## IMPORTANT FEATURES AND CHANGES FOR THIS ISSUE

A limited number of changes are made from time to time to reflect the change from one stage of the business cycle to another, to show new findings of business-cycle research and newly available economic series, or to emphasize the activity of a particular series or series group. Such changes may involve additions or deletions of series used, changes in placement in relation to other series, changes in components of indexes, etc. These changes will be listed in this section each month. The changes made in this issue are as follows:

1. Two series, the average workweek (No. 1) and nonagricultural employment in establishments (No. 41) have been revised by the Bureau of Labor Statistics as a result of the introduction of a new 1959 benchmark and the conversion to the 1957 Standard Industrial Classification. Revised data for these series are plotted, from 1948 to date, in chart 1 and shown, from January 1959 to October 1961, in table 1. Revisions in the directions-of-change tables (tables 6A and 6F) and diffusion indexes (table 4), however, have been carried back to April 1961 only.
2. New private housing units authorized by local building permits (No. 29) has been converted to an index with 1957-59 as the comparison base. The average annual rate for the base period is 1,089 thousand permits.
3. Rates of change for 13 monthly and 10 quarterly business-cycle series have been added to table 2 .
4. Appendix table A, which shows the reference dates and durations of historical business cycles, has been expanded to include the average duration of peacetime cycles.

## Business Cycle Developments

## INTRODUCTION

This report has been prepared to bring together many of the available economic indicators in convenient form for analysis and interpretation by specialists in business-cycle analysis. The presentation and classification of series in this report follows the businessindicators approach. The classification of series and the business-cycle turning dates are those designated by the National Bureau of Economic Research which, in recent years, has been the leader in this field of investigation. However, this publication is not to be taken as implying acceptance or endorsement by the Bureau of the Census or any other government agency of any particular approach to business-cycle analysis. It is intended only to supplement other reports of the Department of Commerce that provide data for analyzing current business conditions.

The unique features are the arrangement of data according to their usual timing relations during the course of the business cycle and the inclusion of special analytical measures and historical cyclical comparisons that help in evaluating the current stage of the business cycle. Electronic computers are used for many of the computations.

The chief merits of this report are the speed with which the data for indicators are collected, assembled, and published, and the arrangement of the series for business-cycle studies. This report is scheduled for publication about the 20 th of the month following the month of data.

Altogether about 70 principal indicators and about 350 components are used for the different measures shown. The movements of the series are shown against the background of the expansions and contractions of the general business cycle sothat "leads" and "lags" can be readily detected and unusual cyclical developments spotted. The exact number of series included for the total and important classes of series may vary from month to month because of additions of new series and revisions in the composition of indexes. Almost all of the basic data are available in published reports. A complete list of the series and the sources of data is shown

Experimental work for this report was carried out in collaboration with the NBER which is responsible for much of the early research in this field. Their background paper, Signals of Recession and Recovery, contains a more detailed description of the measures used, additional historical data, and the history of the development of the techniques employed. This paper (by Julius Shiskin) was published as Occasional Paper 77 of the National Bureau of Economic Research, 261 Madison Avenue, New York 16, N.Y. (207 pages, price \$3).
on the back cover of this report. All the data shown are seasonally adjusted where seasonal variations appear to exist.

## ORGANIZATION AND CONTENT OF THE REPORT

Three types of data are shown in this report. They are as follows:

Basic data (chart 1 and table 1).--Over 50 business-cycle indicators and 20 additional series with business-cycle significance are included. Together they provide a broad view of current and prospective business-cycle fluctuations in the economy as well as the basis for making an economic interpretation of these fluctuations.

Analytical measures (charts 2-3 and tables 2-6).These are measures which aid in forming a judgment of (1) the magnitude of current changes compared to previous changes, (2) the imminence of a turning point in the business cycle, and (3) the extent of current changes in different parts of the economy. They also aid in pointing to developments in particular industries and places.

Cyclical patterns (charts 6-7 and tables 7-9). .The current cyclical change is compared with changes at corresponding stages of earlier cycles. These comparisons are made in different ways depending upon the phase of the business cycle.

In addition to the data shown as part of the regular report, certain appendix materials are presented. These materials include historical data, key information, and adjustment factors.

## DESCRIPTIONS AND PROCEDURES

## Business-Cycle Series

The three major groups of series are those with a fairly consistent timing relation to the business cycle. They are grouped, in accordance with the National Bureau of Economic Research classification, as "leading," "roughly coincident," or "lagging"indicators. Additional series are also included for a more complete coverage of the national economy. The series are described as follows:

NBER Leading Indicators. -- Around 30 series usually reach peaks or troughs before those in aggregate economic activity as measured by the roughly coincident series (see below). For this reason, they are designated as "leading" series. One group of these series pertains to activities in the labor market, another to orders and contracts, and so on.

