BUREAU OF THE CENSUS
A. Ross Eckler, Director Howard C. Grieves, Deputy Director
Morris H. Hansen, Asst. Director for Research and Development
JULIUS SHISKIN, Chief Economic Statistician

PREFACE This report brings together many of the available economic indicators in convenient form for analysis and interpretation. The presentation and classification of series follow the business indicators approach. The classification of series and the business cycle turning dates are those designated by the National Bureau of Economic Research (NBER) which, in recent years, has been the leader in this field of investigation. However, this publication is not to be taken as implying acceptance or endorsement by the Bureau of the Census or any other government ageucy of any particular approach to business cycle analysis. It is intended only to supplement other reports of the Department of Commerce that provide data for analyzing current business conditions.

The unique features are the arrangement of data according to their usual timing relations during the course of the business cycle and the inclusion of special analytical measures and historical cyclical comparisons that help in evaluating the current stage of the business cycle. In addition the movements of the series are shown against the background of the expansions and contractions of the general business cycle so that "leads" and "lags" can be readily detected and unusual cyclical developments spotted.

About 90 principal series and over 300 components are included in preparing the report. The exact number of series included for the total and important classes of series may vary from month to month because of additions of new series and revisions in the composition of indexes. Almost all of the basic data are available in published reports. A complete list of series and the sources of data is shown on the back cover of this report. Series are seasonally adjusted except those that do not appear to contain seasonal movement.

The chief merits of this report are the speed with which the data are collected, assembled, and published and the arrangement of the series for business cycle studies. Publication is scheduled for around the 22d of the month following the month of data.

$\square$ A limited number of changes are made from time to time to reflect the change from one stage of the business cycle to another, to show new findings of business cycle research and newly available economic series, or to emphasize the activity of a particular series or series group. Such changes may involve additions or deletions of series used, changes in placement in relation to other series, changes in components of indexes, etc.

## Changes in this issue are as follows:

1. The series on labor cost per unit of output in manufacturing (series 62) has been revised from 1948 to date. This revision reflects the following:
(a) A change in the method of computing the seasonally adjusted data (Formerly seasonal adjustment factors were applied to the ratio of the seasonally adjusted index of compensation of employees in manufacturing to the unadjusted index of industrial production, manufacturing. Under the present method, seasonally adjusted data--supplied by source agencies-are used for both components to yield the seasonally adjusted ratio. Recently completed tests.show that these alternative methods give very similar results.);
(b) The incorporation of revised wages and salaries data (including supplements) for the period 1963 through 1965 (see item 1, page iii, of the July 1966 issue);
(c) The incorporation of revised data on index of industrial production from 1964 to date (see item 3, below); and
(d) The adoption, by the BCD staff, of a new method of estimating current monthly data on supplements to wages and salaries in manufacturing. This method takes fuller account of the increase in Social Security taxes which became effective at the beginning of 1966 and affects the level of the series for the period beginning with January of this year.
2. The series on price per unit of labor cost in manufacturing (series 17) has been revised from 1948 to date to reflect the use of seasonaliy adjusted components to obtain the seasonally adjusted ratio. The manufacturing wholesale price component is seasonally adjusted by the Census Bureau using the $X-11$ Variant of Census Seasonal Adjustment Method II. (See item 1, above.)
3. Series 47 and D47 on index of industrial production have been revised from January 1964 to date to reflect the source agency's annual updating and seasonal adjustment of these data. This revision is also reflected in revised data for series 17 and 62. (See items 1 and 2, above.) Further information concerning this revision may be obtained from the Board of Governors of the Federal Reserve System, Business Conditions Section.
4. Series 31 on change in manufacturing and trade inventories has been revised for the period 1959 to date to reflect (a) adjustment of the earlier data (1959 to 1965) for the wholesale segment to the level of data obtained from the new sample initiated in January 1966; and (b) the adoption of a new benchmark (1965) for the retail segment affecting data for 1965 to date.
5. Data on U.S. exports and imports (series 86,87 , and 88) have bean revised because of a new seasonal and working day adjustment and to incorporate corrections which have come to light since December 1964. Further information concerning these revisions may be obtained from the Bureau of the Census, Foreign Trade Division.
6. Average changes and related measures have been recomputed for series 17 , 31, 62, $85,98,110$, and 111 to take into account recent revisions in the data. (See appendix C.)
7. Appendix $F$ includes revised historical data for series 17, 31, 62, 85, $86,87,88,98,110$, and 111.

The December issue of BUSINESS CYCLE DEVELOPMENTS is scheduled for release on December 22.

## GENSUS METHOD MI ADSHSTMENT PROGROM. A time series computer

 program for measuring and analyzing seasonal, trading-day, cyclical, and irregular fluctuations and the relations among them. This program is particularly useful in analyzing economic fluctuations which take place within a year.The latest variant, X-11, has greater generality and scope than any of the earlier programs. It can adjust quarterly as well as monthly series and series with negative and positive numbers as well as those with positive numbers alone. The $\mathrm{X}-11$ version measures and adjusts not only for seasonal variations, but also for trading-day variations Further, it computes many summary and analytical measures of the behavior of each series. The program includes various techniques, such as F tests and variance analysis, for use in extending the scope of time series studies and is written in a simplified computer lan-guage-Fortran IV. The program deck can be purchased from the Census Bureau at cost.

## BUSMAESS CYCLE DEVELOPMENTSS. A monthly report for analyzing economic fluctuations over a shorf span of years.

This report brings together several hundred monthly and quarterly "economic indicator" series for the analysis of short-term economic trends and prospects. These series have been selected, tested, and evaluated, after half a century of continuing research, as the most useful and reliable for this purpose. The publication provides not only the basic data, but also various charts and analytical tables to facilitate such studies. In addition, a time series punch-card file, a diffusion index program, and a separate summarymeasures computer program are available for those who wish to carry on further research in business cycle analysis.

## LONG UEGEA ECONOMDC GROWTM. An annual report for the study of economic fluctuations over a long span of years.

This report has been developed from available statistics to provide a comprehensive, long-range view of the U.S. economy. It has been planned, prepared, and published as a basic research document for economists, historians, investors, teachers, and students. It brings together for the first time under one cover, in meaningful and convenient form, the complete statistical basis for a study of long-term economic trends It is a unique presentation of the full range of factors required for an understanding of our country's economic development. Some of the statistical series go back to 1860 .

