small for smooth series and large for irregular series. The month-to-month differences between moving averages of the period equal to MCD are commensurate with the differences between seasonally adjusted values separated by the same MCD span; thus, the month-to-month differences in a 3-month moving average are commensurate with differences in seasonally adjusted values over 3 -month spans. MCD moving averages all have about the same degree of smoothness. Consequently, MCD moving averages of highly irregular series, such as business failures and Federal cash payments, will show their cyclical movements about as clearly as the seasonally adjusted data for such smooth series as industrial production.

MCD moving averages are shown in chart 1 for all series with an MCD of " 5 " or more. To provide an indication of the variation about these moving averages, seasonally adjusted data are also plotted beginning with 1958. Although not so smooth as more powerful moving averages (such as the weighted 15-term Spencer curve), the MCD curve is more current and has a smaller rounding bias around business cycle peaks and troughs. On balance, the MCD curve seems to offer a reasonable compromise in terms of currency, smoothness, and fidelity to the patterns of business cycle fluctuations.

Because of advance reporting and preliminary seasonal factors, the MCD's for current data are usually larger than those computed from historical series and shown in appendix C. MCD is usually computed for a fairly long period, one covering both expansions and contractions. Since the pace of change varies from phase to phase of the business cycle, such a measure will not provide an accurate estimate of the span over which to estimate cyclically significant changes at all times. Thus, MCD computed for the period 1953-63 is likely to be too high during the early stages of recovery when expansion has usually been rapid and too low during the late stages of expansion when the rate of advance has usually been small. This limitation should be borne in mind when making use of this measure. ${ }^{1}$

## ANALYTLCAL RMEASURES © $\mathcal{F}$ GURRENT CHANGE

Three kinds of analytical measures are presented-timing distributions, diffusion indexes, and directions of change. These measures aid in forming a judgment of the current changes compared to previous changes, the imminence of a turning point in the business cycle, and the extent of current changes in different parts of the economy. They also point to developments in particular industries and places.

## Timing Distributions

Distributions of current "highs" appear to be helpful in appraising the evidence for a prospective business cycle turning point. Each month a timing distribution is constructed. This timing distribution shows the number of series reaching new highs and the percent currently high for each of several recent months (see table

[^1]3). Similar distributions of "lows" will be presented during contractions.

To provide historical perspective for interpreting the distribution of current highs, such distributions are also shown for leading and coincident series as they appear 3 months and 6 months before the peak of each of the earlier post-World War II expansions and at their peaks.

To compile timing distributions for the current cyclical phase, the data for the leading and roughly coincident business cycle indicators are scanned each month. During a business cycle expansion, the date of the high value for each series is recorded. (For inverted series-that is, series with negative conformity to the business cycle-dates of low values are taken.) If the values for 2 or more months are equal, the latest date is taken as the high month. In selecting these values, erratic values may be disregarded, although it is, of course, difficult to identify an erratic value, particularly for the current month.

The letter " $H$ " is used in table 2 to identify and highlight the current high values during the expansion. The highs designated during the current cyclical phase will not necessarily be the specific cycle peaks. (See appendix B.) As new high levels are reached during the expansion, the current highs will be moved ahead. Comparisons of the current timing distributions with those for periods around earlier business cycle peaks are helpful for appraising the evidence of a prospective business cycle turning point.

Interpretations of timing distributions must be made in light of the fact that a contraction following a high value reached several months ago may be the result of an erratic fluctuation and that a new high may be reached in some future month. In short, when the percent currently high falls below 50 percent for both the leading and roughly coincident series, this does not necessarily signify that a business cycle peak has occurred. It may do so, but it may simply reflect a short reversal in the upward movement.

## Diffusion Indexes

Diffusion indexes are simple summary measures of groups of economic series. They express, for a given aggregate series, the percent of the series components which have risen over given spans of time. Their turning points tend to lead the turning points of the aggregate and they measure how widespread a business change is. They vary between the limits of 100 (all components rising) and zero (all components falling). Widespread in increases are often associated
with rapid growth and widespread declines with sharp reductions in aggregate activity.

The diffusion indexes in this report are grouped according to the timing classification of the NBER. For monthly series, comparisons are made over 1 month spans (January-February, February-March, etc.) and generally for either 6 - or 9 -month spans, depending upon the irregularity of the series. The indexes based on 1 -month spans are more "current" but they are also more irregular than the 6 - or 9 month indexes. (See chart 2.) Quarterly series are compared over 1 -quarter spans, 3 -quarter spans, and 4 -quarter spans.