NBER Roughly Coincident Indicators.--About 15 series are direct measures of aggregate economic activity or move roughly together with it; for example, nonagricultural employment, industrial production or retail sales. For this reason they are referred to as "roughly coincident" series.

NBER Lagging Indicators.--Some series, such as new plant and equipment expenditures and manufacturers' inventories, usually have reached turning points after they were reached in aggregate economic activity, and for this reason, they are designated as 'lagging" series.

Other series. - About 20 additional U.S. series with business-cycle significance are also shown. Some of the se series, such as change in money supply, merchandise trade balance, and cash surplus or deficit, represent important factors in the economy, but they have not qualified as indicators for various reasons, such as irregularity in timing. Finally, industrial production indexesfor several countries which have important trade relations with the United States are presented.

## Seasonal Adjustments

Official seasonally adjusted data are used in this report wherever they are available. However, for the special purposes of business-cycle studies, around 20 series that are not ordinarily published in seasonally adjusted form are shown on a seasonally adjusted basis in this report. These series are as follows:
2. Accession rate, manufacturing
3. Layoff rate, manufacturing
4. Number of persons on temporary layoff, all industries
5. Initial claims for unemployment insurance, State programs
13. Number of new business incorporations
14. Current liabilities of business failures
15. Number of business failures with liabilities of $\$ 100,000$ and over
18. Profits (before taxes) per dollar of sales, all manufacturing corporations
25. Change in manufacturers' unfilled orders, durable goods industries
30. Nonagricultural placements, all industries
45. Average weekly insured unemployment, State programs
55. Index of wholesale prices, all commodities other than farm products and foods
66. Consumer installment debt, end of month
81. Index of consumer prices
82. Federal payments to the public
83. Federal receipts from the public
84. Net Federal cash surplus or deficit
90. Defense Department obligations, procurement
91. Defense Department obligations, total
92. Militaryprime contract awards to U.S. business firms
125. West Germany, index of industrial production
128. Japan, index of industrial production

Seasonal adjustments for these series were developed by either the Bureau of the Census or the NBER. The adjustment factors used are shown in the appendix, table $D$. Seasonally adjusted data prepared by the collecting agency will be substituted for the series mentioned above whenever they are published.

## Designation of Business-Cycle Turning Points

The historical business-cycle turning points are those designated by the National Bureau of Economic Research. They mark the approximate date when aggregate economic activity reached its cyclical high or low levels. As a matter of general practice, a business-cycle turning point will not be designated until at least 6 months after it has occurred.

## Charts

Shaded areas on the charts indicate periods of business-cycle contraction between reference dates for peaks ("P"-beginnings of shaded areas) and troughs ("T"-ends of shaded areas). The shading for a recession period will be entered only after a trough has been designated.

The month or quarter of the latest data plotted is indicated in a box near the end of each series. Months are indicated by Arabic numerals and quarters by Roman numerals. Quarterly series are identified by the letter " $Q$ " and connected by broken lines. Monthly series are connected by solid lines.

## Analytical Measures of Current Change

Four kinds of analytical measures are pre-sented-rates of change, diffusion indexes, timing distributions, and direction-of-change tables. These measures aid in forming a judgment of the magnitude of current changes compared to previous changes, the imminence of a turning point in the business cycle, and the extent of current changes in different parts of the economy. They also point to developments in particular industries and places.

Rates of change.- There is conside rable interest in the rate of acceleration during expansions and the rate of retardation during recessions. For this reason, rates of change for the principal monthly and quarterly business cycle series are included in table 2 of this report. Rates of change are helpful in judging and appraising trends of acceleration or retardation in a current business cycle phase, despite the fact that the erratic nature of month-tomonth rates of change often makes it difficult to detect the significance of a change until some months after it has occurred. For series, such as unemployment and layoffs, which usually move down during expansions and up during recessions, the changes are inverted so that rises are shown as declines and vice versa.

Diffusion indexes.--Diffusion indexes are simple summary measures of groups of economic series. They express, for a given group, the percent of the series which has risen over given intervals of time. Their turning points tend to lead the turning points of the aggregate and they measure how widespread a business change is. They vary between the limits of 100 (all components rising) and zero (all components falling). Widespread increases are often associated with rapid growth in aggregate activity and widespread declines with sharp reductions.