## UNTRODUCTVON

Students of economic conditions describe the business cycle as consisting of alternating periods of expansion and contraction in production, employment, income, money flows, prices, and other economic processes. The fluctuations take place in a concerted manner, but not simultaneously. Once an expansion gets underway, it spreads from firm to firm, from industry to industry, from area to area, and from process to process, cumulating until a cyclical peak in aggregate activity is reached. Even while expansion is widespread during the upward phase of the business cycle, some activities continue to move in the opposite direction. Declines begin to spread as the expansion nears its peak and continue to spread even faster after the peak has been passed. But some activities continue to expand during the general contraction. Before long these expansions become stronger and more widespread. When they begin to dominate the situation, the upturn in aggregate activity has arrived and a new expansion is underway. This sequence is recurrent, but not periodic.

The causal relations among these various economic rocesses are primarily responsible for the cumulative rature of cyclical forces, and explain why expansion :ventually turns into recession and recession into exransion. Cyclical fluctuations in production and emloyment are preceded by fluctuations in measures vhich relate to future rather than to current produc-ion-measures such as new orders for durable goods, he formation of new business enterprises, and accesions to payrolls. They are followed by fluctuations n various types of economic costs, such as labor costs, nterest rates, fulfillment of long-term commitments, ind holdings of inventories and of debts.

Although this pattern has been characteristic of american economic history, today many economists oo not consider it inevitable.

Intensive research by the National Bureau of Ecomic Research (NBER) over many years has provided - list of those significant series that usually lead, those lat usually move with, and those that usually lag phind cyclical movements in aggregate economic acDigitized for FRASER
tivity. The series have been grouped and classified by the NBER as "leading", "roughly coincident", or "lagging" indicators. These indicators are defined as follows:

- NBER Leading Indicators.-Series that usually reach peaks or troughs before those in aggregate economic activity as measured by the roughly coincident series (see below). One group of these series pertains to activities in the labor market, another to orders and contracts, and so on.
$\triangle$ NBER Roughly Coincident Indicators.-Series that are direct measures of aggregate economic activity or move roughly together with it; for example, nonagricultural employment, industrial production, and retail sales.
$\triangleright$ NBER Lagging Indicators.-Series, such as new plant and equipment expenditures and manufacturers' inventories, that usually reach turning points after they are reached in aggregate economic activity.

Other U.S. series with business cycle significance are included in this report. Some of these series, such as change in money supply, merchandise trade balance, and cash surplus or deficit, represent important factors in the economy, but they have not qualified as indicators for various reasons, such as irregularity in timing. Finally, industrial production indexes for several countries which have important trade relations with the United States are presented.

The list of series covered and sources of the basic data are shown on the back cover of this report. Series numbers are for identification only and do not reflect series relationships or order.

METHOD OF PRESENTATVON
Data are shown in this report in three general categories, as follows:
$\triangle$ Basic Data (chart 1 and tables 1 and 2).-Data are shown for business cycle indicators, additional
U.S. series with business cycle significance, and industrial production indexes for selected countries. Together, they provide a broad view of current and prospective business cycle fluctuations in the economy as well as the basis for making an economic interpretation of these fluctuations.

- Analytical Measures (chart 2 and tables 3 to 5).These are measures that aid in forming a judgment of the imminence of a turning point in the business cycle, determining the extent of current changes in different parts of the economy, and pointing to developments in particular industries and places.
- Cyclical Patterns (chart 3 and tables 6 and 7).Current cyclical levels are compared with levels at corresponding stages of earlier cycles. These comparisons are made in different ways depending upon the phase of the business cycle.

In addition to the data shown as part of the regular report, certain appendix materials are presented. These materials include historical data, key information, and adjustment factors.

## DESVMNATOM OB <br> 圆USINESS CYELE TURNANE PONTS

The business cycle turning dates used in this report are those designated by the NBER. They mark the approximate dates when aggregate economic activity reached its cyclical high or low levels. As a matter of general practice, a business cycle turning date will not be designated until at least 6 months after it has occurred.

Monthly business cycle peaks and troughs have been dated by the NBER for the period 1854-1961. Over this span, expansion has prevailed 61 percent of the time and contraction, 39 percent. If war periods are disregarded, expansion has prevailed 56 percent of the time and contraction, 44 percent.

## SEASONAR AND RREATED STATUSTMAM ADSUSTMENTS

Adjustments for normal seasonal fluctuations are often necessary to bring out the underlying cyclical trends of a series. Such adjustments allow for periodic intrayear variations resulting chiefly from normal differences in weather conditions during the year and from various institutional arrangements. Some series contain considerable variation attributable to the number of working or trading days in each month. An additional adjustment is necessary in such cases to reduce this variation. Variations due to holidays are usually accounted for by the seasonal adjustment process; how-
ever, there are some cases in which a separate holiday adjustment is necessary for holidays with variable dates. Such a case is retail sales of apparel which is affected strongly by the date of Easter and, to a lesser degree, by the dates of Labor Day and Thanksgiving.

In general, the seasonal adjustment process is designed to adjust for average weather conditions but not for the dispersion about that average. Thus, some seasonally adjusted series, such as housing starts, will tend to be low in months of unusually bad weather and high during unusually good weather. At the Bureau of the Census, studies have been started on some series to determine the effects of abnormal weather. Although it eventually may be possible, Census methods do not at present make any adjustments for such variations.

Most of the series contained in this report are presented in seasonally adjusted form. Unadjusted data are used only for those series which appear to have no pattern of seasonal variation. (Unadjusted series are identified in table 2.) In most cases, the seasonally adjusted data used for a series are the official figures released by the source agency; therefore, several different methods of seasonal adjustment are involved. In addition, for the special purposes of business cycle studies, a number of series that are not ordinarily published in seasonally adjusted form are shown on a seasonally adjusted basis in this report. For these series, seasonal adjustments have been developed by either the NBER or the Census Bureau. The adjustment factors for these series, derived by Census Method II, are shown in appendix D. Factors for series which are the sums of seasonally adjusted components or which are based on unpublished source data are not shown.

## NCD NOMNM AMremers

MCD (months for cyclical dominance) is an estimate of the appropriate span over which to observe the cyclical movements in a monthly series. This span is usually longer than a single month because month-to-month changes are often dominated by erratic movements, but shorter than the frequently used 12 -month span (change from the same month a year ago), and is different for different series (see appendix C for MCD values and method of computation).

MCD is, on average, the first span of months for which the average change for the cyclical factor is greater than that of the irregular factor and remains so. It is small for smooth series and large for irregular series. The month-to-month differences between moving averages of the period equal to MCD are com mensurate with the differences between seasonally
adjusted values separated by the same MCD span; thus, the month-to-month differences in a 3-month moving average are commensurate with differences in seasonally adjusted values over 3 -month spans. MCD moving averages all have about the same degree of smoothness. Consequently, MCD moving averages of highly irregular series, such as business failures and Federal cash payments, will show their cyclical movements about as clearly as the seasonally adjusted data for such smooth series as industrial production.

