Preface

This report has been prepared to bring together many of the available economic indicators in convenient form for analysis and interpretation by specialists in business cycle analysis. The presentation and classification of series in this report follows the business indicators approach. The classification of series and the business cycle turning dates are those designated by the National Bureau of Economic Research (NBER) which, in recent years, has been the leader in this field of investigation. However, this publication is not to be taken as implying acceptance or endorsement by the Bureau of the Census or any other government agency of any particular approach to business cycle analysis. It is intended only to supplement other reports of the Department of Commerce that provide data for analyzing current business conditions.

The unique features are the arrangement of data according to their usual timing relations during the course of the business cycle and the inclusion of special analytical measures and historical cyclical comparisons that help in evaluating the current stage of the business cycle.

About 30 principal indicators and over 300 components are used for the different measures shown. The movements of the series are shown against the background of the expansions and contractions of the general business cycle so that "leads" and "lags" can be readily detected and unusual cyclical developments spotted. The exact number of series included for the total and important classes of series may vary from month to month because of additions of new series and revisions in the composition of indexes. Almost all of the basic data are available in published reports. A complete list of the series and the sources of data is shown on the back cover of this report. All the data shown are seasonally adjusted where seasonal variations appear to exist.

The chief merits of this report are the speed with which the data for indicators are collected, assembled, and published and the arrangement of the series for business cycle studies. Electronic computers are used for many of the computations, thus making early publication possible. Publication is scheduled for around the 22nd of the month following the month of data.

1

New Features and Changes for This Issue

A limited number of changes are made from time to time to reflect the change from one stage of the business cycle to another, to show new findings of business cycle research and newly available economic series, or to emphasize the activity of a particular series or series group. Such changes may involve additions or deletions of series used, changes in placement in relation to other series, changes in components of indexes, etc. These changes will be listed in this section each month. The changes made in this issue are as follows:

1. Series 68, index of labor cost per dollar of real corporate gross national product, has been revised for the period 1961 to date. This change reflects the annual revisions in national income accounts made by the Office of Business Economics.

2. Appendix F includes historical data for series 40, 41, 42, 49, 50, 51, 52, 55, 57, 66, 67, and 81.

The September issue of <u>Business Cycle Devel-</u> opments is scheduled for release on September 23.

Technical Papers and Background Materials

To aid users of <u>Business Cycle Developments</u>, technical papers dealing with the statistical adjustments and series used in BCD will be included in this report from time to time. The following papers have been included as part of this program:

- No. 1. Summary Description of the X-9 and X-10 Versions of the Census Method II Seasonal Adjustment Program (published as appendix E in the September 1963 issue). A new version of this program is scheduled to be released in the fall. Announcement will be made at that time.
- No. 2. Business Cycle Indicators The Known and the Unknown by Julius Shiskin (published as appendix H in the September 1963 issue). This paper explains what is known about business cycle indicators, the problems of using them, and the research needed to improve their usefulness. It was presented at the 34th session of the International Statistical Institute in Ottawa, Canada, on August 24, 1963.
- No. 3. Census Trading-Day Adjustment Method by Allan H. Young (published in May 1964 issue). This paper is a summary of the technique used at the Census Bureau to adjust monthly series for variations arising from the number of trading or working days in the month. This technique will be included in a new variant of the Census Method II seasonal-adjustment program (X-11) to be released later this year.
- No. 4. Eight Series on Manufacturers' Orders and Inventories: Descriptions and <u>Procedures</u> by John Musgrave and John Kuntz (published in July 1964 issue). This paper describes eight BCD series (6, 20; 24, 25, 64, 65, 96, and 99) which are compiled and seasonally adjusted by the Bureau of the Census, briefly explains their typical business cycle behavior, and gives a comprehensive list of sources of such information.

A limited number of copies of these articles are available, free of charge, from the Chief Economic Statistician, Bureau of the Census, Washington, D.C., 20233. Copies for classroom use can usually be provided.

Descriptions and Procedures

Business Cycle Series

Intensive research over many years has provided a record of the typical sequence of changes in economic processes during a business cycle; more specifically, a list of significant series that usually lead, those that usually move with, and those that usually lag behind cyclical movements in aggregate economic activity. The series have been grouped, in accordance with the NBER classification, as "leading," "roughly coincident," or "lagging" indicators. In addition, other series are included in this report for a more complete coverage of the national economy. The series are described as follows:

<u>NBER Leading Indicators</u>.—Around 30 series usually reach peaks or troughs before those in aggregate economic activity as measured by the roughly coincident series (see below). For this reason, they are designated as "leading" series. One group of these series pertains to activities in the labor market, another to orders and contracts, and so on.

NBER Roughly Coincident Indicators. —About 15 series are direct measures of aggregate economic activity or move roughly together with it; for example, nonagricultural employment, industrial production and retail sales. For this reason they are referred to as "roughly coincident" series.

<u>NBER Lagging Indicators</u>.—Some series, such as new plant and equipment expenditures and manufacturers' inventories, usually have reached turning points after they were reached in aggregate economic activity, and for this reason, they are designated as "lagging" series.

Other series.—Additional U.S. series with business cycle significance are also shown. Some of these series, such as change in money supply, merchandise trade balance, and cash surplus or deficit, represent important factors in the economy, but they have not qualified as indicators for various reasons, such as irregularity in timing. Finally, industrial production indexes for several countries which have important trade relations with the United States are presented.

Method of Presentation

Data are shown in this report in three general categories, as follows:

Basic data (chart 1 and tables 1 and 2).—Over 50 business cycle indicators and about 30 additional series with business cycle significance are included. Together they provide a broad view of current and prospective business cycle fluctuations in the economy as well as the basis for making an economic interpretation of these fluctuations.

<u>Analytical measures</u> (charts 2-3 and tables 3-6). — These measures aid in forming a judgment of the imminence of a turning point in the business cycle and the extent of current changes in different parts of the economy. They also aid in pointing to developments in particular industries and places.

<u>Cyclical patterns</u> (charts 4-5 and tables 7-9).— The current cyclical change is compared with changes at corresponding stages of earlier cycles. These comparisons are made in different ways depending upon the phase of the business cycle.

In addition to the data shown as part of the regular report, certain appendix materials are presented. These materials include historical data, key information, and adjustment factors.

Designation of Business Cycle Turning Points

The historical business cycle turning points are those designated by the NBER. They mark the approximate date when aggregate economic activity reached its cyclical high or low levels. As a matter of general practice, a business cycle turning point will not be designated until at least 6 months after it has occurred.

Seasonal and Related Statistical Adjustments

Official seasonally adjusted data are used in this report wherever they are available. However, for the special purposes of business cycle studies, a number of series that are not ordinarily published in seasonally adjusted form are shown on a seasonally adjusted basis in this report. These series are as follows: 4, 5, 9, 10, 11, 13, 14, 15, 17, 18, 30, 37, 55, 62, 81, 82, 83, 84, 90, 91, 92, 97, 112, and 128. Seasonal adjustments for these series were developed by either the NBER or the Bureau of the Census using Method II. The adjustment factors are shown in appendix table D, except for series 11 and 97 which are the sums of seasonally adjusted components, and series 9 and 10 which are based on unpublished source data. Seasonally adjusted data prepared by the collecting agency will be substituted for the series mentioned above whenever they are published.