The diffusion indexes in this report are grouped according to the timing classification of the National Bureau of Economic Research. For monthly series, two comparison intervals are used: l-month intervals (January-February, February-March, etc.) and 3-month intervals (January-April, FebruaryMay, etc.). The indexes based on l-month intervals are more "current" but they are also more irregular than the 3 -month indexes (see chart 2 ). Quarterly series are compared over l-quarter intervals and 4-quarter intervals.

This report includes 29 diffusion indexes. Seventeen of these indexes utilize 300 components of 9 principal indicators. For 8 of these indicators, the components are compared over $3-$ month as well as l-month spans, while for 1 of them, comparisons are made over 1 -month spans only. The 12 other diffusion indexes are based on 7 series which are closely related to the principal indicators. They include the Chicago Purchasing Agents Association index based on monthly reports of changes in profits (200 companies), the First National City Bank of New York index based on quarterly profit reports ( 600 companies) , and 10 NBER diffusion indexes, as follows: Manufacturers' actual and anticipated sales ( 800 companies) and actual and anticipated new orders ( 400 companies), based on data from Dun and Bradstreet, Inc.; actual and anticipated carloadings ( 19 commodity groups), based on data from the Association of American Railroads; actual and anticipated new plant and equipment expenditures ( 16 industries), based on data from Office of Business Economics and the Securities and Exchange Commission; and actual indexes of capital appropriations for 602 companies and for 15 industries, based on data from the National Industrial Conference Board.

Diffusion indexes constructed on the basis of current data are often highly irregular and require careful judgment in their use and interpretation.

Series numbers preceded by the letter " $D$ " designate diffusion indexes. When one of these numbers corresponds to a basic indicator series number, it means that the diffusion index has been computed from components of the indicator series; for example, the diffusion index numbered "D6" is computed from components of series number 6. Diffusion indexes not computed from basic series components are assigned new numbers.

Timing distributions.--Distributions of current highs and lows appear to be helpful in identifying a turning point in the business cycle promptly afterit occurs. Each month a timing distribution is constructed which shows the number of series reaching high (low) values during each of the recent expansion (contraction) months. The timing distribution is summarized by showing the number of series reaching new highs (lows) and the percent currently high (low) for each of several recent months (see table 3 ).

To compile timing distributions, the data for each of the 50 business-cycle indicators over the period
of the current cyclical phase are scanned each month. During a business cycle contraction, the low value for each series is identified; during an expansion, the high value is identified. For inverted series, that is, series with negative conformity to the business cycle, high values are taken during contraction and low values during expansion. If the values for 2 or more months are equal, the latest date is taken as the low (high) month. In selecting these values, erratic values are disregarded, although it is, of course, difficult to identify an erratic value, particularly for the current month.

The letter "L" is used in the basic data table (table 1) to identify and highlight the current low values during contraction and the letter " $\mathrm{H}^{\prime \prime}$, to identify current high values during expansion. In addition, the se symbols are used to identify the low values preceding current highs and high values preceding current lows. These identifications facilitate an economic interpretation of the timing distribution since they show which economic activities reached lows or highs in the several months.

Interpretations of timing distributions must be made in light of the fact that a contraction following a high value reached several months ago may be the result of an erratic fluctuation and that a new high may be reached in some future month. In short, when the percent currently high falls below 50 percent for both the leading and roughly coincident series, this does not necessarily signify that a business-cycle peak has occurred. It may do so, but it may also simply reflect a short reversal in the upward movement.

Direction-of-change tables.--Direction-of-change tables show directions of change ("+" for rising, "o" for unchanged, and "-" for falling) in the components used for the diffusion indexes. These tables provide a convenient view of changing business conditions and are helpful in making an economic inter pretation of the movements in the more highly aggregated statistical measures. That is, they show which economic activities went up, which went down, and how long such movements have persisted. They also help to show how a recession or recovery spreads from one sector of the economy to another.

## Comparisons of Cyclical Patterns

In forming a judgment about the current intensity and probable ultimate character of a cyclical fluctuation, some economists find it helpful to compare the behavior of the indicator series and diffusion indexes in the current business-cycle phase with their behavior during the corresponding phase of previous business cycles. These comparisons are made in different ways depending upon the phase of the business cycle.

Contractions are compared by computing changes over the span from the most recent business-cycle peak to the current month and over equal spans from previous reference peaks. This type of comparison is designated as representing changes from reference peak levels and from reference peak dates.