Recent research has shown that the longer-span diffusion indexes are not only smoother, but have systematically larger amplitudes than the 1 -month indexes. The 1 -month indexes generally have large irregular fluctuations, but the movements may be significant when important changes are taking place, particularly around cyclical turning points. Since the longer-span diffusion indexes are centered, there is an apparent loss in currency equal to one-half the span; for example, 3 months in the case of a 6 -month diffusion index. However, the most recent figure for a 6 -month or longer-span index does provide the latest available information on changes over that span. If a significant reversal has taken place within that span, the 1 -month indexes are likely to reveal it. Presentation of both 1 -month and longer-span diffusion indexes provides an opportunity for the user to take advantage of the best features of each in interpreting current changes.

Series numbers preceded by the letter "D" designate diffusion indexes. When one of these numbers corresponds to the number of a basic indicator series, it means that the diffusion index has been computed from components of the indicator series; for example, the diffusion index numbered "D6" is computed from components of series 6. Diffusion indexes not computed from basic series components are assigned new numbers.

Diffusion indexes that are based on business expectations show what proportion of business enterprises (or industries) are forecasting a rise in activity. Comparisons with indexes based on actual changes show whether there is a generally optimistic bias or a lag in recognition of actual developments.

## Direction-of-Change Table

The direction-of-change table (table 5) shows directions of change (" + " for rising, " 0 " for unchanged,
and "一" for falling) in the components used for the diffusion indexes. This table provides a convenient view of changing business conditions and is helpful in making an economic interpretation of the movements in the more highly aggregated statistical measures. That is, it shows which economic activities went up, which went down, and how long such movements have persisted. The table also helps to show how a recession or recovery spreads from one sector of the economy to another.

Directions of change for most diffusion index components are shown for consecutive months and, depending upon the irregularity of the series, for either 6 - or 9 -month spans.

## COMPARIIIONS

 OF GYCBCAL PAPRERNSIn forming a judgment about the current intensity and probable ultimate character of a cyclical fluctuation, some economists find it helpful to compare the behavior of the indicator series in the current business cycle phase with their behavior during the corresponding phase of previous business cycles. These comparisons are made in different ways depending upon whether the current cyclical phase is an expansion or contraction.

Expansions are compared in one way by measuring changes from the immediately preceding peak levels. In table 6 of this report, data for the latest month in the current expansion (shown by number of months from the February 1961 trough) are compared with the May 1960 reference peak. For each earlier expansion, data for a like period (same number of months from the trough of the expansion) are compared with the preceding reference peak. This type of comparison is designated as changes computed from reference peak levels and from reference trough dates. This type of comparison shows whether, and by how much, the current level of activity exceeds or falls short of the level at the preceding business cycle peak, and how the current situation compares, in this respect, with earlier expansions. For those earlier periods of expansion that were shorter than the current one, the comparisons reflect the status at a point after a new contraction had set in.

Expansions are also compared by computing changes from reference trough levels and from reference trough dates (table 7). For the current expansion, this type of comparison measures the extent of the rise from the trough level (February 1961) to the level at the current month. For each earlier expan-
sion, data for a like period (same number of months from the trough of the expansion) are compared with the level at the trough. The same situation exists here as for the comparisons shown in table 6: For earlier expansions that were shorter than the current one, the comparisons show the status at a point after a new contraction had set in.

Contractions can be compared by computing changes over the span from the most recent business cycle peak to the current month and over equal spans from previous reference peaks. This type of comparison is designated as changes from reference peak levels and from reference peak dates. These comparisons will be made during a contraction period.

In addition to comparing cyclical fluctuations on the basis of reference dates (which are the same for all series), comparisons are made on the basis of specific peak and trough dates identified for each series. For example, the specific peak for the index of industrial production is January 1960 (corresponding to the May 1960 reference peak); the specific peak for stock prices is July 1959. (See appendix B.) Specific cycle comparisons are shown in table 8. For earlier expansions, these comparisons differ from those shown for reference cycles in that they show only the period up to the next specific peak date and do not include any part of the contraction that followed. In many cases, therefore, the earlier comparisons cover fewer months than those for the current expansion.

Nearly all series have undergone changes in definition, coverage, or estimation procedure since 1919; therefore, the historical comparisons are to be considered only approximate. Furthermore, it is sometimes necessary to use data for a closely related series for cycles prior to the period covered by the series used currently. The principal substitutions of this type are as follows:
7. New private nonfarm dwelling units started (prior to 1948: Residential building contracts, floor space, by F. W. Dodge Corp.)
41. Number of employees in nonagricultural establishments (prior to 1929: Factory employment)
52. Personal income (prior to 1929: Quarterly data as published by Barger and Klein)
54. Sales of retail stores (prior to 1929: Department store sales)
62. Index of labor cost per unit of output, total manufacturing (prior to 1948: Production worker wage cost per unit).

Two types of charts are used to highlight the cyclical patterns of the business cycle indicators: Historical time series and cyclical comparisons.

## Historical Time Series (charts 1 and 2)

These charts show cyclical fluctuations against the background of expansions and contractions in general business activity from 1948 to the current month. Shaded areas on the charts indicate periods of business cycle contractions between business cycle peak dates (beginnings of shaded areas) and business cycle trough dates (ends of shaded areas). The shading for a new contraction will be entered only after a trough has been designated.