Method II adjusts for changes in average climatic conditions and institutional arrangements during the year. Adjustments for variations in the number of trading days are also made for some series; for example, new building permits. Further adjustments for variable holidays, such as Easter, are made for certain series; for example, retail sales of apparel. Studies are now underway to determine whether similar adjustments for Labor Day, Thanksgiving Day, and the day of the week upon which Christmas falls would be useful.

Studies of the effects of unusual weather upon some series have also been started. It is important to note, however, that present methods adjust for <u>average</u> weather conditions and not for the <u>disper-</u><u>sion</u> about this average; that is, present methods are designed to adjust for normal but not abnormal weather at any time of the year. For this reason, many seasonally adjusted series, such as housing starts, will tend to be low in months when the weather is unusually bad and high in months when the weather is unusually good. While it eventually may be possible, Census methods do not at present make any adjustments for such variations.

MCD Moving Averages

MCD (months for cyclical dominance) is an estimate of the appropriate span over which to observe the cyclical movements in a monthly series. This span is usually longer than a single month because month-to-month changes are often dominated by erratic movements, but shorter than the frequently used 12-month span (change from the same month a year ago), and is different for different series (see appendix C for MCD values and method of computation).

MCD is, on average, the first interval of months for which the average amplitude of the cyclical factor is greater than that of the irregular factor and remains so. It is small for smooth series and large for irregular series. The differences between moving averages of the period equal to MCD are commensurate with the differences between seasonally adjusted values separated by the same MCD span; thus, the month-to-month differences in a 3-month moving average are commensurate with differences in seasonally adjusted values over 3-month spans. MCD moving averages all have about the same degree of smoothness. Consequently, MCD moving averages of highly irregular series, such as business failures and Federal cash payments, will show their cyclical movements about as clearly as the seasonally adjusted data for such smooth series as industrial production and personal income.

MCD moving averages are shown in chart 1 for all series with an MCD of "5" or more. To provide an indication of the variation about these moving averages, seasonally adjusted data are also plotted for years beginning with 1958. Although not so smooth as more powerful moving averages such as the weighted 15-term Spencer curve, the MCD curve is more current and has a smaller rounding bias around business cycle peaks and troughs. On balance, the MCD curve seems to offer a reasonable compromise in terms of currency, smoothness, and fidelity to the patterns of business cycle fluctuations.

Because of advance reporting and preliminary seasonal factors, the MCD's for current data are usually larger than those computed from historical series and shown in appendix C. MCD is usually computed for a fairly long period, one covering both expansions and contractions.¹ Since the pace of change varies from phase to phase of the business cycle, such a measure will not provide an accurate estimate of the span over which to estimate cyclically significant changes at all times. Thus MCD computed for the period 1953-63 is likely to be too high during the early stages of recovery when expansion has usually been rapid and too low during the late stages of expansion when the rate of advance has usually been small. This limitation should also be borne in mind when making use of this measure, ²

Analytical Measures of Current Change

Three kinds of analytical measures are presented—diffusion indexes, timing distributions, and direction-of-change tables. These measures aid in forming a judgment of the magnitude of current changes compared to previous changes, the imminence of a turning point in the business cycle, and the extent of current changes in different parts of the economy. They also point to developments in particular industries and places.

<u>Diffusion indexes</u>. - Diffusion indexes are simple summary measures of groups of economic series. They express, for a given group, the percent of the series which has risen over given intervals of time. Their turning points tend to lead the turning points of the aggregate and they measure how widespread a business change is. They vary between the limits of 100 (all components rising) and zero (all components falling). Widespread increases are often associated with rapid growth in aggregate activity, and widespread declines with sharp reductions.

The diffusion indexes in this report are grouped according to the timing classification of the NBER. For monthly series, comparisons are made over 1-month intervals (January-February, February-March, etc.) and generally for either 3- or 5-month intervals depending upon the irregularity of the

¹Various terms are used to describe the phases of the business cycle. In this report both "contraction" and "recession" are used to describe the declining phase. No difference in meaning is intended.

²For a more complete description of MCD and its use in studying economic series, see <u>Business</u> <u>Cycle Indicators</u>, Geoffrey H. Moore, editor; National Bureau of Economic Research, Inc., vol. 1, ch. 18, "Statistics for Short-Term Economic Forecasting," by Julius Shiskin (Princeton University Press: 1961).

series. The indexes based on 1-month intervals are more "current" but they are also more irregular than the 3- or 5-month indexes (see chart 2). Quarterly series are compared over 1-quarter intervals and 4-quarter intervals.

Series numbers preceded by the letter "D" designate diffusion indexes. When one of these numbers corresponds to a basic indicator series number, it means that the diffusion index has been computed from components of the indicator series; for example, the diffusion index numbered "D6" is computed from components of series number 6. Diffusion indexes not computed from basic series components are assigned new numbers.

This report includes 29 diffusion indexes based on 15 indicator series (see tables 4 and 5). Eighteen of these indexes are computed by the Bureau of the Census utilizing nearly 300 components of 9 indicators (D1, D5, D6, D19, D23, D41, D47, D54, and D58). Indexes for these indicators show comparisons for components over 1-month and either 3- or 5-month spans. The 11 other diffusion indexes are based on 7 indicators closely related to the above 9 indicators. They include two National Industrial Conference Board indexes (1- and 3quarter spans) based on newly approved capital appropriations (17 industries); the First National City Bank of New York index based on quarterly profit reports (700 companies); and 8 NBER diffusion indexes-actual and anticipated-for the following: Manufacturers' sales (800 companies) and new orders (400 companies), based on data from Dun and Bradstreet, Inc.; carloadings (19 commodity groups), based on data from the Association of American Railroads; and new plant and equipment expenditures (16 industries), based on data from the Office of Business Economics and the Securities and Exchange Commission.

Diffusion indexes that are based on anticipations show what proportion of business enterprises (or industries) are forecasting a rise in activity. Comparisons with indexes based on actual changes show whether there is a generally optimistic bias or a lag in recognition of actual developments.

Diffusion indexes constructed on the basis of current data are often highly irregular and require careful judgment in their use and interpretation.

<u>Timing distributions</u>.—Distributions of current "highs" appear to be helpful in appraising the evidence for a prospective business cycle turning point. Each month a timing distribution is constructed which shows the number of series reaching high values during each month of the expansion. The timing distribution is summarized by showing the number of series reaching new highs and the percent currently high for each of several recent months (see table 3). Similar distributions of "lows" will be prepared during contractions.

To provide historical perspective for interpreting the distribution of current highs, such distributions are also shown for leading and coincident series as they appear 3 months and 6 months before the peak of each of the earlier post-World War II expansions and at their peaks. To compile timing distributions for the current cyclical phase, the data for the principal business cycle indicators are scanned each month. During a business cycle expansion, the high value for each series is recorded. (For inverted series, that is series with negative conformity to the business cycle, low values are taken during expansions and high values during contractions.) If the values for 2 or more months are equal, the latest date is taken as the high month. In selecting these values, erratic values are disregarded, although it is, of course, difficult to identify an erratic value, particularly for the current month.