MCD moving averages are shown in chart 1 for all series with an MCD of " 5 " or more. To provide an indication of the variation about these moving averages, seasonally adjusted data are also plotted beginning with 1958. Although not so smooth as more powerful moving averages (such as the weighted 13-term Henderson curve), the MCD curve is more current and has a smaller rounding bias around business cycle peaks and troughs. On balance, the MCD curve seems to offer a reasonable compromise in terms of currency, smoothness, and fidelity to the patterns of business cycle fluctuations.

Because of advance reporting and preliminary seasonal factors, the MCD's for current data are usually larger than those computed from historical series and shown in appendix C. MCD is usually computed for a fairly long period, one covering both expansions and contractions. Since the pace of change varies from phase to phase of the business cycle, such a measure will not provide an accurate estimate of the span over which to estimate cyclically significant changes at all times. Thus, MCD computed for the period 1953-63 is likely to be too high during the early stages of recovery when expansion has usually been rapid and too low during the late stages of expansion when the rate of advance 'has usually been small. This limitation should be borne in mind when making use of this measure. ${ }^{1}$

##  Os Cutamy chanct

Three kinds of analytical measures are presented-timing distributions, diffusion indexes, and directions of rhange. These measures aid in forming a judgment of he current changes compared to previous changes, the mminence of a turning point in the business cycle, and he extent of current changes in different parts of the zconomy. They also point to developments in partifular industries and places.

[^1]
## Timing Distributions

Distributions of current "highs" appear to be helpful in appraising the evidence for a prospective business cycle turning point. Each month a timing distribution is constructed. This timing distribution shows the number of series reaching new highs and the percent currently high for each of several recent months (see table 3). Similar distributions of "lows" will be presented during contractions.

To provide historical perspective for interpreting the distribution of current highs, such distributions are also shown for leading and coincident series as they appear 3 months and 6 months before the peak of each of the earlier post-World War II expansions and at their peaks.

To compile timing distributions for the current cyclical phase, the data for the leading and roughly coincident business cycle indicators are scanned each month. During a business cycle expansion, the date of the high value for each series is recorded. (For inverted series-that is, series with negative conformity to the business cycle-dates of low values are taken.) If the values for 2 or more months are equal, the latest date is taken as the high month. In selecting these values, erratic values may be disregarded, although it is, of course, difficult to identify an erratic value, particularly for the current month.

The letter " $H$ " is used in table 2 to identify and highlight the current high values during the expansion. The highs designated during the current cyclical phase will not necessarily be the specific cycle peaks. (See appendix B.) As new high levels are reached during the expansion, the current highs will be moved ahead. Comparisons of the current timing distributions with those for periods around earlier business cycle peaks are helpful for appraising the evidence of a prospective business cycle turning point.

Interpretations of timing distributions must be made in light of the fact that a contraction following a high value reached several months ago may be the result of an erratic fluctuation and that a new high may be reached in some future month. In short, when the percent currently high falls below 50 percent for both the leading and roughly coincident series, this does not necessarily signify that a business cycle peak has occurred. It may do so, but it may simply reflect a short reversal in the upward movement.

## Diffusion Indexes

Diffusion indexes are simple summary measures of groups of economic series. They express, for a given aggregate series, the percent of the series components
which have risen over given spans of time. Their turning points tend to lead the turning points of the aggregate and they measure how widespread a business change is. They vary between the limits of 100 (all components rising) and zero (all components falling). Widespread increases are often associated with rapid growth and widespread declines with sharp reductions in aggregate activity.

The diffusion indexes in this report are grouped according to the timing classification of the NBER. For monthly series, comparisons are made over 1month spans (January-February, February-March, etc.) and generally for either 6 - or 9 -month spans, depending upon the irregularity of the series. The indexes based on 1 -month spans are more "current" but they are also more irregular than the 6 - or 9 month indexes. (See chart 2.) Quarterly series are compared over 1 -quarter spans, 3-quarter spans, and 4-quarter spans.

Recent research has shown that the longer-span diffusion indexes are not only smoother, but have systematically larger amplitudes than the 1 -month indexes. The 1 -month indexes generally have large irregular fluctuations, but the movements may be significant when important changes are taking place, particularly around cyclical turning points. Since the longer-span diffusion indexes are centered, there is an apparent loss in currency equal to one-half the span; for example, 3 months in the case of a 6-month diffusion index. However, the most recent figure for a 6-month or longer-span index does provide the latest available information on changes over that span. If a significant reversal has taken place within that span, the 1 -month indexes are likely to reveal it. Presentation of both 1 -month and longer-span diffusion indexes provides an opportunity for the user to take advantage of the best features of each in interpreting current changes.

Series numbers preceded by the letter " $D$ " designate diffusion indexes. When one of these numbers corresponds to the number of a basic indicator series, it means that the diffusion index has been computed from components of the indicator series; for example, the diffusion index numbered "D6" is computed from components of series 6 . Diffusion indexes not computed from basic series components are assigned new numbers.

Diffusion indexes that are based on business expectations show what proportion of business enterprises (or industries) are forecasting a rise in activity. Comparisons with indexes based on actual changes show whether there is a generally optimistic bias or a lag in recognition of actual developments.

## Diffusion-Index Components

Many of the component series used to make up the diffusion indexes are shown in table 5. Where possible, recent basic data for the components are shown in part $A$. In part $B$, directions of change in these components are indicated for consecutive months and, depending upon the irregularity of the diffusion index, for either 6- or 9 -month spans. The directions of change are indicated by " + " for rising, " 0 " for unchanged, and "-" for falling. (In counting the number of components rising, a " $o$ " is counted as onehalf.)

This table provides a convenient view of changing business conditions and is helpful in making an economic interpretation of the movements in the more highly aggregated statistical measures. That is, it shows which economic activities went up, which went down, and how long such movements have persisted. The table also helps to show how a recession or recovery spreads from one sector of the economy to another.

## CORAPMEONS (1) CHMERCAL PATHBOMS

In forming a judgment about the current intensity and probable ultimate character of a cyclical fluctuation, some economists find it helpful to compare the behavior of the various series in the current business cycle phase with their behavior during the corresponding phase of previous business cycles. These comparisions are made in different ways depending upon whether the current cyclical phase is an expansion or contraction.