Expansions may be compared by measuring changes from the immediately preceding peak levels. In this report the current expansion is related to the May 1960 reference peak. For earlier expansions, percentage changes are also computed from their respective reference peaks to dates which are the same number of months beyond the succeeding reference troughs as the current expansion is beyond its reference trough. This type of comparison is designated as representing changes computed from reference peak levels and from reference trough dates. Although the spans from reference trough dates are the same for each expansion, the spans from the preceding peak dates are different, depending on the length of the contractions. This type of comparison answers the question whether, and by how much, the current level of activity exceeds or falls short of the level at the preceding business-cycle peak, a given number of months after the recovery began, and how the current situation compares in this respect with earlier recoveries.

Expansions also may be compared by computing changes from reference trough levels and from reference trough dates. This type of comparison measures the extent of the rise from the trough level so many months after the upswing began.

In addition to comparing cyclical fluctuations on the basis of reference dates (which are the same for all series), comparisons are made on the basis of specific peak and trough dates identified for each series. For example, the specific peak in retail
sales corresponding to the May 1960 reference peak is April 1960; the specific peak in stock prices is July 1959.

Recent performance in several individual indicators is compared graphically with that in earlier business cycles. In making graphic comparisons, the reference peak or trough levels are set equal to 100, and the reference peak or trough dates are alined depending on the phase of the business cycle.

In order to make historical comparisons, itis frequently necessary to use data for a closely related series for cycles prior to the initial date covered by the series used currently. Such comparisons are, therefore, to be considered only approximate. Nearly all series have undergone change in definition, coverage, or estimation procedure since 1919. The principal cases of this sort are as follows:
7. New private permanent nonfarm dwelling units started (prior to 1939: Residential building contracts, floor space)
41. Number of employees in nonagricultural establishments (prior to 1929: Employment in manufacturing)
54. Sales of retail stores (prior to 1935: Department store sales)
62. Index of wage and salary cost per unit of output, total manufacturing (prior to 1946: Production worker wage cost per unit. Supplements to wages and salaries, which are a part of total labor cost, are not included).

| NBER LAGGING INDICATORS |  |  |  |  |
| 61. Business expenditures on new plant and equipment, total. | -4.6 | -1.0 | +3.9 |  |
| 63. Index of labor cost per dollar of real gross national product. | +0.6 | -0.1 | +0.6 |  |
| 67. Bank rates on short-term business loans, 19 cities.. | -0.4 | 0.0 | +0.4 |  |

${ }^{1}$ Because this series usually falls when general business activity rises and rises when business falls, it is inverted so that rises are shown as declines and vice versa. The month-to-month percentage changes are calculated in the usual way, but the signs are reversed to facilitate interpretations of the cyclical movements; for example, if the rate decreased by 0.6 percent, the sign of this drop is reversed and shown as +0.6 .
${ }^{2}$ October to November percentage changes cover part of November only.

See "How to Read the Time Series Charts," page 4.

Table 4.--DIFFUSION INDEXES (PERCENT RISING) OVER SPECIFIED INTERVALS FOR 12 MAJOR ECONOMIC ACTIVITIES: OCTOBER 1958 TO PRESENT

Numbers are centered within intervals: l-month figures are placed on latest month; 3-month figures are centered on the middle month; 4-quarter figures are centered in the middle quarter; l-quarter figures are placed in lst month of $2 d$ quarter. Seasonally adjusted components are used except in indexes D1la, D19, D23, and D33, which require no adjustment, and D34 and D58, which are adjusted directly. Table 6 identifies the components for most of the indexes shown.

${ }^{1}$ Revisions have been carried back to this month. See "Important Features and Changes for This Issue" (p. ii, par. I) for explanation of revisions.

## Table 4.․-DIFFUSION INDEXES (PERCENT RISING) OVER SPECIFIED INTERVALS FOR 12 MAJOR ECONOMIC ACTIVITIES: OCTOBER 1958 TO PRESENT--Continued

Numbers are centered within intervals: l-month figures are placed on latest month; 3-month figures are centered on the middle month; 4-quarter figures are centered in the middle quarter; l-quarter figures are placed in list month of 2 d quarter. Seasonally adjusted components are used except in indexes D11a, D19, D23, and D33, which require no adjustment, and D34 and D58, which are adjusted directly. Table 6 identifies the components for most of the indexes shown.

${ }^{3}$ The diffusion index is based on 86 components through January 1960; on 85 components, February 1960 to November 1960 , and on 82 components thereafter. 19 components and 5 composites representing an additional 22 components are shown in the direction-of-change table (table 6C).
${ }^{2}$ November 16, 1961.