The letter "H" is used in the basic data table (table 2) to identify and highlight the current high values during the expansion, and the letter "L" to identify the low values preceding the current highs. The highs designated during the current cyclical phase will not necessarily be the specific cycle peaks. Thus, as new high levels are reached during the expansion, the current highs will be moved ahead. On the other hand, lows preceding current highs are usually specific cycle troughs. Comparisons of the current timing distributions with those for periods around earlier business cycle troughs and peaks are helpful for appraising the evidence of a prospective business cycle turning point.

Interpretations of timing distributions must be made in light of the fact that a contraction following a high value reached several months ago may be the result of an erratic fluctuation and that a new high may be reached in some future month. In short, when the percent currently high falls below 50 percent for both the leading and roughly coincident series, this does not necessarily signify that a business cycle peak has occurred. It may do so, but it may also simply reflect a short reversal in the upward movement.

Direction-of-change tables. — Direction-of-change tables show directions of change ("+" for rising, "o" for unchanged, and "-" for falling) in the components used for the diffusion indexes. These tables provide a convenient view of changing business conditions and are helpful in making an economic interpretation of the movements in the more highly aggregated statistical measures. That is, they show which economic activities went up, which went down, and how long such movements have persisted. They also help to show how a recession or recovery spreads from one sector of the economy to another.

Directions of change for each index component are shown for consecutive months and, depending upon the irregularity of the series, for either 3- or 5-month spans.

Comparisons of Cyclical Patterns

In forming a judgment about the current intensity and probable ultimate character of a cyclical fluctuation, some economists find it helpful to compare the behavior of the indicator series and diffusion indexes in the current business cycle phase with their behavior during the corresponding phase of previous business cycles. These comparisons are made in different ways depending upon the phase of the business cycle—whether it is in an expansion or contraction.

Expansions may be compared by measuring changes from the immediately preceding peak levels. In table 7 of this report, the current expansion is measured from the May 1960 reference peak to the month of latest reported data. For earlier expansions, percentage changes are computed from their respective reference peaks to dates which are the same number of months beyond the succeeding reference troughs as the current expansion is beyond its reference trough. This type of comparison is designated as representing changes computed trom reference peak levels and from reference trough dates. Although the spans from reference trough dates are the same number of months for each expansion, the spans from the preceding peak dates are different, depending on the length of the contractions for each period. Also, for those earlier periods of expansion that were shorter than the current one, the comparisons made in table 7 reflect the status at a point after a new contraction had set in. This type of comparison answers the question whether, and by how much, the current level of activity exceeds or falls short of the level at the preceding business cycle peak, a given number of months after the recovery began, and how the current situation compares, in this respect, with earlier expansions.

Expansions also may be compared by computing changes from reference trough levels and from reference trough dates (table 8). This type of comparison measures the extent of the rise from the trough level so many months after the upswing began. The same situation exists here as for the comparisons shown in table 7: For earlier expansions that were shorter than the current one, the comparisons show the status at a point after a new contraction had set in.

Contractions can be compared by computing changes over the span from the most recent business cycle peak to the current month and over equal spans from previous reference peaks. This type of comparison is designated as representing changes from reference peak levels and from reference peak dates. These comparisons will be made during a contraction period.

In addition to comparing cyclical fluctuations on the basis of reference dates (which are the same for all series), comparisons are made on the basis of <u>specific peak and trough dates</u> identified for <u>each series</u>. For example, the specific peak in retail sales corresponding to the May 1960 reference peak is April 1960; the specific peak in stock prices is July 1959 (See appendix B). Specific cycle comparisons are shown in table 9. These comparisons differ from those shown for reference cycles in that they show the status only up to the specific peak date. For some series past specific expansions were shorter than the current one and, therefore, the earlier comparisons span fewer months than those for the current expansion.

In order to make historical comparisons, it is frequently necessary to use data for a closely related series for cycles prior to the initial date covered by the series used currently. Such comparisons are, therefore, to be considered only approximate. Nearly all series have undergone change in definition, coverage, or estimation procedure since 1919. The principal cases of this sort are as follows:

- 7. New private nonfarm dwelling units started (prior to 1939: Residential building contracts, floor space)
- Number of employees in nonagricultural establishments (prior to 1929: Employment in manufacturing)
- 52. Personal income (prior to 1929: Quarterly data as published by Barger and Klein)
- 54. Sales of retail stores (prior to 1935: Department store sales)
- 62. Index of labor cost per unit of output, total manufacturing (prior to 1946: Production worker wage cost per unit).

Charts

Two types of charts are used to highlight the cyclical patterns of the business cycle indicators: Historical time series and cyclical comparisons.

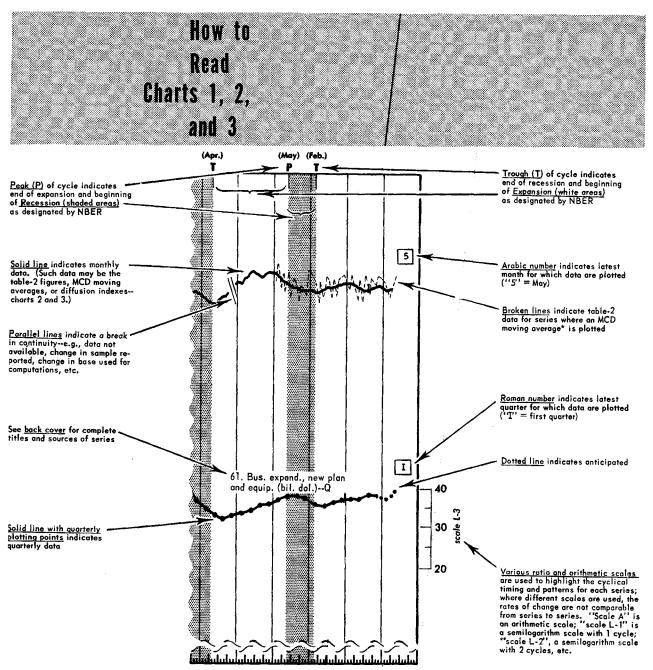

Historical Time Series (charts 1, 2, and 3).--These charts show the cyclical fluctuations of each series against the background of expansions and recessions in general business activity from 1948 to the current month. Shaded areas on the charts indicate periods of business cycle recession between business cycle peak dates (beginnings of shaded areas) and business cycle trough dates (ends of shaded areas). The shading for a new recession will be entered only after a trough has been designated.

Several different ratio and arithmetic scales are used to highlight the cyclical movements of the various series. The scale selected for each series is identified in the margin of the chart. Rates of change of various series can be compared with each other only where scales are identical. See the diagram, page 5, for additional help in using these charts.

<u>Cyclical Comparisons</u> (charts 4 and 5).—These charts compare the performance of each series during the current expansion with its performance during the expansion phase of previous business cycles. The usual date sequence followed in charts is disregarded, and instead the data are alined at the strategic point of the business cycle: For expansions, the reference trough (chart 4) and specific trough (chart 5). Thus these charts facilitate judgements on the vigor of the current expansion relative to cyclical movements during the corresponding expansions of previous cycles.