Expansions are compared in one way by measuring changes from the immediately preceding peak levels. In table 6 of this report, data for the latest month in the current expansion (shown by number of months from the February 1961 trough) are compared with the May 1960 reference peak. For each earlier expansion, data for a like period (same number of months from the trough of the expansion) are compared with the preceding reference peak. This type of comparison is designated as changes computed from reference peak levels and reference trough dates. This type of comparison shows whether, and by how much, the current level of activity exceeds or falls short of the level at the preceding business cycle peak, and how the current situation compares, in this respect, with earlier expansions. For those earlier periods of expansion that were shorter than the current one, the comparisons reflect the status at a point after a new contraction had set in.

Expansions are also compared by computing changes 'rom reference trough levels and reference trough dates (table 7). For the current expansion; this type of somparison measures the extent of the rise from the rough level (February 1961) to the level at the curent month. For each earlier expansion, data for a ike period (same number of months from the trough of he expansion) are compared with the level at the rough. The same situation exists here as for the :omparisons shown in table 6: For earlier expansions hat were shorter than the current one, the comparisons how the status at a point after a new contraction had et in.

Contractions can be compared by computing changes jver the span from the most recent business cycle peak o the current month and over equal spans from orevious reference peaks. This type of comparison is lesignated as changes from reference peak levels and eference peak dates. These comparisons will be made luring a contraction period.

In addition to comparing cyclical fluctuations on the rasis of reference dates, which are the same for all eries, similar comparisons may be made using the pecific peak and trough dates identified for each series. Appendix B lists specific dates for a selected group of series.) Such comparisons would be based on :hanges from specific peak levels and specific trough lates and on changes from specific trough levels and pecific trough dates. Although these specific cycle omparisons are not currently included in this report, hey have been shown in previous issues.

Nearly all series have undergone changes in definiion, coverage, or estimation procedure since 1919; herefore, the historical comparisons are to be conidered only approximate. Furthermore, it is someimes necessary to use data for a closely related series or cycles prior to the period covered by the series sed currently. The principal substitutions of this ype are as follows:
7. New private nonfarm dwelling units started (prior to 1948: Residential building contracts, floor space, by F. W. Dodge Corp.)

1. Number of employees in nonagricultural establishments (prior to 1929: Factory employment)
2. Personal income (prior to 1929: Quarterly data as published by Barger and Klein)
F. Sales of retail stores (prior to 1929: Department store sales)
3. Index of labor cost per unit of output, total manufacturing (prior to 1948: Production worker wage cost per unit).

Two types of charts are used to highlight the cyclical patterns of the business cycle series: Historical time series and cyclical comparisons.

## Historical Time Series

## (charts 1 and 2)

These charts show cyclical fluctuations against the background of expansions and contractions in general business activity from 1948 to the current month. Shaded areas on the charts indicate periods of business cycle contractions between business cycle peak dates (beginnings of shaded areas) and business cycle trough dates (ends of shaded areas). The shading for a new contraction will be entered only after a trough has been designated.

Several different ratio and arithmetic scales are used to highlight the cyclical movements of the various series. The scale selected for each series is identified in the margin of the chart. Rates of change of various series can be compared with each other only where scales are identical. See the diagram, page 6, for additional help in using these charts.

## Cyclical Comparisons (chart 3)

This chart compares the movements of selected series during the current business cycle with their movements through the corresponding phases of previous business cycles. Actually, it is an extension of the concept behind table 6. While table 6 makes a comparison at one point in time, chart 3 shows these comparisons over the course of the whole business cycle. These comparisons facilitate judgments on the vigor of the current expansion relative to behavior during the expansions of earlier cycles.

Instead of following the usual date sequence, as in charts 1 and 2, the data in this chart are alined according to the strategic points of the business cycle. Each of the included series is separated into four segments which encompass the three complete business cycles since 1948 and the current expansion. These segments are alined so that the trough dates all fall at the same point on the horizontal scale and so that the levels of' the preceding peaks all fall at the same point on the vertical scale.

A similar chart, based on specific cycle dates, was previously included in this report but has been discontinued for the present.

Peak ( $P$ ) of cycle indicates end of
expansion and beginning of Recession (shaded areas) as designated by NBER.

## CHART 1 - Business Cycle Series

See back cover for complete titles and sources of series.

Solid line indicates monthly data. (Data may be actual monthly figures or MCD moving averages. ${ }^{*}$ )

Broken line indicates actual monthly data for series where an MCD moving average * is plotted.

Parallel lines indicate a break in continuity (data not available, changes in series definitions, extreme values, etc.)

Solid line with plotting points indicates quarterly data.

Trough ( $T$ ) of cycle indicates end of recession and beginning of Expansion (white areas) as designated by NBER.

Arabic number indicates latest month for which data are plotted. (" 12 " = December)

Roman number indicates latest quarter for which data are plotted. ("ll" = second quarter)

Dotted line indicates anticipated data.

Various scales are used to highlight the patterns of the individual series. "Scale A" is an arithmetic scale, "scale L'1" is a logarithmic scale with 1 cycle in a given distance, "s'ale L'2" is a logarithmic scale with 2 cycles in that distance, etc. The scales should be carefully noted because they show whether or not the plotted lines for various series are directly comparable.

Solid line indicates monthly data over 6 - or 9 -month spans.

Broken line indicates monthly data over 1-month spans.

Solid line with plotting points indicates quarterly data over various spans.

* Many of the more irregular series are shown in terms of their MCD moving averages as well as their actual monthly data. In such cases, the 4-, 5-, or 6-term moving averages are plotted $11 / 2,2$, or $21 / 2$ months, respectively, behind the actual data. See page 2 for a description of MCD moving averages.

## CHART 2 - Diffusion Indexes

Scale shows percent of components rising.

Arabic number indicates latest month for which data are used in computing the indexes. (" 12 " = December)

Roman number indicates latest quarter for which data are used in computing the indexes. ("Ill"= third quarter)

Broken line with plotting points indicates quarterly data over various intervals. This line is also used to indicate anticipated quarterly data.