Several different ratio and arithmetic scales are used to highlight the cyclical movements of the various series. The scale selected for each series is identified in the margin of the chart. Rates of change of various series can be compared with each other only where scales are identical. See the diagram, page 6, for additional help in using these charts.

## Cyclical Comparisons <br> \section*{(charts 3 and 4)}

These charts compare the performance of selected indicators during the current expansion with their performance during the expansion phase of previous business cycles. The usual date sequence followed in charts is disregarded, and instead the data are alined at the strategic point of the business cycle: For expansions, the reference trough (see chart 3 ) and specific trough (see chart 4). Thus, these comparisons facilitate judgments on the vigor of the current expansion relative to cyclical movements during the expansions of previous cycles.

Two types of cyclical comparisons are made. Chart 3 compares the pattern of the current reference cycle (the cycle for aggregate economic activity) with movements over the corresponding phases of previous reference cycles. Chart 4 compares the pattern of the current specific cycle (the cycle for a particular series) with the movements over the corresponding phases of previous specific cycles in that series. In both'charts, the trough dates are alined. In chart 3, the levels of the preceding peaks are also alined while in chart 4 , the levels of the troughs are alined. See the section, "Comparisons of Cyclical Patterns", for more detailed descriptions of these comparisons.

Peak (P) of cycle indicates end of
expansion and beginning of Recession (shaded areas) as designated by NBER.

## CHART 1 - Business Cycle Series

See back cover for complete titles and sources of series.

Solid line indicates monthly data. (Data may be actual monthly fig. ures or MCD moving averages.*)

Broken fine indicates actual monthly data for series where an MCD moving average * is plotted.

Parallel lines indicate a break in continuity (data not available, changes in series definitions, etc.).

Solid line with plotting points indicates quarterly data.

Trough ( T ) of cycle indicates end of recession and beginning of Expansion (white areas) as designated by NBER.

Arabic number indicates latest month for which data are plotted. (" 12 " = December)

Roman number indicates latest quarter for which data are plotted. ("ll" = second quarter)

Dotted line indicates anticipated data.

Various scales are used to highlight the patterns of the individual series. Series plotted to different scales are not directly comparable. "Scale A" is an arithmetic scale, "scale L-1" is a logarithmic scale with 1 cycle in a given distance, "scale $L-2$ " is a logarithmic scale with 2 cycles in that distance, etc.

## CHART 2 - Diffusion Indexes

Solid line indicates monthly data over 6. or 9-month spans.

Broken line indicates monthly data over 1-month spans.

Solid line with plotting points indicates quarterly data over various spans.

* Many of the more irregular series are shown in terms of their MCD moving averages as well as their actual monthly data. In such cases, the 4-, 5-, or 6-term moving averages are plotted $11 / 2,2$, or $21 / 2$ months, respectively, behind the actual data. See page 2 for a description of MCD moving averages.

Scale shows percent of components rising.
rabic number indicates latest month for which data are used in computing the indexes. (" 12 " $=$ December)

Roman number indicates latest quarter for which data are used in computing the indexes. ("Ill" = third quarter)

Broken line with plotting points indicates quarterly data over various intervals. This line is also used to indicate anticipated quarterly data.

## charts and tables

LEADING INDICATORS
Sensitive employment and unemployment
New investment commitments
New businesses and business failures
Profits and stock prices
Inventory investment, buying policy, and sensitive prices
ROUGHLY COINCIDENT INDICATORS
Employment and unemployment
Production
Income and frade
Wholesale prices

## LAGGING INDICATORS

Investment expenditures
Cost per unif of output
Invenfories
Debt
Interest rates
OTHER U.S. SERIES
Federal budget and military commitments
Reserves, money supply, and financing
Interest rates
Foreign frade
INTERNATIONAL COMPARISONS
Industrial production indexes for selected foreign countries

ISeries are seasonally adjusted except for those series, indicated by an asterisk (*), that appear to contain no seasonal movement. See additional basic data and notes in table 2.
${ }^{2}$ To facilitate interpretations of cyclical movements, those series that usually fall when general business activity rises and rise when business fallsare inverted so that rises are shown as declines and declines as rises (see series $3,4,5,14,15,40,43$, and 45 ). Percent changes are calculated in the usual way but the signs are reversed; e.g., if the rate of decrease is 0.6 percent, it is shown as +0.6 . See footnote 5 for other "change" qualifications.
${ }^{3}$ This average is based on month-to-month (or quarter-to-quarter) changes without regard to sign. The period varies among the series, covering $1953-63$ for most series.
${ }^{4}$ Quarterly series. Figures are placed in the middle month of quarter.
5 Since basic data for this series are expressed in plus or minus amounts, the changes are month-to-month (or quarter-to-quarter) differences expressed in the same unit of measure as the basic data, rather than in percent.
${ }^{6}$ Figures are placed in the last month of quarter.