Table 4.--DIFFUSION INDEXES (PERCENT RISING) OVER SPECIFIED INTERVALS FOR 12 MAJOR ECONOMIC ACTIVITIES: OCTOBER 1958 TO PRESENT--Continued
Numbers are centered within intervals: 1-month figures are placed on latest month; 3-month figures are centered on the middle month; 4-quarter figures are centered in the middle quarter; l-quarter figures are placed in lat month of 2 d quarter. Seasonally adjusted components are used except in indexes D11a, D19, D23, and D33, which require no adjustment, and D34 and D58, which are adjusted directly. Table 6 identifies the components for most of the indexes shown.

For series with a "months for cyclical dominance" (MCD) of " 1 " or " 2 " (series 1), the figure for the reference peak is set at " $100^{\text {". For series with on MCD of " } 3 \text { " or more (series 9, 24, 29), the average of the reference peak month, the month }}$ preceding the reference peak month, and the month following the reference peak month is set at " 100 ".
${ }^{1}$ For the 1949, 1954, and 1958 eyeles, a 3 -term moving overage is shown. Latest data plotted: Series 9 .September; Series 1, 24, 29-October.

CHART 4 COMPARISONS OF REFERENCE CYCLE PATTERNS.-Con.
Percent of reference peak levels measured from reference peak dates to 18 months after reference trough dates in 4 recent business cycles, for selected series.

For series with a "months for cyelical dominance" (MCD) of " 1 " or " 2 " (series 19,23 ), the figure for the reference peak is set at " 100 ". For series with an MCD of " 3 " or more (series 13, 17), the average of the reference peak month, the month preceding the reference peak month, and the month following the reference peak month is set at " 100 ".
Latest data plotted: Series 13-September; Series 17,19, 23 -October.

For series with a "months for cyclical dominance" (MCD) of " 1 " or ${ }^{\prime \prime} 2^{\prime \prime}$ (series $41,43,55$ ), the figure for the reference peak is set at " 100 ". For series with an MCD of " 3 " or more (series 54 ), the average of the reference peak month, the month preceding the reference peak month, and the month following the reference peak month is set at "100".
Latest dato plotted: Series 41, 43, 54, 55-October.

For series with a "months for cyclical dominonce" (MCD) of " 1 " or ${ }^{\circ} 2^{\prime \prime}$ (series $47,49,52$ ), the figure for the reference peak is set at " 100 ". For series with an MCD of " 3 " or more (series 51 ), the average of the reference peak month, the month preceding the reference peak month, and the month following the reference peak month is set at " 100 ".
Latest data plotted: Series 47, 49, 51, 52-October.

For series with a "months for cyclical dominance" (MCD) of " 1 " or " 2 " (series 1 ), the figure for the specific trough is set at " 100 ". For series with an MCD of " 3 " or more (series 9, 24, 29), the average of the specific trough month, the month preceding the specific trough month, and the month following the specific trough month is set at " $100^{\text {" }}$.
${ }^{1}$ For the 1949, 1954, and 1958 cycles, a 3-term moving average is shown; the 1961 specific trough date hes been selected tentatively.
Latest data plotted: Series 9-September; Series 1, 24, 29-October.

## CHART 5 COMPARISONS OF SPECIFIC CYCLE PATTERNS--Con.

Percent of specific trough levels measured Ito 30 months after specific trough dates in 4 recent expansions, for selected series.

19. Stock prices, 500 common stocks

Specific trough dotes
identified with refer.
ence trough dates in..
1949—....
1958 - - -
1961 —
17. Price per unit of labor cost

23. Industrial materials prices

For series with a "months for cyclical dominance" (MCD) of "1" or " $2^{\prime \prime}$ (series 19, 23), the figure for the specific trough is set at "100". For series with an MCD of "3" or more (series 13, 17), the average of the specific trough month, the month preceding the specific trough month, and the month following the specific trough month is set at " 100 ".
Latest data plotted: Series 13-September; Series 17, 19, 23-October.

For series with a "months for cyclical dominance" (MCD) of " 1 " or " 2 " (series 41, 43, 55), the figure for the specific trough is set at " $100^{\text {". For series with an MCD of "3" or more (series } 54 \text { ), the avarage of the specific trough month, the }}$ month preceding the specific trough month, and the month following the specific trough month is set at " 100 ".
$\mathbf{1}^{\mathbf{N}}$ o specific trough has been selected. Data for current expansion is arbitrarily selected to begin in May 1961 . Latest dato plotted: October.

Percent of specific trough levels measured 1 to 30 months after specific trough dates in 4 recent expansions, for selected series.