Two types of cyclical comparisons are made. Chart 4 compares the pattern of the current business or reference cycle (i.e., the cycle for aggregate economic activity) with movements over the corresponding phase of previous reference cycles. Chart 5 compares the pattern of the current <u>specific cycle</u> (i.e., the cycle for a particular series) with the movements over the corresponding phases of previous specific cycles in that series. In both charts, the trough dates are alined. In chart 4, the levels of the preceding peaks are also alined and in chart 5, the levels of the preceding troughs are also alined. See the section, "Comparisons of Cyclical Patterns", for more detailed descriptions of these comparisons.

Descriptions and Procedures

*Certoin irregular series are shown in terms of their MCD moving averages. These series are noted. Such averages are plotted 2 months behind actual data for MCD 5-term moving averages and 2½ months behind, for MCD 6-term moving averages. See text for description of MCD moving averages.

r = revised; p = preliminary; e = estimated; a = anticipated; NA = not available. ¹Series are seasonally adjusted except for those series indicated by an asterisk (*), that appear to contain no sea-

sonal movement. See additional basic data and notes in table 2. ²To facilitate interpretations of cyclical movements, those series that usually fall when general business activity rises and rise when business falls are inverted so that rises are shown as declines and declines as rises (see series 3, A, 5, 14, 15, 40, 43, and 45). Percent changes are calculated in the usual way but the signs are reversed; e.g., if the rate of decrease is 0.6 percent, it is shown as 40.6. See footnote 5 for other "change" qualifications. ³This average is based on month-to-month (or quarter-to-quarter) changes without regard to sign. The period varies among the series, covering 1953-63 for most series. ⁴Quarterly series. Figures are placed in the middle month of quarter.

⁵Since basic data for this series are expressed in plus or minus amounts, the changes are month-to-month (or quarterto-quarter) differences expressed in the same unit of measure as the basic data, rather than in percent. ⁶ End-of-quarter series. Figures are placed in the last month of quarter.

² 🕒 = December 1960.

Table 2.-BASIC DATA FOR BUSINESS CYCLE SERIES: JANUARY 1961 TO PRESENT-Continued

Series are seasonally adjusted except those that appear to contain no seasonal movement. Unadjusted series are indicated by an asterisk (*). Low values preceding current highs are indicated by () and current highs, by (1); the reverse is true for inverse series (series 3, 4, 5, 14, 15, 40, 43, and 45). Series numbers are for identification only and do not reflect series relationships or order. Complete titles and sources are shown on the back cover. The "x" indicates revised; "p", preliminary; "e", estimated; "a", anticipated; and "NA", not available.

Basic Data

Table 2.-BASIC DATA FOR BUSINESS CYCLE SERIES: JANUARY 1961 TO PRESENT-Continued

Series are seasonally adjusted except those that appear to contain no seasonal movement. Unadjusted series are indicated by an asterisk (*). Low values preceding current highs are indicated by (**D**) and current highs, by (**H**); the reverse is true for inverse series (series 3, 4, 5, 14, 15, 40, 43, and 45). Series numbers are for identification only and do not reflect series relationships or order. Complete titles and sources are shown on the back cover. The "r" indicates revised; "p", preliminary; "e", estimated; "a", anticipated; and "NA", not available.

All quarterly series, 1 leading monthly series (series 15), and 1 roughly coincident series (series 40) are omitted from the distribution. ¹⁵ series were not available.

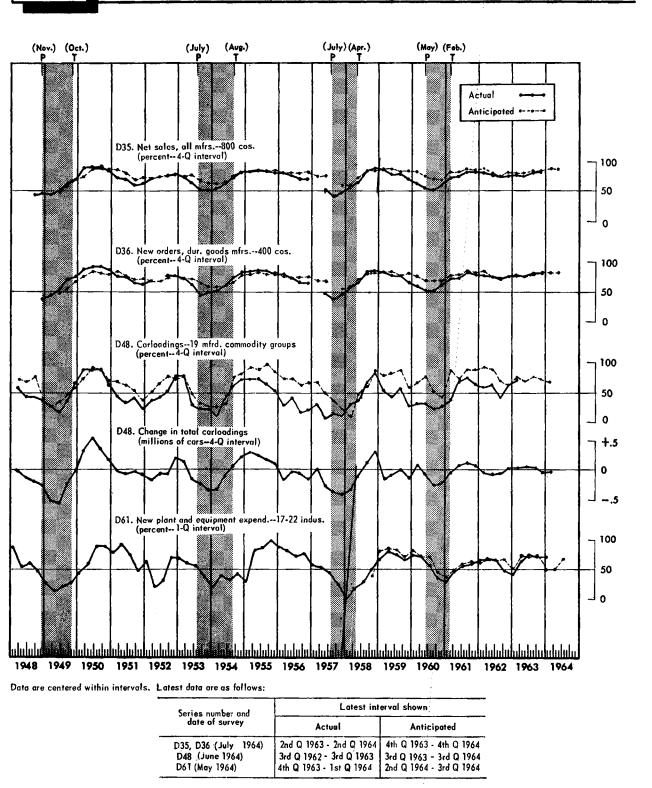

²2 series were not available and 2 series were omitted because their peaks were reached during the Korean War and such peaks were disregarded in this distribution.

DIFFUSION INDEXES, ACTUAL AND ANTICIPATED: 1948 TO PRESENT

See "How to Read Charts 1, 2, and 3," page 5.

Table 4 .-- DIFFUSION INDEXES FOR 11 MAJOR ECONOMIC ACTIVITIES: JANUARY 1961 TO PRESENT

Percent of series components rising. Numbers are centered within intervals: 1-month figures are placed on latest month; 3-month figures are placed on the 3d month and 5-month figures are placed on the 4th month of span; 4-quarter figures are centered in the middle quarter; 3-quarter figures are placed on the 1st month of the 3d quarter; 1-quarter figures are placed in the 1st month of the 2d quarter. Seasonally adjusted components are used except in indexes D19, which requires no adjustment, and D34, which is adjusted only for the index. Table 6 identifies the components for most of the indexes shown. The "r" indicates revised; "p", preliminary; and "NA", not available.

¹The diffusion index is based on 82 components, January 1961 to February 1963; on 80 components, March 1963 to August 1963; on 79 components, September 1963 to March 1964; and on 78 components thereafter. 18 components and 5 composites, representing an additional 23 components, are shown in the direction-of-change table (table 6). ²Average for August 17, 18, and 19.

Table 4.--DIFFUSION INDEXES FOR 11 MAJOR ECONOMIC ACTIVITIES: JANUARY 1961 TO PRESENT--Continued

Percent of series components rising. Numbers are centered within intervals: 1-month figures are placed on latest month 3-month figures are placed on the 3d month and 5-month figures are placed on the 4th month of span; 4-quaster figures are centered in the middle quarter; 3-quarter figures are placed on the 1st month of the 3d quarter; 1-quarter figures are placed in the 1st month of the 2d quarter. Seasonally adjusted components are used except in indexes D19, which requires no adjustment, and D34, which is adjusted only for the index. Table 6 identifies the components for most of the indexes shown. The "r" indicates revised; "p", preliminary; and "NA", not available.

- = rising; o = unchanged; + = falling. Because this series usually rises when general business activity falls and falls when business rises, it is inverted to show a comparable activity pattern. The direction of change is shown for the week ending nearest the 22d of the month. Series components are seasonally adjusted by the Bureau of the Census before the direction of change is determined.