## LATEST DATA FOR BUSINESS CYCLE SERIES-Continued

NBER Roughly Coincident Indicators

NOTE: Series are seasonally adjusted except those that appear to contain no seasonal movement. Unadjusted series are indicated by an asterisk (*). Current high values are indicated by $\boldsymbol{w}$; for series that move counter to movements in general business activity (series $3,4,5,14,15,40,43$, and 45 ), current low values are indicated by 国. Series numbers are for identification only and do not reflect series relationships or order. Complete titles and sources are shown on the back cover. The "r" indicates revised; "p", preliminary; "e", estimated; "a", anticipated; and "NA", not available.
${ }^{1}$ Beginning with April 1962, the 1960 Census is used as the benchmark for computing this series. Prior to April 1962, the 1950 Census is used as the benchmark. ${ }^{2}$ Data exclude Puerto Rico which is included in figures published by source agency.

## charts and tables

## DISTRIBUTION OF 'HIGHS’ FOR CURRENT AND COMPARATIVE PERIODS

> DIFFUSION INDEXES BASED ON HUNDREDS OF COMPONENTS Average workweek- $\mathbf{2 1}$ industries

New orders-36 indusiries
Capital appropriations-17 industries
Profits- 700 companies
Stock prices-80 industries
Industrial materials prices-13 materials State unemployment claims-47 areas

Nonagricultural employment- 30 industries Production-24 industries
Wholesale prices- 23 indusfries
Retail sales-24 types of stores
Net sales- 800 companies
New orders-400 companies
Carloadings-19 commodity groups
Plant and equipment expenditures-22 industries

## DISTRIBUTION OF "HIGHS" FOR CURRENT AND COMPARATIVE PERIODS

NOTE: All quarterly series and 2 monthly series (series 15, a leading indicator, and series 40 , a roughly coincident indicator) are omitted from the distribution.
${ }^{1} 4$ series were not available.
$z_{1}$ series was not available and 2 series were omitted because their peaks were reached during the korean war and such peaks were disregarded in this distribution.

NOTE: Figures are the percent of series components rising and are centered within spans: 1 -month indexes are placed on latest month and 9 -month indexes are placed on the 6th month of span; l-quarter indexes are placed on the 1 st month of the $2 d$ quarter. Seasonally adjusted components are used except in indexes D19 which requires no adjustment and D34 which is adjusted only for the index. Table 5 identifies the components for most of the indexes shown. The "r" indicates revised; "p", preliminary; and "NA", not available.
${ }^{1}$ The diffusion index is based on 82 components, July 1961 to February 1963; on 80 components, March 1963 to August 1963; on 79 components, September 1963 to March 1964; on 78 components, April 1964 to November 1964; and on 77 components thereafter.
${ }^{2}$ Average for June 14, 15, and 16.

NOTE: Figures are the percent of series components rising and are centered within spans: l-month indexes are placed on latest month, 6 -month indexes are placed on the 4 th month, and 9 month indexes are placed on the 6 th month of span. Seasonally adjusted components are used. Table 5 identifies the components for the indexes shown. The "r" indicates revised; "p", preliminary; and "NA", not available.

Actual and Anticipated Indexes

| Year and month | D35. Net sales, manufactures (800 companies) <br> 4-quarter span |  | D36. New orders, durable manufactures (400 companies) 4-quarter span |  | D48. Freight carloadings (19 manufactured commodity groups ) <br> 4-quarter span |  |  | D61. New plant and equi.pment expenditures (16 industries) l-quarter span |  |

NOTE: Figures are the percent of series components rising and are centered within spans: 4 -quarter indexes are centered in the midale quarter; 1-quarter indexes are placed in the lst month of the 2 d quarter. Seasonally adjusted components are used for series D61; other indexes, based on 4 -quarter spans (same quarter a year ago), require no seasonal adjustment. The "r" indicates revised; "p", preliminary; and "NA", not available.
${ }^{1} 3$ d quarter 1965.