49. GNP, current dollars

Months from specific troughs

For series with a "months for cyclical dominance" (MCD) of " 1 " or " 2 " (series 47. 49.52), the figure for the specific trough is set at " $100^{\prime \prime}$. For series with an MCD of " 3 " or more (series 51 ), the average of the specific trough month, I the month preceding the specific trough month, and the month following the specific trough month is set ot "100".
$I_{\text {Based on tentative specific trough date for } 1961 \text { expansion. Latest data plotted: Series 47, 49, 51, 52-October. }}^{\text {B }}$.

## Table 7.--PERCENT OF REFERENCE PEAK LEVELS AS MEASURED AT DESIGNATED MONTHS AFTER THE REFERENCE TROUGH DATES IN THE 9 MOST RECENT EXPANSIONS, FOR SELECTED SERIES

For series with a "months for cyclical dominance" (MCD) of "l" or "2" (series 1, 19, 23, 41, 43, 47, 52, 55, 62, 64, and 66), the figure for the reference peak month is used as the base. For series with an MCD of " 3 " or more (series $2,3,6,7,9,13,14,17,24,29,51$, and 54 , , the average of the reference peak month, the month immediately preceding the reference peak month, and the month immediately following the reference peak month is used as the base. The base for quarterly series 49 and 67 is the reference peak quarter. See also "MCD" footnote to appenaix table B.

| Selected series | Months after reference trough ${ }^{2}$ | Percent of reference peak prior to reference expansion beginning in-- |  |  |  |  |  |  |  |  |

NA Not available. NSC No specific cycle.
${ }^{1}$ Based on period from most recent "specific" trough of each series to the latest month for which data are available. The number is the same for each expansion. "Specific" trough and peak dates are shown in appendix table B.
${ }^{2}$ For series with a "months for cyclical dominance" (MCD) of "l" or "2" (series 1, 19, 23, 41, 47, and 52), the figure for the "specific" peak month is used as the base. For series with an MCD of "3" or more (series 9, 13, 17, 24, 29, 51, and 54), the average of the "specific" peak month, the month immediately preceding the "specific" peak month, and the month immediately following the "specific" peak month is used as the base. The base for quarterly series 49 is the "specific" peak quarter. See also "MCD" footnote to appendix table B.
${ }^{3}$ Changes are computed in a 3-term moving average of the seasonally adjusted series except for 1961.
${ }^{4}$ For series with an MCD of " 1 " or " 2 ", the figure for the "specific" trough month is used as the base. For series with an MCD of "3" or more, the average of the "specific" trough month, the month immediately preceding the "specific" trough month, and the month immediately following the "specific" trough month is used as the base. The base for quarterly series is the "specific" trough quarter. See also "MCD" footnote to appendix table C.

${ }^{1}$ Not computed for series when MCD is "6" or more.
The following are brief definitions of the measures shown in this table. More complete explanations appear in Business Cycle Indicators, Geoffrey H. Moore, editor; National Bureau of Economic Research, Inc., volume l, chapter 17, "Electronic Computers and Business Indicators" by Julius Shiskin (Princeton University Press: 1961).
" $\overline{\mathrm{CI}} "$ is the average month-to-month percentage change, without regard to sign, in the seasonally adjusted series.
"Ī" is the same for the irregular component, which is obtained by dividing the cyclical component into the seasonally adjusted series.
" $\bar{C}$ " is the same for the cyclical component which is a smooth, flexible moving average.
"MCD" represents months for cyclical dominance. The average (without regard to sign) percentage changes in the irregular component and cyclical component are computed for 1-month spans (January-February, February-March, etc.), 2 -month spans (January-March, February-April, etc.), up to 5-month spans. MCD is the shortest span for which the average change (without regard to sign) in the cyclical component is larger than the average change (without regard to sign) in the irregular component. Since changes are not computed for spans greater than 5 months, all series with an MCD greater than "5" are shown as "6". MCD is small for smooth series and large for erratic series.
" $\bar{I} / C^{C}$ is a measure of the relative smoothness (small values) or irregularity (large values) of the seasonally adjusted series. It is shown above for l-month spans and for spans of the period of MCD. When MCD is "6", no $\bar{I} / \mathrm{C}$ ratio is shown for the MCD period.
"Average duration of run" is a measure of smoothness, and is equal to the average number of consecutive monthly changes in the same direction in any series of observations. When there is no change between 2 months, it is assumed that the "no change" is a change in the same direction as the preceding change. The average duration of run is shown for the seasonally adjusted series CI, irregular component $I$, cyclical component $C$, and the MCD moving average. The MCD moving average is a moving average (with the number of terms equal to MCD) of the seasonally adjusted series.