## charts and tables

## LEADING INDICATORS

Sensitive employment and unemployment
New investment commitments
New businesses and business failures
Profits and stock prices
Invenfory investment, buying policy, and sensitive prices
ROUGHLY COINCIDENT INDICATORS
Employment and unemployment
Production
Income and trade
Wholesale prices

## LAGGING INDICATORS

Investment expenditures
Cost per unit of output
Inventories
Debt
Interest rates
OTHER U.S. SERIES
Federal budget and military commitments
Reserves, money supply, and financing Inferest rates

Foreign trade
INTERNATIONAL COMPARISONS
Industrial production indexes for selected foreign countries

## CHANGES OVER 4 LATEST MONTHS

NOTE: Series are seasonally adjusted except those that appear to contain no. seasonai movement. Unadjusted series are indicated by an asterisk (*). Current high lalues are indicated by $\boldsymbol{T}$; for series that move counter to movements in general business activity (series $3,4,5,14,15,40,43$, and 45), current low values are indicated $y B$ Series numbers are tor identification only and do not reflect series relationships or order. Complete titles and sources are shown on the back cover. The "r" indiates revised; " $p$ ", preliminary; " $e$ ", estimated; " $a$ ", anticipated; and "NA", not available.
${ }^{1}$ The data from 1961 on have been adjusted to reflect a change in the seasonal adjustment of appropriations for the petroleum fand coal products industry and a change in the reporting basis of nonelectrical machinery. These revisions do not materially affect comparability with the data before 1961. (See NICB publication, Investment Statistics-Capital Appropriations: First Quarter 1965.)

NOTE: Figures are the percent of series components rising and are centered within spans: 1-month indexes are placed on latest month and 9-month indexes are placed on the 6th month of span; 1 -quarter indexes are placed on the 1st month of the $2 d$ quarter. Seasonally adjusted components are used except in indexes D19 which requires no adjustment and D34 which is adjusted only for the index. Table 5 identifies the components for most of the indexes shown. The "r" indicates revised; "p", preliminary; and "NA", not available.
${ }^{1}$ The diffusion index is based on 82 components through February 1963; on 80 components, March 1963 to August 1963 ; on 79 components, September 1963 to March 1964; on 78 components, April 1964 to November 1964; and on 77 components thereafter.
${ }^{2}$ Average for November 16,17 , and 18.

## $p=$ preliminary. $\quad r=$ revised.

${ }^{1}$ Data are seasonally adjusted by the Bureau of the Census. (See "Seasonal and Related Statistical Adjustments", page 2.)

Basic data for components of diffusion index D19, Index of stock prices, 500 common stocks, and of diffusion index 05 , |nitial claims for unemployment insurance, State programs, are not available from the Census Bureau.

# Directions of Change-Continued 

$+=$ rising; $0=$ unchanged; $-=$ falling.
${ }^{1}$ Data are not seasonally adjusted.
${ }^{2}$ The 23 components shown here include 18 of the more important industries and 5 composites representing an additional 23 of the industries used in computing the diffusion index in table 4.
${ }^{3}$ Based on 77 components.

# SELECTED DIFFUSION INDEXES AND COMPONENTS—Continued 

## Directions of Change-Continued

$-=$ rising; $0=$ unchanged; $+=$ falling. The signs are reversed because this series usually rises when general business activity falls and falls when business rises. Data used are tor the week including the 12th of the month.
${ }^{1}$ Series components are seasonally adjusted by the Bureau of the Census before the direction of change is determined. (See "Seasonal and Related Statistical Adjustments", page 2.) The percent rising is based on 47 labor market areas. Directions of change are shown separately for only the 26 largest areas. The number in parentheses indicates the size rank for each labor market area.

NOTE: For series with a "months for cyclical dominance" (MCD) of " 1 " or " 2 " (series $19,23,41,47,52,55,62,64$, and 66 ), the value for the month indicated in the 1st column (month after reference trough) is divided by the value for the reference peak month. Similarly, the reference peak quarter is used as the percentage base for quarterly series (series $16,49,50,61$, and 67 ). For series with an MCD of " 3 " or more (series $1,2,3,6,7,9,13,14,17,24,29,51$, and 54 ), the average of the 3 months centered on the reference peak month is used as the base. See MCD footnote to appendix C. For all earlier expansions except the one beginning in June 1938, the peak had been passed and a reference contraction was underway by the month indicated in the lst column. See appendix A for the reference peak dates.

NANOt available.
${ }^{1}$ Based on period from February 1961 (current trough) to latest month for which data are available. Measures for shorter time spans can be found in earlier issues of BUSINESS CYCLE DEVELOPMENTS. ${ }^{2}$ Except for 1961, changes are computed in a 3-term moving average of the seasonally adjusted series. ${ }^{3}$ Measures are differences from the reference peak levels. ${ }^{3}$ Anticipated expenditures (4th quarter 1966) are used for computing the entry shown for the current expansion only. Actual expenditures are used for all other entries. ${ }^{\text {C }}$ Changes are computed in a 6 -term moving average of the seasonally adjusted series.

${ }^{1}$ Not computed for series when MCD is "6" or more.

The following are brief definitions of the measures shown in this table. More complete explanations appear in'Electronic Computers and Business Indicators, by Julius Shiskin, issued as Occasional Paper 57 by the National Bureau of Economic Research, 1957 (reprinted from Journal of Business, October 1957.
"CII", is the average month-to-month (or quarter-to-quarter) percentage change, without regard to sign, in the seasonally adjusted series. "II" is the same for the irregular component, obtained by dividing the cyclical component into the seasonally adjusted series. "C" is the same for the cyclical
component, a smooth, flexible moving average of the seasonally adjusted series.
"MCD" (months for cyclical dominance) provides an estimate of the appropriate time span over which to observe cyclical movements in a monthly series. It is small for smooth series and large for irregular series. In deriving MCD, percentage changes are computed separately for the irregular component and the cyclical component over 1 -month spans (Jan.-Feb., Feb.Mar., etc.), 2-month spans (Jan.-Mar., Feb.-Apr., etc.), up to 5 -month spans. Averages, without regard to sign, are then computed for the changes over each span. MCD is the shortest span in months for which the average percentage change (without regard to sign) in the cyclical component is larger than the average percentage change (without regard to sign) in the
irregular component, and remains so. Thus, it indicates the point at which fluctuations in the seasonally adjusted series become dominated by cyclical rather than irregular movements. Since changes are not computed for spans greater than 5 months, all series with an MCD greater than "5" are shown as "6". Similarly, "QCD" provides an estimate of the appropriate time span over which to observe cyclical movements in quarterly series. It is the shortest span (in quarters) for which the average percentage change (without regard to sign) in the cyclical component is larger than the average percentage change (without regard to sign) in the irregular component, and remains so.
$" \overline{\mathrm{I}} / \mathrm{C} "$ is a measure of the relative smoothness(small values) or irregularity (large values) of the seasonally adjusted series. For monthly series, it is shown for l-month spans and for spans of the period of MCD. When MCD is "6", no $\bar{I} / \bar{C}$ ratio is shown for the MCD period. For quarterly series, $\overline{\mathrm{I}} / \overline{\mathrm{C}}$ is shown for l-quarter spans and QCD spans.
"Average Duration of Run" (ADR) is another measure of smoothness and is equal to the average number of consecutive monthly changes in the same direction in any series of observations. When there is no change between 2 months, a change in the same direction as the preceding change is assumed. The $A D R$ is shown for the seasonally adjusted series CI, irregular component $I$, cyclical component $C$, and the MCD curve. The MCD
curve is a moving average (with the number of terms equal to MCD) of the seasonally ad.justed series.