# Section THREE 

## charts and tables

## REFERENCE CYCLES

Current expansion compared with expansions in earlier business cycles

## SPECIFIC CYCLES

Current expansions in selected series compared with earlier
expansions in these series

## PERCENT CHANGES FOR CURRENT AND EARLIER EXPANSIONS

Percent of reference peak levels
Percent change from reference trough levels
Percent of specific peak levels
Percent change from specific trough levels

PERIOD COVERED
_ Nov. 1948 to Apr. 1954 (Reference trough: Oct. 1949)
......... July 1953 to Feb. 1959 (Reference trough: Aug. 1954)
-------- July 1957 to Oct. 1962 (Reference trough: Apr. 1958)
_ May 1960 to present (Reference trough: Feb. 1961)

(

## PERIOD COVERED

—_Nov. 1948 to Apr. 1954 (Reference trough: Oct. 1949)
....... July 1953 to Feb. 1959 (Reference trough: Aug. 1954)
———— July 1957 to Oct. 1962 (Reference trough: Apr. 1958)
——May 1960 to present (Reference trough: Feb. 1961)

$-12-6 \quad 0+6+12+18+24+30+36+42+48+54$

Months from reference troughs
Months from reference troughs
 in a given distance; scale L- 2 is a logarithmic scale with 2 cycles in that distance, etc. -Lines represent actual data rather than percentages of reference peak levels.
*Reference peak level. * Point at which this expansion reached a new reference peak. O Point at which a new reference trough was reached.

## COMPARISONS OF REFERENCE CYCLES-Continued

## PERIOD COVERED

—__ Nov. 1948 to Apr. 1954 ( Reference trough: Oct. 1949)
............. July 1953 to Feb. 1959 (Reference trough: Aug. 1954)
-——— July 1957 to Oct. 1962 (Reference trough: Apr. 1958 )
_M May 1960 to present (Reference trough: Feb. 1961)

$-12-6 \quad 0+6+12+18+24+30+36+42+48+54$
Months from reference troughs

 in a given distance; scale L. 2 is a logarithmic scale with 2 cycles in that distance, etc. +Latest data anticipated.
*Reference peak level. * Point at which this expansion reached a new reference peak. OPoint at which a new reference trough was reached.

PERIOD COVERED
Comparisons cover a 60 -month period beginning
with specific trough dates corresponding to the reference troughs of--

- 1949
------ 19581961

 scales are used. Scale $L-1$ is a logarithmic scale with 1 cycle in a given distance; scale $L-2$ is a logarithmic scale with 2 cycies in that distance, etc.
*Specific trough level.

## COMPARISONS OF SPECIFIC CYCLES-Continued

PERIDD COVERED
Comparisons cover a 60 -month period beginning
with specific trough dates corresponding to
the reference troughs of.-

 scales are used. Scale L- 1 is a logarithmle scale with 1 cycle in a given distance; scale L-2 is a logarithmic scale with 2 cycles in that distance, etc.
*specific trough level. ${ }^{1}$ Lines represent actual data rather than percentages of specific trough levels.

PERIOD COVERED
Comparisons cover a 60 -month period beginning with specific trough dates corresponding to the reference troughs of-.

|  |
| :--- |
| $\ldots \ldots . . . . .1949$ |

See appendix B for specific dates. Table 2 shows latest month in current (1961) expansion. Changes for this month and comparable months after the specific troughs of previous expansions are shown in table 8 . Various scales are used. Scale L-1 is a logarithmic scale with 1 cycle in a given distance; scale L- 2 is a logarithmic scale with 2 cycles in that distance, etc.

* Specific trough level. + Latest data anticipated.

NOTE: For series with a "months for cyclical dominance" (MCD) of "1" or "2" (series 1, 17, 19, 23, 41, 43, 47, 52, 54, 55, 62,64 , and 66), the value for the month indicated in the 1 st column (month after reference trough) is divided by the value for the reference peak month. Similarly, the reference peak quarter is used as the percentage base for quarterly series (series l6, $49,50,61$, and 67). For series with an MCD of " 3 " or more (series 2, 3, 6, 7, 9, 13, 14, 24, 29, and 51 ), the average of the 3 months centered on the reference peak month is used as the base. See MCD footnote to appendix C. For all earlier expansions except the one beginning in June 1938, the peak had been passed and a reference contraction was underway by the month indicated in the first column. See appendix A for the reference peak dates.

NA Not available.
${ }^{1}$ Based on period from February 1961 (current trough) to latest month for which data are available. Measures for shorter time spans can be found in earlier issues of BUSINESS CYCLE DEVETOFMENTS. ${ }^{2}$ Except for 1961, changes are computed in a 3 -term moving average of, the seasonally adjusted series. ${ }^{3}$ Measures are differences from the reference peak levels. 4 Anticipated expenditures (4th quarter 1965) are used for computing the entry shown for the current expansion only. Actual expenditures are used for all other entries.

NOTE: For series with a "months for cyclical dominance" (MCD) of "1" or "2" (series 1, 17, 19, 23, 41, 43, 47, 52, 54, 55, 62, 64, and 66), the value for the month indicated in the lst colum (month after reference trough) is divided by the value for the reference trough month. Similarly, the reference trough quarter is used as the percentage base for quarterly series (series 16, 49, 50, 61, and 67). For series with an MCD of "3" or more (series 2, 3, 6, 7, 9, 13, 14, 24, 29, and 51), the average of the 3 months centered on the reference trough month is used as the base. See MCD footnote to appendix C. For all earlier expansions except the one beginning in June 1938, the peak had been passed and a reference contraction was underway by the month indicated in the first column. See appendix A for the reference peak dates.