*Designated by Bureau of Employment Security as an area of substantial unemployment (6 percent or more) in July 1964.

**Designated by Bureau of Employment Security as an area of substantial (6 percent or more) and persistent unemployment in July 1964.

¹The percent rising is based on 47 labor market areas. Directions of change are shown separately for only the largest 26.

COMPARISONS OF REFERENCE CYCLE PATTERNS

Percent of reference peak levels of selected series compared for 4 business cycles. Period begins with the reference peak date preceding the trough of each cycle.

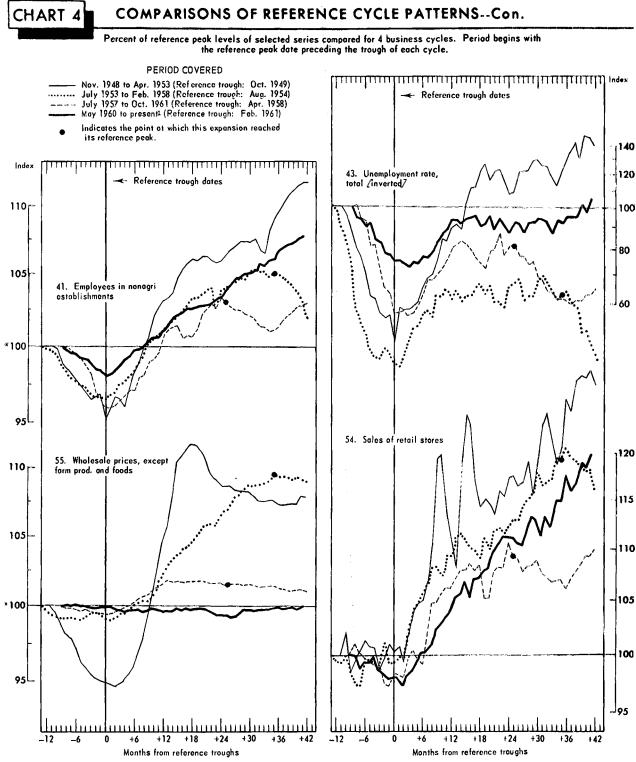

*Reference peak level. For series with a "months for cyclical dominance" (MCD) of "1" or "2", the figure for the reference peak is set at "100". For series with an MCD of "3" or more, the average of the 3 months centered on the reference peak month is set at "100". For quarterly series, the reference peak quarter i set at "100". MCD values are shown in appendix C. ¹See table 2 for latest month in current period. Percent changes for this month and comparable months of previous expansions are shown in table 7.

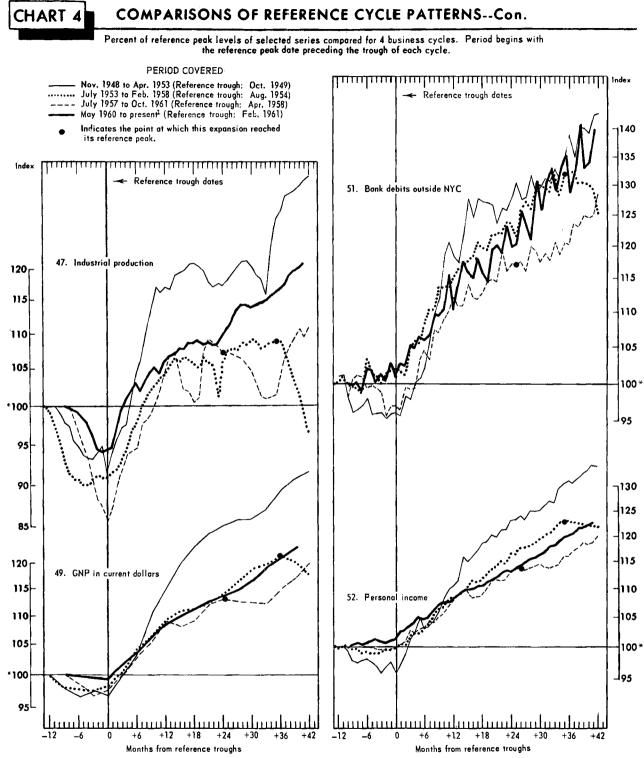

²For the 1949, 1954, and 1958 cycles, a 3-term moving overage is shown.

*Reference peak level. For series with a "months for cyclical dominance" (MCD) of "1" or "2", the figure for the reference peak is set at "100". For series with an MCD of "3" or more, the average of the 3 months centered on the reference peak month is set at "100". For quarterly series, the reference peak quarter is set at "100". MGD values are shown in appendix C.
"See table 2 for latest month in current period. Percent changes for this month and comparable months of previous expansions are shown in table 7.

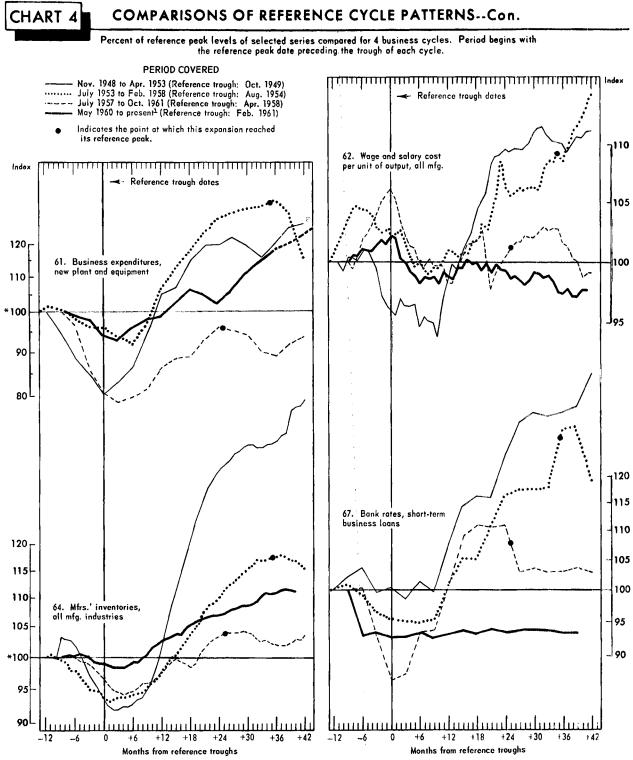

*Reference peak level. For series with a "months for cyclical dominance" (MCD) of "1" or "2", the figure for the reference peak is set at "100". For series with an MCD of "3" or more, the average of the 3 months centered on the reference peak month is set at "100". For guarterly series, the reference peak quarter is set at "100". MCD values are shown in appendix C.
¹See table 2 for latest month in current period. Percent changes for this month and comparable months of previous expansions are shown in table 7.

*Reference peak level. For series with a "months for cyclical dominance" (MCD) of "1" or "2", the figure for the reference peak is set at "100". For series with an MCD of "3" or more, the average of the 3 months centered on the reference peak month is set at "100". For quarterly series, the reference peak quarter is set at "100". MCD values are shown in appendix C.

NA Not available. NSC No specific cycle related to reference dates.