A comparison of these measures of $A D R$ with the expected $A D R$ of a random series gives an indication of whether the changes approximate those of a random series. Over l-month intervals in a random series, the expected value of the $A D R$ is 1.5. The actual value of ADR falls between 1.36 and 1.75 about 95 percent of the time. Over 1-month intervals in a moving average (MCD) of a random series, the expected value of $A D R$ is 2.0. For example, the $A D R$ of $C I$ is 1.65 for the series on bank debits, all SMSA's except New York (series 51). This indicates that 1 -month changes in the seasonally adjusted series, on the average, reverse sign about as often as expected in a random series. The $A D R$ measures shown in the next two columns, 1.50 for $I$ and 30.40 for $C$, suggest that the seasonally adjusted series has been successfully separated into an essentially random component and a cyclical (nonrandom) component. Finally, ADR is 4.29 for the MCD moving average. This indicates that a 3 -month moving average of the seasonally adjusted series ( 3 months being the MCD span) reverses direction, on the average, about every 4 months. The increase in the ADR from 1.65 for CI to 4.29 for the MCD moving average indicates that, for this series, month-to-month changes in the MCD moving average usually reflect the underlying cyclical trend movements of the series, whereas the month-to-month changes in the seasonally adjusted series usually do not.

## ${ }^{1}$ Not computed for series when MCD is "6" or more.

The measures in the above table are computed by an additive method to avoid the distortion caused by zero and negative data. Thus, "CI" is the average month-to-month (or quarter-to-quarter) change in the seasonally adjusted series. This average is computed without regard to sign and is expressed in
the same unit of measure as the series itself. " $\overline{\mathrm{C}}$ " is the same for the cyclical component, which is a moving average of the seasonally adjusted series. "Ī" is the same for the irregular component, which is determined by subtracting the cyclical component from the seasonally adjusted series.

All other measures shown above have the same meaning as in part 1.

Appendix D.-CURRENT ADJUSTMENT FACTORS FOR BUSINESS CYCLE SERIES (NOV. 1965 TO DEC. 1966)

| Series |
| :--- |

NOTE: These data are not published by the source agency in seasonally adjusted form. Seasonal adjustments were made by the Bureau of the Census or the National Bureau of Economic Research, Inc. They are kept current by the Bureau of the Census. Seasonally adjusted data prepared by the source agency will be substituted whenever they are published. For a description of the method used to compute these factors, see Bureau of the Census Technical Paper No. 15, The X-11 Variant of the Census Method II Seasonal Adjustment Program.
${ }^{1}$ Factors are products of seasonal and trading-day factors. Seasonally adjusted data resulting from the application of these combined factors may differ slightly from those obtained by separate applications of seasonal and trading-day factors.
${ }^{2}$ Quarterly series; figures are placed in middle month of quarter.
${ }^{3}$ These quantities, in millions of dollars, are to be subtracted from the original monthly data to yield the monthly seasonally adjusted data. They were computed by the additive version of the $\mathrm{X}-11$ variant of the Census Method II seasonal adjustment program.
${ }^{4}$ Factors apply to total series before month-to-month changes are computed.

NOTE: For series with a "months for cyclical dominance" (MCD) of "1" or "2" (series 41, 43, 47, and 52), the figure for the reference peak (trough) month is used as the base. For series with an MCD of "3" or more (series 51 and 54 ), the average of the 3 months centered on the reference peak (trough) month is used as the base. The base for quarterly series (series 49 and 50 ) is the reference peak (trough) quarter. See also MCD footnote to appendix C.

NA Not available.
${ }^{1}$ The most recent quarterly reference dates are as follows: 2d quarter 1958 (trough); 2d quarter 1960 (peak); and lst quarter 1961 (trough). For earlier dates, see Business Cycle Indicators (NBER) vol. 1, p. 670.
${ }^{2}$ Based on average for the calendar year.
${ }^{3}$ Differs from figure for same date in expansion (contraction) part of table because of change in series used.
${ }^{4}$ World War II contraction or expansion period.
${ }^{5}$ Korean War contraction or expansion period.
${ }^{6}$ The median is an average of the middle 2 or 3 items.

## ONG TERM ECONOMIC GROWTH 1860-1965

LONG TERM ECONOMIC GROWTH has been developed from available ste tistics to provide a comprehensive, long-range view of the U.S. economy. It ha been planned, prepared, and published as a basic research document for econc mists, historians, social scientists, political scientists, bankers, investors, teacher and students, and community and business long-range planners. For these users LONG TERM ECONOMIC GROWTH brings together for the first time under on cover, in meaningful and convenient form, the complete statistical basis for study of long-term economic trends. It is a unique presentation of the full rang of factors required for an understanding of our country's economic developmen

The data that have gone into this new statistical compendium originated $i$ various public source materials from both government and nongovernmer agencies and individuals. Charts and tables are based on data from distinguishe private research groups such as the National Bureau of Economic Research, th Committee for Economic Development, and the Brookings Institution; an government agencies such as the Office of Business Economics of the Depar ment of Commerce, the Bureau of Labor Statistics of the Department of Labc and the Board of Governors of the Federal Reserve System.

LONG TERM ECONOMIC GROWTH brings together about 400 aggregat annual economic time series and nearly 800 component series that are useful fc studying economic growth. It carries all of the series far back in time-some $t$ 1860. Source data will be revised continuously in updated new editions; ner series will probably be added and some may be dropped.

The book is organized into five major parts-
I Gives various basic measures of economic growth-output of goods an services, potential output, input of different human and material factors and productivity.
II Deals with factors vitally related to economic growth such as educatior research and development, and health, with background economic pror esses such as prices, interest rates, saving, wages, profits, debt, assets c financial institutions, balance of payments, monetary gold stock, use c labor and capital, and seasonal and cyclical forces.
III Shows very long.range regional and industry growth trends below th aggregate level, for fuller understanding of economic growth features an points out regions and industries undergoing the most rapid rates c change.
IV Compares U.S. economic growth with that of six major foreign countrie:
$\checkmark$ Features "growth rate triangles'" showing growth rates for key measure useful in making comparisons over various time periods and amon different series.
Following the five parts are the appendixes, which include a specially dr signed compound interest rate table, descriptions and sources of various serie used, and the basic source data for charts and tables included in the book.