NA Not available.
${ }^{1}$ Based on period from February 1961 (current trough) to latest month for which data are available. Measures for shorter time spans can be found in earlier issues of BUSINESS CYCLE DEVELOPMENTS. 2Except for 1961, changes gre computed in a 3-term moving average of the seasonally adjusted series. $\quad{ }^{3}$ Measures are differences from the reference trough levels. 4 Anticipated expenditures (4th quarter 1965) are used for computing the entry shown for the current expansion only. Actual expenditures are used for all other entries.

## NBER LEADING INDICATORS

1. Average workweek of production workers, mfg
2. New business incorporations.
3. Ratio, price to ýnit labor cost index.
4. Stock prices, 500 common stocks.
5. Industrial materials prices.
6. New orders, machinery and equipment indus.
7. New building permits, private housing.

NBER ROUGHLY COINCIDENT INDICATORS
41. Employees in nonagri. establishments.
43. Unemploy. rate (percent), total (inverted) ${ }^{2}$
47. Industrial production.
49. GNP in current dollars (Q)
50. GNP in 1954 dollars (Q).
53. Labor income in mining,
54. Sales of retail stores.

NBER LAGGING INDICATORS
61. Bus. expend., new plant and equip. (Q):
a. Actual.
b. Anticipated ${ }^{3}$
62. Labor cost per unit of output, mfg
64. Book value of mfrs.' inventories
67. Bank rates on short-term business ioans (Q)

NOTE: For series with a "months for accid
( and 64), the value for the month indicated in the lst column (month after specific trough) is divided by the value for the specific peak or trough month. Similarly, the specific peak or trough quarter is used as the percentage base for quarteriy series (series 49,50, 61, and 67). For series with an MCD of " 3 " or more (series 13, 24, and 29), the average of the 3 months centered on the specific peak or trough month is used as the base. See MCD footnote to appendix C.

NA Not available. NSC No specific cycle corresponding to reference date. *Indicates that a specific peak had been passed and a specific contraction was underway for this series by the month indicated in the first column. The figure shown represents the change to the specific peak, and the period covered is shorter than that of the current expansion. See appendix $B$ for specific peak dates.
${ }^{1}$ Based on period of the most recent specific expansion for each series; i.e., from the most recent specific trough to the latest month shown in table 2. The number of months is the same for each expansion except those indicated by an asterisk (*). Percent measures for shorter time spans can be found in earlier issues of BUSINESS CYCLE DEVELOPMENTS. Specific trough dates are shown in appendix B. ${ }^{2}$ Measures are differences from the specific peak or trough levels. ${ }^{3}$ Anticipated expenditures (4th quarter 1965) are used for computing the entry shown for the current expansion only. Actual expenditures are used for all other entries.

NOTE: Specific trough and peak dates are the actual dates when individual series reached a trough or peak as distinguished from reference dates which are those dates designated as the trough or peak of business activity as a whole. This table shows, for selected indicators, the specific dates corresponding to reference dates in 9 recent business cycles.

NA Not available. NSC No specific cycle corresponding to reference date.

NOTE: For most series, measures are computed for a period of at least 10 years. Figures for series 7, 86, 87, and 116 are based on shorter periods.
${ }^{1}$ Not computed for series when MCD is "6" or more.

The following are brief definitions of the measures shown in this table. More complete explanations appear in Electronic Computers and Business Indicators, by Julius Shiskin, issued as Occasional Paper 57 by the National Bureau of Economic Research, 1957 (reprinted from Journal of Business, Dctober 1957).
" $\overline{C I} "$, is the average month-to-month (or quarter-to-quarter) percentage change, without regard to sign, in the seasonally
adjusted series. " $\bar{I} "$ is the same for the irregular component, obtained by dividing the cyclical component into the seasonally adjusted series. " $\bar{C}$ " is the same for the cyclical component, a smooth, flexible moving average of the seasonally adjusted series.
"MCD" (months for cyclical dominance) provides an estimate of the appropriate time span over which to observe cyclical movements in a monthly series. It is small for smooth series and large for irregular series. In deriving MCD, percentage changes are computed separately for the irregular component and the cyclical component over l-month spans (Jan.-Feb., Feb.Mar., etc.), 2-month spans (Jan.-Mar., Feb.-Apr., etc.), up to 5 -month spans. Averages, without regard to sign, are then computed for the changes over each span. MCD is the shortest span in months for which the average percentage change (without regard to sign) in the cyclical component is larger than the average percentage change (without regard to sign) in the
irregular component, and remains so. Thus, it indicates the point at which fluctuations in the seasonally adjusted series become dominated by cyclical rather than irregular movements. Since changes are not computed for spans greater than 5 months, all series with an MCD greater than "5" are shown as "6". Similarly, "QCD" provides an estimate of the appropriate time span over which to observe cyclical movements in quarterly series. It is the shortest span (in quarters) for which the average percentage change (without regard to sign) in the cyclical component is larger than the average percentage change (without regard to sign) in the irregular component, and remains so.
" $\overline{\mathrm{I}} / \mathrm{C} "$ is a measure of the relative smoothness (small values) or irregularity (large values) of the seasonally adjusted series. For monthly series, it is shown for l-month spans and for spans of the period of MCD. When MCD is "6", no I/C ratio is shown for the MCD period. For quarterly series, $\bar{I} / \bar{C}$ is shown for l-quarter spans and QCD spans.
"Average Duration of Run" (ADR) is another measure of smoothness and is equal to the average number of consecutive monthly changes in the same direction in any series of observations. When there is no change between 2 months, a change in the same direction as the preceding chenge is assumed. The $A D R$ is shown for the seasonally adjusted series $C I$, irregular component $I$, cyclical component $C$, and the MCD curve. The MCD
curve is a moving average (with the number of terms equal to MCD) of the seasonally adjusted series.