*Indicates that a specific peak had been passed and a specific contraction was underway for this series by the month indicated in the first column. The figure shown represents the change to the specific peak and the period covered is shorter than that of the current expansion (col. 1). See appendix B for specific peak dates. ¹Based on period of the most recent specific expansion for each series; i.e., from the most recent specific trough to

Based on period of the most recent specific expansion for each series; i.e., from the most recent specific trough to the latest month shown in table 2. The number of months is the same for each expansion except those indicated by an asterisk (*). Specific trough dates are shown in appendix B.

²Except for 1961, changes are computed in a 3-term moving average of the seasonally adjusted series.

³Since no specific trough or peak has been designated, figures are based on the low (L) shown in table 2 and the high preceding that low.

Appendix B.--SPECIFIC TROUGH AND PEAK DATES FOR SELECTED BUSINESS INDICATORS

Specific trough and peak dates are the actual dates that each series reaches its trough and peak. Reference dates are those dates designated as the trough or peak of business activity as a whole. This table shows, for selected leading and coincident series, the specific dates related to reference dates in 9 recent business cycles.

NOTE: Measures are computed for a period of at least 13 years beginning with January 1953, except for series 7, 86, 87, and 116. The period begins with May 1959 for series 7 and with January 1960 for series 116. For series 86 and 87, the period ends with June 1962.

¹Not computed for series when MCD is "6" or more.

The following are brief definitions of the measures shown in this table. More complete explanations appear in Electronic Computers and Business Indicators, by Julius Shiskin, issued as Occasional Paper 57 by the National Bureau of Economic Research, 1957 (reprinted from Journal of Business, October 1957).

" \overline{CI} ", is the average month-to-month (or quarter-toquarter) percentage change, without regard to sign, in the seasonally adjusted series. " \overline{I} " is the same for the irregular component, obtained by dividing the cyclical component into the seasonally adjusted series. " \overline{C} " is the same for the cyclical component, a smooth, flexible moving average of the seasonally adjusted series.

"MCD" (months for cyclical dominance) provides an estimate of the appropriate time span over which to observe cyclical movements in a monthly series. It is small for smooth series and large for irregular series. In deriving MCD, percentage changes are computed separately for the irregular component and the cyclical component for 1-month spans (Jan.-Feb., Feb.-Mar., etc.), 2-month spans (Jan.-Mar., Feb.-Apr., etc.), up to 5-month spans. Averages, without regard to sign, are then computed for the changes over each span. MCD is the shortest span in months for which the average percentage change (without regard to sign) in the cyclical component is larger than the average percentage change (without regard to sign) in the irregular component, and remains so. Thus, it indicates the point at which fluctuations in the seasonally adjusted series become dominated by cyclical rather than irregular movements. Since changes are not computed for spans greater than 5 months, all series with an MOD greater than "5" are shown as "6". Similarly, "QCD" provides an estimate of the appropriate time span over which to observe cyclical movements in quarterly series. It is the shortest span (in quarters) for which the average percentage change (without regard to sign) in the cyclical component is larger than the average percentage change 'without regard to sign) in the irregular component, and remains so.

" $\overline{I/C}$ " is a measure of the relative smoothness (small values) or irregularity (large values) of the seasonally adjusted series. For monthly series, it is shown for 1-month spans and for spans of the period of MCD. When MCD is "6", no $\overline{I/C}$ ratio is shown for the MCD period. For quarterly series, $\overline{I/C}$ is shown for 1-quarter spans and QCD spans.

"Average Duration of Run" (ADR) is another measure of smoothness and is equal to the average number of consecutive monthly changes in the same direction in any series of observations. When there is no change between 2 months, a change in the same direction as the preceding change is assumed. The ADR is shown for the seasonally adjusted series CI, irregular component I, cyclical component C, and the MCD curve. The MCD curve is a moving average (with the number of terms equal to MCD) of the seasonally adjusted series.

A comparison of these measures of ADR with the expected ADR of a random series gives an indication of whether the changes approximate those of a random series. Over 1month intervals in a random series, the expected value of the ADR is 115. The actual value of ADR falls between 1.36 and 1.75 about 95 percent of the time. Over 1-month intervals in a moving average (MCD) of a random series, the expected value of ADR is 2.0. For example, the ADR of CI is 1.67 for series 6, Value of Manufacturers' New Or-ders, Durable Goods Industries. This indicates that 1month changes in the seasonally adjusted series, on the average, reverse sign about as often as expected in a random series. The ADR measures shown in the next two columns. 1.54 for I and 8.33 for C, suggest that the seasonally adjusted series has been successfully separated into an essentially random component and a cyclical (nonrandom) component. Finally, ADR is 4.56 for the MCD moving average. This indicates that a 3-month moving average of the seasonally adjusted series (3 months being the MCD span) reverses direction, on the average, about every 4 to 5 months. The increase in the ADR from 1.67 for CI to 4.56 for the MCD moving average indicates that, for this series, monthto-month changes in the MCD moving average usually reflect the underlying cyclical-trend movements of the series. whereas the month-to-month changes in the seasonally adjusted series usually do not.

88. Merchandise	trade balance	Mil. dol	58.96	56.60	17.50	3.23	3	.93	1.82	1.61	11.30	2.64

NOTE: Measures are computed for the period, January 1953 to mid-1964, except for series 88 and 112. For series 88, the period ends with June 1962 and for series 112, the period begins with August 1959.

 $^{\rm L}{\rm Where}~{\rm MCD}$ is larger than "6", a 6-term moving average is used as the MCD curve.

The measures in the above table are computed by an additive method to avoid the distortion caused by zero and negative data. Thus, " \overline{CT} " is the average month-to-month change in the seasonally adjusted series. This average is computed without regard to sign and is expressed in the same unit of measure as the series itself. " \overline{C} " is the same for the cyclical component, which is a moving average of the seasonally adjusted series. " \overline{T} " is the same for the irregular component, which is determined by subtracting the cyclical component from the seasonally adjusted series. All other measures shown above have the same meaning as in part 1.

These data are not published by the source agency in seasonally adjusted form. Seasonal adjustments were made by the Bureau of the Census or the National Bureau of Economic Research, Inc. Seasonally adjusted data propared by the source agency will be substituted whenever they are published. Factors are a combination of seasonal and trading-day factors.

²Quarterly series; figures are placed in middle month of quarter. ³Factors apply to total series before month-to-month changes are computed.

For series with a "months for cyclical dominance" (MCD) of "1" or "2" (series 41, 43, 47, 52, and 54), the figure for the reference peak (trough) month is used as the base. For series with an MCD of "3" or more (series 51), the average of the 3 months centered on the reference peak (trough) month is used as the base. The base for quarterly series (series 49 and 50) is the reference peak (trough) quarter. See also MCD footnote to appendix C.

¹The most recent quarterly reference dates are as follows: 2d quarter 1958 (trough); 2d quarter 1960 (peak); and 1st quarter 1961 (trough). For earlier dates, see <u>Business Cycle Indicators</u> (NBER), vol. 1, p. 670.

²Based on average for the calendar year.

³Differs from figure for same date in expansion (contraction) part of table because of change in series used. World War II contraction or expansion period.

⁵Korean War contraction or expansion period.

⁶The median is an average of the middle 2 or 3 items.

Source: National Bureau of Economic Research, Inc.