Table C.--AVERAGE QUARTERLY PERCENTAGE CHANGES AND RELATED MEASURES FOR 12 QUARTERLY BUSINESS-CYCLE SERIES

| Quarterly series | $\overline{C I}$ | $\bar{I}$ | $\overline{\mathrm{c}}$ | $\overline{\mathrm{I}} / \mathrm{C}$ | QCD | $\begin{aligned} & \hline \overline{\mathrm{I}} / \mathrm{C} \\ & \text { for } \\ & \mathrm{QCD} \\ & \text { span } \end{aligned}$ | Average duration of run |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | CI | I | C | QCD |

| NBER ROUGHLY COINCIDENT INDICATORS |  |  |  |  |  |  |  |  |  |  |
| 50. Gross national product in 1954 dols. . | 1.44 | . 65 | 1.13 | . 58 | 1 | . 58 | 3.19 | 1.50 | 5.10 | 3.19 |
| 49. Gross national product in current dollars. | 1.88 | . 69 | 1.59 | . 43 | 1 | .43 | 4.25 | 1.42 | 6.38 | 4.25 |
| 57. Final purchases (series 49 minus 21 ). | 1.60 | . 82 | 1.45 | . 57 | 1 | .57 | 4.64 | 1.46 | 7.29 | 4.64 |
| NBER LAGGING INDICATORS |  |  |  |  |  |  |  |  |  |  |
| 61. Business expenditures on new plant and equipment, total.................... | 3.61 | 1.49 | 2.94 | . 51 | 1 | . 51 | 4.64 | 1.55 | 5.67 | 4.64 |
| 63. Index of labor cost per dollar of real gross national product......... | 1.02 | . 60 | . 84 | . 71 | 1 | .71 | 2.68 | 1.31 | 7.29 | 2.68 |
| 67. Bank -ates on short-term business loans, 19 cities. | 2.96 | 1.94 | 2.37 | . 82 | 1 | . 82 | 2.68 | 1.55 | 6.38 | 2.68 |

The measures shown in this table are similar to the measures described for table $B$, except that they are computed from quarterly data:
" $\overline{\mathrm{CI}} "$, " $\overline{\mathrm{I}} "$, and $" \overline{\mathrm{C}} "$ are the average quarter-to-quarter percentage changes (without regard to sign) in the seasonally adjusted series, the irregular component, and the cyclical component.
"QCD" represents quarters for cyclical dominance. It is the shortest span (in quarters) for which the average change (without regard to sign) in cyclical component is larger than the irregular average (without regard to sign) in component.
" $\bar{I} / \mathrm{C} "$ is shown for l-quarter spans and $Q C D$ spans.
"Average duration of run" is the average number of consecutive quarterly changes in the same direction.

Table D.--SEASONAL ADJUSTMENT FACTORS, NOVEMBER 1960 TO DECEMBER 1961, FOR BUSINESS-CYCLE SERIES ADJUSTED BY BUREAU OF THE CENSUS OR NBER

NOTE: These data are not published by the source agency in seasonally adjusted form. Seasonal adjustments were made by the Bureau of the Census or the National Bureau of Economic Research, Inc. Seasonally adjusted data prepared by the source agency will be substituted whenever they are published.
${ }^{1}$ Quarterly series; figures are placed in middle month of quarter.
${ }^{2}$ The seasonal factors are applied to the unfilled orders series; then the change in unfilled orders is computed.

The numbers assigned to the series are for identification purposes only and do not necessarily reflect series relationships or order. " $M$ " indicates monthly series and " $Q$ " indicates quarterly series. The general classification of series follows the approach of the National Bureau of Economic Research. The series preceded by an asterisk (*) were included in the 1960 NBER list of 26 indicators.