Charts in this brochure are reduced from the full page size $91 / 8^{\prime \prime} \times 113 / 8^{\prime \prime}$.

## Titles and Sources of Principal Business C̀ycle Series and Diffusion Indexes

The numbers assigned to the series are for identification purposes only and do not necessarily reflect series relationships or order. " $M$ " indicates monthly series " $Q$ " indicates quarterly series. Data apply to the whole period except for series designated by "EOM" or "EOQ". "EOM" indicates that data are for the end of the month and "EOQ" indicates data are for the end of the quarter. The Roman numeral identifies the economic process group in which a series is listed in the Finding Guide. Thus, "( $M, I I$ )" indicates a manthly series listed in group II. The general classification of series follows the approach of the National Bureau of Economic Research. The series preceded by an osterisk (*) were included in the 1960 NBER list of 26 indicators.

## 30 NBER LEADING INDICATORS

${ }^{*}$ I. Average workweek of production workers, manufacturing ( $M, 1$ ).--Department of Labor, Bureau of Labor Statistics
*2. Accession rate, manufacturing ( $M, I$ ).--Department of Labor, Bureau of Labor Statistics
*3. Layoff rate, manufacturing ( $M, I$ ).--Department of Labor, Bureau of Labor Statistics
4. Number of persons on temporary layoff, all industries ( $M, I$ ).--Department of Labor, Bureau of Labor Statistics; seasonal adjustment by Bureau of the Census
5. Average weekly initial claims for unemployment insurance, State programs ( $M, I$ ).--Department of Labor, Bureau of Employment Security; seasonal adjustment by Bureau of the Census
*6. Value of manufacturers' new orders, durable goods industries ( $\mathrm{m}, \mathrm{III}$ ).--Department of Commerce, Bureau of the Census
*7. New private nonfarm dwelling units started ( $M, 111$ ).--Department of Commerce, Bureau of the Census
*9. Construction contracts awarded for commercial and industrial buildings, floor space ( $M, I I I$ ).--F. W. Dodge Corporation; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
10. Contracts and orders for plant and equipment ( $M, I I I$ ).--Department of Conmerce, Bureau of the Census, and F. W. Dodge Corporation; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
11. Newly approved capital appropriations, 1,000 monufacturing corporations (Q,III).--National Industrial Conference Board; component industries are seasonally adjusted and added to obtain seasonally adjusted total
13. Number of new business incorporations ( $M$, III).--Dun and Bradstreet, Inc.; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
*14. Current liabilities of business failures ( $M, \mathrm{VI}$ ).--Dun and Bradstreet, Inc.; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
15. Number of business failures with liabilities of $\$ 100,000$ and over (M,VI).--Dun and Bradstreet, Inc.; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.
*16. Corporate profits after taxes (Q,V).--Department of Commerce, Office of Business Economics
17. Price per unit of labor cost index--ratio, wholesale prices of manufactured goods index to index of compensation of employees (sum of wages, salaries, and supplements to wages and salaries) per unit of output ( $M, V$ )..-Department of Commerce, Office of Business Economics; Department of Labor, Bureau of Labor Statistics; and Board of Governors of the Federal Reserve System; seasonal adjustment by Bureau of the Census
18. Profits (before taxes) per dollar of sales, all manufacturing corporations ( $\mathbf{Q}, \mathrm{V}$ ).Federal Trade Commission and Securities and Exchange Commission; seasonal adjustment by Bureau of the Census
*19. Index of stock prices, 500 common stocks ( $M, V$ ).--Standard and Poor's Corporation; no seasonal adjustment
20. Change in book value of manufacturers' inventories of materials and supplies ( $M, \mathrm{IV}$ ).Department of Commerce, Bureau of the Census
*21. Change in business inventories, farm and nonfarm, ofter valuation adjustment (GNP component) (Q,IV).--Department of Commerce, Office of Business Economics
22. Ratio of profits (after taxes) to income originating, corporate, all industries ( $Q, V$ ).-Department of Commerce, Office of Business Economics
*23. Index of industrial materials prices ( $M, \mathbf{V}$ )..-Department of Labor, Bureau of Labor Statistics; no seasonal adjustment
24. Value of manufacturers' new orders, machinery and equipment industries ( $M, I I$ )...-Department of Commerce, Bureau of the Census
25. Change in manufacturers' unfilled orders, durable goods industries ( $M$,IV)...Department of Commerce, Bureau of the Census
26. Buying policy--production materials, percent reporting commitments 60 days or longer ( $M$, IV),--National Association of Purchasing Agents; no seasonal adjustment
29. Index of new private housing units authorized by local building permits (M,III).--Department of Commerce, Bureau of the Census
30. Nonogricultural placements, all industries ( $\mathrm{M}, \mathrm{I}$ )..-Department of Labor, Bureau of Employment Security; seasonal adjustment by Bureau of the Census
31. Change in book value of manufacturing and trade inventories, total (M,IV).--Department of Commerce, Office of Business Economics
32. Vendor performance, percent reporting slower deliveries (M,IV).--Chicago Purchasing Agents Association; no seasonal adjustment
37. Percent reporting higher inventories, purchased materials ( $M, I V$ )...National Association of Purchasing Agents; seasonal adjustment by Bureau of the Census
*38. Index of net business formation ( $M$, III)..-Dun and Bradstreet, Inc., and Depariment of Commerce, Bureau of the Census; seasonal adjustment by Bureau of the Census and National Bureau of Economic Research, Inc.