Appendix F.--HISTORICAL DATA FOR SELECTED SERIES

Each month historical data are presented for certain series that either have not been shown here previously or have been revised historically. The months of issue for series previously included in this appendix are given in the index. Current data are shown in tables 2, 4, and 5. Data are seasonally adjusted.

Appendix F .-- HISTORICAL DATA FOR SELECTED SERIES-- Continued

Each month historical data are presented for certain series that either have not been shown here previously or have been revised historically. The months of issue for series previously included in this appendix are given in the index. Current data are shown in tables 2, 4, and 5. Data are seasonally adjusted.

Appendix F .-- HISTORICAL DATA FOR SELECTED SERIES -- Continued

Each month historical data are presented for certain series that either have not been shown here previously or have been revised historically. The months of issue for series previously included in this appendix are given in the index Current data are shown in tables 2, 4, and 5. Data are seasonally adjusted except series 67.

²Before May 1964, this appendix was "C".

TITLES AND SOURCES OF PRINCIPAL BUSINESS CYCLE SERIES AND DIFFUSION INDEXES

The numbers assigned to the series are for identification purposes only and do not necessarily reflect series relationships or order. "M" indicates monthly series and "Q" indicates quarterly series. Data apply to the whole period except for series designated by "EOM" or "EOQ". "EOM" indicates that data are for the end of the month and "EOQ" indicates that data are for the end of the quarter. The general classification of series follows the approach of the National Bureau of Economic Research. The series preceded by an asterisk (*) were included in the 1960 NBER list of 26 indicators.

30 NBER LEADING INDICATORS

- *1. Average workweek of production workers, manufacturing (M).--Department of Labor, Bureau of Labor Statistics
- *2. Accession rate, manufacturing (M).--Department of Labor, Bureau of Labor Statistics
- *3. Layoff rate, manufacturing (M).--Department of Labor, Bureau of Labor Statistics
- 4. Number of persons on temporary layoff, all industries (M).--Department of Labor, Bureau of Labor Statistics; seasonal adjustment by Bureau of the Census
- Average weekly initial claims for unemployment insurance, State programs (M).--Department of Labor, Bureau of Employment Security; seasonal adjustment by Bureau of the Census
- *6. Value of manufacturers' new orders, durable goods industries (M).--Department of Commerce, Bureau of the Census
- *7. New private nonform dwelling units started (M).--Department of Commerce, Bureau of the Census
- *9. Construction contracts awarded for commercial and industrial buildings, floor space (M).-.F. W. Dodge Corporation; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
- Economic Research, Inc.
 10. Contracts and orders for plant and equipment (M).--Department of Commerce, Bureau of the Census, and F. W. Dodge Corporation; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
- Newly approved capital appropriations, 602 manufacturing corporations (Q).--National Industrial Conference Board; component industries are seasonally adjusted by National Bureau of Economic Research, Inc., and added to obtain seasonally adjusted total
- *12. Net change in the business population, operating businesses (EOQ).--Department of Commerce, Office of Business Economics
- 13. Number of new business incorporations (M).--Dun and Bradstreet, Inc.; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
- *14. Current libbilities of business foilures (M).--Dun and Bradstreet, Inc.; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
- 15. Number of business failures with liabilities of \$100,000 and over (M).--Dun and Bradstreet, Inc.; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
- *16. Corporate profits after taxes (Q).--Department of Commerce, Office of Business Economics
- 17. Price per unit of labor cost index-ratio, wholesale prices of manufactured goods index to index of compensation of employees (sum of wages, salaries, and supplements to wages and salaries) per unit of output (M).--Department of Commerce, Office of Business Economics; Department of Labor, Bureau Labor Statistics; and Board of Governors of the Federal Reserve System; seasonal adjustment by Bureau of the Census
- Profits (before taxes) per dollar of sales, all manufacturing corporations (Q)...Federal Trade Commission and Securities and Exchange Commission; seasonal adjustment by Bureau of the Census
- * 19. Index of stock prices, 500 common stocks (M).--Standard and Poor's Corporation; no seasonal adjustment
 20. Change in book value of manufacturers' inventories of materials
- 20. Change in book value of manufacturers' inventories of materials and supplies (EOM).-Department of Commerce, Bureau of the Census
- *21. Change in business inventories, farm and nonfarm, after valuation adjustment (GNP component) (9).-Department of Commerce, Office of Business Economics
- 22. Ratio of profits (after taxes) to income originating, corporate, all industries (Q).-Department of Commerce, Office of Business Economics
- *23. Index of industrial materials prices (M).--Department of Labor, Bureau of Labor Statistics; no seasonal adjustment
- 24. Value of manufacturers' new orders, machinery and equipment industries(M).-Department of Commerce, Bureau of the Census
- 25. Change in monufacturers' unfilled orders, durable goods industries (EOM).-Department of Commerce, Bureau of the Census
- 26. Buying policy--production materials, percent reporting commitments 60 days or longer (M).--National Association of Purchasing Agents; no seasonal adjustment
- Index of new private housing units authorized by local building permits (M).--Department of Commerce, Bureau of the Census

- 30. Nonagricultural placements, all industries (M)...Department of Labor, Bureau of Employment Security; seasonal adjustment by Bureau of the Census
- Change in book value of manufacturing and trade inventories, total (EOM).--Department of Commerce, Office of Business Economics
- 32. Vendor performance, percent reporting slower deliveries (M).--Chicago Purchasing Agents Association; no seasonal adjustment
- 37. Percent reporting higher inventories, purchased materials(M). --National Association of Purchasing Agents; seasonal adjustment by Bureau of the Census

15 NBER ROUGHLY COINCIDENT INDICATORS

- 40. Unemployment rate, married males, spouse present (M).--Department of Labor, Bureau of Labor Statistics
- *41. Number of employees in nonagricultural establishments (M).--Department of Labor, Bureau of Labor Statistics
- Total nonogricultural employment, labor force survey (M).--Department of Labor, Bureau of Labor Statistics, and Department of Commerce, Bureau of the Census
- *43. Unemployment rate, total (M).--Department of Labor, Bureau of Labor Statistics, and Department of Commerce, Bureau of the Census
- 45. Average weekly insured unemployment rate, State programs (M).--Department of Labor, Bureau of Employment Security
- 46. Index of help-wanted advertising in newspapers (M).--National Industrial Conference Board and B. K. Davis and Bro. Advertising Service
- *47. Index of industrial production (M).--Board of Governors of the Federal Reserve System
- *49. Gross national product in current dollars (Q).--Department of Commerce, Office of Business Economics
- *50. Gross national product in 1954 dollars (Q).--Department of Commerce, Office of Business Economics
- *51. Bank debits outside New York City, 343 centers (M)...Board of Governors of the Federal Reserve System
- *52. Personal income (M).--Department of Commerce, Office of Business Economics
- 53. Labor income in mining, manufacturing, and construction (M).--Department of Commerce, Office of Business Economics
- *54. Sales of retail stores (M).--Department of Commerce, Bureau of the Census
- *55. Index of wholesale prices, all commodities, other than farm products and foods (M).-.Department of Labor, Bureau of Labor Statistics; seasonal adjustment by Bureau of the Census
- 57. Final sales (series 49 minus series 21) (Q).--Department of merce, Office of Business Economics