## 29 NBER LEADING INDICATORS

*1. Average workweek, manufacturing (M).--Department of Labor, Bureau of Labor Statistics
*2. Accession rote, manufacturing ( $M$ ).--Department of $L$ abor, Bureau of Labor Statistics; seasonal adjustment by Bureau of the Census
*3. Layoff rate, monufacturing (M).--Department of Labor, Bureau of Labor Statistics
4. Number of persons on temporary layoff, all industries (M).--Department of Labor, Bureau of Labor Statistics
5. Initial claims for unemployment insurance, State programs (M).--Department of Labor, Bureau of Employment Security; seasonal adjustment by Bureau of the Census
*6. Value of manufacturers' new orders, durable goods industries $(M)$.--Department of Commerce, Bureau of the Census and Office of Business Economics
*7. New private permanent nonfarm dwelling units started (M).-- Department of Commerce, Bureau of the Census
*9. Construction contracts awarded for commercial and industrial buildings, floor space (M).--F. W. Dodge Corporation
10. Contracts and orders for plant and equipment (M).-Department of Commerce, Office of Business Economics, and F.W. Dodge Corporation; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
11. Newly approved capital appropriations, 602 manufacturing corporations (Q). $\cdots$ National Industrial Conference Board
*12. Net change in the business population, operating businesses (Q).--Department of Commerce, Office of Business Economics
13. Number of new business incorporations (M).--Dun and Bradstreet, Inc.; seasonal adjustment by National Bureau of Economic Research, Inc.
*14. Current liabilities of business failures (M). --Dun and Bradstreet, Inc.; seasonal adjustment by National Bureau of Economic Research, Inc.
15. Number of business fallures with liabilities of $\$ 100,000$ and over (M)..-Dun and Bradstreet, Inc.; seasonal adjustment by National Bureau of Economic Research, Inc.
*16. Corporate profits after taxes (Q). --Department of Commerce, Office of Business Economics
17. Price per unit of labor cost index (ratio of wholesale prices of manufactured goods index to wage and salary cost per unit of output index) (M).--Department of Commerce, Office of Business Economics; Department of Labor, Bureau of Labor Statistics; and Board of Governors of the Federal Reserve System
18. Profits (before taxes) per dollar of sales, all manufacturing corporations (Q). - Federal Trade Commission and Securities and Exchange Commission; seasonal adjustment by Bureau of the Census
*19. Index of stock prices, 500 common stocks (M).-Standard and Poor's Corporation; no seasonal adjustment
20. Change in book value of manufacturers' inventories, purchased material (M). - -Department of Commerce, Office of Business Economics
*21. Change in business inventories, farm and nonfarm, after valuation adjustment (GNP Component) ( $Q$ ). .--Department of Commerce, Office ot Business Economics
*23. Index of industrial materials prices (M).--Department of Labor, Bureau of Labor Statistics; no seasonal adjustment
24. Value of manufacturers' new orders, machinery and equipment industries (M).--Department of Commerce, Bureau of the Census and Office of Business Economics
25. Change in manufacturers' unfilled orders, durable goods industries (M).--Department of Commerce, Office of Business Economics; seasonal adjustment by Bureau of the Census
26. Buying policy--production materials, percent reporting commitments 60 days or longer (M).--National Association of Purchasing Agents; no seasonal adjustment
27. Buying policy--capital expenditures, percent reporting commitments 6 months or longer (M).--National Association of Purchasing Agents; no seasonal adjustment
29. Index of new private housing units authorized by local building permits ( $M$ ).--Department of Commerce, Bureau of the Census
30. Nonagricultural placements, all industries (M).--Department of Labor, Bureau of Employment Security; seasonal adjustment by Bureau of the Census
31. Change in book value of manufacturing and trade inventories, total ( $M$ ).--Department of Commerce, Office of Business Economics
32. Vendor performance, percent reporting slower deliveries (M).--Chicago Purchasing Agents Association; no seasonal adjustment

## 15 NBER ROUGHLY COINCIDENT INDICATORS

*41. Number of employees in nonagricultural establishments (M).--Department of Labor, Bureau of Labor Statistics
42. Total nonagricultural employment, labor force survey (M).-Department of Labor, Bureau of Labor Statistics, and Department of Commerce, Bureau of the Census
*43. Unemployment rate (M).--Department of Labor, Bureau of Labor Statistics, and Department of Commerce, Bureau of the Census
44. Number of unemployed persons 14 years old and over (M).--Department of Labor, Bureau of Labor Statistics, and Department of Commerce, Bureau of the Census
45. Average weekly insured unemployment, State programs (M).--Department of Labor, Bureau of Employment Security; seasonal adjustment by Bureau of the Census
46. Index of help-wanted advertising in newspapers (M).-National Industrial Conference Board
*47. Index of industrial production (M), *-Board of Governors of the Federal Reserve System
*49. Gross national product in current dollars (Q).--Department of Commerce, Office of Business Economics
*50. Gross national product in 1954 dollars (Q).--Department of Commerce, Office of Business Economics
*51. Bank debits outside New York City, 343 centers (M).-Board of Governors of the Federal Reserve System
*52. Personal income (M).--Department of Commerce, Office of Business Economics
53. Labor income in mining, manufacturing, and construction (M).--Department of Commerce, Office of Business Economics
*54. Sales of retail stores $(M)$.--Department of Commerce, Bureau of the Census and Office of Business Economics