## 15 NBER ROUGHLY COINCIDENT INDICATORS

40. Unemployment rate, married males, spouse present (M,I).--Department of Labor, Bureau of Labor Statistics
*41. Number of employees in nonagricultural establishments ( $M, 1$ )..-Department of Labor, Bureau of Labor Statistics
41. Total nonogricultural employment, labor force survey ( $M, 1$ ).--Department of Labor, Bureau of Labor Statistics, and Department of Commerce, Bureau of the Census
*43. Unemployment rate, total ( $M, 1$ ), .--Department of Labor, Bureau of Labor Statistics, and Department of Commerce, Bureau of the Census
42. Average weekly insured unemployment rate, State programs ( $M, I$ )...Department of Labor, Bureau of Employment Security
43. Index of help-wanted advertising in newspapers ( $M, I$ ).--National Industrial Conference Board
*47. Index of industrial production ( $\mathbf{m , H}, \mathbf{1}$ )--Board of Governors of the Federal Reserve System
*49. Gross national product in current dollars ( $Q, I I$ ).--Department of Commerce, Office of of Business Economics
*50 Gross national product in 1958 dollars ( $\mathbf{Q}, \mathrm{II}$ ).--Department of Commerce, Office of Business Economics
*51. Bank debits, all standard metropolitan statistical areas except New York (224 SMSA's) ( $M$, II).--Board of Governors of the Federal Reserve System
*52. Personal income ( $M, I I$ ).--Department of Commerce, Office of Business Economics
44. Labor income in mining, manufacturing, and construction ( $M, 11$ ).--Department of Commerce, Office of Business Economics
*54. Sales of retail stores ( $M, I I$ ).--Department of Commerce, Bureau of the Census
*55. Index of wholesale prices, all commodities other than farm products and foods ( $M, V$ )..Department of Labor, Bureau of Labor Statistics; seasonal adjustment by Bureau of the Census
45. Final sales (series 49 minus series 21) (Q,II).-Department of Commerce, Office of Business Economics

## 7 NBER LAGGING INDICATORS

*61. Business expenditures on new plont and equipment, total ( $Q, I I 1$ )..-Department of Commerce, Office of Business Economics, and the Securities and Exchange Commission
*62. Index of labor cost per unit of output, total manufacturing-rratio, index of compensotion of employees in monufacturing (the sum of wages ond salaries and supplements to wages and salaries) to index of industrial production, manufacturing ( $M, V$ ).-Department of Commerce, Office of Business Economics, and the Board of Governors of the Federal Reserve System; seasonal adjustment by Bureau of the Census
*64. Book value of manufacturers' inventories, all manufacturing industries (EOM,IV)..-Department of Commerce, Bureau of the Census
65. Book value of manufacturers' inventories of finished goods, all manufacturing industries (EOM,IV).--Department of Commerce, Bureau of the Census
*66. Consumer installment debt (EOM,VI).--Board of Governors of the Federal Reserve System. FRS seasonally adjusted net change added to seasonally adjusted figure for previous month to obtain current figure
*67. Bank rates on short-term business loons, 19 cities (EOQ,VI).--Board of Governors of the Federal Reserve System; no seasonal adjustment
68. Index of labor cost per dollar of real corporate gross national product (ratio of compensation of employees in corporate enterprises to value of corporate product in 1958 dollars) (Q,V)..-Department of Commerce, Office of Business Economics, Na tional Income Division

[^0]:    about the cover-
    Series in this publication are grouped according to their usual timing and shown against the background of contractions and expansions in general business activity. The cover design illustrates this concept. The black vertical bar represents a contraction; the top curve, the Leading Series which usually fall before a contraction has begun and rise before it has ended; the middle curve, the Coincident Series which usually fall with the contraction period; the bottom curve, the Lagging Series which fall after a contraction has begun and rise after it ends.

[^1]:    ${ }^{1}$ For a more complete description of MCD and its use in |tudying economic series, see Business Cycle Indicators, teoffrey H. Moore, editor; National Bureau of Economic Reearch, Inc., vol. 1, ch. 18, "Statistics for Short-Term Economic 'orecasting," by Julius Shiskin (Princeton University Press: 961).

[^2]:    $r=$ revised; $p=$ preliminary; $e=$ estimated; $a=$ anticipated; $N A=$ not available. $\quad$ Series are seasonally adjusted except for those series, indicated by an asterisk *), that appear to contain no seasonal movement. See additional basic data and notes in table $2 .{ }^{2}$ Average percent changes are based on month-to-month (or quarter-touarter) percent changes for the specified periods. ${ }^{3}$ To facilitate interpretations of cyclical movements, those series that usually fall when general business activity rises nd rise when business falls are inverted so that rises are shown as declines and declines as rises (see series $3,4,5,14,15,40,43$, and 45 ). Percent changes are comuted in the usual way but the signs are reversed. (See footnote 8 for other "change" qualifications.) 4 Average computed with regard to sign. 5 Average computed ithout regard to sign. ${ }^{6}$ The period varies among the series; however, for most series, the period covered is $1953-65$. ${ }^{7}$ Quarterly series; figures are placed in the middle onth of quarter. ${ }^{8}$ Since basic data for this series are expressed in plus or minus amounts, the changes are month-to-month (or quarter-to-quarter) differences expressed in le same unit of measure as the basic data, rather than in percent. ${ }^{9}$ Figures are placed in the last month of quarter.

[^3]:    ${ }^{2}$ High value (32) was reachea in February 1962.
    a See "New Features and Changes for This Issue," page iii.
    ${ }^{3}$ Average for November 16, 17, and 18.

[^4]:    ${ }^{1}$ High value ( +6.6 ) was reached in December 1961.
    ${ }^{2}$ See "New Features and Changes for This Issue," page iii.
    ${ }^{3}$ Average for November 16, 17, and 18.

[^5]:    ${ }^{1}$ Because of a change in coverage, data beginning with July 1966 are not comparable with data for the earlier period.

[^6]:    ${ }^{1}$ The data from 1961 on have been adjusted to reflect a change in the seasonal adjustment of appropriations for the petroleum and coal products industry and a change in the reporting basis of nonelectrical machinery. These revisions do not materially affect comparability with the data before 1961. (See NICB publication, Investment Statistics--Capital, Appropriations: First Quarter 1965.)
    ${ }^{2}$ See "New Features and Changes for This Issue," page iii.

[^7]:    ${ }^{1}$ The data from 1961 on have been adjusted to reflect a change in the seasonal adjustment of appropriations for the petroleum and coal products industry and a change in the reporting basis of nonelectrical machinery. These revisions do not materially affect comparability with the data before 1961. (See NICB publication, Investment Statistics--Capital Appropriations: First Quarter 1965.)

[^8]:    ${ }^{1}$ The diffusion index is based on 24 components through June 1964, and on 23 components thereafter.
    ${ }^{2}$ See "New Features and Changes for This Issue," page iii.

[^9]:    
    in a given distance; scale L-2 is a logarithmic scale with 2 cycles in that distance, etc. $\boldsymbol{\sim}$ Latest data anticipated.

    * Reference peak leval. * Point at which this expansion reached a new reference peak. OPoint at which a new reference trough was reached.

[^10]:    ${ }^{1}$ Ratio, index of wholesale prices of manufactured goods to index of labor cost per unit of output (series 62).
    ${ }^{2}$ Ratio, index of compensation of employees in manufacturing (sum of wages and salaries plus supplements to wages and salaries) to index of industrial production, manufacturing.