7 NBER LAGGING INDICATORS

- *61. Business expenditures on new plant and equipment, total (Q).--Department of Commerce, Office of Business Economics; and the Securities and Exchange Commission
- *62. Index of labor cost per unit of output, total manufacturingratio, index of compensation of employees in manufacturing (the sum of wages and salaries and supplements to wages and salaries) to index of industrial production, manufacturing (M).--Department of Commerce, Office of Business Economics, and the Board of Governors of the Federal Reserve System; seasonal adjustment by Burcau of the Census
- *64. Book value of manufacturers' inventories, all manufacturing industries (EOM).-Department of Commerce, Bureau of the Census
- 65. Book value of manufacturers' inventories of finished goods, all manufacturing industries (EOM)...Department of Commerce, Bureau of the Census
- *66. Consumer installment debt (EOM).--Board of Governors of the Federal Reserve System. FRS seasonally adjusted net change added to seasonally adjusted figure for previous month to obtain current figure
- *67. Bank rates on short-term business loans, 19 cities (Q).--Board of Governors of the Federal Reserve System; no seasonal adjustment
- 68. Index of labor cost per dollar of real corporate gross national product (ratio of compensation of employees in corporate enter-prises to value of corporate product in 1954 dollars) (Q).-Dc-partment of Commerce, Office of Business Economics, National Income Division

OFFICIAL BUSINESS

FIRST CLASS MAIL

TITLES AND SOURCES OF PRINCIPAL BUSINESS CYCLE SERIES AND DIFFUSION INDEXES--Con.

28 OTHER U.S. SERIES WITH BUSINESS CYCLE SIGNIFICANCE

- Index of consumer prices (M).--Department of Labor, Bureau of Labor Statistics; seasonal adjustment by Bureau of the Census
- 82. Federal cash payments to the public (M).-Treasury Department, Bureau of Accounts. Monthly seasonal adjustments by the Bureau of the Census do not equal quarterly totals of the official seasonally adjusted series because of differences in the method of seasonal adjustment.
- 83. Federal cash receipts from the public (M).-Treasury Department, Bureau of Accounts. Monthly seasonal adjustments by the Bureau of the Census do not equal quarterly totals of the official seasonally adjusted series because of differences in the method of seasonal adjustment.
- 84. Federal cash surplus or deficit (M).-Treasury Department, Bureau of Accounts. Monthly seasonal adjustments by the Bureau of the Census do not equal quarterly totals of the official seasonally adjusted series because of differences in the method of seasonal adjustment.
- Percent change in total U.S. money supply (demand deposite plus currency) (M).-- Board of Governors of the Federal Reserve System
- 86. Exports, excluding military aid shipments, total (M).--Department of Commerce, Bureau of the Census
- 87. General imports, total (M).--Department of Commerce, Bureau of the Census
- Merchandise trade balance (series 86 minus series 87) (M).--Department of Commerce, Bureau of the Census
- 89. Excess of receipts or payments in U.S. balance of payments (Q)...Department of Commerce, Office of Business Economics
- 90. Defense Department obligations, procurement (M).-.Department of Defense, Fiscal Analysis Division; seasonal adjustment by Bureau of the Census
- Defense Department obligations, total (M).-Department of Defense, Fiscal Analysis Division; seasonal adjustment by Bureau of the Census
- 92. Military prime contract awards, U.S. business firms (M).--Department of Defense, Directorate for Statistical Services; seasonal adjustment by Bureau of the Census
- Free reserves (member bank excess reserves minus borrowings) (M).--Board of Governors of the Federal Reserve System; no seasonal adjustment
- 94. Index of construction contracts, total value (M).--F. W. Dodge Corporation
- 95. Surplus or deficit, Federal income and product account (Q).--Department of Commerce, Office of Business Economics
- 96. Manufacturers' unfilled orders, durable goods industries (EOM).---Department of Commerce, Bureau of the Census
- 97. Backlog of capital appropriations, manufacturing (Q).--National Industrial Conference Board; component industries are seasonally adjusted by National Bureau of Economic Research, Inc., and added to obtain seasonally adjusted total
- Percent change in total U.S. money supply (demand deposits and currency) and commercial bank time deposits (M).--Board of Governors of the Federal Reserve System
- 99. New orders, defense products (M).--Department of Commerce Bureau of the Census
- Total funds raised by private nonfinancial borrowers in credit markets (Q).--Board of Governors of the Federal Reserve System
- 111. Gross retained earnings of nonfinancial corporations (Q).--Board of Governors of the Federal Reserve System

- 112. Net change in bank loons to businesses (M), Boardof Governors of the Federal Reserve System; seasonal adjustment by Bureau of the Census
- 113. Net change in consumer installment debt (EOM).-Board of Governors of the Federal Reserve System
- 114. Discount rate on new issues of 91-day Treasury bills (M),--Board of Governors of the Federal Reserve System; no seasonal adjustment
- 115. Yield on long-term Treasury bonds (M).-Treasury Department, no seasonal adjustment
- 116. Yield on new issues of high-grade corporate bonds (M).--First National City Bank of New York and Treasury Department; no seasonal adjustment
- 117. Yield on municipal bonds, 20-bond average (M).-- The Bond Buyer; no seasonal adjustment
- 118. Secondary market yields on FHA mortgages (M).-Federal Housing administration; no seasonal adjustment

7 INTERNATIONAL COMPARISONS OF INDUSTRIAL PRODUCTION

- 121. Organization for Economic Cooperation and Development, European Countries, index of industrial production (M).--Organization for Economic Cooperation and Development
- 122. United Kingdom, index of industrial production (M).--Central Statistical Office (London)
- 123. Canada, Index of Industrial production (M).--Dominion Bureau of Statistics (Ottawa)
- 125. West Germany, index of industrial production (M).-Deutsche Bundesbank (Frankfurt)
- 126. France, index of industrial production (M).--Statistical Office (Paris)
- 127. Italy, index of industrial production (M)...Organization for Economic Cooperation and Development
- 1.3. Jopon, index of industrial production (M),--Ministry of International Trade and Industry (Tokyo); seasonal adjustment by compiler and Bureau of the Census
- ... United States, Index of Industrial production (M).--Sec series 47.

DIFFUSION INDEXES

The "D" preceding a number indicates a diffusion index. Diffusion indexes and corresponding business cycle series bear the same number and are obtained from the same sources. See sources above for D1, D5, D6, D11, D19, D23, D41, D47, D54, and D61. Sources for other diffusion indexes are as follows:

- D34. Profits, Monufacturing, FNCB (Q).--First National City Bank of New York; no seasonal adjustment of series components. Diffusion indexes are seasonally adjusted by National Bureau of Economic Research, Inc.
- D35. Net sales, total monufactures (Q).--Dun and Bradatreet, Inc.; no seasonal adjustment
- D36. New orders, duroble monufactures (Q).--Dun and Bradstreet, Inc.; no seasonal adjustment
- D48. Freight carloadings (Q).--Association of American Railroads; no seasonal adjustment
- D58. Wholesale prices, monufocturing (M).--Department of Labor, Bureau of Labor Statistics; seasonal adjustment by Bureau of the Census