A comparison of these measures of $A D R$ with the expected $A D R$ of a random series gives an indication of whether the changes approximate those of a random series. Over l-month intervals in a random series, the expected value of the ADR is 1.5. The actual value of ADR falls between 1.36 and 1.75 about 95 percent of the time. Over l-month intervals in a moving average (MCD) of a random series, the expected value of $A D R$ is 2.0. For example, the ADR of $C I$ is 1.67 for the series on new orders, durable goods industries (series 6). This indicates that l-month changes in the seasonally adjusted series, on the average, reverse sign about as often as expected in a random series. The ADR measures shown in the next two columns, 1.54 for $I$ and 8.33 for C, suggest that the seasonally adjusted series has been successfully separated into an essentially random component and a cyclical (nonrandom) component. Finally, $A D R$ is 4.56 for the MCD moving average. This indicates that a 3 -month moving average of the seasonally adjusted series ( 3 months being the MCD span) reverses direction, on the average, about every 4 to 5 months. The increase in the ADR from 1.67 for $C I$ to 4.56 for the MCD moving average indicates that, for this series, month-to-month changes in the MCD moving average usually reflect the underlying cyclical-trend movements of the series, whereas the month-tomonth changes in the seasonally adjusted series usually do not.

## Appendix C.-AVERAGE CHANGES AND RELATED MEASURES FOR BUSINESS CYCLE SERIES-Continued

Part 2.-Average Unit Changes

| Monthly series | Unit of measure | $\overline{C I}$ | $\overline{\mathrm{I}}$ | $\overline{\mathrm{c}}$ | $\overline{\mathrm{I}} / \mathrm{C}$ | MCD ${ }^{1}$ | $\begin{gathered} \overline{\mathrm{I}} / \mathrm{C} \\ \mathrm{for} \\ \mathrm{MCD} \\ \mathrm{span} \end{gathered}$ | Average duration of run (ADR) |  |  |  |

NOTE: For most series, measures are computed for a period of at least 10 years. Figures for series 88 and 112 are based on shorter periods.
${ }^{1}$ Where MCD is larger than "6", a 6-term moving average is used as the MCD curve.

The measures in the above table are computed by an additive method to avoid the distortion caused by zero and negative data. Thus, "CI" is the average month-tommonth (or quarter-
to-quarter) change in the seasonally adjusted series. This average is computed without regard to sign and is expressed in the same unit of measure as the series itself. " C " is the same for the cyclical component, which is a moving average of the seasonally adjusted series. "II" is the same for the irregular component, which is determined by subtracting the cyclical component from the seasonally adjusted series.

All other measures shown above have the same meaning as in part 1.

Appendix D.-CURRENT ADJUSTMENT FACTORS FOR BUSINESS CYCLE SERIES (MAY 1964 TO JUNE 1965)

| Series | 1964 |  |  |  |  |  |  |  | 2965 |  |  |  |  |  |

NOTE: For series with a "months for cyclical dominance" (MCD) of "1" or "2" (series 41, 43, 47, 52, and 54), the figure for the reference peak (trough) month is used as the base. For series with an MCD of "3" or more (series 51), the average of the 3 months centered on the reference peak (trough) month is used as the base. The base for quarterly series (series 49 and 50 ) is the reference peak (trough) quarter. See also MCD footnote to appendix C.

NA Not available.
${ }^{1}$ The most recent quarterly reference dates are as follows: 2 d quarter 1958 (trough); 2d quarter 1960 (peak); and lst quarter 1961 (trough). For earlier dates, see Business Cycle Indicators (NBER) vol. 1, p. 670.
${ }^{2}$ Based on average for the calendar year.
${ }^{3}$ Differs from figure for same date in expansion (contraction) part of table because of change in series used.
${ }^{4}$ World War II contraction or expansion period.
${ }^{5}$ Korean War contraction or expansion period.
${ }^{6}$ The median is an average of the middie 2 or 3 items.

${ }^{1}$ See back cover for series titles and sources.

[^0]:    ABOUT THE COVER-
    Series in this publication are grouped according to their usual timing and shown against the background of contractions and expansions in general business activity. The cover design illustrates this concept. The black vertical bar represents a contraction; the top curve, the Leading Series which usually fall before a contraction has begun and rise before it has ended; the middle curve, the Coincident Series which usually fall with the contraction period; the bottom curve, the Lagging Series which fall after a contraction has begun and rise after it ends.

[^1]:    ${ }^{1}$ For a more complete description of MCD and its use in studying economic series, see Business Cycle Indicators, Geoffrey H. Moore, editor; National Bureau of Economic Research, Inc., vol. 1, ch. 18, "Statistics for Short-Term Economic Forecasting," by Julius Shiskin (Princeton University Press: 1961).

[^2]:    NOTE: Data are not shown when held confidential by the source agency.

[^3]:    $+=$ rising; $o=$ unchanged; $-=$ falling.

[^4]:    $+{ }_{1}=$ rising； $0=$ unchanged；$-=$ falling．
    NA Not available． The percent rising is based on 24 industry components．Where actual data for separate industries are not available，esti－
    mates are used to compute the percent rising．Directions of change for the most recent spans are computed before figures are rounded．

[^5]:    ${ }^{1}$ Data are seasonally adjusted by the Bureau of the Census. See "Seasonal and Related Statistical Adjustments", page 2.

[^6]:    + = rising; $0=$ unchanged; - = falling.
    ${ }^{1}$ Data are not seasonally adjusted.
    ${ }^{2}$ The 23 components shown here include 18 of the more important industries and 5 composites representing an additional 23 of the industries used in computing the diffusion index in table 4.
    ${ }^{3}$ Based on 78 components to November 1964 and on 77 components thereafter:

[^7]:    －＝rising； $0=$ unchanged；$+=$ falling，The signs are reversed because this series usually rises when general business ac tivity falls and falls when business rises．Data used are for the week ending nearest the 22d of the month．
    ＊Designated by Bureau of Employment Security as an area of substantial unemployment（ 6 percent or more）in April 1965.
    ＊＊Designated by Bureau of Employment Security as an area of substantial（ 6 percent or more）and persistent unemployment in April 1965.
    ${ }^{1}$ Series components are seasonally adjusted by the Bureau of the Census before the direction of change is determined．See ＂Seasonal and Related Statistical Adjustments＂，page 2．The percent rising is based on 47 labor market areas．Directions of change are shown separately for only the 26 largest areas．The size rank for each labor market area is indicated by the number in parentheses．

[^8]:     in a given distance; scale L-2 is a logarithmic scale with 2 cycles in that distance, etc.
    *Reference peak level. *Point at which this expansion reached a new reference peak.
    OPoint at which a new reference trough was reached.

[^9]:    ${ }^{1}$ For the period since January 1959, data are not entirely comparable with those for the period prior to 1959. Annual levels for the earlier years have been substantially revised to make them comparable with those for the later years. Month-to-month movements for the earlier period, however, were not similarly revised but were superimposed on the new annual levels in accordance with the monthly pattern of the old series. An explanation of the revision of the annual data is given in the Bureau of the Census report, Housing Starts in May 1964 (Construction Reports: Housing Starts, C20-60). The figures shown in that source are limited to annual aggregates. The monthly data have been prepared by the Business and Defense Services Administration, U. S. Departmient of Commerce. (See June 1964 issue of Construction Review.)
    ${ }^{2}$ The index for the period 1948 -1953 is based upon an estimate of the number of new privately owned dwelling units authorized in urban areas as defined in the 1940 Census of Population. Building permit data from reporting cities representing approximately 85 percent of the 1940 urban population were expanded to represent all urban areas by "matching" nonreporting to reporting urban places on the basis of city population size and location, and applying trend ratios for reporting places to nonreporting places. Between 1954 and 1958, the data are based on reports from approximately 6,600 identical permit-issuing places including practically all large cities, a large proportion of smaller cities, and counties, towns, and townships. The universe was further expanded in 1959 to 10,000 permit places and beginning in January 1963 to 12,000 such places. These data have been made continuous by ratio adjustment and converted to an index, 1957-1959=100. Because of changes in the number of permit-issuing areas during the three time periods mentioned above, this index (1) measures only short-term changes in the number of housing units authorized by identical permit-issuing places; (2) does not measure the movement of permits in all permit-issuing places; and (3) does not measure the trend of housing construction in permit and nonpermit issuing places combined. Hence, because of the variations in coverage, the 1948-53, 1954-59, and 1960-65 segments are not directly comparable.
